as about sulphur springs and craters of volcanoes. The great repository of gypsum, however, is the water of the ocean, which always holds it in solution, and from which it has been precipitated by evaporation to form all the great masses of this substance. It is also soluble in fresh water in the proportion of 1 part to 400 or 500 of water. The most important deposits known are those of the Paris basin at Montmartre, which are of eocene age, and from which it has taken the common name of plaster of Paris; those of Nova Scotia, Virginia, and Michigan, of carboniferous age; of central New York, Ohio, and Canada West, in the upper Silurian; and in the triassic strata of the far west. It also occurs in the trias at Bex in Switzerland, Vic and Dieuze in France, Cheshire in England, and Stasfurt in Germany. In all these, as in the most important American localities, it is associated with rock salt. Gypsum is known to exist in large quantities in Mexico, South America, Africa, India, Australia, and China.—The origin of the great masses and strata of gypsum found in many countries has been a subject of much discussion. By most writers they are represented to have been produced by the action of sulphuric acid contained in the water of acid springs acting upon strata of limestone. This theory is, however, inapplicable to all the most important deposits, which are undoubtedly derived from the precipitation of gypsum by evaporation from its solution in circumscribed basins of salt water, like the Dead sea and Great Salt lake. This is apparent in the structure of the gypsum beds, which are generally accurately stratified, and not unfrequently alternate with sheets of limestone. Gypsum is also usually associated with greater or less quantities of the salts which are found in sea water, viz., the chlorides of sodium, calcium, magnesium, the sulphate of soda, &c. Of all the solid matter contained in sea water, gypsum is the least soluble, and therefore is the first precipitated. It is thus deposited by itself, and forms continuous and regular strata many miles in extent and of great thickness. The next ingredient which would be thrown down in the evaporation of sea water is the chloride of sodium; and this we find in the strata of rock salt which accompany beds of gypsum. The other salts mentioned have such an affinity for water that they are not found solid, but compose the bitterns of the brines of wells and springs. In New York, Canada, and Ohio, gypsum occurs chiefly in the Salina or Onondaga salt group. This formation is made up of a series of earthy sediments interstratified with salt and gypsum, and is plainly the deposit which accumulated at the bottom of a great salt lake, which in the Silurian age reached from eastern New York to the Cincinnati axis. In the western part of this basin, at Sandusky, Ohio, the Salina group contains sheets of regularly bedded strata of gypsum, divided horizontally by thin sheets of carbo-

nate of lime. In the carboniferous age evaporating pans where salt water precipitated its solid contents existed in Nova Scotia, Michigan, Virginia, and Arizona, and later in the triassic age, in the region now occupied by the Llano Estacado and in the Indian territory. In all these localities proof is abundant that the strata of gypsum are precipitated sediments, and that the theory which attributes the formation to the action of acid springs is a fallacy.—The uses of gypsum in the arts are varied and important. When calcined, its combined water is driven off. If now ground to powder and again mixed with water, this water recombines with it, and the mass becomes first plastic, then solid, and takes the form of any model into which it may have been poured. This property of gypsum has many applications in the arts. It makes the most convenient of mortars, and was extensively used by the ancient inhabitants of Mexico as well as those of Egypt in their masonry. The use of gypsum in the formation of plaster casts is too common and well understood to require special notice. When mixed with glue water, plaster of Paris is converted into stucco. If mixed with a solution of borax, alum, or sulphate of potash, and subsequently rebaked and powdered, and again mixed with a solution of alum, it forms a hard cast which takes a high polish. This composition is called Keene's cement if made with alum, Parian if with borax, and Martin's if with potash. In the preparation of plaster of Paris, the gypsum rock is ground between buhr stones until it is reduced to a fine powder. This is calcined by being heated in kettles or stills, the escaping water producing a movement like ebullition. As calcined plaster absorbs moisture from the atmosphere, it should be prepared as wanted, or carefully protected from dampness. Gypsum is sometimes used for the glazing of porcelain. But the principal consumption of it is as a fertilizer for soils. Sulphate of lime enters into the composition of grasses, potatoes, turnips, &c., and these cannot flourish in soils entirely free from it. Its potency, however, is probably due in a far greater degree to its action in fixing volatile and escaping carbonate of ammonia. When this comes in contact with sulphate of lime, double decomposition takes place, carbonate of lime and sulphate of ammonia being formed. Its value as a fertilizer may be readily tested by distributing a quantity of it in a narrow line across a meadow. Where the plaster has fallen, the grass will frequently be so much stronger and greener, that the difference may be seen even at a considerable distance. Gypsum is not unfrequently mingled with, and sometimes shades into, anhydrite, the anhydrous sulphate of lime. Both pass under the name of plaster, the anhydrite being called hard and gypsum soft plaster. The uses to which they are applied are the same.—The commerce in gypsum in the United States amounts to about \$1,000,000 per annum, almost equally divided

between the miner and manufacturer, and between three districts: the Atlantic coast, where the material is derived from Nova Scotia, and the states of New York and Michigan, where it is indigenous and abundant. The importation of gypsum into the United States from Nova Scotia and New Brunswick in 1873 was 118,280 tons, valued at \$117,828. The annual production of gypsum in New York and Michigan may be estimated at about 100,000 tons each.

**GYROSCOPE** (Gr. *γυρός*, a ring, and *σκοπεῖν*, to examine), a name applied to various instruments designed to illustrate the phenomena of rotation. The most curious and generally interesting form of gyroscope, rightly named "mechanical paradox," although its principle was discovered long before its first construction, consists essentially of a disk revolving on pivots within a ring, having on the line of prolongation of its axis, on one side, a bar or spur with a smooth notch beneath to receive the hard smooth point of an upright support. Thus placed, when the disk is not turning, the whole falls, of course, like any heavy body unsupported—

Gyroscope.

ed. Rotate rapidly by unwinding a string, set on the support, but uphold the opposite side of the ring; no peculiar movement then occurs. But if while the disk is rapidly turning, the bar being on the support, the opposite side be set free, the whole, instead of falling, as would be expected, commences a steady revolution in a horizontal circuit about the point of support, moving more rapidly as the primary rotation is expended, and sinking, at first imperceptibly, then more rapidly, until in from one to three minutes it comes to rest. Mathematical analysis shows that when set free, it continually falls and rises, but this motion is not visible. The disk started with its axis in or below the horizontal never rises, without aid, above its first position. Started with high speed above the horizontal, it may rise, and if its connection with the support allow, as when this is by a ball and socket, it may even ascend to a vertical position, and spin as a top. Arrested in its travelling movement, it always descends; hastened, it rises. Checked in any part, it inclines in the direction of that part. In the form now given, the travelling or orbital movement is always in the

direction in which the bottom of the disk is going. But if the axis be prolonged beyond the support, and the disk and ring slightly overpoised by a weight on the other side, then the disk always travels in the direction in which its top is going, and nearly all the phenomena are reversed. Many other curious results may be obtained; it will here be added further only that the disk below the horizontal is always, and above it usually, slowly falling; and that the orbital motion invariably takes place toward that side of the disk in which the force of the rotation about its own axis is most resisted or checked. For proof of this latter principle, let any small wheel be rotated, and while turning rub or seize it upon any side; the rotation in this side being thus checked, and actually or in effect subtracted from, that in the opposite side preponderates, and the wheel is urged toward the side in which the checking occurs.—Perhaps no completely satisfactory explanation of the phenomena can be given without employing the language and processes of the higher mathematics. This has been done in a very complete manner by Gen. J. G. Barnard in a paper published in the “*American Journal of Education*” for June, 1857, and also published separately under the title “*Analysis of Rotary Motion as applied to the Gyroscope*” (New York, 1857). The following explanation proposed by Dr. Levi Reuben of New York is perhaps as satisfactory as it is possible to give without the aid of mathematics. There are two facts to be explained: support, and orbital movement, or travelling about the supporting point. For the first, suppose the disk composed of 1,000 equally heavy particles. When it is set rotating and released, each of these particles is, as a separate ball, acted on by two moving forces, that giving the rotation, and that of gravity; but the whole is also held together by the constraining action of cohesion. Suppose that, when released, the axis points below the horizontal: gravity acts in vertical lines and equally on all the particles. Its direction and amount may be represented by equal short pendent threads dropping down from all the particles. If the particles be also supposed in a single plane, the extremities will all lie in a new plane, slightly without and below the plane of the disk, and parallel with it. The forces impressed in giving rotation upon the several particles of the disk will all point in its plane, being represented at any moment by tangents to the circles in which the several particles move, pointing in all directions, and varying in length from the axis, where this is zero, to the periphery, where it is a maximum. But the resultant movements or tendencies of the particles must all terminate in the exact plane in which the gravitative components were seen to terminate. Every particle thus acted upon, then, tends to go outward or forward into the new plane already referred to. The several pressures are to points scattered somewhat widely in that plane; but owing to the

cohesion of all the particles, they are constrained to move or press forward in a body. The effect is as if the whole disk were pulled outward and very slightly downward, while the pivot in the notch reacts or pulls in the opposite direction; and the wheel is supported, in part, as if slung up by strings attached to its two faces and pulled in opposite directions. When the disk is above the horizontal, the new plane is behind or within it; it then pushes against the pivot, and this reacting, there occurs support by opposite pressures, instead of tractions. Thus we discover one reason why no material support is needed for the remote end of the axis; while as a consequence of this view, if the axis be horizontal it must first sink slightly, yet it may be only imperceptibly, before support can occur. This agrees entirely with the results of mathematical analysis. In the second place, why does the disk travel around the supporting point? When not overpoised, gravitation acting downward, and rotation, in the ascending side of the disk, upward, the latter is in effect decomposed into a horizontal and a vertical component, the horizontal expressing itself in the pressure already referred to, the vertical being resisted or antagonized by the force of gravity; the result for each particle being the sum which the latter as a negative quantity would form with the former. In the ascending side, therefore, gravity overbalances, equals, or diminishes, according to the place of each particle, the rotative force of ascent acting upon it; but to the vertical component of the rotative force of all the particles in the descending side it adds alike a quantity of action equal to its own amount. Hence, the whole rotative force in the descending half may be considered as increased, that in the ascending as diminished. There will be some point in the ascending half at which the vertical component of rotation equals gravity; this will become in effect a point of rest, or of no action. This is then the point pierced by the resultant axis—the point about which all the particles under the combined forces will tend to revolve: those in the ascending half starting with less radii to sweep round this point as a centre; those in the descending starting with longer radii, and sweeping in longer curves about the same point. Thus the disk is continually carried to the side in which the action is most checked; and this constitutes the travelling movement. When overpoised on the opposite side, the action of gravity on the disk itself is upward, the axis acting as a lever, the support on which it rests as a fulcrum; the rotative force of the descending particles is now resisted by it; and for a like reason the disk now moves toward its descending side. When not overpoised, the travelling movement of the disk itself introduces a new element into the case, by resisting the rotating of particles in the upper half backward in the course of movement. This checks and diminishes the action in the upper half of the disk,

and constitutes a new source of support by generating a tendency upward; and it is doubtless this part of the action that raises the disk at times to an erect position. The principles thus arrived at explain also why the disk travels faster as its axial rotation lessens, and also when weights are added to it; why in the ordinary form it rises if its motion is hastened with the hand; why, if overpoised, it descends by being hastened, and rises on being delayed in its orbital movement; and in fact, it may safely be said, every phenomenon which the instrument can be made to present. The same explanation, in effect, applies if the rotating body be a sphere, or of any other form. The facts of support and orbital movement, though separately considered, are really but two different expressions of the same phenomenon; the two actions, here for convenience separated, really conspire in one movement, and that is the composition of a rotation caused by gravity with another imparted by the hand. The reason why the rotating body does not fall is, that in such a body, whenever its plane is oblique to the vertical, gravity is no longer allowed to act singly, but must in every instant enter into composition with another force. Hence the body in such case cannot simply fall, but must move toward such new place in space as the combined actions shall determine; and hence, again, the same force which ordinarily produces a vertical fall, here carries a body round in a horizontal circle, or secondarily sometimes even causes it to ascend. The weight

of the rotating disk, however, is in all positions sustained by the support and base on which the apparatus rests. In this explanation, the distance through which the gravitative force acts has been taken as very short, because by experiment and calculation it can be proved that, unless the weight of the ring is very great, the whole downward action of gravity on the disk is very slight compared with that of the rotation first imparted by the hand, sometimes as small as in the ratio of 1 to 40 or 60.

**GYROWETZ, Adalbert**, a Bohemian composer, born in Budweis, Feb. 19, 1753, died in Vienna in 1850. He studied counterpoint under Sala, and was as well skilled on the violin as on the piano. In 1804 he was appointed director of the orchestra of the imperial theatre in Vienna. Among his operas are "Semiramis," "Agnes Sorel," "The Oculist," and "The Blind Harpist." He also composed melodramas, ballets, numerous instrumental works and vocal pieces, but excelled most in symphonies. His autobiography appeared in Vienna in 1848.

**GYULA**, a market town of Hungary, capital of the county of Békes, 30 m. N. of Arad; pop. in 1870, 18,495. It is divided by the White Körös river into two distinct villages, surnamed Magyar and Német (German), in one of which Hungarian and in the other German is principally spoken. It has a Greek united, a Greek non-united, and a Protestant church, a castle, a court house, and several oil mills. The vine is extensively cultivated in the neighborhood, and there is a trade in wine, salt, and cattle.

## H

**H**, THE eighth letter in the Latin alphabet, and in others derived directly from it, as English, French, German, and Italian. It was also the eighth letter in the original Greek alphabet, where it was represented by the character Η, and so appears in inscriptions; but the letter was in time dropped, and the character was used for the new letter *eta*; and the two halves (Ɑ and Ɱ), subsequently modified into ' and '̇, designated as the "rough" and "smooth" breathings, were superscribed over the initial vowel of a word; the initial *v* always having the rough breathing (*ῑ*), while the other vowels may have either. The initial *ρ* is always aspirated, and when this letter is doubled in the middle of a word, the first has the rough and the second the smooth breathing (*ῑῑ*). H in English, when sounded, is a mere emission of the unvoiced breath; but in producing it the vocal organs are placed in position to form the succeeding vowel; thus in uttering *he*, *ha*, or *ho*, the lips and tongue are in different positions. H is sometimes silent, as in *hour*, *heir*, *honor*; that is, the breath is emitted so gently as to be inaudible; in a few words, such as *humble* and

*humor*, the usage varies; but when audible it has but one sound, as in *hat*. There is a vulgarism not uncommon in England of reversing the proper usage at the beginning of a word; as *ouse* for house, *happle* for apple. At the end of a word it is silent, or at most gives additional force to the preceding vowel. H enters into combination with other letters, usually modifying their sound. *Ch*, as in *church*, is properly a distinct letter (and is so regarded in Spanish, the only language in which it is the same as in English), the sound of which is only approximately represented by *tsh*; in some words of French origin, as *chaise* and *machine*, it is equivalent to *sh*; when it is the representative of the Greek χ, it is usually sounded like *k*, as in *chorus*, but occasionally, as in *archbishop*, it assumes the normal English sound. In *gh*, at the beginning of a word, the *h* is silent, as in *ghost*; in other positions both letters are usually silent, as in *light*, *bough*, but occasionally, as in *laughter*, they sound like *f*. *Ph* is merely the representative of the Greek φ, and sounds like *f*. *Rh* is only used to represent the Greek ρ. *Th* has two sounds, as in *thin* and in *that*. In *wh*, the

sound of *h* precedes that of *w*, as in *what* (*hwat*); in *who*, *whom*, *whose*, *whole*, the *w* is silent. Many persons drop the *h* in this combination, pronouncing *wig* for *whig*, *wip* for *whip*, &c.—In German music, H denotes the 7th diatonic interval, or the 12th string of the chromatic scale. This note was anciently B, and is so yet in Dutch and English music; but after the introduction of the chromatics, both itself and its flat (which was first contrived) being named B, in order to distinguish them, one was made of square shape. From this B *quadratum* was formed the ♮ (French *bé carré*) and the German H, while its flat became *b*, whence the sign ♭ (French *bé mol*).

**HAARLEM, Haerlem, or Harlem**, a city of the Netherlands, in the province of North Holland, on the navigable river Spaarne, 3 m. from the sea, 10 m. W. of Amsterdam, and 17 m. N. N. E. of Leyden, with both which cities it communicates by canals and railways; pop. in 1872, 32,-

schools, a gymnasium, an academy of arts founded in 1752, and the Teyler institute; and in the S. outskirts are many nursery gardens, renowned for tulips, hyacinths, and other bulbous plants, in which an extensive trade is carried on. It possesses manufactories of cotton, silk, linens, velvets, ribbons, damasks, lace, jewelry, sail cloth, and soap, and has refineries of salt, tanneries, and dye works. Prior to the discovery of the art of bleaching by chlorine, Haarlem enjoyed celebrity for its bleacheries. Large quantities of linen were supplied to England, and hence came to be called *holland*s.—Haarlem was a flourishing town in the middle of the 12th century, and figured in the wars between the Dutch and West Frisians. The revolted peasants seized it in 1492, but lost it the same year. Having joined the revolt of the Netherlands against the Spaniards it was besieged by the troops of Alva in 1572-'3. The citizens made one of the most heroic defences

on record. After seven months' siege, during which the Spaniards lost 10,000 men, and twice breached the walls, but were unable to obtain entrance, they turned the siege into a blockade, and placed a fleet on the lake to cut off supplies. The defenders, who originally numbered 4,000, including some German auxiliaries and a corps of 300 women, being reduced to 1,800, and the last mouthful of food eaten, proposed to place the women and children in their centre, fire the city, and cut their way through the besiegers. The Spaniards now of-

Quay of the Grain Market, with St. Bavon's Church.

156. The city is well built, clean, and intersected by canals. A picturesque gateway on the high road to Amsterdam is a part of the old fortifications; the ramparts have been converted into public promenades. Most of the public edifices are built around a handsome square, in the centre of which is a bronze statue to Laurens Coster, whom the Dutch regard as the inventor of printing. The principal buildings are the town hall, formerly the residence of the counts of Holland, the palace of the states general containing a gallery of paintings, 12 Protestant and three Roman Catholic churches, and one Old Catholic (Jansenist) church. It is the seat of a Catholic and an Old Catholic bishop. St. Bavon's church, erected in the 15th century, is the largest ecclesiastical edifice in Holland, and is celebrated as containing the great organ constructed in 1738, and which until lately was the largest in the world. The city has a botanical garden, numerous public

ferred terms if they would surrender. The proposal was accepted. Alva's troops marched in, disarmed the inhabitants, and the 57 hostages were put to death; and four executioners were kept constantly busy until they ceased from fatigue after 2,000 persons had been butchered, when 300 remaining victims were tied in twos, back to back, and cast into the lake. William of Orange retook the city in 1577.

**HAARLEM MEER, or Lake of Haarlem**, a former lake 14 m. long and 10 m. broad, covering 70 sq. m., communicating N. with the Zuider Zee by the inlet called the Y, and S. with the Old Rhine, and occupying, with an average depth of water of 13 ft., the area between the cities of Haarlem, Leyden, and Amsterdam. This sheet of water was formed in the 16th century by an inundation which united four ponds into one, and destroyed several villages. It gradually encroached on the land, till in the present century it covered 45,000 acres. It was

drained between 1839 and 1852, and it was nearly all reclaimed. It forms a commune of about 10,000 inhabitants. (See DRAINAGE.)

**HABAKKUK**, one of the twelve minor prophets, of whose birth or death we know with certainty neither the time nor the place. His prophecy is variously dated by different scholars from about 630 to 590 B. C. It relates chiefly to the threatened invasion of Judea by the Chaldeans. The style is highly poetical, and the ode or prayer of the 3d chapter is probably unrivalled, not only for splendor of diction and subject, but for sublimity, simplicity, and power. See Delitzsch, *Der Prophet Habakuk, ausgelegt* (Leipsic, 1843), and *De Habacuci Prophetæ Vita atque Ætate* (2d ed., 1844).

**HABBERTON, John.** See supplement.

**HABEAS CORPUS**, an ancient English writ, used for a variety of purposes from the remotest time. It is addressed to a sheriff or other officer, and commands him to have the body of the person named at a certain place and time. When all writs were in Latin, the characterizing words of this writ were *ut habeas corpus*, and the name has long survived the use of these words in the writ. One of the purposes for which it was used was to recover freedom which had been wrongfully taken away. Personal liberty was always asserted by the common law from its earliest ages; and it was always assailed by kings who would be tyrants, and with an earnestness proportioned to their tyranny. Hence it became necessary to declare this principle in the most solemn manner in Magna Charta. It is there said that "no man shall be taken or imprisoned but by the lawful judgment of his peers, or by the law of the land;" and this clause, more than any other, has given to that instrument the name of the palladium of English liberty, a name which is deserved rather by the writ of habeas corpus. For, on the one hand, the great charter did not enact this as a new rule of law, but only declared it to be the law of the land; and, on the other, its force and influence gradually faded, in despite of repeated formal confirmations; and this law became actual and operative only by means of the habeas corpus. This writ was issuable from the king's bench; and it was used to protect or restore liberty, by bringing the prisoner before the court, whose duty it was to order his immediate discharge if he were not restrained of his liberty according to law. But it was evaded by courts and sheriffs, who were disposed to support royal or ministerial usurpations; and it became so powerless that early in the reign of Charles I. the court of king's bench formally decided that they had no power to release any person imprisoned without any cause assigned, if he were imprisoned by the express command of the king, or by the lords of the privy council. The petition of right, passed in 1628, asserted the illegality of this decision, and declared that "no freeman should be imprisoned or detained without cause shown, to which he may make

answer according to law." But the means of enforcing this rule were still imperfect, and personal liberty was still violated; and by 16 Charles I., ch. 10, various provisions were enacted, intended to make the writ more effectual. But this was not enough. The judges still continued to refuse the writ at their pleasure, or to insist that it could be issued only in term time; and prisoners were sent to distant jails, and sheriffs and jailers refused to obey it; or if the party imprisoned were brought before an examining court, his liberty was still withheld on frivolous pretences. At length, in the 31st year of the reign of Charles II. (1679), what is now always understood by the habeas corpus act was enacted. It consisted of a variety of provisions, devised with so much skill, and so well adapted to give each other mutual support, that it may safely be asserted that personal liberty will be safe in England and the United States so long as this law remains in force. Evasion of it is almost impossible; and it can be made ineffectual only by a positive and open violation of its essential provisions, or by a distinct denial of its interposition. The English statute has been copied in the United States, without essential change; the variations from it being only such as would, in the opinion of the various legislatures, make its provisions more stringent, and the security it gives to liberty more certain and available.—The provisions of the statutes of habeas corpus, now in force in the different states, may be stated generally thus: 1. The writ commands the sheriff, or other person to whom it is directed, to have the body of the person who is said to be restrained of his liberty forthwith before the justice issuing it, or some other tribunal competent to try the questions the case may present; and to summon the person restraining the alleged prisoner to be there also, and bring with him the cause of the restraint; that all parties may then and there submit themselves to whatever may be lawfully adjudged and ordered in their behalf. The language varies in the different statutes which give the form of the writ; but it is always substantially as above. 2. The writ must be granted, as of right, by any of the justices of the higher courts, and, in their absence or inaccessibility, by any of those of a lower court, down to justices of the quorum; the law covering in this respect a wide range, so as to insure to every applicant some one from whom this redress or remedy may come. 3. It must be granted at any time when it is prayed for, whether a court be sitting or not. 4. It must be granted either to the party himself restrained of his liberty, or to any one applying for him; and if his name be unknown, the best description which can readily be given is sufficient. 5. The application must be in writing, and must be verified by the oath of the applicant. 6. The sheriff or other officer to whom it is directed must render prompt obedience, and make immediate service, and return the

writ forthwith with a full statement of his doings. 7. It must be returned before the proper magistrate at chambers, if a court to which it is made returnable be not then in session. 8. Upon the return, the alleged prisoner being present, the case is tried; and unless sufficient cause for his imprisonment is shown, he is ordered to be discharged at once. 9. If not wholly discharged, the court or magistrate may order him to be discharged on giving reasonable bail, if he be held for any bailable offence or cause. 10. In some of the states it is provided that the writ may not issue if the party restrained be imprisoned for crime, or in execution civil or criminal, and by lawful warrant. In others these exceptions are not made, but if facts like these appear on trial, the prisoner is remanded. 11. In general, after a party has been discharged on habeas corpus, he cannot be again imprisoned or restrained of his liberty for the same cause. 12. The issuing of the writ by the magistrate applied to, and prompt and full obedience to it by the officer or other person to whom it is directed, are secured by very heavy penalties; and also by the fact that any applicant to whom the writ is refused by one magistrate may apply to another, and the number of those to whom he may thus resort is so large that it is hardly possible for them all to be corrupted, or for any reason indisposed to render due obedience to the law.—The vast importance of this law can be appreciated only by those who have studied the history of despotism; although it discloses only what might have been inferred with almost equal certainty from the reason of the thing. Whether the ruling authority of a nation (be it in the hands of one or of many) shall be absolute or subordinated to law must depend, in the last result, upon its power over the persons of those who are subject to it. Whatever be the law, if there be a sovereign who may disregard it, and put in strict imprisonment those who would resist him; if he may substitute his own commands for law, and take away from society and from all power of resort to law those who do not obey him; it is perfectly obvious that there can be no disobedience and no resistance which is not rebellion if it be put down, or revolution if it succeed. The histories of France and of England offer the most perfect illustration of this. Beginning from the feudal ages, they stood then about upon an equality in respect to the power of the sovereign and the personal rights of the subject. Under some of her monarchs, of the Plantagenet and Tudor families, England seemed to be yielding herself up to a more absolute tyranny than was known to her neighbor. But as the ages went on, it became apparent in France that the subjection of the citizen to the sovereign became with every generation more complete. By insidious rather than open increase, the power of the king, or rather the power of ministers who acted in the name of the king, to imprison at their pleasure whom they would,

for political or personal, public or private reasons, became so entirely established, that every minister of the crown had, it is said, a large number of blank *lettres de cachet* (or letters under the privy seal of the king) which he could fill with names at his pleasure, and by which the police were authorized and commanded to imprison the party named and hold him in prison at the pleasure of the minister. The Bastille became a recognized instrument of state; and in its cells lay those who were placed there only at the suspicion or the caprice of some minister, and who remained there only because they were forgotten. Of course this state of things could not last; for no one acquainted with human nature could doubt that such irresponsible and enormous power would be enormously abused, and lead its possessors into folly and insanity. Therefore the French revolution came to do the work which must be done, and only revolution could do, and therefore the reign of terror almost necessarily replaced the despotism which had been its parent. If we now turn to England, we shall see that in the Anglo-Saxon times despotism was rarely attempted, and never successful; that the laws and institutions of those days are all founded on the presumption of personal liberty and rights; that this element of character might for a time be suppressed or enfeebled, but that it could never be annihilated; that it rose from time to time into prominence and activity, and, as opportunity offered or could be made, gradually asserted itself: first in the fact of a common law, which the courts regarded as binding upon them; then in the recognition of personal liberty and right as an unquestionable principle of common law; then by such timely assertions as in Magna Charta, in the petition of right, and finally in the act of habeas corpus.—That this act is sufficiently valued in the United States may be inferred from the fact that the federal constitution (art. I., sec. 9, No. 2) provides that “the provisions of the act shall not be suspended, unless when in case of rebellion or invasion the public safety may require it;” and there is a provision to the same effect in some of the state constitutions. Everywhere the statute itself is enacted, and, so far as words can have the effect, made stringent and effectual. By various acts of congress jurisdiction is conferred upon the federal courts to issue the writ of habeas corpus in cases of confinement by federal or under pretence of federal authority, and also in other cases where it may be necessary to the enforcement of federal jurisdiction. How far the state courts have the right to inquire into unlawful restraints upon personal liberty under claim of federal authority has been the subject of no little discussion and conflict of decision. The supreme court of the United States has finally determined that though the state courts may issue the writ in all cases, yet when it appears by the return that the restraint is under a claim of federal authority, they can pro-

ceed no further, but must leave the validity of the claim to be determined by the federal courts. —The technical name of this writ is *habeas corpus ad subjiciendum*, from the requirement contained in it that the alleged prisoner and the persons restraining him should "submit themselves to the order of the court." It is sometimes called also *habeas corpus cum causa*. *Habeas corpus ad testificandum* was formerly used to compel witnesses to testify in certain cases, and *habeas corpus ad satisfaciendum* was employed to obtain satisfaction of certain judgments. But these are now obsolete. This writ is now frequently resorted to by parents of minors who have enlisted without their permission, by parents who wish to obtain possession of children withheld from them, and for similar purposes. It has been solemnly decided that the *habeas corpus* act can be suspended only by the legislature; and that the proclamation of martial law by a military officer is not sufficient.

**HABENECK, Antoine François**, a French musician, of German parentage, born in Mézières, June 1, 1781, died in Paris in February, 1849. His father, a musician of a French regiment, gave him lessons on the violin, of which instrument he became a distinguished master under the tuition of Baillot. The empress Josephine gave him a pension of 1,200 francs, and he became adjunct and successor of Kreutzer as solo player, and from 1806 to 1815 he presided over the orchestra at the *conservatoire*; and he was the first to produce there the music of Beethoven, which through his perseverance and enthusiasm gradually acquired universal popularity. From 1821 to 1824 he was director of the opera; and he was leader of the orchestra till 1846, and in this capacity and as a violinist he was without a rival, though he composed little. His younger brothers **CORENTIN** and **JOSEPH** became also known as excellent violinists.

**HABERSHAM**, a N. E. county of Georgia, bordering on South Carolina, and containing the sources of the Chattahoochee, Broad, and other rivers; area, about 500 sq. m.; pop. in 1870, 6,322, of whom 949 were colored. It is traversed by branches of the Blue Ridge, between which are fertile valleys. Iron is abundant; rubies, carnelians, and occasionally diamonds have been found; and the gold mines were formerly among the richest in the state. The chief productions in 1870 were 5,409 bushels of wheat, 4,795 of rye, 132,824 of Indian corn, 5,915 of oats, 16,297 of sweet potatoes, 25,127 lbs. of tobacco, 83,241 of butter, and 79 bales of cotton. There were 695 horses, 1,354 milch cows, 2,244 other cattle, 4,729 sheep, and 7,370 swine. Capital, Clarkesville.

**HABINGTON, William**, an English poet, born at Hindlip, Worcestershire, Nov. 5, 1605, died there, Nov. 13, 1645. He was educated at the Jesuit college of St. Omer, and at Paris; but he showed no inclination for a life of celibacy, and married Lucy Herbert, the daughter of Lord Powis. He lived mostly in the coun-

try, and his life passed quietly. His works, marked by nice fancy and moral elevation, are: "Castara," a collection of poems addressed to his wife (4to, London, 1634; with a preface and notes by Charles A. Elton, 12mo, Bristol, 1812); "The Queene of Aragon, a Tragi-comedie" (fol., 1640), revived in 1666 with a prologue and epilogue by Samuel Butler, author of "Hudibras;" "The Historie of Edward IV." (1640), said to have been partly written by the poet's father; and "Observations upon the Historie of Henry the Second's Association of his eldest Sonne to the Regal Throne" (8vo, 1641).

**HACHETTE, Jean Nicolas Pierre**, a French mathematician, born in Mézières, May 6, 1769, died in Paris, Jan. 16, 1834. At the age of 19 he was made designer to the professors of physics and chemistry at the engineering school of Mézières. In 1792 he became professor of hydrography at Collioure, in 1794 adjunct professor of descriptive geometry in the polytechnic school in Paris, and in 1810 adjunct professor in the Parisian faculty of sciences and the normal school. On the restoration he was dismissed from the polytechnic school on account of his political sentiments, and although elected a member of the academy of sciences in 1823, he was not allowed to take his seat until after the revolution of 1830. He wrote many works on mathematics and physics.

**HACKBERRY** (*Celtis occidentalis*), the popular name of a tree belonging to the nettle family (*Urticaceæ*), and the elm suborder (*Ulmaceæ*). In different parts of the country it is also known as sugarberry, nettle tree, sweetgum, false elm, beaverwood, and hoop ash. The ge-

Hackberry (*Celtis occidentalis*).

neric name *Celtis* is the Greek for the lotus, the berries of *C. australis*, of southern Europe, being supposed to have been the food of the *lotophagi*. The hackberry is found as a small straggling bush, and as a medium-sized or a large tree. It has a very close resemblance in

general appearance to the elm, except that its branches are more horizontal, and instead of a winged fruit it bears singly or in pairs a globular drupe, about the size of a wild cherry, dark purple when ripe, and sweet and edible. The wood, though fine-grained and compact, is not heavy, and when exposed to the weather is not durable; it splits readily and is sometimes used for rails and even for baskets; it is said to make excellent charcoal. The tree extends from New England to the Pacific, and southward to Texas; and being found in widely different situations, it presents great variation in the size, form, and thickness of the leaves. At least a dozen forms have from time to time been described by botanists as species; but as every intermediate state can be found between these nominal species, the best authorities unite them all under *C. occidentalis*. This tree in the northern states is rarely found growing in great numbers in any one locality, and is perhaps the least known of any of our forest trees; at the south it is more abundant, and attains a large size on the coast as well as on the river banks, where specimens 60 to 80 ft. high, with a trunk 3 to 5 ft. in diameter, are not rare. Tree planters seem to overlook the merits of the hackberry as an ornamental tree, and it is better appreciated in Europe than with us; as a lawn tree it presents an elegant form, and is remarkably free from the attacks of insects; it holds its leaves until late in autumn, when they turn yellow and fall all at once. A dwarf hackberry is found in western Texas, which seems to be a distinct species; it is a crooked shrub of a few feet in height, and was called by Torrey *C. pallida*. The wood of the European *C. australis* is valued for making furniture, and especially for carving; the very strong and flexible shoots serve for making hay forks, whip handles, and the like.

**HACKEE.** See CHIPMUNK.

**HACKERT, Philipp**, a German artist, born at Prenzlau, Prussia, Sept. 15, 1737, died near Florence, April 28, 1807. He studied painting with his father, and afterward at Berlin, and went to Paris in 1765, and to Italy in 1768. In Rome the empress Catharine of Russia ordered of him two pictures to represent the naval battle of Tchesme, July 5, 1770, and the burning of the Turkish fleet. In order that he might understand the appearance of the explosion of a ship, Count Orloff blew up one of his frigates before him. After the task was finished the empress ordered six pictures of the victories of the Russians in the Mediterranean. He resided for some time in Naples, but was compelled by the revolution of 1799 to go to Florence; and he purchased a villa near that city, in which he resided until his death. His contemporary reputation was beyond his merits. He engraved many of his own paintings, and wrote *Sull' uso della vernice nella pittura* (1788), and *Theoretisch-praktische Anleitung zum Landschaftszeichnen* (1803). Goethe wrote a biographical sketch of Hackert (1811).

**HACKETT, Horatio Balch**, an American Biblical scholar, born in Salisbury, Mass., Dec. 27, 1808, died in Rochester, N. Y., Nov. 2, 1875. He graduated at Amherst college in 1830, and studied theology at Andover, Halle, and Berlin. He became a tutor in Amherst college, in 1835 professor of ancient languages in Brown university, and in 1839 of Biblical literature in the Newton theological institution. In 1851-'2 he travelled in Italy, Egypt, Palestine, and other countries. In 1858-'9 he resided several months in Athens, for the purpose of studying modern Greek, as auxiliary to the interpretation of the New Testament, and visited places in and near Greece possessing a Biblical interest. In 1869 he resigned his professorship at Newton, and in 1870 became professor of New Testament Greek in the Rochester theological seminary. He published Plutarch's *De Sera Numinis Vindicta*, with notes (Andover, 1844); a translation of Winer's Chaldee grammar, with additions (1845); "Hebrew Grammar" and "Hebrew Reader" (1847); a "Commentary on the Acts" (Boston, 1851; new ed. greatly extended, 1858); "Illustrations of Scripture suggested by a Tour through the Holy Land" (1855); translation of the "Epistle to Philemon, with Notes" (1860); "Memorials of Christian Men in the War" (1864); translation of Van Oosterzee's "Commentary on Philemon," for Lange's "Commentary" (1868); and translation of Braune's "Commentary on Philippians," with additions, for Lange's "Commentary" (1870). He contributed to the English edition of Smith's "Dictionary of the Bible," and with Dr. Ezra Abbot edited the American edition. He also edited the American edition of Rawlinson's "Historical Illustrations of the Old Testament," with notes and appendix (1873). He was one of the American revisers of the English Bible.

**HACKETT, James Henry**, an American actor, born in New York, March 15, 1800, died at Jamaica, L. I., Dec. 28, 1871. He entered Columbia college in 1815, but remained only a year. In 1817 he began the study of law, and in the following year became a clerk in a grocery store. In 1819 he married an actress of the Park theatre. He was in mercantile business in Utica and in New York from 1820 to 1825, but failed, and then devoted himself to the stage, making his first appearance at the Park theatre, March 1, 1826, as Justice Woodcock. On March 10 he made a decided success as Sylvester Daggerwood. He went to England the same year, and also made successful professional visits there in 1832, 1840, 1845, and 1851. Upon his return from his first visit to England he appeared as Rip Van Winkle, and subsequently as Monsieur Mallet and Falstaff. In 1829-'30 he was associated in the management of the Bowery and Chatham theatres in New York. In 1837 he managed the National theatre, and in 1849 he was lessee and manager of the Astor place opera house, and lost more than \$4,000 by the Forrest and

Macready riots. In 1854 he engaged Grisi and Mario, and gave successfully a series of Italian operas throughout the United States. Until 1869, when he withdrew from the stage, he continued to act at intervals. His Falstaff was thought to be his best character, and in it he made his last appearance in New York, Dec. 25, 1869. He projected the plan for the Shakespeare monument in the Central Park, and the corner stone was laid under his auspices at the Shakespeare tercentenary, April 23, 1864. He published "Notes, Criticisms, and Correspondence upon Shakespeare's Plays and Actors" (New York, 1863).

**HACKLÄNDER, Friedrich Wilhelm von**, a German author, born at Burtseid, Nov. 1, 1816, died July 5, 1877. He qualified himself for mercantile pursuits at Elberfeld, to which he returned after serving for a short time in the army. Becoming dissatisfied with commercial life, he removed to Stuttgart, where he published in 1841 *Bilder aus dem Soldatenleben in Friedenszeit und Wachtstubenabenteuer*, which made him famous. In the same year he accompanied Baron Taubenheim, the grand master of the horse, to the East for the selection of Arabian horses for King William of Württemberg. After his return he published sketches of oriental life (*Daguerreotypen*, 2 vols., 1842), and *Pilgerzug nach Mekka* (1847). The king gave him employment in the exchequer, and in 1843 he became secretary and travelling companion of the crown prince, the present King Charles. His active duties terminated in 1849, though he retained a salary. He then joined the suite of the Austrian general Radetzky during the war with Sardinia, and published *Soldatenleben im Kriege* (2 vols., 1849-'50). His visit to Spain in 1854 he described in *Ein Winter in Spanien* (2 vols., 1855). In 1859 he went to the headquarters of the Austrian army at the request of the emperor Francis Joseph, who afterward conferred upon him a patent of hereditary nobility. In the same year he was appointed director of royal buildings and gardens at Stuttgart, and contributed greatly to the embellishment of that city. He lost his office on the death of King William in 1864, but continued to reside in Stuttgart. His works were published in 48 vols. in 1863-'6, but were afterward increased to about 70 vols., including, besides his popular military sketches and books of travel, a number of comedies, of which *Der geheime Agent* (1850) was the most successful; delineations of his early mercantile experiences (*Handel und Wandel*, 2 vols., 1850; translated into English by Mary Howitt, "Behind the Counter," 1868); and stories, tales, and novels, which place him in the front rank of humorous and pathetic writers. Many of them have been translated into French, and Mrs. Wister translated one of them into English under the title "Enchanting and Enchanted" (Philadelphia, 1870). The following are among his most elaborate novels: *Europäisches Sklavenleben* (4

vols., 1854); *Der neue Don Quixote* (5 vols., 1858); *Künstlerroman* (5 vols., 1866); *Das Geheimniss der Stadt* (3 vols., 1868); *Der letzte Bombardier* (4 vols., 1870); *Geschichten im Zick-Zack* (4 vols., 1870-'71); *Der Sturmvogel* (6 vols., 1871-'2); and *Kainzeichen* (1874).

**HACKMATAK.** See LARCH.

**HADDINGTONSHIRE**, or East Lothian, a county of Scotland, bordering on the frith of Forth, the North sea, Berwickshire, and Edinburghshire, or Mid-Lothian; area, 280 sq. m.; pop. in 1871, 37,770. The surface rises gradually, though with slight undulations, from the coast toward the Lammernuir hills. It is divided by the river Tyne into two nearly equal portions. The climate is heathful, but variable. The soil is in general fertile. The low lands of the north and west are extremely productive, and the districts adjoining the Lammernuir range are adapted to pasturage. The principal crops are wheat, potatoes, and turnips. Sheep and cattle are reared in the hill districts. There are no manufactures of any importance. Capital, Haddington, on the Tyne, 17 m. E. by N. of Edinburgh; pop. about 4,000.

**HADDOCK.** 1. A soft-rayed fish of the cod family, and genus *morrhua* (Cuv.). This well known species varies in length from 1 to 2 ft., and in weight from 2 to 6 lbs., though some have been taken weighing 17 lbs. The color is dark gray above and silvery gray below, with a jet-black lateral line, and an oblong dark blotch on each side, on a line with and just above the pectorals. The body is stout in the anterior half, tapering backward; the head is large, flattened between the eyes, and the snout prominent; the eyes large, with bluish iris; the upper jaw the longer, with several rows of sharp-pointed teeth, and a single row in the lower; a very minute barbule suspended from the chin. There are three dorsals, the first high and triangular, whence its name of *M. æglefinus* (Linn.); the pectorals are triangular, and the ventrals are in front of them, under the throat; there are two anals, and the caudal is emarginated. The haddock is found everywhere on the American coast from New York to the arctic regions; they occur in immense

Haddock (*Morrhua æglefinus*).

shoals, often changing ground as their food becomes exhausted; they are found on our coast from spring to autumn, at the season when cod are scarce. It is an excellent fish when eaten fresh. The spawning time is in early spring; its food consists of small fish, crustaceans, mollusks, and marine worms;

from its voracity it is a ready biter, and is easily caught; the fishery is valuable to New England and the British provinces, and is pursued in the same manner as for cod, and in deep water. The haddock is equally abundant on the coast of northern Europe, and is very common in the English markets; it is found in the arctic seas, supplying food to the inhabitants of Greenland, and to the seals and other aquatic mammals of the northern regions. The name "young haddock" is sometimes given to the pollack, a gadoid fish of the genus *merlangus* (Cuv.). II. The Norway haddock is the *sebastes Norvegicus* (Cuv.), an acanthopterous marine fish of the family *scelero-genidae* or "mailed cheeks." It attains a length of from 1 to 2 ft.; the body and the upper parts of the head are covered with scales; the gill covers are spiny; the teeth are numerous, small, equal, in both jaws, and on the vomer and palate bones; the single dorsal is partly spinous, as are the anal and ventrals. The color of the living fish is bright red, with a black blotch on the posterior part of the gill covers; after death the lower parts become white; the iris is yellow. It is found on both sides of the Atlantic, and on the American coast from New York to the far north; it is called here rose fish, red perch, and snapper. It is abundant in Newfoundland, where it feeds on small fish. The spines of the dorsal are used as needles by the Greenlanders and Esquimaux.

**HADERSLEBEN** (Danish, *Haderslev*), a city of Prussia, in the province and 52 m. N. of the city of Schleswig, on the Hadersleben fiord, a small arm of the sea connecting with the Little Belt; pop. in 1870, 8,259. It consists of an old and a new town, and has a normal school, gymnasium, hospital, and a monument to Luther. There are several breweries and distilleries, and a glove factory. The harbor is only adapted for small vessels. The outer harbor is at the custom house of Stevelt. Hadersleben was formerly an imperial city, the seat of a bishop before the reformation, and had a strong castle. In the first Schleswig-Holstein war the city was occupied by the Germans April 9, 1849, and in the second, Feb. 14, 1864.

**HADES** (Gr. *Αἰδης*), in Grecian mythology, a name originally given to the king of the lower or invisible world, but afterward applied to the infernal regions, while the king came to be known as Pluto. Hades was a place of darkness, the residence of Pluto and Proserpine, and the abode of the dead. Its gates were kept closed, that no shade might escape to the world of light, and were guarded by the terrible many-headed dog Cerberus.

**HADJI**, an Arabic word signifying pilgrim, *hadj* being the term used by Mohammedans for the sacred pilgrimage to Mecca. A certain part of the ceremony which takes place at Mecca on the arrival of the pilgrims is also called *hadj*. The Mohammedan theologians define the original meaning of *hadj* to be "aspiration," and they consider it expressive of the

sentiment that man is but a wayfarer on earth travelling toward another and a better world. Every Mohammedan is bound once in his life to visit the holy city Mecca, and a Mohammedan who has made the pilgrimage afterward bears the title Hadji prefixed to his name; as Hadji Ibrahim, Hadji Mohammed.

**HADJI KHALFA**, the surname of **MUSTAPHA BEN ABDALLAH**, also known under the title of Katib Tchelebi (noble secretary), a Turkish historian, born at Constantinople, died there in 1658. His father was employed in the ministry of finance, and he entered the service in 1622. In 1626 he was present at the siege of Erzerum. In 1629 he made the campaign of Mesopotamia, and in 1633 the pilgrimage to Mecca. Having returned to Constantinople, he undertook his great bibliographical work. He resigned his office in 1642, but in 1648 was appointed *khalifa* (minister of finance). He wrote in Turkish, Arabic, and Persian. His most important work is *Keshf ul-tzunn*, a bibliographical lexicon in Arabic, in which are titles of more than 18,000 Arabic, Persian, and Turkish books, with brief notices of the authors. A complete edition of the text, with a Latin translation, was published by Flügel, under the title *Lexicon Bibliographicum et Encyclopedicum* (7 vols., London, 1835-'58). He also wrote some historical works, of which the most important are, *Takvim at-tewarikh* ("Chronological Tables," Constantinople, 1733; Latin translation by Reiske, Leipsic, 1766); *Jihân numâ* ("Mirror of the World," Constantinople, 1732; Latin translation by Norberg, Lund, 1818); and *Tohfat al-kobar fi asfar al-behar* (Constantinople, 1728; English translation by Mitchell, "History of the Maritime Wars of the Turks," London, 1830). His autobiography is appended to the *Takvim at-tewarikh*, and has been translated into German by Von Hammer.

**HADLEY, James**, an American scholar, born in Fairfield, Herkimer co., N. Y., March 30, 1821, died in New Haven, Conn., Nov. 14, 1872. When nine years old he was accidentally lamed for life, and devoted himself to study, soon acquiring a mastery of ancient languages. He graduated at Yale college, at the head of his class, in 1842, was for a short time tutor in Middlebury college, Vermont, where he displayed remarkable mathematical ability, and graduated at the theological seminary in New Haven in 1845. In that year also he became tutor, in 1848 assistant professor, and in 1851 professor of Greek in Yale college, holding the chair until his death. He was familiar with Sanskrit, Hebrew, Arabic, Greek, Latin, Armenian, Gothic, and many modern languages, including Swedish and Welsh, and had given special attention to early forms of English; and he was master of the methods and main results of comparative philology. He was a leading member of the American oriental society, and during the last two years of his life its president. He was vice president of the

philological association, before which he read a number of papers of value. He was one of the American committee for the revision of the New Testament now in progress. His acquisitions were all made during the regular discharge of his duties as a teacher, in which position he was most successful. He wrote the "History of the English Language" in the introduction to Webster's Dictionary, and was the author of a "Greek Grammar" (1860); "Elements of the Greek Language" (1869); an essay on the Greek accent, republished in German in Curtius's *Studien zur griechischen und lateinischen Grammatik*; an article on the "Language of the New Testament," in the American edition of Smith's "Dictionary of the Bible;" "Lectures on Roman Law" (1873); and "Essays Philological and Critical," edited by Prof. W. D. Whitney (1873).

**HADLEY, John**, an English astronomer, died Feb. 15, 1744. The time and place of his birth, as well as the particulars of his life, are unknown. He became a fellow of the royal society in 1717, and is chiefly known as the reputed inventor of the instrument commonly called Hadley's quadrant, of which he published an account in the "Transactions" for 1731. It is now believed, however, that Sir Isaac Newton and Thomas Godfrey are entitled to the honor of the invention. The claims of Godfrey and Hadley were investigated by the royal society, and it was decided that both were original inventors, and a prize of £200 was awarded to each. (See GODFREY, THOMAS.)

**HADRAMAUT**, a district of S. Arabia, lying along the shores of the Indian ocean. Its limits are not well defined, but it is bounded generally N. by the Dahna or great desert, N. E. by Oman, S. by the sea, and W. by Yemen. Its coast line extends in a N. E. direction from lon. 45° to 56° 30' E., but some authorities limit it to less than 200 m. It is supposed to extend inland about 120 m. The coast is low, excepting where some spur from the mountains inland forms a projecting cape. Back of the lowlands a range of mountains, which stretches from Yemen to the regions bordering on Oman, rises in terraces to a considerable height, and behind it an elevated plateau, diversified by occasional peaks and numerous valleys, descends gradually into the desert. But little was known of the interior until the explorations of the baron von Wrede, who visited the wady Doan in 1843. He describes this valley as a deep gap which bisects the table land, beginning about 80 m. N. W. of Makallah and ending 120 m. E. of it on the Tehama or lowland near the sea. Its length is about 150 m., and its breadth in its widest part from 25 to 35 m. It has many branches, and is studded with towns and villages throughout its extent. The slopes of the hills and most of the level tracts are well cultivated, the fields being irrigated from a small stream which runs through it. This river, though sometimes a raging flood, is

frequently dry. In 1870 the W. part of Hadramaut was visited by Capt. S. B. Miles of the British army, in company with Werner Munzinger, the German traveller, who landed at Hisu Ghorab, about lon. 48° 30', and passed through the country between that point and Aden. The lowland about Hisu Ghorab consists of barren sand and rocks to the hills, about 10 m. inland. In the uplands anthracite is found, with bitumen in abundance and signs of copper. Dates are the chief product, and a little indigo is raised, but no coffee. No game was seen, excepting a few gazelles, but singing birds were numerous.—The coast between there and Aden is peopled by four tribes, settled in towns and villages and not nomadic, who have been independent about 100 years, having been previously subjects of the imam of Sana. The most easterly tribe, the Wahidi, occupy the greater part of the wady Maifah, in a sand and limestone region, which is very productive. They are the least aggressive of any of the tribes, and are mostly settled down as peaceful tillers of the soil. Their chief towns are Hota, with 8,000 inhabitants, and Habbān, with 3,000. No coffee or cotton is cultivated, and cattle, sheep, and goats are scarce and dear. They are divided into three sections, each under the rule of a sultan, who has little more than patriarchal authority. Their founder was Abdul Wahid, a Koreish chief who conquered the territory. Next W. of them are the Deaybi, who are called by their neighbors Himyars, and claim to be the descendants of the ancient Himyarites. Their language is a dialect of the Sabæan. They occupy a portion of the wady Maifah and a part of the coast to about 50 m. inland. Each of their seven divisions is ruled by an *abu* (father). They are said to be rapacious and marauding in their habits. The Owlaki hold about 60 m. of the coast from the Deaybi to Mugatein. They have two divisions, the Owlaki Ali Nasir and the Owlaki el-Nisab, each having a sultan. The former, who number about 15,000, hold the coast; the latter the interior. Their country is well cultivated, and they own numerous flocks of sheep, goats, and camels. They are the only tribe possessing horses, of which they have a fine breed. From Mugatein to Iwad, near Aden, about 100 m., the coast is possessed by the Fudhili, a restless, warlike, and ambitious tribe, numbering about 17,000. Their country is intersected by two wadies, the Hassan and the Bunna, which are well watered. Along the sea is a thick forest of mimosas, and beyond, toward the hills, are fields of grass and corn. Ambergis is sometimes found on the coast. The agricultural products are wheat, barley, millet, sesamum, and cotton. No coffee is cultivated, but it might easily be raised with proper irrigation. Indigo is grown, but not to any extent. Myrrh trees abound, and frankincense trees are found in the Himyar hills, but the gum is scarcely known to the Arabs. The E. part of the coast,

next to Oman, is occupied by the Mahra tribe.—The principal seaport of Hadramaut is Makallah, which has a considerable trade with India and Yemen, exporting to the former vegetable products, and to the latter carpets, silk shawls, linen, and yambeas or girdle knives. The people of the coast are fond of going abroad, and many of them are seen in India and Egypt, serving as soldiers or sailors; but they usually return to their country when they have acquired a competence.—Hadramaut, in the narrower sense, constituted a part of the ancient Arabia Felix. It derived its name from the Adramitæ, an Arabian tribe, who were actively engaged in the drug, spice, and silk trade, of which their capital Sabatha was the emporium.

**HADRIAN**, or **Adrian** (**PUBLIUS ÆLIUS HADRIANUS**), a Roman emperor, born in Rome, Jan. 24, A. D. 76,\* died July 10, 138. His father, a Roman senator, married the aunt of Trajan; and when he died, Trajan, who had not yet succeeded to the empire, became one of Hadrian's guardians. The emperor Nerva adopted Trajan, and the next year died, and Hadrian travelled from upper to lower Germany, and was the first to announce the event to the new emperor. He next married Julia Sabina, granddaughter of Trajan's sister; and through this new connection, joined to the favor of the emperor's wife Plotina, he rose rapidly to various high offices at Rome, being quæstor in 101, tribune of the people in 105, prætor in 107, and *legatus prætorius* of Lower Pannonia in 108. He accompanied Trajan in most of his expeditions, and distinguished himself in the second war against the Dacians (104–106). Trajan made him his private secretary, and probably selected him as his heir. When Trajan died, Hadrian was in command of the armies of the East, and was proclaimed emperor at Antioch, Aug. 11, 117. He immediately wrote to the senate apologizing for this haste, and asking their sanction of his election, which they at once gave. Hadrian's policy was pacific. He renounced the conquests made by Trajan east of the Euphrates, concluded a treaty with the Parthians, and returned to Rome, where he celebrated a triumph in honor of his predecessor (118). Some warlike movements of the Sarmatians now drew him toward Dacia, but his progress was checked by intelligence of the discovery of a conspiracy at Rome, led by men of high rank. He directed the chief conspirators to be put to death, a severity which offended many. To recover his popularity he cancelled the arrears of taxes for the last 15 years, and assured the senate that he would never again put to death a senator without their consent. In 119 he began his tour through the Roman empire, visited Gaul and Germany, and in Britain built a rampart of earth about 60 m. long for the defence of the Roman province, extending from Solway frith to the North sea near the mouth of the Tyne. He then returned through Gaul, spent a winter in Spain,

crossed into Mauritania, visited Egypt and western Asia, and finally paused at Athens for three years, where he was initiated into the Eleusinian mysteries, and presided at the public games. In this journey he won the favor of the provincials by his liberality, and by various public works which he planned and executed for their benefit. The Jews having revolted in 131, he punished them with great severity. Judea was desolated and reduced almost to a wilderness; the Jews were expelled from Jerusalem, and were forbidden to return thither, a Roman colony being planted in their place. His health declining, he chose Titus Aurelius, afterward known as Antoninus Pius, his heir, but obliged him to adopt the son of Ælius Verus, and also M. Annianus Verus, the future Marcus Aurelius. He had built a magnificent villa near Tibur, where he now passed much of his time. As death approached, his mind became affected, and he grew suspicious and cruel. He was an able and generally a wise ruler. His literary attainments were considerable; he wrote and spoke with eloquence, and left numerous works in prose and verse, all of which are lost except a few epigrams.

**HADROSAURUS**, a gigantic extinct dinosaurian reptile, living on the shores and in the forests of the cretaceous epoch, abundant in the re-

Hadrosaurus.

gion of New Jersey, where its remains have been found. It attained a length of 30 ft., its femur having been found 5 ft. long, considerably longer than that of the great iguanodon of

England; the fore limbs were less than half the size of the hind, but the tail was of immense strength. It was evidently a land animal, and its grinding teeth indicate the vegetable character of its food. Its favorite attitude must have been to support itself upon the very strong hind limbs and tail, after the manner of the megatherioids, reaching to the foliage on which it fed by its smaller and freely movable anterior limbs. As the iguanodon seems to have been the prophetic type of the great pachyderms of the tertiary age, the hadrosaurus seems to point to the coming of the huge edentates like megatherium and mylodon. A fine restoration of this animal (*hadrosaurus Foulki*, Leidy) is in the museum of the academy of natural sciences at Philadelphia.

**HADRUMETUM**, or *Adrumetum*, an ancient city in northern Africa, on the seacoast, in the *sinus Neapolitanus* (gulf of Hammamet). It was founded by the Phœnicians, and became one of the chief ports for the corn-producing province of Byzacena, of which it was the capital under the Romans. It figured in the Punic and civil wars, was devastated by the Vandals, and was restored by Justinian under the name of Justinianopolis. Its remains are identified at the modern Suse, 70 m. S. S. E. of Tunis.

**HADZIEWICZ, Rafael**, a Polish painter, born at Zamek, near Lublin, in 1806. He exhibited in 1829 "Marius on the Ruins of Carthage" and "St. Stanislas," and perfected his art in Paris and in Italy. On returning to Poland he executed pictures for the cathedral of Warsaw, and became professor in that city after having held for five years a chair at the university of Moscow. He excels in religious and historical subjects.

**HAECKEL, Ernst Heinrich**, a German naturalist, born in Potsdam, Feb. 16, 1834. His early predilections were for botanical studies, and while still at the gymnasium he prepared for publication a *Flora Merseburgensis*. He studied anatomy and histology in Würzburg under Kölliker and Leydig, and in Berlin under Johannes Müller. Returning to Würzburg, he became the assistant of Rudolf Virchow. Having studied medicine, he settled in Berlin in 1858 as a practising physician. In 1854 and 1856 he had made with Kölliker and H. Müller scientific excursions to the Mediterranean, some of the results of which he published in 1857 in an essay on the tissues of the river crab. A 15 months' residence in Italy during 1859-'60, which he employed in zoological researches, finally withdrew him from the practice of medicine and made him a professed zoologist. On March 4, 1861, he submitted to the university of Jena his thesis *De Rhizopodium Finibus et Ordinibus*; and in 1862 he was made extraordinary professor. In the same year he wrote an essay on *radiolaria* or radiary rhizopods, with an atlas of 35 plates, to which the Cothenius gold medal was awarded. This work contains not only a complete collection, systematic arrangement, and critical

examination of all the genera and species of *radiolaria* previously observed, but the names, description, and figures of 46 new genera and 144 new species, nearly three times as many as were before known. In this essay Haeckel avowed his conviction "of the mutability of species, and of the actual genealogical relationship of all organisms." Without subscribing to all the views and hypotheses of Darwin as to natural selection, he recognized the great merits of the Darwinian theory, and pointed out its logical consequences. At that time Darwinism was generally looked upon with great disfavor in German scientific circles; and when on Sept. 19, 1863, Haeckel appeared before the convention of German physicians and naturalists held in Stettin as its enthusiastic advocate, he stood almost alone. Thenceforth he determined to devote his life to the extension, establishment, and promulgation of the doctrine of evolution. By continued special investigations he has become an authority among the gatherers of facts in many departments of zoology. In 1864 he published, with illustrations, "Contributions to the Knowledge of Corycæide Crustacea," in the *Jenaische Zeitschrift für Medicin und Naturwissenschaft*; and in 1865 an illustrated monograph on geryonide medusæ, which had previously appeared in the same periodical. In the latter year the university of Jena created a regular chair of zoology especially for him, and he began to form by personal collection a museum which has since become one of the most valuable in existence for instruction, and as illustrating points of ontogeny and morphology. From that time his lectures, together with those of Gegenbaur, have made the small university of Jena unrivalled as a school for zoology and comparative anatomy. He has refused very advantageous appointments to other universities, mainly because he would not be separated from his friend and collaborer Gegenbaur. In 1866 he completed a work which, though eclipsed in popularity by two of his later works, the *Natürliche Schöpfungsgeschichte* and *Die Kalkschwämme*, must be considered one of the landmarks of biological science; this is the *Generelle Morphologie der Organismen* (2 vols. 8vo). Its purpose was to trace for anatomy and embryology "immutable natural law in all events and forms." The amount of positive information which this work contains is very remarkable. We are told in the preface that 20 years previously (that is, when he was only 12 years old) he had two herbariums: "the official one," containing typical forms, all carefully labelled as separate and distinct species; the other a secret one, in which were placed the "bad kinds" of *rubus*, *rosa*, *salix*, &c., presenting a long series of individuals transitional from one good species to another. These were at that time the forbidden fruits of knowledge, which in leisure hours were his secret delight. He had later in life greeted Darwin's revival of the transmutation theory with enthusiasm.

Now he could maintain that the boundary lines between different organic forms were not partitions existing in nature, but the expression on our part of the differences which result from divergent development, and which for practical reasons are defined more sharply in our apprehension than the connecting links. He endeavored to bring out the connections and transitions, and to represent them in systematic arrangement in the form of genealogical trees. He propounded as a fundamental biogenetic law that "the ontogeny of every organism repeats in brief time and in general outline its phylogeny;" *i. e.*, that the individual development of every organism, or the series of forms through which it passes from germ to completed form, repeats approximately the development of its race, or the series of forms through which its ancestors have passed. Moreover, all organic beings hitherto had been classified into the two kingdoms, animal and vegetable; but a number of creatures were found to present in external form, in internal structure, and in all vital phenomena, so remarkable a mixture or combination of distinguishing animal and vegetable characteristics, that it was impossible, except arbitrarily, to assign them to either realm; he assigned these doubtful beings to a kingdom by themselves, below and yet between the two other organic kingdoms, and this he called *protistic*. Again and again in existing forms he traced development from preëxisting ones. Many biologists, among them Prof. Huxley, have pronounced this the most important work of the kind ever published. During the winter of 1866 Haeckel made a zoölogical excursion to the Canary islands, remaining three months at Areife, the harbor town of the island of Lanzarote. His report of the trip, and of the marine fauna met with, appeared in the *Jenaische Zeitschrift* for September, 1867. During the following winter he delivered a series of popular lectures on the evolution doctrine in general, and the views of Kant, Lamarck, Goethe, and Darwin in particular, the stenographic report of which constitutes the basis of the *Natürliche Schöpfungsgeschichte*, which has made him known to the German reading public at large. Many editions of this book have been published, and it has been translated into several languages. Darwin says of it in the introduction to his "Descent of Man" (1871): "If this work had appeared before my essay had been written, I should probably never have completed it. Almost all the conclusions at which I have arrived I find confirmed by this naturalist, whose knowledge on many points is much fuller than mine." His *Biologische Studien, erstes Heft: Studien über Moneren und andere Protisten* (1870), is a collection of papers on moneres, "On Catallacts, a new Group of Protists," &c., previously published in the *Jenaische Zeitschrift*. In 1869 a gold medal was awarded him at Utrecht for an essay on the development of siphonophores. He spent the

months of August and September of that year on the coast of Norway, and March and April, 1871, on the Dalmatian coast, at Lesina, and in Trieste; while in 1873 he made a more extended excursion in the East. During the last three or four years he has delivered popular scientific lectures at Jena and at Berlin, of which he has published *Ueber Arbeitstheilung in Natur- und Menschenleben* (1869), *Das Leben in den grössten Meerestiefen* (1870), and *Ueber die Entstehung und den Stammbaum des Menschengeschlechts* (2d ed., 1871); and has written on various subjects for periodicals lay and scientific, and a great number of essays. But in September, 1869, appeared an article in the *Jenaische Zeitschrift*, translated for the "Annals and Magazine of Natural History," "On the Organization of Sponges and their Relationship to Corals;" this was followed by another entitled "Prodromus of a System of the Calcareous Sponges" (an artificial system), and a year later by one "On the Sexual Propagation and the Natural System of Sponges." These articles were the forerunners of the great work on calcareous sponges before mentioned, *viz.*, *Die Kalkschwämme: Eine Monographie* (2 vols., with an atlas of 60 plates and explanations, forming vol. iii., 1872). In the investigation and accurate pictorial representation of new genera and species, and the description of the structure and functions of these comparatively unknown members of the animal kingdom, Haeckel has enriched our knowledge as much as all previous investigators together; yet this is only an incidental and secondary object of his work. Its aim is to prove the theory of descent in a way that had never before been attempted, namely, analytically, by showing the genealogical connection in a complete group of organisms of the various forms distinguished from each other as species, genera, &c. What Darwin and all others had attempted was to solve the problem of the origin of species synthetically, *i. e.*, to prove the truth of the transmutation theory by arguments from philosophy and biology, from comparative anatomy and palæontology, by considerations of the mutual affinities of organic beings, of their embryological relations, their geographical distribution, geological succession, &c. To such considerations Darwin had added the theory of natural selection. Haeckel himself, in his *Generelle Morphologie*, had applied the synthetical method to organic forms, and popularized it in his *Natürliche Schöpfungsgeschichte*. But experience had shown that the synthetical proof alone is not esteemed sufficient by all biologists. Many have asked for analytical proof; and such proof Haeckel has undertaken. He has selected the group of calcareous sponges, and has shown by thousands of examinations the gradual transitions from the most simple to the most perfect sponge form. This is the first attempt made to follow up the *bona species* into its last and darkest nook, to bring it to the light, and

to show that it is originally always a *mala species*. In the preface Haeckel says: "Every thinking and candid systematist who has made himself familiar with the natural and artificial systems in the second volume of this monograph will admit that there are here no true species in the dogmatic sense of the schools. Prove to me among the species of calcareous sponges of which numerous individuals have been examined, any *bona species* in the sense of the schools, and I will give up the whole theory of descent." From this point of view this book, though treating of so special a subject, is of universal interest. With its publication the doctrine of evolution entered upon a new phase. Haeckel's latest work is an essay on "The Gastræa Theory, the Phylogenetic Classification of the Animal Kingdom, and the Homology of the Germ Layers" (1874). The gastræa theory, to which he was led by his researches on the development of calcareous sponges, is based upon the consideration that all the six higher animal classes, from the sponges to the lowest of the vertebrates, pass through a similar stage of development, which he calls the gastrula stage; it is found that in all of them the original egg cell divides itself by the characteristic process of segmentation or furrowing into at first 2, then 4, then 8, then 16, 32, 64, &c., divisions; and the cellular mass thus formed differentiates itself into two epithelial layers, from the inner one of which the digestive canal with all its appendages is developed, while from the outer layer are formed the skin, nervous system, &c. From the fact that at one stage of their existence they all essentially consist of a primitive stomach or digestive cavity (whence the name *gastrula*), and are at that stage more or less alike, and from the homology of the primitive epithelial layers of the germ traceable in all of them, he concludes that they must have been derived from a common original form. This form, essentially corresponding to the developmental stage of gastrula, he proposes to call *gastræa*, stomach-possessor. The infusoria and still more simple animal organisms have nothing which corresponds to the gastrula stage; and he divides the animal kingdom into the two great groups *protozoa*, including animal moneres, amoeba, and gregarina (which together he calls *ovularia*), and infusoria; and *metazoa*, or *gastrozoa*, the descendants of the *gastræa*, which include on the one hand the zoöphytes or coelenterates, and on the other the worms, with the four higher classes (mollusks, echinoderms, arthropods, and vertebrates) which have sprung from worms.

**HÆMLOPTYSIS** (Gr. *ἡμα*, blood, and *πρῶσις*, a spitting), the spitting or raising of blood from the lungs. Hæmoptysis may be a simple exudation from the mucous membrane without appreciable lesion, or may be caused by an organic lesion of the lungs; it is most common between the ages of 16 and 35, in the female sex, and in nervous and sanguine tempera-

ments; it appears to be often hereditary, and is most apt to attack those whose professions require prolonged and forced use of the voice; other causes are violent muscular efforts, paroxysms of cough, blows or pressure on the chest, inspiration of irritating vapors or of the rarefied air on high mountains; it is also symptomatic of the suppression of various natural and morbid secretions. It may be exuded from the bronchial membranes, or may proceed from capillaries communicating with the air passages in any part of their extent; the amount varies from a drachm or two to as many pints at a time, and is florid and more or less mixed with air, differing from the dark coagulated blood which comes from the stomach. An attack of hæmoptysis is generally announced by a feeling of heat and oppression in the chest behind the sternum, followed by a cough which brings up the blood; when the quantity is very great, it pours forth without cough, with considerable spasmodic effort. The effect of profuse hæmoptysis is that of other great hæmorrhages, increased by the terror which spitting of blood always inspires. It sometimes takes the place of the suppressed menstrual or other discharges, and with the same relief to the system. Though spitting of blood sometimes occurs after the violent paroxysms of whooping cough, asthma, and chronic bronchial disease, and also in congestive affections of the lungs, it is more peculiarly the sign of tubercular phthisis or consumption, in the earlier as well as advanced stages of the disease. In making a diagnosis it is important to ascertain the source of the blood which escapes from the mouth, and if determined to be from the lungs, to decide whether it is symptomatic of disease of these organs or merely vicarious in its character. The prognosis in hæmoptysis, chiefly on account of this tubercular complication, is generally serious, although immediate danger is usually not great. The treatment consists in the application of ice to the chest, swallowing lumps of ice, and the administration of internal remedies, called hæmostatics, the mode of whose action is somewhat obscure. Among the most popular and efficient is common salt, taken dry, or with very little water. Tincture of chloride of iron or dilute sulphuric acid may be given, it is said, with benefit, and inhalation of its vapor has been found efficacious. Wunderlich recommends the exhibition of ergot in doses of from 5 to 10 grains until numbness of the fingers is produced. Narcotics may be used quite freely, tending to produce calmness. In all cases the treatment should be assisted by tranquillity of mind, rest, cool air, and looseness of dress. After the attack has ceased, astringent tonics, like iron and quinine, may be given, care being taken not to produce plethora. The return of the bleeding should be guarded against by avoiding the exciting causes, and attending to the rules of hygiene.

**HÆMORRHAGE** (Gr. *ἡμα*, blood, and *ῥήγνισθαι*, obs. *ῥαγνῖν*, to burst), an escape of blood from

the vessels of the living body, called active or passive according as it is arterial or venous in character. Hæmorrhage may be natural, as in the menstrual discharge; symptomatic of disease, as in scurvy, typhoid fever, epistaxis, and hæmorrhoids; essential, inasmuch as the bleeding appears to constitute the principal disease, arising from and keeping up a degeneration of the vital fluid; and traumatic, when the blood vessels are wounded. Active hæmorrhage, when not traumatic, consists in an escape of blood from the capillaries, distended and ruptured by inflammation and excitement, as in bleeding from the mucous membrane of the lungs, nose, rectum, urethra, and from granulating wounds; this is accompanied by local heat, pain, tension, and general febrile condition. In passive hæmorrhage the blood is venous, as in chronic diseases of the liver, uterus, and rectum. There are certain persons called "bleeders," in whom a hæmorrhagic diathesis exists, a peculiar and often hereditary constitutional defect in which the blood seems to have no power of coagulation and the vessels none of contractility; in such the most trifling wounds are followed by profuse and sometimes uncontrollable and fatal bleeding. The symptoms of hæmorrhage vary according to its seat, whether external or internal, active or passive; the amount of blood lost is almost always greatly overestimated by terrified patients and bystanders. In most acute attacks there are premonitory symptoms, constituting the so-called *molimen hæmorrhagicum*, such as chills followed by heat and fulness of the vessels of the part. A small loss of blood may produce great relief in congestions and inflammations, but hæmorrhage carried beyond this point causes paleness, chilliness, cold sweats, nausea and vomiting, hurried respiration, weak and rapid pulse, dizziness, fainting, and finally convulsions and death. In severe wounds these symptoms may in a few moments end fatally; at other times the train may be prolonged for years, with a gradual sinking of the vital forces. In acute inflammations an amount of blood may be taken which would be seriously felt in a state of health. Bouillaud and his disciples of the French school applied the lancet, cups, and leeches in a way that deservedly excited the opposition of other practitioners; Lisfranc, in a case of tetanus, bled a patient from the arm 19 days in succession, and applied nearly 800 leeches along the spine. The loss to the system from profuse bleeding is very soon made up, and the sooner in proportion to the rapidity of the abstraction, in a healthy person; while the feebleness arising from frequent but inconsiderable hæmorrhages may require years for its removal. Modern practitioners generally avoid venesection except in inflammatory and congestive diseases of threatening character, as where the brain, heart, and lungs are in momentary danger; arterial sedatives (like digitalis and *veratrum viride*), and revulsives to the skin and mucous

membranes, have nearly taken the place of the lancet and the leech. Bleeding from the nose is most frequent in the young, from the lungs between the time of puberty and adult age, and from the rectum, bladder, and uterus later in life. The prognosis of hæmorrhage varies according to its origin and amount, and the constitution of the individual. While an effusion of blood into the brain or the pericardium would be very dangerous, a bleeding from the nose or from piles would be generally of little importance; blood coming from the stomach and urinary organs is a graver symptom than that from the air passages; a rapid is more dangerous than a slow loss to the same amount, and a passive than an active hæmorrhage.—The treatment of hæmorrhage, exclusive of strictly surgical means, consists, in the active forms, of general and local depletion, cold and astringent applications; the administration of digitalis and *veratrum viride* to quiet the circulation; of common salt, especially in bleeding from the lungs; of the mineral acids, chloride and sulphate of iron, vegetable astringents, as tannin, and sometimes ergot of rye; and rest and elevated position of the bleeding part when practicable. Arterial hæmorrhage may be known by the florid color, profuse quantity, and pulsating jet of the blood. Nature's processes for arresting such a flow are the contraction of the divided orifice, the retraction of the vessel into its sheath, the coagulation of the blood in and about the sheath, and the retardation of the circulation by faintness; and these will generally suffice for the wound of an artery of the size of the temporal. When art interferes, it is by pressure, torsion, the ligature, cold, styptics, and caustics; a partial is more dangerous than a complete division of an artery, as contraction and retraction are prevented, and for this reason a small vessel should be completely divided. A lacerated artery contracts almost immediately, and rarely bleeds; hence the umbilical cord of animals bitten or torn by the mother gives forth no blood, and hence the efficacy of torsion. Hæmorrhage from a vein is continuous and darker colored, and rarely dangerous, unless from a large, deep-seated, or varicose vessel; pressure, elevated position, and styptics will generally arrest it, and as a last resort the ligature. Bleeding from the nose may be either arterial or venous, and requires nothing special beyond snuffing up astringents and plugging the nostrils. In each case the treatment must depend upon the seat of the lesion, and other circumstances, which require either topical or general remedies. Whenever topical applications are admissible, they are the most efficient.—For hæmorrhage of the lungs and rectum, see HÆMOPTYSIS, and HÆMORRHOIDS. Bleeding from the stomach is *hæmatemesis*, and that from the uterus *metrorrhagia*, or *menorrhagia* when connected with the menstrual discharge.

**HÆMORRHOIDS** (Gr. *haima*, blood, and *rhein*, to flow), or Piles, tumors situated near the

anus, generally commencing by a varicose enlargement of the hæmorrhoidal veins of the rectum, and frequently complicated with, if not arising from, erectile tumors, blood-filled cysts in the submucous areolar tissues, and dilatation of the capillary vessels. By whatever caused, the mucous membrane becomes irritated, sensitive, disposed to bleed, thickened, and more or less obstructing the rectal canal. They have been divided into internal or external piles, according to their situation within or without the anus; the former are generally within the last three inches of the rectum, of firm texture, varying in size from a pea to a walnut, pale when indolent, and dark red when congested or inflamed; the latter are found on the margin of the anus, of firmer texture, often covered half with skin and half with mucous membrane. Hæmorrhoids are also divided into open, or bleeding, and shut, or blind piles. The tumors are rarely single, generally spherical, with a large base, but occasionally pedunculate; their surface may be either smooth or irregular, rough, and ulcerated; when indolent and internal, they produce simply the inconvenience of bulk and consequent trouble in defecation; when irritated, either internal or external, they cause a sense of heat, tension, and itching, pain and straining during evacuation of the bowel, accompanied by more or less bleeding, frequent micturition, and weight and pain in the back and thighs. When external, the friction of the clothes often renders standing, sitting, or walking exceedingly painful; when just on the verge of the anus, the act of defecation is accompanied by tenesmus and excruciating pain, rendered more intense by the usually present constipation. By constant efforts, the mucous membrane becomes prolapsed, adding another source of discomfort. Hæmorrhoids, though generally a local disease, may be the channel by which a periodical flux or a constitutional plethora finds relief; in such cases the bleeding is preceded by the general and local symptoms of excess of blood. All ages and both sexes are subject to this disease, though it is comparatively rare before puberty, and females are more frequently sufferers from it than males, especially during gestation, and plethoric persons more than the anæmic. The predisposing causes are such as produce fulness of the hæmorrhoidal veins and impede the return of blood from them, such as sedentary habits, city life, constipation, pregnancy, the use of corsets, the weight of heavy garments suspended from the hips, and diseases of the thoracic and abdominal organs interfering with the circulation. The exciting causes are anything which irritates the lower portion of the intestine, as the presence of pin worms, the use of aloëtic medicines and injections, and, in warm climates especially, the use of too nourishing food, with its tendency to produce plethora, and its accompanying luxurious habits. The prognosis is generally favorable, unless the disease be of long standing,

in a debilitated constitution, or accompanied by malignant affection of the rectum; in some cases the hæmorrhoidal flux may be positively advantageous, and its sudden and complete suppression may subject the patient to more grave disease.—The general principles of treatment are, according to the evident causes, to diminish the amount of blood sent to the parts by active habits, abstemious living, avoidance of constipation, and attention to other hygienic rules. In case of irritation, leeches or cupping in the neighborhood, fomentations, poultices, enemata, refrigerant and soothing lotions, are of advantage. Strict observance of cleanliness, astringent applications like tannin ointment, pressure by bandage and pad, ice, and antiphlogistic measures will suffice in many cases. A surgical operation is often necessary for a radical cure. This consists in excision, either by knife, cautery, or ligature, usually the last. It is excessively painful, unless the patient is placed under the influence of anæsthetics.

**HAFF** (Dan. *Hav*, sea), a word used in connection with adjectives to designate three large lagoon-like estuaries on the S. shore of the Baltic, communicating with it by one or more narrow passages. They are all in Prussia, and are called Kurisches Haff, Frisches Haff, and Stettiner or Pommersches Haff.

**HAFIZ**, Mohammed Shems ed-Din, a Persian poet, born in Shiraz near the beginning of the 14th century, died about 1390. He early devoted himself to Mohammedan jurisprudence and theology, in which he became profoundly versed, and which he taught publicly. He then lived as a dervish, in luxurious pleasure, in the quarter of Shiraz called Mosella, under the dynasty of the Mosafferids, whose eulogist he was. The sultan Ahmed Ilkhani vainly invited him to his court at Bagdad. When in 1387 Tamerlane conquered Shiraz, he treated the poet with the greatest distinction. In his old age he abandoned luxury for austerities, and employed his talents in celebrating the unity of God and the praises of the prophet. This conversion did not secure him the pardon of zealous Mussulmans for his previous songs of love and wine, and they persisted in deeming him an infidel, an atheist, or a Christian, and after his death denied him the honors of sepulture. His admirers, however, maintained his orthodoxy, and, it being at length agreed to leave the decision to chance, the lot fell on a passage from his odes which avowed his faults, but at the same time affirmed that he was predestined to paradise. A magnificent tomb was then erected to his memory; it stands amid scenery described in his poems, and is still a favorite rendezvous of the young men of Shiraz, who resort thither to sing his verses and to drink wine. His only work is the *Divan*, a collection made after his death of 571 detached odes, called gazels, and seven elegies. His most licentious and passionate verses are regarded by the Persians as inspired by divine love, and are read as a devotional

exercise by pious Mussulmans; and the principal oriental commentators occupy themselves with allegorizing and spiritualizing his expressions. A Persian edition was published at Calcutta in 1791; and later eastern editions are those of Bombay (1828 and 1850), Cairo (1834), and Constantinople (1840), with the commentary of Sudi. Dr. Thomas Hyde, the first English orientalist who studied the poems of Hafiz, translated into Latin his first gazel, with the Turkish commentary of Feridun. Others of them were translated into Latin by Rzewuski and Sir William Jones. The whole *Divan* was translated into German by Von Hammer (2 vols., Tübingen, 1812-'15), and several of the gazels into English by Richardson (1774), Nott (1787), and Hindley (1800).

**HAGAR**, an Egyptian servant belonging to Sarah, who, being childless, gave her to her husband Abraham, that by her as a substitute she might be blessed with children. Her descendants are called in the Bible Hagarites or Hagarenes, from herself, and Ishmaelites, from her son Ishmael. The Arabs, who claim descent from her son, regard her with veneration, and speak of her as Abraham's lawful wife.

**HAGEN**, a town of Prussia, in the province of Westphalia, on the Volme and Empe, and on the Dortmund and Düsseldorf railway, 24 m. W. of Arnsberg; pop. in 1871, 13,445. It has two Catholic churches, a Protestant church, a synagogue, a chamber of commerce, and a trade school. Iron and steel ware, tobacco, paper, and cloth are manufactured. There are also wire-drawing and copper-rolling works.

**HAGEN, Ernst August**, a German author, born in Königsberg, April 12, 1797. While at the university of his native city he wrote a romance, *Olfrid und Lisena* (1820). In 1821 he visited Rome, and in 1824 lectured at Königsberg on the history of art and literature; and in 1825 he was appointed professor in this department. As founder of the Prussian antiquarian society at Königsberg, he edited (1846-'57) the *Neue preussische Provinzialblätter*. He published the art histories, *Norica* (Breslau, 1827; English translation, London, 1851), *Die Chronik seiner Vaterstadt vom Florentiner Ghiberti* (Leipsic, 1833), and *Wunder der heiligen Katharina von Siena, and Leonardo da Vinci in Mailand* (1840). Among his other works are *Die deutsche Kunst in unserm Jahrhundert* (1857), and *Acht Jahre aus dem Leben Michel Angelo Buonarrotti's* (1864).

**HAGENAU** (Fr. *Hagenau*), a city of Germany, in Alsace, on the Moder, in the midst of a large forest called the Hagenauer Wald, 16 m. N. by E. of Strasburg; pop. in 1871, 11,331. It is surrounded by ancient walls flanked with towers. There are five churches, of which that of St. Nicholas was built in the 13th century and St. George's in the 12th, a communal college, manufactories of woollen and cotton, tanneries, breweries, and hemp mills, and a considerable trade in timber, wool, madder, and hops. It was founded about the middle

of the 12th century, and fortified by the emperor Frederick I. In 1423 it was pawned by the emperor Sigismund to the elector palatine, but was redeemed by Ferdinand I. in 1558, and afterward belonged to the house of Hapsburg, until by the peace of Westphalia (1648) it came to France. There were bloody encounters near Hagenau, between the French and Austrians, Oct. 17 and Dec. 22, 1793; but it was retained by the French until the war of 1870 gave Alsace to Germany.

**HAGENBACH, Karl Rudolf**, a German historian, born in Basel, March 4, 1801, died there, June 7, 1874. He studied at Basel, Bonn, and Berlin, adopted the views of Schleiermacher, and in 1828 became professor of theology at Basel. He resigned his professorship shortly before his death. Among his works are: *Tabellarische Uebersicht der Dogmengeschichte* (1828); *Encyclopädie und Methodologie der theologischen Wissenschaften* (1833; 7th ed., 1864); *Vorlesungen über Wesen und Geschichte der Reformation* (6 vols., 1834-'43; 2d ed., 1851-'6); *Kirchengeschichte des 18. und 19. Jahrhunderts* (2 vols., 2d ed., 1848-'9; English translation, "History of the Church in the Eighteenth and Nineteenth Centuries," London, 1869); *Lehrbuch der Dogmengeschichte* (2 vols., 1840-'41; 4th ed., 1857; English translation, "History of Doctrines," 3d ed., Edinburgh, 1858); *Geschichte der theologischen Schule Basels* (1860); *Grundlinien der Homiletik und Liturgik* (1863); and *Vorlesungen über die Kirchengeschichte von der ältesten Zeit bis zum 19. Jahrhundert* (new and revised complete ed., 1868-'72). He has also published a poem, *Luther und seine Zeit* (1838), and *Gedichte* (1846; 2d ed., 1863); and since 1845 he has edited the *Kirchenblatt für die reformirte Schweiz*.

**HAGERSTOWN**, a city and the capital of Washington co., Maryland, on the W. bank of Antietam creek, 22 m. above its entrance into the Potomac, and at the intersection of the Cumberland Valley and Western Maryland railroads with the Washington County branch of the Baltimore and Ohio line, 60 m. W. N. W. of Baltimore; pop. in 1860, 4,132; in 1870, 5,779, of whom 869 were colored. It has broad streets, is built mostly of brick and stone, and contains a handsome court house, recently erected at a cost of \$77,000. It is surrounded by a rich agricultural region, and has considerable trade. There are two iron foundries, a manufactory of agricultural implements, an extensive flour mill, two sash and door factories, an extensive bone mill, a tannery, and a national and a state bank, with an aggregate capital of \$250,000. About 7 m. S. of Hagerstown is the college of St. James, an Episcopal institution. The city, besides several public schools, contains a female seminary, an academy for boys, a daily, a semi-weekly, and three weekly newspapers, and 12 churches, of which two are for colored people.

**HAG FISH.** See MYXINIDS.

**HAGGAI**, the tenth of the minor prophets, and first of those who prophesied after the captivity, supposed to have been born at Babylon, and to have come back from there with Zerubbabel, although one expression (ii. 3) has been thought to imply that he had seen the first temple. Nothing is known as to his death, though Epiphanius tells us he was buried at Jerusalem among the priests; if so, he must have been of the family of Aaron. He is mentioned in the Apocrypha as Aggeus. The prophecy of Haggai was delivered about 520 B. C., after the return of the Jews to their own land. It is chiefly occupied with keen reproofs and affecting exhortations respecting the building of the second temple.

**HAGIOGRAPHA** (Gr. *ἅγιος*, sacred, and *γράφειν*, to write), or **Holy Writings** (in Hebrew, *Ketubim*, writings), the name given by the Jews to their third division of the Old Testament Scriptures. There are various suppositions concerning the earliest arrangement of this division by the Jews, founded on contradictory statements in Josephus, Philo, Jerome, the Talmud, &c., including a passage of Luke (xxiv. 44): "the things written in the law of Moses, and in the prophets, and in the psalms." According to the arrangement now general among the Jews, the Hagiographa includes three divisions: 1, the Psalms, Proverbs, and Job; 2, the Song of Songs, Ruth, Lamentations, Ecclesiastes, and Esther; 3, Daniel, Ezra, Nehemiah, and the Chronicles. These books probably received the name of "Hagiographa," or "Holy Writings," because, though not written by Moses, or any of the prophets, strictly so called, they were nevertheless regarded as inspired.

**HAGUE**, The (Dutch, *'s Gravenhage*; Fr. *La Haye*; Ger. *Der Haag*), a city of the Netherlands, capital of the province of South Holland, about 2 m. from the sea, 31 m. S. W. of Amsterdam and 12 m. N. N. W. of Rotterdam; pop. in 1872, 92,785, of whom one third are Roman Catholics. It is the seat of the court, the government, the states general or parliament, and of the foreign ministers, and has become since 1850 one of the finest cities in Europe, owing to the erection of stately houses and the laying out of fine parks. The streets are regular and spacious, and many of them are traversed by canals and lined with trees. The most conspicuous buildings are the royal palace and the palace of the prince of Orange;

and in the outskirts of the city is the *Huis ten Bosch* (the house in the wood), a private palace of the queen of Holland. The *Binnenhof*, so called because it formed the inner court of the count's palace, contains the chambers of the states general and other public offices, and its Gothic hall is celebrated. Barneveldt was executed in this building. Among other notable edifices are: the state prison in which Cornelius de Witt was confined, and from which he and his brother John were dragged and torn to pieces by the populace; the town hall; three Calvinistic, a French Reformed, English Presbyterian, Evangelical Lutheran, Remonstrant, and five Roman Catholic churches, two synagogues, and a fine theatre. The royal library contains about 100,000 volumes. The principal artistic attraction of the Hague is the picture gallery and museum, situated in the building called the *Maurits Huis* after Maurice of Nassau, by whom it was built; it

The Maurits Huis.

contains some of the best works of the Dutch masters. The museum abounds with rarities from China and Japan, and contains a large collection of Japan ware and Japanese weapons, and many historical relics. The Hague possesses many educational, charitable, artistic, scientific, and religious institutions. There is a brass foundery, but little trade and industry. Within a few miles of the city is the fashionable watering place Scheveningen, and the environs are dotted with elegant villas.—The Hague owes its origin to a hunting seat built by the count of Holland in the 13th century, and the name is traced to the enclosure (*hage* or hedge) which surrounded the counts' (*graven*) park. In the 16th century it became the residence of the states general, the stadtholder, and the foreign ambassadors; and it acquired, especially in the 17th century, great historical interest as the most important focus of European diplomacy. A convention was held here

March 31, 1710, in which Germany, Russia, Prussia, and the maritime powers took part for maintaining the neutrality of North Germany against France. A triple alliance between France, England, and the Netherlands was concluded here Jan. 4, 1717, and on Feb. 17 a treaty of peace between Spain, Savoy, and Austria. Yet the Hague was never mentioned in all these great transactions excepting as a village, and it was certainly the most extensive and remarkable village that ever existed. The revolution of 1795 gave a great shock to the prosperity of the place, and a final blow was given to it by King Louis Bonaparte in removing the seat of government to Amsterdam and of the law courts to Utrecht. Since the restoration in 1813-14 of the house of Orange, the Hague has rapidly recovered its former prestige, especially as it once more became the virtual capital of the nation, although Amsterdam remains the nominal capital, and retains as such various prerogatives.

**HAGUE, William**, an American clergyman, born in New York about 1805. He graduated at Hamilton college in 1826, was ordained to the ministry, and has been pastor of Baptist churches in Providence, Boston, Newark, Albany, New York, Chicago, and Orange, N. J. Besides many occasional addresses and minor works, he has published "The Baptist Church Transplanted from the Old World to the New" (New York, 1846); "Christianity and Statesmanship" (1855); and "Home Life," a series of lectures on family duties and relations (1855).

**HAHN, August**, a German theologian, born near Eisleben, March 27, 1792, died in Breslau, May 13, 1863. He was educated at Eisleben, Leipsic, and Wittenberg, in 1819 was appointed extraordinary professor of theology at Königsberg, and gained distinction by his writings on Bardesanes, Marcion, and Ephraem. In 1827 he was called to the ordinary professorship of theology at Leipsic, and published *De Rationalismi, qui dicitur, Vera Indole, et qua cum Naturalismo contineatur Ratione*. He regarded a supranatural revelation as the necessary foundation of religion. In his treatise entitled *Offene Erklärung an die evangelische Kirche zunächst in Sachsen und Preussen* (1827) he maintained that the rationalists ought in conscience voluntarily to leave the evangelical church. In 1833 he was called as consistorial counsellor and ordinary professor to Breslau, and in 1844 he was made general superintendent for Silesia. He also published *Lehrbuch des christlichen Glaubens* (1828; 2d ed., 1858), and an edition of the Hebrew Bible (1831).

**HAHN-HAHN, Ida Marie Luise Sophie Friedrike Gustave**, countess, a German authoress, born at Tressow, Mecklenburg-Schwerin, June 22, 1805. Her father, Count Karl Friedrich von Hahn-Neuhaus (born 1782), was a theatrical enthusiast, who, after devoting his whole life and fortune to the stage, was compelled in his old age to support himself by managing a provincial company, and died in poverty at Altona,

May 21, 1857. At the age of 21 she was married to her cousin, Count Friedrich Wilhelm Adolf von Hahn-Hahn, from whom she was divorced in 1829. Between 1835 and 1837 she published three volumes of verse, followed by a series of novels, such as *Gräfin Faustine*, *Ulrich*, *Sigismund Forster*, and *Cecil*. In 1839 she submitted to a dangerous operation on the eye, which for a time threatened to deprive her of sight; and to divert her mind she went to the East, recording her adventures in the *Orientalische Briefe* (3 vols., 1844). In 1850 she embraced the Roman Catholic faith, giving an account of her conversion in *Von Babylon nach Jerusalem* (1851). In 1852, wearied with the world, she entered the mother house of the order of the Good Shepherd at Angers. She afterward took up her residence at Mentz, where she devoted herself to the reformation of outcasts of her own sex, and wrote several works, among which are: *Bilder aus der Geschichte der Kirche* (3 vols., 1856-'64); *Peregrina* (1864); and *Eudoxia* (1868).

**HÄHNEL, Ernst Julius**, a German sculptor, born in Dresden, March 9, 1811. He studied architecture under Rietschel in Dresden, and under Schwanthaler in Munich, and sculpture at Rome and Florence. In 1835 he went to Munich, and in 1848 became professor at the academy of Dresden. In 1855 he was invited to the academy of Vienna, where he was a successful teacher. Among his best works are a statue of Beethoven at Rome, and a Madonna. The bass-reliefs in the new museum at Dresden are also his work. These were followed by the "Four Evangelists," and the "Three Holy Kings," of colossal size, for the tower at Neustadt-Dresden (1858), and the tomb of King Frederick Augustus II. of Saxony (1866).

**HAHNEMANN, Samuel Christian Friedrich**, the founder of the homœopathic system of medicine, born in Meissen, Saxony, April 10, 1755, died in Paris, July 2, 1843. He was educated at the high school of his native town, and at the age of 20 went to Leipsic to study medicine. Here he devoted his leisure to teaching languages, and to translating foreign medical authors into German, and was accustomed to sleep only every other night, a habit he persevered in for several years. In 1777 he went to Vienna, where he came under the notice of Quarin, physician to Joseph II. and chief physician to the hospital of the Leopoldstadt, who intrusted him with the care of one of the hospital wards, and subsequently recommended him to Baron von Brückenthal, the governor of Transylvania, in whose family at Hermannstadt he remained as librarian and physician for nearly two years. In August, 1779, he took his degree of M. D. at Erlangen. After a brief residence in Hettstädt and Dessau, where he studied chemistry and mineralogy, and at Gommern near Magdeburg, where in 1785 he was married, he settled in 1787 in Dresden. Here he was rapidly acquiring reputation as a physician and writer on medical

science, when a distrust of the received system of therapeutics caused him to pause in his labors. In place of facts and laws, he complained that he found only hypotheses and theories. Finding that he could no longer conscientiously practise his profession, he returned in 1789 to Leipsic, where he resumed his chemical studies, and endeavored to support his family by translating English and French medical authors. At first he was obliged to struggle with poverty, and his children experiencing severe attacks of illness, he could only prescribe for them according to a system in which he had ceased to place confidence. This stimulated his desire to establish a new system of therapeutics. In 1790, while engaged upon a translation of Cullen's "Materia Medica," he was struck with the contradictory properties ascribed to Peruvian bark, and the various explanations given of its operation in intermittent fever. He resolved to try upon himself the effects of the medicine, and, after several powerful doses, discovered symptoms analogous to those of intermittent fever. The fact that a drug had produced upon a man in health the very symptoms which it was required to cure in a sick man immediately suggested to him the law, *Similia similibus curantur* ("Like cures like"), which is the groundwork of the homœopathic system. He determined to test the principle fully before announcing it to the world, and experimented upon himself with a variety of drugs. Similar results having been obtained in every instance, and also in experiments tried upon others, he applied the new law to the treatment of the patients in the insane asylum at Georgenthal near Gotha, over which the duke of Saxe-Gotha had appointed him, with complete success. From Georgenthal he proceeded to Pymont, Brunswick, and Königsblutter, effecting in each place remarkable cures. In 1796, in a paper published in Hufeland's *Journal der praktischen Heilkunde*, he made his first public exposition of the *similia similibus* principle, which, if not its discoverer, he was the first to declare to be the leading principle in therapeutics. His suggestions were received with indifference or ridicule, and during the next 15 years he was the object of ceaseless attacks from those whose interests were opposed to the innovations he sought to introduce into medical practice. During this period he published several works, all treating of the new theory; among which was *Fragmenta de Viribus Medicamentorum Positivis sine Obvis in Corpore Sano* (2 vols., Leipsic, 1805). But in his *Organon der rationellen Heilkunde* (Dresden, 1810) homœopathy first received its distinctive name, and was first reduced to a system and methodically illustrated. This work created much sensation in Germany, and a bitter warfare was waged for upward of 12 years between the old and new schools of therapeutics. About this time he fixed his residence in Leipsic, where he entered upon an extensive practice, and gathered

about him many friends and disciples. During the prevalence of a malignant form of typhus in 1813, caused by the recent presence of the allied and French armies, the patients became so numerous that it was necessary to divide them among the physicians of the city. Of the 73 allotted to Hahnemann, and treated on the homœopathic method, all recovered except one old man. But this only increased the enmity of his opponents, and an old law was revived which prohibited a physician from dispensing his own medicines, a practice Hahnemann had always followed, and was unwilling to relinquish. He therefore in 1820 removed to Köthen, where for a time he encountered the same hostility which had driven him from Leipsic. But the homœopathic system was meanwhile making its way silently over Europe, and patients repaired from all sides to receive the advice of its founder. The importance which the petty town of Köthen thus acquired soon caused a reaction in his favor, and when, upon his marriage for a second time in 1835 with Mlle. d'Hervilly, a young French woman, he took his departure, it was deemed necessary to go secretly by night for fear the populace might insist upon detaining him. Repairing with his wife to Paris, he resided there in the active practice of his profession until his death. A statue of Hahnemann was erected in Leipsic in 1851 by the homœopathic physicians of Germany, and another in Berlin in 1855. Besides those already mentioned, his principal works are: *Reine Arzneimittellehre* (6 vols., Dresden, 1811-'20; 3d ed., 1830-'33); *Die chronischen Krankheiten* (4 vols., Dresden, 1828-'30; 2d ed., 1835-'9); and *Heilung der asiatischen Cholera* (Nuremberg, 1831). A collection of his minor works has been published (2 vols., Dresden, 1829-'34). Several of his works have been translated into English and other languages. (See HOMŒOPATHY.)

**HAIL**, the aqueous vapor of the atmosphere congealed in icy masses, called hailstones, and precipitated upon the earth. Hailstones vary in size and internal structure, from the homogeneous masses one eighth of an inch in diameter forming sleet, to the larger masses 9 in. in diameter, of beautiful crystalline structure, and to the still larger accretions of these masses sometimes a foot or more in diameter. The crystalline structure of most hailstones is remarkably distinct. The centre of the hail is a collection of semi-translucent granules or a spongy mass of snow and opaque ice; surrounding this nucleus is a more or less well defined radiated structure of crystals of ice; a large quantity of air is always enclosed within the interstices of the hailstone. Occasionally the stones are composed of concentric rings of ice and snow; when they consist of clear ice without the snowy nucleus, there is almost invariably found in the centre, in place of the nucleus, a cavity filled with condensed air; from experiments made in 1871 it has been shown that this bubble of enclosed air is sub-

jected to a pressure of many atmospheres. Small bits of dust, leaves, and other foreign particles are occasionally found in the interior of the mass of a hailstone, and crystals of sulphur as well as ashes are particularly observed when the hail storm occurs in a volcanic region.

Different Forms of Hail.

The small hailstones that fall in storms of sleet are generally regarded as drops of water that have been frozen in their downward passage through layers of cold air; and their formation is therefore believed to be a different process from that attending the formation of larger hailstones. These latter occur in connection

Section of Hailstone, magnified.

with a class of storms that are distinctively known as hail storms.—The velocity with which large hailstones fall to the ground is often so great that, taken in connection with their mass, they cause very serious devastation; instances are recorded of animals being destroyed in large

numbers, and damage is frequently done to houses, forests, and crops. It is believed that the velocity is indeed usually much less than is due to bodies of their size and density, and several theories have been devised to account for this. Prof. Olmsted supposed that the true reason is found in the retardation occasioned by the nucleus continually taking up in its descent accessions of vapor, which immediately before was in a state of rest; it has however not yet been shown that there is any necessity for such an explanation, since we know too little concerning the altitude above the earth's surface, at which hail is formed. Hail storms occur most frequently in the spring and summer months, and in the warmest part of the day. Kaemtz has shown that in Germany and Switzerland 50 per cent. of these storms occur in the springtime. Weselowski shows that in Russia 40 per cent. occur in summer, and 30 per cent. in spring. In the Netherlands and France 40 per cent. occur in spring. It is comparatively rare that hail storms take place between 9 P. M. and 7 A. M.; 60 per cent. of the storms in Germany occur between noon and 6 P. M. As regards the frequency of hail storms in various portions of the globe, it is generally believed that they rarely or never occur in the polar regions, and but little more frequently in those portions of the tropical regions whose climate is controlled by the neighboring ocean; thus they are recorded as of extreme rarity in the islands of Martinique, Mauritius, and in the lowlands of Java and Borneo. On the other hand, in the higher portions of Java, Borneo, and Santo Domingo, hail is by no means infrequent; in the island of Cuba, according to Poey, over 40 hail storms have been recorded since 1784. In the temperate zone, both in rolling and mountainous countries, hail storms are far more frequent. Of these countries, some, such as France, are peculiarly subject to severe hail storms, while again in every such land many localities are pointed out where it never hails. In general these latter localities are found to be decidedly higher than the average elevation of the surrounding country, or else decidedly lower; thus, according to Savigne, a mountain in the neighborhood of Clermont was during 23 years only once visited by hail, while the country about its neighborhood was frequently devastated. In Lithuania hail occurs on the hills more frequently than on the plains, while in Poland it occurs at the foot of the Carpathian mountains more frequently than in the lowlands. Leopold von Buch states that it never hails in regions where cretins are found; a generalization, however, that does not seem to be accepted by many, and the cause of which must, if the fact be granted, be looked for in some peculiarity common to the regions in question.—Among the special phenomena of hail storms may be mentioned the pauses that occur between successive falls of hail, which are well described by Kaemtz as observed by

him. He says that at the beginning of the severest storm that he ever witnessed, there fell some large drops of rain; these soon ceased, and after a short interval there fell hailstones, shaped like beans, of one or two tenths of an inch in diameter; this ceased, and there followed rain, and after another pause fresh hail of two or three tenths of an inch diameter; again another pause, and a new fall of hail. Of these successive falls of hailstones, the first possessed only a slight coating of ice over the snowy nucleus; the second class were partially surrounded with a thicker layer of ice; and the last hailstones were generally rounded masses one third of an inch in diameter. In all cases he found the kernel not transparent, while the surrounding ice was so in a high degree. Another very general peculiarity of hail storms consists in the fact that the central portion of the region passed over by the storm is almost entirely free from the fall of hailstones, which on the other hand are almost invariably found in two or more belts parallel to the track of the storm centre, and some distance therefrom. Thus in the storm of July 13, 1788, which passed from France in a northeasterly direction into Holland, the storm track was about 500 m. in length, and was traversed in less than nine hours; over the central track, to a breadth of 6 m. on either side, no hail fell, but heavy rain; on either side of this region, to a distance of 5 or 10 m., the country was visited with hail of the most destructive kind, by which property valued at more than \$5,000,000 was destroyed; rain also fell over a district stretching far beyond the belts of hail.—Perhaps the most frequent accompaniment of hail, and the most prominent peculiarity of the hail storm, is found in the discharges of electricity, which are usually but not always remarkably severe. While numerous thunder storms occur without attending hail, it is on the other hand generally the case that hail storms are also thunder storms. Ordinary thunder storms of a moderate degree of severity, as well as tornadoes, waterspouts, sand or dust storms, whirlwinds, and hail storms, have many points of similarity, and may be said to pass by insensible shadings from one to the other. Peltier enumerates 116 tornadoes or *trombes*, of which 14 were accompanied by hail. Reye, in his work on *Wirbelstürme*, enumerates 33 tornadoes that occurred in America, of which only three are noted as having been accompanied by hail. Hail storms, and indeed all that class of disturbances just enumerated, have a local character, and it is believed that in general their paths are related to the larger areas of low barometer that move over the surface of the earth; they are more numerous and more intense at those times when the barometric pressure is diminishing in advance of some extensive region of low pressure; they may in fact be said to be the precursors of, or to initiate, some more general atmospheric distur-

ance.—Our knowledge of the operations going on in the interior of a hail storm has been materially increased of late years, though still far from being complete; and the theories of Volta, Olmsted, &c., may be said to possess now only a historical interest. According to Volta, atmospheric electricity plays a very important part in the formation of hail, the snowy nucleus being alternately attracted and repelled by two layers of clouds charged by opposite electricities, and in the mean time continually adding to its size, until its weight brings it down to the earth. This theory may be regarded as distinct from the earlier electrical theories of Musschenbroek, Monge, &c.; and notwithstanding its many defects, it seems to have been very widely accepted, especially in France and Germany, during the latter part of the 18th century. Montbeillard was led in 1776 by its consideration to propose the use of Franklin's lightning rod as a protection against hail storms; a proposition that has been very widely adopted in France, but it is believed without producing the desired effect, although a popular and almost superstitious belief prevails in that country in regard to its efficiency. Leopold von Buch maintained that the water was frozen by very rapid evaporation from the surface of each drop; a hypothesis concerning which Kaemtz remarks that even if it were possible thus to convert rain drops into hailstones, this method of formation would not accord with the ordinary saturated condition of the atmosphere in the cloud region. The hypothesis that uprising currents of moist warm air, by their mixture with higher currents of very cold dry air, thereby give rise to the formation of hailstones, seems to have been first propounded by Muncke, and has, in a more or less modified form, been favored and even adopted by prominent meteorologists in Europe, and has been developed independently by Olmsted in America. More recent writers, as Peslin (1866) and Reye (1864 and 1872), have developed the consequences of the principle first announced in meteorology by Espy, that storms (including in that term every phase of atmospheric disturbance) owe their energy to the condensation of aqueous vapor caused by the cooling consequent on the internal work performed in the ascension of moist air to elevated regions of the atmosphere. It is demonstrated by these writers that the rapid ascent of the moist air found near the surface of the ground on a warm summer's day is attended with such a rapid cooling that a portion of the vapor must necessarily be condensed, either as drops of water or flakes of snow and crystals of ice. According to Reye, who in this respect is but a disciple of Espy, the phenomena of cyclones and hurricanes, of waterspouts and whirlwinds, of thunder storms and hail storms, can all be developed as the consequences of a single simple law of the mechanical theory of heat, namely, the condensation

of atmospheric aqueous vapor contained in up-rising currents of air.

**HAILES, Lord.** See DALRYMPLE, Sir DAVID.

**HAINAN**, an island of China, in the China sea, between lat. 18° and 20° N., and lon. 108° and 111° E.; area, about 12,000 sq. m.; pop. about 1,500,000 Chinese, besides the tribes in the interior. It forms part of the province of Kwangtung, and lies off the peninsula of Lien-chow, from which it is separated by the strait of Hainan, 15 m. broad and of difficult navigation. The E. coast is steep and rocky; the N. W. coast is unapproachable because of sand banks; but the S. coast is indented with several commodious and safe harbors. The interior of the island is mountainous and barren, but the low lands near the sea are fertile and well cultivated. The principal productions are rice, sweet potatoes, sugar, tobacco, fruits, medicinal plants, sandal wood, brazilletto, ebony, dye woods, and wax, the last obtained from the *pehlah-chung* or white wax insect. There are valuable fisheries, and great quantities of dried and salted fish are shipped to Canton. The inhabitants of the maritime districts are mostly the descendants of Chinese settlers, but the interior is occupied by a distinct race, called Li, who claim to be independent of the Chinese government, and are supposed to be aborigines. These people are described as inoffensive and industrious. Hainan is divided into 13 districts. Kienschow, the residence of the governor and the capital of the whole island, on the N. coast, has a population estimated at 200,000.

**HAINAU**, a town of Prussia, in the province of Silesia, on the Deichsel, and on the railway from Frankfort-on-the-Oder to Breslau, 11 m. W. N. W. of Liegnitz; pop. about 4,500. It has manufactories of woollen and linen cloth, tile works, a shoe manufactory, and a market for horses. Here the Prussian cavalry defeated the French vanguard, May 26, 1813.

**HAINAUT**, or **Hainaut** (Flem. *Henegouwen*; Ger. *Hennegau*), a province of Belgium, bordering on France and the provinces of West and East Flanders, Brabant, and Namur; area, 1,437 sq. m.; pop. in 1871, 896,285. It is traversed by the rivers Sambre, Scheldt, Dender, and Haine (from which last the province received its name), and several canals. It is very hilly in the southeast, but in other parts generally level. The soil, except in the district of Charleroi, is fertile. The mineral productions are coal, iron, lead, slates, marble, building stones, and limestone. The number of persons employed in the coal mines at the end of 1870 was 68,831, and the production amounted to 10,196,530 tons. The chief crops are wheat, barley, oats, rye, flax, beans, hemp, hops, potatoes, tobacco, and chicory. Horned cattle, sheep, and horses are reared, the latter valued as draught animals. There is also abundance of poultry, game, and bees. Hardware, glass, woollen and linen goods, porcelain, pottery, bricks, lace, and Brussels carpets are the principal manufactures. The most important ex-

ports are coal, iron, and lime. The province is traversed by good roads and railways, the great lines being the Brussels and Namur and the Brussels and Valenciennes. The principal towns are Mons, the capital, Tournay, Ath, Soignies, Charleroi, and Thuin.—The territory of Hainaut was known in ancient times as *Han-agadensis Comitatus* and *Hannonia*. Among the earliest inhabitants were the warlike Nervii. It was not called Hainaut until the 7th century, and it was long governed by local counts. It passed through many vicissitudes from the 10th to the 15th century, and, after having successively been united with Flanders and Burgundy, in 1477 came into the possession of the house of Hapsburg, and was ruled by the Spanish branch of that line from 1555 to 1713, and subsequently by the Austrian branch, with the exception of S. Hainaut, which in 1659 became part of France by the treaty of the Pyrenees. In 1793 the French annexed Austrian Hainaut, and formed of it the department of Jemmapes. In 1815 other districts were added to it, and it formed a part of the kingdom of the Netherlands until the establishment of the kingdom of Belgium in 1830.

**HAIR**, an elongated, more or less cylindrical epidermic appendage, analogous to the feathers of birds and the scales of reptiles. Its essential structure consists of an assemblage of epidermic cells at the bottom of a flask-shaped follicle in the substance of the skin, supplied with blood by vessels distributed to its walls; it is made up of a root, from which the hair is developed, and a stem or shaft continuous with it. The root exhibits a bulbous enlargement, which, with the lower part of the stem, is enclosed in an inversion of the epidermis, having an outer or cellular and an inner or fibrous layer, formed of granular cells; each hair follicle is implanted in a depression in the dermis, between whose epidermic lining and the stem is a space into which the canals of sebaceous follicles frequently open, and in which entozoa are often developed; the inspissated sebaceous secretion forms the scurf at the roots of the hair; the follicle penetrates sometimes  $\frac{1}{2}$  of an inch, reaching on the head, face, and pubis the subcutaneous areolar tissue, but generally is imbedded in the substance of the true skin. The bottom of the follicle is occupied by a papilla upon which the hair rests, a compound cellular vesicle, the true germ of the hair. The stem is composed of a cortical investing horny layer of scales, arranged in an imbricated manner, a softer medullary or pith-like substance in the centre, and a fibrous intermediate portion constituting two thirds of the bulk of the hair; the last two are by Carpenter considered as forming together the medullary substance. The growth of hair takes place at the root by the development of new cells at the bulb, the old being pressed forward by the new or becoming elongated in the stem. Hairs are very rarely cylindrical, but generally elliptical and flattened in proportion to the curl or crispness;

the size is greatest toward the lower third, the root being smaller and the end terminating in a point. The hairs of the head are the longest, those of the beard the thickest, and those of the general surface the finest; among women the hair of the head has been known to fall below the feet, and the beard of man occasionally reaches to the waist; frequent cutting and shaving of hairs increase their thickness, but not necessarily their number. Hairs are observed in the fetus as early as the third or fourth month, in the order of follicle, bulb, and hair. From the resemblance of the mucous membranes to the skin, it is not surprising that hairs are sometimes developed on the conjunctiva of the eye, in the intestines, ovaries, &c.; they are frequently found in encysted tumors and in other inversions of epidermic structure. Hairs may be transplanted, and will contract organic adhesion in the new tissues; according to Eble, a hair which has reached its full development becomes contracted just above the bulb and falls off. In vigorous health the hairs are thick and firmly set in the skin; in debilitated persons they fall out spontaneously or with very slight force; in the latter case the bulb generally alone comes away, the sheath and germ remaining behind, and capable of reproducing the hairs under proper treatment or favorable circumstances; even when the entire follicles are removed, it is possible that new ones with their germs may be formed; new shafts are constantly in process of formation, as is shown by the short and pointed hairs on the scalp of old persons. The nutrition of hairs is effected through vessels in close contact with their tissue, without entering into their structure; so that causes affecting the general health, and especially the condition of the skin, act powerfully upon the nutrition of the hair; the premature baldness and grayness of the Americans as a people is in great measure

A Hair in its Hair Sac.

*a*, shaft of hair above the skin; *b*, cortical substance of the shaft, the medulla not being visible; *c*, newest portion of hair growing on the papilla (*d*); *e*, cuticle of hair; *f*, cavity of hair sac; *g*, epidermis (and root sheaths) of the hair sac corresponding to that of the integument (*m*); *h*, division between dermis and epidermis; *i*, dermis of hair sac corresponding to dermis of integument (*l*); *j*, mouths of sebaceous glands; *k*, horny epidermis of integument.

owing to the non-observance of hygienic rules, and to excess of mental and physical labor in a climate foreign to the race. Hairs are distributed over the entire surface of the human body except the palms, soles, and terminal joints of the fingers and toes; but for special purposes most abundantly on the scalp, brows, edge of the lids, pubis, chin, cheeks, armpits, chest, and entrance of the nose and ears. In these situations the number varies according to temperament, age, health, and sex. According to Withof, the quarter of a square inch contained 293 hairs on the head, 39 on the chin, 23 on the forearm, 19 on the back of the hand, and 13 on the front of the thigh; in the same extent he counted 147 black, 162 brown, and 182 flaxen hairs, showing the comparative fineness. Long and strong hairs are often found growing from moles and naevi in various parts of the body. The hair generally grows in an oblique direction on account of the way in which the follicles are placed; these are sometimes placed wrongly on the scalp, causing much trouble to anxious mothers; perseverance will generally bring the refractory locks into the desired direction. From contraction or corrugation of the skin from cold, fear, or other causes, the hair, especially on the head, becomes partially erect, though it can never stand on end "like quills upon the fretful porcupine."—The color of the hair depends partly on the presence of pigment granules, and partly on the existence of numerous minute air spaces which cause it to appear dark by transmitted light; its intensity generally bears a close relation to the color of the iris and the skin; in albinos and in gray-haired persons the coloring matter is deficient or absent. Long contact with chlorine decolorizes hair; and the undoubted fact that hair may turn white in a short time under the influence of strong emotions is doubtless to be explained by some chemical action upon the oily coloring matter, as suggested by Dr. D. F. Weinland, and more fully explained in the article FEATHERS. The turning gray of the hair is no sign of its loss of vitality, as hair of this color often grows for years as vigorously as the darker hued. Hair is remarkable for strength, elasticity, and durability, the first depending on its fibrous structure and the last two on its horny nature; a single hair will bear a strain of 1,150 grains. Hairs will endure not only during a long life, but will grow after death, and last for centuries. It is well known that hairs, especially of cats and other animals, become electrical by rubbing; the hygroscopic property of hair has been painfully manifested to many a beau and belle whose rebellious locks have refused to retain their artistic curl on the sudden occurrence of a moist atmosphere. Nitrate of silver blackens hair, forming a sulphuret, and this substance and sulphur form the bases of most of the popular hair dyes. When burned, hair emits a disagreeable odor as of burning horn.—The uses of

hair are manifest. On the head of man it is one of his chief ornaments, as well as a protection from injury; on the face it gives character and dignity; on the brows and lids, and at the entrance of the nose and ears, it prevents the contact and entrance of foreign bodies; and, even in man, the general covering of hairs doubtless contributes to the warmth and proper electric condition of the skin; the object of the hair in animals is obvious to every one.—The two essential parts of cortex and medulla are found in the hairs of all animals, however much they may differ in appearance. In the cats, seals, and other animals, the whiskers are supplied with large nerves, and become exquisite organs of touch; in the soft hair of the sable there is very little fibrous portion; in the musk and reindeer the entire substance seems to be composed of delicate polygonal cells; in the smaller rodents the cortical tubular portion is crossed by transverse partitions, partial or complete; in the bats the projections of the cortical scales are often arranged in whorls around the stem; in the peccary the cortical substance sends inward radiating processes whose interspaces are filled with the medullary portion, and this is essentially the structure of the quills of the porcupine, which, as Shakespeare has hinted, are only modified hairs; even the horn of the rhinoceros is only an assemblage of compact hairs, and does not differ in its essential structure from the finest wool. In proportion to the prominence of the imbricated scales will the hair of animals have the property of becoming felted.—In most nations the adornment of the hair has always formed one of the principal duties of the toilet, and the caprices of different races and epochs in this respect are very remarkable. While the Hebrews and Greeks considered long hair a beautiful object, the Egyptians, regarding it as an incumbrance, removed it, and substituted light wigs. The Roman ladies used artificial hair, dyed their own, sprinkled it with gold dust, and represented in it various fanciful devices. So desirable was a fine head of hair considered, that it became sacred, and was often dedicated to the gods on important occasions of marriage, victory, escape from danger and death, and burial of friends; plucking it out or neglecting it was a token of affliction. In the time of Francis I. short hair became the fashion, and under Louis XIII. long hair, curls, and wigs; then came hair powders, periwigs, and perukes of monstrous size, which were banished by the French revolution, since which civilized nations have been in the main content with natural heads of hair.—Some persons are born without hair on any part of the body; on the head it falls off after many febrile diseases, especially typhoid fever, and after erythematous affections of the scalp and irritating applications. Tightly fitting and unyielding hats no doubt contribute largely toward the premature fall and grayness of the hair. The bulbs are often diseased, and

in *plica Polonica* the hair, generally insensible, becomes exceedingly sensitive at the roots and liable to bleed. For the various diseases of the hair tonic and stimulating applications are sometimes beneficial; when the hair is thin and falls out easily, shaving the scalp will generally produce a thicker, firmer, and darker-colored growth. For diseases of the hair depending on parasites, see *EPHYPHYTES*, and *ERIZOA*.—Microscopic examination shows that the hair of the negro is not wool, though differing considerably in form from that of Europeans; the form is not connected with the color; the differences in the form of the hair, being permanent, are considered by some as of the same specific value as those of the fur, feathers, and scales of lower animals. Straight hair approximates to the cylindrical form, but the curled or crisp varieties are flattened; the negro hair has the deepest longitudinal groove, and a transverse section like that of a bean, and its peculiar twist is said to be due to a greater tension of the fibres along this groove; the closely matted hair of the Bushman is very flat and ribbon-like, four or five times broader than thick.—Many insects are provided with hairs, both in the larval and perfect states, which afford beautiful microscopic objects, from their branches, tufts, spines, and protuberances. The cuticle of plants is often beset with hairs, made up of a linear series of elongated cells, attached end to end; they sometimes have glandular bodies connected with them, as those which secrete the viscosity on the leaf of the sundew (*drosera*), or the irritating liquid of the nettle. In the invertebrates and in plants there are many evident connecting links between hairs and scales; vegetable hairs generally exhibit the phenomena of rotating fluids, or circulation of currents.

**HAIR WORM** (*gordius*), the type of the long hair-like annelids of the order (*gordiacea*) of helminths or entozoa. These thread-like parasites in their larva state inhabit the bodies of various insects, especially beetles and grasshoppers; they have a mouth and alimentary canal, but no anus; the sexes are distinct, and when full grown they leave the bodies of their hosts to deposit their eggs in long chains in water or in moist earth. They look very much like long horse hairs, and have been popularly believed to be hairs transformed to worms. They often attain a length very much greater than that of the body of the insect they infest, occupying with their coils the larger part of its body. They can endure a great amount of dryness without perishing.

**HAIZINGER.** I. Anton, a German vocalist, born at Wilfersdorf, Austria, in 1796, died in Carlsruhe, Dec. 31, 1869. He acquired celebrity as a tenor, and on retiring from the stage about 1840 he became director at Carlsruhe of a musical school, which trained many fine artists. II. Amalie, wife of the preceding, born in Carlsruhe in 1800. Her family name was Morstadt, and after the death of her first hus-

band, the actor Neumann, she married Hainzinger. She became known as a comic actress in Carlsruhe, and since 1844 in Vienna.

**HAJE.** See ASP, and COBRA DE CAPELLO.

**HAKE**, a name properly applied to fishes of the cod family, of the genus *merlucius* (Cuv.), and improperly in New England to gadoids of the genus *phycis* (Artedi). There is great confusion in the application of the names to the first genus; the European *merlucius*, properly called hake, is styled the *merlan* or whiting in the Mediterranean; our *merlucius* is also generally called whiting, but the true whiting is a *merlangus*, one of the species of which we name pollack; the American hake, or *phycis*, is styled codling by De Kay, in order to avoid confusion. The European hake (*merlucius vulgaris*, Cuv.) is generically distinguished from the cod by having only two dorsal fins, a single long anal, and no barbule on the chin; the head is flattened, the body elongated, the first dorsal short, the second dorsal and the anal long and deeply emarginated. The color on the back is ashy gray, and below dirty white. The wide mouth is provided with numerous long, sharp, incurved teeth on both jaws, on the palate, and in the pharynx. It is abundant

European Hake (*Merlucius vulgaris*).

in the ocean and in the Mediterranean, and on the coasts of Ireland and Cornwall in immense shoals from June to September during the mackerel and herring seasons; it grows to a length of 1 or 2 ft., is very voracious, and feeds principally on the last mentioned fishes. Its flesh is white and flaky, and is dried in northern countries like that of the cod; from its inferior quality it is commonly called "poor John;" the liver is a delicate dish, and was highly esteemed by the ancients. The American hake (*M. albidus*, De Kay), very generally called whiting in New England, and sometimes silver hake, is 1 or 2 ft. long; when alive, the upper parts of the body and sides are rusty brown with golden reflections, becoming leaden after death; silvery white beneath; iris silvery; dorsals and caudal rusty, pectorals and ventrals sooty, anal colorless, inside of the mouth purple, and lateral line lighter than the upper parts; the lower jaw is the longer, and the teeth are very long and sharp. It is found

from New York northward, and is especially abundant in the British provinces; it is exceedingly voracious, pursuing the smaller fishes, and is caught in great numbers in some seasons both in nets and by hooks; its flesh, when fresh, is sweet and wholesome, but it soon becomes soft and tasteless.—The American hakes of the genus *phycis* have an elongated body;

White Hake (*Phycis Americanus*).

two dorsals, the first triangular with the third ray filamentous and prolonged, the second commencing just behind the first and extending nearly to the caudal; the ventrals with a single ray at the base, afterward divided; anal long and single; chin with one barbule. The white or common hake (*P. Americanus*, Storer) grows to a length of from 1 to 3 ft., and when alive is reddish brown above, bronzed upon the sides, and beneath whitish with minute black dots; upper edge of the dorsal black, as is the edge of the anal and end of the caudal; fins also dotted with black; after death the back becomes grayish brown, and the abdomen dirty white; the head is very flat above, broad, strongly convex back of the eyes, with prominent rounded snout and large eyes; upper jaw the longer, and both well armed with rows of sharp incurved teeth; teeth also on the vomer. It is found from the New Jersey coast northward, and is taken in large numbers, chiefly on muddy bottoms, and generally at night or on cloudy days; it feeds principally on small fish and crustaceans. It is an excellent fish for the table, fried or boiled; it is also valuable when salted, and in this condition is largely exported from the British provinces under the name of ling. There is a small species (*P. filamentosus*, Storer), called squirrel hake by the Massachusetts fishermen, which rarely exceeds a length of 18 in. or a weight of 2½ lbs.; the head is longer in proportion, the body more slender, top of the head depressed in its whole extent, and the filamentous ray of the first dorsal considerably longer than in the preceding species; there are no spots upon the pure white of the lower parts. Other species are described in America, on the coast of Europe, and in the Mediterranean.—The name hake is also erroneously given on the coast of New Jersey to the king fish, a scænoid of the genus *umbrina* (Cuv.), from its having a barbule on the chin.

**HAKLUYT, Richard**, an English author, born about 1553, died Oct. 23, 1616. He was educated at Westminster school and at Oxford

university, where he was appointed lecturer on cosmography and was the first to teach the use of globes. In 1582 he published "Diuers Voyages touching the Discouerie of America and Islands adjacent unto the same" (new ed., 1850). In 1584 he accompanied the English ambassador Sir Edward Stafford to Paris, probably as chaplain, as he was at this time professor of divinity. While there he published in French (1586) the narrative of the voyages of Loudonnière and others, which he afterward translated and published under the title "Foure Voyages unto Florida," &c. (1587). He also published in Paris an improved edition of Peter Martyr's *De Orbe Novo* (1587), which at his suggestion was translated into English by Michael Lok, the London agent of the Muscovy company, under the title "The Historie of the West Indies." On his return to England in 1589 he was appointed by Sir Walter Raleigh a member of the company of gentlemen adventurers and merchants for colonizing Virginia; and in the same year he published his great work, "The principal Navigations, Voyages, and Discoveries made by the English Nation" (fol., London; enlarged ed., 3 vols. in 2, fol., 1598, '99, 1600; new ed. with additions, 5 vols. 4to, London, 1809-'12). Besides the different voyages, this work contains many curious public documents, such as charters

granted by the czar, the sultan, and other monarchs, to English merchants. In many copies the voyage to Cadiz (pp. 607-'19, vol. i., 2d ed.) is omitted, having been suppressed by order of Queen Elizabeth after the disgrace of the earl of Essex. The additions to the last edition comprise all the voyages and travels printed by Hakluyt, or at his suggestion, which were not included in his collection. In 1605 Hakluyt was appointed prebendary of Westminster, having previously been prebendary of Bristol; and he received afterward the rectory of Wetheringset in Suffolk. He was buried in Westminster abbey. His unpublished MSS. were used by Purchas in his "Pilgrims." His name is perpetuated in Hakluyt's head, a promontory on the N. W. end of Spitzbergen, named by Henry Hudson in 1608; in Hakluyt's island in Baffin bay, named by Bylot; and in the Hakluyt society, founded in 1846 for the republication of early voyages and travels. For an analysis of the contents of his chief work, see Oldys's "British Librarian."

**HAKODADI**, a city of Japan, in the province of Matsmai, near the S. end of the island of Yesso, on the N. side of the strait of Sangar about 42 m. N. E. of the city of Matsmai, and nearly in lat. 42° N.; pop. about 50,000, including many Chinese and some Europeans and Americans. It extends about 3 m. along

Hakodadi.

the base of a promontory whose peaks rise more than 1,100 ft. above the sea. The foliage of the lower slopes partly conceals the city, which is on the shore of a beautiful and spacious bay, forming one of the best harbors in the world. The town consists of rows of broad streets, rising one above the other, parallel to the beach. The houses are mostly of wood and two stories high, with fronts open to the street, and deep projecting eaves. At night the fronts are closed by folding doors or shutters. There are many large temples in the city, some of the Sintoo and others of the Buddhist sect; some of the latter are well built and gorgeously decorated. They are generally in the elevated and retired parts of the town, and

partially encircled by trees. A bazaar is attached to one of the temples. There are many fire-proof stores, strongly built, with thick whitewashed walls, deep window gratings, and massive shutters. The principal articles of trade are seaweed (*fucus saccharinus*), timber, dried fish, deer skins, horns, potatoes, coal, fish oil, tobacco, salt, and silk. The harbor is constantly thronged with hundreds of junks, and the general dullness of the city is relieved by droves of laden pack horses. The aggregate value of imports and exports in 1870 exceeded \$1,300,000.—Originally a small fishing village belonging to the local daimio, Hakodadi was sold to the Japanese government, and owing to its advantages as a seaport rapidly rose into

importance. It was opened to American commerce by the treaty negotiated by Commodore Perry in 1854, which has since been extended to all foreign nations.

**HALAS**, a market town of Hungary, in the district of Little Cumania, about 75 m. S. S. E. of Pesth; pop. in 1870, 13,127. It has a Reformed gymnasium. The inhabitants are chiefly engaged in the breeding of cattle and the cultivation of the vine.

**HALBERSTADT**, a town of Prussian Saxony, in the district and 28 m. S. W. of the city of Magdeburg, on the right bank of the Holzemme; pop. in 1871, 25,421. The principal public buildings are the Dom or cathedral, a Gothic structure restored in 1850, which contains celebrated collections of the episcopal and priestly robes of the middle ages, and the Liebfrauenkirche, erected in the 11th century, in the Byzantine style, with singular bass-reliefs and wall paintings. Halberstadt has a gymnasium and a number of schools, two large libraries, and good collections of coins, antiquities, and pictures, many of the last in the so-called "temple of friendship." The chief manufactures are woollen cloth, gloves, carpets, refined sugar, leather, tobacco, cigars, and chemical products. The poet Gleim gathered around him in this town a large circle of authors, which was called the poetical union of Halberstadt; and he was buried here. In the middle ages the bishopric of Halberstadt formed a state of the empire.

**HALBIG, Johann**, a German sculptor, born at Donnersdorf, Bavaria, July 13, 1814. He was educated in the academy of Munich, and became professor of statuary there. Since 1835 he has executed the group of lions for the old Pina-kothek, the statues of Roma and Minerva in the royal park, and many other important works in Munich and other German cities, in Russia, and in Belgium. He is said to have modelled since 1846 more than 1,000 busts. His most celebrated works are the group of lions at the Munich gate of Victory, and the 18 figures representing the principal states of Germany in the hall of independence at Kelheim; the statue of Christ on the cross in the Campo Santo of Munich (1853); the monument in honor of Maximilian II. in the town (1854), and that at the port, of Lindau; and an allegorical group representing North America for a gentleman of New York. In 1873 he was commissioned by Louis II. of Bavaria to prepare a colossal group of the crucifixion to be erected on the mountain near Oberammergau; and in 1874 he designed a statue of the late king William of Wurtemberg for the town of Canstatt.

**HALDANE. I. Robert**, a Scottish philanthropist, born in 1764, died Dec. 12, 1842. Though heir to a large property, he had a passion for a seafaring life, and in 1780 entered the royal navy, in which he served with honor under Capt. Jervis, afterward Earl St. Vincent. He retired from the navy in 1783, and in 1785

married and settled upon his estate of Airthrey. He welcomed the advent of the French revolution, and was consequently exposed to much obloquy; but, disappointed by the revolutionary excesses, and convinced of the divine origin of Christianity, he resolved to devote his life to its advancement. He conceived the idea of organizing a vast scheme of missionary labor in India, including the establishment of schools and a printing press, all the expenses to be borne by himself. The East India company, suspecting some hidden design, refused to sanction the scheme, and Haldane was forced to abandon it. He then selected Scotland as his field of work, sold his estate, and devoted his means to hiring and erecting places for worship, and to educating young men for the ministry. His efforts were highly successful in this respect. Afterward he formed a plan for the evangelization of Africa, and imported 30 children from Sierra Leone to receive Christian education, giving his bond for £7,000 to pay the expenses. At the commencement of his revival labors in Scotland he seceded from the established church and adopted many of the tenets of Sandeman, with some rigid forms of discipline; and he afterward joined the Baptists, but gave no prominence to peculiar sectarian views. He published a work on the "Evidence and Authority of Divine Revelation" (Edinburgh, 1816), an "Exposition of the Epistle to the Romans" (London, 1835), and several minor writings. **II. James Alexander**, brother of the preceding, born in Dundee, July 14, 1768, died in Edinburgh, Feb. 8, 1851. In 1785 he went to sea in the service of the East India company, and in 1793 was appointed captain of a ship. But while the vessel was detained he experienced a religious change like that of his brother. He sold his commission and his share of the ship's property for £15,000, retired to Scotland, and devoted himself to religious labors. He made journeys through the country, gathering large congregations, for which churches were immediately built by his brother Robert. In 1799 he became pastor of the Tabernacle in Leith walk, Edinburgh, in which office he continued without emolument for more than 50 years. His life, with that of his brother, was written by Alexander Haldane (London, 1852).

**HALDEMAN, S. Stehman**, an American naturalist and philologist, born near Columbia, Pa., in 1812. He was educated at Dickinson college, and in 1836 became assistant in the geological survey of New Jersey, and in 1837 of Pennsylvania, and discovered the *scolithus lineasis*, the oldest fossil then known. In 1851 he became professor of natural history in the university of Pennsylvania, and in 1855 in Delaware college, and also of geology and chemistry to the state agricultural society of Pennsylvania. He has made numerous contributions to entomology, conchology, and philology, including "Monograph of the Fresh-Water Univalve Mollusca" (Philadelphia, 1840-'45); *Mono-*

*graphie du genre leptoxis* (in Chenu's *Illustrations conchologiques*, Paris, 1847); "On some Points in Linguistic Ethnology" (in "Proceedings of the American Academy," Boston, 1849); "Zoölogy of the Invertebrate Animals" (in the "Iconographic Encyclopædia," New York, 1850); "On the Relations of the English and Chinese Languages" (in "Proceedings of the American Association for the Advancement of Science," 1856); and "Analytic Orthography," which in 1858 gained in England a prize over 18 European competitors.

**HALDIMAND**, a S. county of Ontario, Canada, bordering on Lake Erie near its E. end; area, 475 sq. m.; pop. in 1871, 24,851, of whom 7,792 were of English, 6,991 of Irish, 4,768 of German, and 3,078 of Scotch origin or descent. It is drained by Grand river, and is traversed by the Grand Trunk, the Great Western, Canada Southern, and Hamilton and Lake Erie railways. Capital, Cayuga.

**HALE**, a central county of Alabama, bounded W. by the Black Warrior river, and drained by its affluents; area, about 600 sq. m.; pop. in 1870, 21,792, of whom 16,990 were colored. The surface is moderately uneven, and the soil very fertile. The Alabama and Chattanooga railroad passes through the N. W. corner; the Alabama Central skirts the S. border; the Selma, Marion, and Memphis line runs to the county seat. The chief productions in 1870 were 384,420 bushels of Indian corn, 26,462 of sweet potatoes, and 18,573 bales of cotton. There were 1,176 horses, 2,734 mules and asses, 2,494 milch cows, 4,435 other cattle, 2,626 sheep, and 9,019 swine; 9 flour mills, and 1 machine shop. Capital, Greensboro.

**HALE, Benjamin**, an American clergyman, born at Newburyport, Mass., Nov. 23, 1797, died there, July 15, 1863. He graduated at Bowdoin college in 1818, studied theology at Andover, and in 1822 was licensed to preach as a Congregationalist. In 1823 he became tutor in Bowdoin college, but soon after established the Gardiner lyceum, of which he was principal for four years. From 1827 to 1835 he was professor of chemistry and mineralogy in Dartmouth college, and in the mean while took orders in the Protestant Episcopal church. In 1836 he became president of Hobart college, Geneva, N. Y., and held the position for about 20 years; he then resigned on account of impaired health, and returned to his native town. Besides sermons and pamphlets on education, he published "Introduction to the Mechanical Principles of Carpentry" (1827), and "Scriptural Illustrations of the Liturgy" (1835).

**HALE, David**, an American journalist, born at Lisbon, Conn., April 25, 1791, died at Fredericksburg, Va., Jan. 20, 1849. His father was a clergyman, from whom and in the common school he received his education. In 1809 he went to Boston, where he entered into mercantile business, and also contributed to newspapers. In 1827 he removed to New York to become commercial editor of the "Journal of

Commerce," of which in the following year he became one of the proprietors. The "Journal" soon acquired an influential position, and afforded a large income to its owners. Mr. Hale contributed largely to benevolent and religious enterprises, and for many years supported several missionaries in the thinly settled parts of the country. A memoir of him by the Rev. J. P. Thompson, embracing some of his writings, was published in 1849.

**HALE, Edward Everett**, an American author, son of the journalist Nathan Hale, born in Boston, April 3, 1822. He graduated at Harvard college in 1839, studied theology, and was pastor of the church of the Unity, Worcester, Mass., from 1846 to 1856. In the latter year he was called to the South Congregational church of Boston, of which he is still pastor (1874). He has been at different periods editor of the "Christian Examiner" and the "Sunday School Gazette," besides being a frequent contributor to other literary and theological journals. In 1869 he founded "Old and New," a literary and critical monthly, mainly devoted to social reform, to which he has been the principal contributor. His separate works are: "The Rosary" (1848); "Margaret Percival in America" (1850); "Sketches of Christian History" (1850); "Letters on Irish Emigration" (1852); "Kansas and Nebraska" (1854); "Ninety Days' Worth of Europe" (1861); "The Man without a Country;" "If, Yes, and Perhaps" (1868); "The Ingham Papers" (1869); "How to Do it;" "His Level Best;" "Ten times One is Ten: the possible Reformation" (1870); "Ups and Downs;" "Sybaris and Other Homes" (1870); "Christmas Eve and Christmas Day;" "In His Name;" "Working Men's Homes" (1874); and many historical papers published by the American antiquarian society.

**HALE, John Parker**, an American statesman, born in Rochester, N. H., March 31, 1806, died in Dover, N. H., Nov. 19, 1873. He graduated at Bowdoin college in 1827, and took up his residence at Dover, where he was admitted to the bar in 1830. In 1832 he represented that town in the state legislature, and in 1834 President Jackson appointed him United States attorney for the district of New Hampshire. This office he held till 1841, when President Tyler removed him on political grounds. In 1843 he was elected as a democrat to congress, where he sided with the opponents of slavery. In the presidential canvass of 1844 he opposed the scheme for annexing Texas, and was renominated for congress. The New Hampshire legislature having passed a resolution instructing the congressional delegation from that state to support the annexation measure, Mr. Hale addressed a letter to the people of New Hampshire, in which he declared that the annexation of Texas was demanded for the purpose of strengthening and perpetuating slavery, and that if the people wished their representatives to support such a measure they must choose another man

than himself to represent them. The state convention struck his name from the ticket and placed another nominee in his stead. Mr. Hale ran as an independent candidate, supported chiefly by the "independent democrats," but was defeated. In June, 1845, he attempted to make a speech in the Old North church at Concord, vindicating his course; but frequent interruptions soon turned it into a sharp debate between himself and Franklin Pierce, which lasted from 2 P. M. till sundown, and is still the most memorable in the history of New Hampshire. The popular verdict gave the victory to Hale. In the following year he was elected to the legislature, became speaker of the house, and before the close of the session was chosen United States senator for six years from March, 1847. In the senate he steadily maintained the position he had taken on the slavery question, and opposed the compromise measures of Clay. In 1851 he was counsel for the defendants in the trials which grew out of the rescue of the fugitive slave Shadrach. In 1847 the liberty party convention at Cleveland gave him a nomination for president, which he declined, and supported the Van Buren and Adams ticket in 1848. In 1852 he was nominated at Pittsburgh by the free-soil party, and received 157,685 votes. From 1853 to 1855 he practised law in the city of New York, and in the latter year was again elected as United States senator from New Hampshire, to fill the unexpired term of Mr. Atherton, deceased. In 1858 he was reelected for a full term of six years. To the administration of President Lincoln he gave a hearty support, speaking frequently on the most important subjects of legislation during the civil war. On retiring from the senate in March, 1865, he was appointed minister to Spain. He had discharged the duties of this office for about three years, when a quarrel arose between himself and Mr. Perry, his secretary of legation. Mr. Hale was charged with evading the revenue laws of Spain by importing, under his privilege as a minister, goods which were put upon the market and sold as ordinary merchandise. He averred that the secretary was the real culprit, and that he had used the signature of the minister without his knowledge for illegal purposes. The result was that both minister and secretary were recalled by President Grant. Returning from Europe in 1870, Mr. Hale was prostrated by paralysis, and in the summer of 1873 his hip was dislocated by a fall, which was the immediate cause of his death.

**HALE, Sir Matthew**, an English jurist, born at Alderley, Gloucestershire, Nov. 1, 1609, died there, Dec. 25, 1676. His father, originally a lawyer, abandoned his profession on account of conscientious scruples. The son, an orphan at an early age, was committed to the care of a Puritan relative, who placed his ward in 1626 at Magdalen hall, Oxford. He had been designed for the church, but becoming involved

in a lawsuit with a person who laid claim to part of his paternal estate, he exhibited such aptitude for legal science that the lawyer who was charged with the defence of his case persuaded him to study law. He applied himself with remarkable diligence, reading, it is said, for several years at the rate of 16 hours a day. The variety of his studies was remarkable. Philosophy, anatomy, and physiology, as well as theology, are mentioned as only a few of the subjects which received his attention. He probably began practice as a barrister in 1636; and he was employed in most of the celebrated trials growing out of parliamentary troubles in 1640. Bishop Burnet states that Hale was assigned as counsel for Strafford, but he is believed to have been only privately retained by that nobleman to assist in his defence. In 1643, however, he was expressly assigned by parliament as counsel for Archbishop Laud. In 1647 he was appointed one of the counsel for the eleven members of the commons whose impeachment was demanded by the army. He is said to have been retained as counsel for the defence of Charles I.; but as the king refused to acknowledge the jurisdiction of the court, his counsel took no public part in the proceedings of the trial. In 1643 Hale had taken the covenant as prescribed by parliament; in 1651 he professed allegiance to the commonwealth, "without king or house of lords;" and in the following year he was one of a commission for considering the expediency of reforming the law. He was raised to the bench of the court of common pleas in 1654, and soon afterward was returned to Cromwell's first parliament for his native county. Several instances are related of his resolute rejection of the arbitrary dictation of Cromwell in the administration of law. On one occasion he discharged a jury which he discovered had been packed by express directions of the protector. Cromwell reprimanded him severely, adding, "You are not fit to be a judge." "That," replied Hale quietly, "is very true;" and soon after he declined to serve on the trial of a person who had revolted against Cromwell's authority. In 1659 he represented the university of Oxford in the parliament which met after the death of Cromwell; and in the following year he sat again for Gloucestershire in the convention which recalled the Stuarts. Soon after the restoration, the lord chancellor Clarendon with some difficulty persuaded him to accept the appointment of lord chief baron of the court of exchequer (1660), when he was knighted. His name appears among the commissioners for the trial of the regicides, but it is supposed that he was not present at the trials. During the period that he sat in the court of exchequer two women were indicted for witchcraft. Hale is reported to have admitted to the jury that he did not doubt the existence of "such creatures as witches." The women were condemned and executed. He was the last English judge to sanction the con-

viction of prisoners charged with this crime. After the great fire in London in 1666, his exertions with a view to improvements in the rebuilding of the city obtained for him the highest praise. "He was," says Baxter, "the great instrument for rebuilding London; his prudence and justice removing multitudes of impediments." In 1671 Hale was made chief justice of the court of king's bench, and four years later he was attacked by inflammation of the diaphragm, which in 1676 compelled him to retire upon his pension. Withdrawing to Acton, he amused himself principally in the study of mathematics and physics. He was twice married; and by his first wife, the daughter of Sir Henry Moore, he had ten children. His second wife was a servant girl, whom he married in order to have a nurse in his declining years, and whom in his will he called a "most dutiful, faithful, and loving wife." She was appointed one of his executors, and to her he confided the education of his grandchildren. After his death were published several works which have created for him a high reputation as a legal and constitutional writer. His *Historia Placitorum Coronæ* (1678, several times edited with additions by various hands), a work of great authority, and the "History of the Common Law" (6th ed., by C. Runnington, 8vo, London, 1820), may be specially cited. The treatise on the "Original Institution, Power, and Jurisdiction of Parliament" (1709), which bears his name, was written, according to Hargrave, by some other person. Sir Matthew Hale's moral and religious works, with his life by Bishop Burnet, were published by the Rev. T. Thirlwall (2 vols. 8vo, London, 1805).

**HALE, I. Nathan**, an American soldier, born in Coventry, Conn., June 6, 1755, executed in New York, Sept. 22, 1776. He graduated at Yale college in 1773, and became a teacher at East Haddam, and afterward at New London. His parents intended him for the ministry; but in 1775 he entered the army as lieutenant, and in a few months was made captain. In September, 1776, when in New York, he with an associate captured a British sloop laden with provisions, taking her at midnight from under the guns of a frigate, and distributing her prize goods to the American soldiers. After the retreat of the army from Long Island, Washington applied for a discreet officer to enter the enemy's lines and procure intelligence, and Hale volunteered for the service. He passed in disguise to the British camp, and made full drawings and memoranda of all the desired information. On his return he was captured and taken before Sir William Howe, by whom he was ordered to be executed the next morning; and he was hanged as a spy, saying with his last breath, "I only regret that I have but one life to lose for my country." Dwight extolled him in prose and verse.—See "Life of Capt. Nathan Hale, the Martyr Spy," by I. W. Stuart (12mo, Hartford, 1856). **II. Nathan**, an American journalist, nephew of the preceding,

born at Westhampton, Mass., Aug. 16, 1784, died at Brookline, Feb. 9, 1863. He graduated at Williams college in 1804, studied law, and was for two years an instructor in the academy at Exeter, N. H. He then removed to Boston, was admitted to the bar in 1810, practised for four years, and was also one of the editors of the "Boston Weekly Messenger," the first weekly periodical in America devoted to literature and politics. In 1814 he purchased the Boston "Daily Advertiser," the first and for many years the only daily newspaper in New England. This journal, of federal and afterward whig politics, for many years under his charge, exercised a wide influence. It opposed the Missouri bill in 1820, and the Nebraska bill in 1854, and was the first newspaper to urge the immediate free colonization of Kansas. Mr. Hale served several terms in the legislature of Massachusetts, occupied other public offices, was for 19 years president of the Boston and Worcester railroad, the first in New England upon which steam power was used, and was the head of the commission which introduced water into Boston in 1848. He made many improvements in printing, and was among the founders of the "North American Review" and the "Christian Examiner." He published an excellent map of New England (1825), a work on the protective policy (1828), and a series of stereotype maps on a plan of his own invention (1830). His wife was a sister of Edward Everett, and he was the father of the Rev. E. E. Hale.

**HALE, Sarah Josepha (Buell)**, an American authoress, born at Newport, N. H., in 1795. In 1814 she married David Hale, a prominent lawyer, and upon his death in 1822 she was left with five young children dependent upon her for support. In 1828 she became editor of the Boston "Ladies' Magazine," which was in 1837 united with "Godey's Lady's Book," Philadelphia, Mrs. Hale continuing to be one of the editors. Besides her editorial labors she has published more than 20 separate works, among which are: "The Genius of Oblivion, and other Poems" (1823); "Northwood," a novel (1827); "Traits of American Life" (1835); "Ladies' New Book of Cookery" (1852); "Dictionary of Poetical Quotations" (1852); "New Household Receipt Book" (1853); "Woman's Record, Sketches of Distinguished Women" (1853); "Liberia, or Mr. Peyton's Experiment" (1854); "Letters of Madame de Sévigné," and "Letters of Lady Mary Wortley Montagu" (1856).

**HALES, Alexander of.** See ALEXANDER OF HALES.

**HALES, Stephen**, an English clergyman, born at Beckesbourn, Kent, Sept. 7, 1677, died at Teddington, Middlesex, Jan. 4, 1761. He studied theology at Cambridge, became perpetual curate of Teddington, and received several other livings. He devoted himself to scientific pursuits, and in 1717 was made a member of the royal society, and in 1753 a foreign

associate of the French academy of sciences. He acquired eminence by his "Vegetable Statics" (1727-'31; republished under the title of "Statical Essays" in 1733 and 1769), one of the earliest works on vegetable physiology; it has been translated into several languages. He wrote other works, produced some valuable inventions, and is regarded as one of the first advocates of temperance societies.

**HALÉVY. I. Jacques François Fromental Élie**, a French composer, born in Paris, May 27, 1799, died in Nice, March 17, 1862. His parents were Jews, and placed their son under musical instruction at the conservatory at the age of 10. His successive teachers were Cazot, Lambert, Berton, Cherubini, and for a brief period Mehul. By Cherubini, who always remained his friend, he was taught for five years. At 20 he obtained the first prize for composition at the academy of fine arts, entitling him to a pensionary residence of two years at Rome, of which he availed himself. He returned to France in 1822, and for five years besought the managers in vain to produce either his grand opera *Pygmalion* or his comic opera *Les deux pavillons*. At last in 1827 his one-act opera *L'Artisan* was brought out with moderate success at the Théâtre Feydeau. In 1829 he had better fortune at the Théâtre Italien with his three-act opera *Clari*, since Malibran assumed the principal rôle. In 1830 a grand ballet in three acts, *Manon Lescaut*, the text written by Scribe, was produced. In 1835 *La Juive*, the opera through which he achieved his widest reputation, was represented at the royal academy of music; and it has since been heard at most of the principal opera houses of the world. Of his many subsequent operas, some of which obtained a celebrity almost equal to that of *La Juive*, the principal are: *L'Éclair* (1835), *La reine de Chypre* (1841), *Charles VI.* (1843), *Les mousquetaires de la reine* (1846), *Le val d'Andorre* (1848), *Le Juif errant* (1852), *Jacquarita* (1855), and *La magicienne* (1857). Though Halévy won the esteem of all musicians and considerable popularity, he had not sufficient genius to place himself in the first rank of composers. The impression left by the best of his operas is that they are the work of a man of unquestionable talent, of profound and exact learning, of industry, and of considerable melodic invention, but the music is often elaborate to the point of dulness. He wrote in all more than 30 operas, five or six of which still keep the stage. He was also distinguished as a graceful writer on musical subjects, and wrote *Leçons de lecture musicale* (1857), adopted as a text book in the schools of Paris; *Souvenirs et portraits, études sur les beaux-arts* (1860); and *Derniers souvenirs et portraits* (posthumous, 1863). He succeeded Fétis as professor of composition at the conservatory, and perpetual secretary of the academy of fine arts. A pension of 5,000 francs was bestowed upon his widow by the French government. His biography was written by his brother Léon

(*F. Halévy, sa vie et ses œuvres*, 1862). **II. Léon**, a French author, brother of the preceding, born in Paris, Jan. 14, 1802. He left the Charlemagne lyceum with the reputation of a distinguished Greek scholar and poet, and some of his metrical translations from the Greek were published in 1817. He became a disciple of Saint-Simon and one of the founders of *Le Producteur*, and wrote the introduction to his master's *Opinions littéraires, philosophiques et industrielles* (1825). From 1831 to 1834 he was adjunct professor of literature at the polytechnic school, and from 1837 to 1857 he was connected with, and for some years chief of, the bureau of historical monuments in the ministry of the interior. His *Fables* (1843), *Fables nouvelles* (1855), and *La Grèce tragique* (3 vols., 1845-'61) won prizes from the academy. Among his other works is *Résumé de l'histoire des Juifs* (2 vols., 1827-'8). He also translated "Macbeth," and wrote much for the stage, his tragedies comprising *Électre* (1864), and *Luther, ou la diète de Worms* (1865). **III. Ludovic**, a French dramatist, son of the preceding, born in Paris in 1834. He was employed from 1852 to 1858 in the ministry of state, and till 1861 as chief of bureau in the ministry for Algeria and the colonies. He is the author of the libretti for the bouffe operas *Orphée aux enfers* (1861), *La belle Hélène* (1865), *Barbe-Bleue* (1866), *La grande duchesse* (1867), *La Pêricle* (1868), *Froufrou* (1869), and for other operas by Offenbach and various composers. Among his recent productions are the comedy *Tricocche et Cacolet* (1871), the vaudeville *Réveillon* (1872), and a collection of equivocal sketches, including *Madame et Monsieur Cardinal* (1872). His father and other writers have been associated with him in various works.

**HALFORD, Sir Henry**, an English physician, born in Leicester, Oct. 2, 1766, died in London, March 9, 1844. He was the son of Dr. James Vaughan, and took the name of Halford in 1814, upon inheriting a large estate from Sir Charles Halford, a distant relation on his mother's side. He was educated at Rugby and Oxford, was elected a fellow of the college of physicians in 1794, and almost immediately embarked in a large practice in London. He was made a baronet in 1809, and was physician to George III., George IV., William IV., and Victoria. In 1824 he was elected president of the college of physicians. He published a volume of "Essays and Orations" (1831; 3d ed., 1842), in which is contained an account of the discovery in 1813 of the head of Charles I. in the vaults of St. George's chapel, Windsor; "The Death of some Eminent Persons of Modern Times" (1835); and *Nugæ Metricæ*, consisting of Latin poems and translations (1842).

**HALIBURTON, Thomas Chandler**, a Canadian humorist, known by the *nom de plume* of "Sam Slick," born at Windsor, Nova Scotia, in 1796, died at Isleworth, England, Aug. 27, 1865. He studied law, was called to the bar in 1820, became chief justice of common pleas

in 1829, and judge of the supreme court of Nova Scotia in 1840. In 1842 he took up his residence in England, and in 1859 was returned to parliament for Launceston, holding his seat until his death. In 1835 he wrote a series of newspaper sketches satirizing the Yankee character, which were published in 1837 under the title of "The Clockmaker, or Sayings and Doings of Samuel Slick of Slickville," of which subsequent series appeared in 1838 and 1840. He also wrote "Historical and Statistical Account of Nova Scotia" (1829); "Bubbles of Canada," "The Old Judge, or Life in a Colony," and "Letter Bag of the Great Western" (1839); "The Attaché, or Sam Slick in England" (1843; 2d series, 1844); "Rule and Misrule of the English in America" (1851); "Yankee Stories" and "Traits of American Humor" (1852); and "Nature and Human Nature" (1855).

**HALIBUT**, a fish of the family *planidae* and genus *Hippoglossus* (Cuv.). The genus is characterized by a flat oblong body, compressed vertically; the eyes and colored surface are on the right side; the lips large and fleshy, the lower jaw the longer; both jaws and the pharynx armed with sharp and strong teeth, in some portions card-like. The common species (*H. vulgaris*, Cuv.) grows to a length of from 3 to 6 ft., varying in weight from 100 to 500

Halibut (*Hippoglossus vulgaris*).

lbs.; a specimen is on record, taken on the coast of Maine, which weighed more than 600 lbs. The right side is of an almost uniform dark brown, and the left or under surface pure white; in rare instances, the eyes and the colored surface are on the left side. The dorsal fin arises over the anterior third of the eye, ending at the fleshy portion of the caudal fin; the pectorals arise just back of the operculum; the ventrals are small, beneath the base of the pectorals; the anal extends from the posterior half of the pectorals to near the tail. Of two apertures in front of the anal fin, the anterior is the anus, the posterior the urinary outlet. It is found from the coast of New York to Greenland, and also on the northern shores of Europe; the Boston market is supplied principally from George's banks and Nantucket shoals; in summer it is caught by hook and line in shallow water, retiring to deeper in the winter; it is abundant in the bay of Fundy and in the waters of Nova Scotia. It is exceedingly voracious; its flesh is coarse and dry, but much esteemed by some, when boiled or fried; the fins are considered a delicacy;

large quantities of the flesh, dried, salted, or smoked, are consumed by the Greenlanders and other northern nations. In the United States it sells for a higher price than cod; in England it is not much esteemed.—For the characters of this family, see FLOUNDER.

**HALICARNASSUS** (originally called Zephyria), an ancient city of Caria in Asia Minor, on the Ceramic gulf. Its site is now occupied by the town of Bodrum or Budrun, 96 m. S. of Smyrna (pop. about 10,000), one of the most miserable of Turkish towns, notable only for the remains of the ancient city. Halicarnassus was founded by a colony from Troezen, and was one of the six cities which constituted the Doric hexapolis. It was afterward excluded from that confederacy, and was conquered by the Persians under Darius, who permitted Lygdamis, a Greek, to rule it under his authority, with the title of dynast. Under Lygdamis and his successors Halicarnassus retained its Grecian character and language, but remained faithful to Persia; and Artemisia, his daughter and successor, fought in the fleet of Xerxes at Salamis. About 380 B. C. the city appears as subject to independent Carian princes, the most famous of whom was Mausolus, husband and brother of the younger Artemisia, who restored and fortified it. He died in 352, and over his remains Artemisia caused to be raised a monument so beautiful that it still gives a name to similar structures. Not long afterward the city reverted to Persia by the marriage of one of its queens with a Persian satrap, and after a long siege it was taken by Alexander of Macedon, who destroyed most of it by fire. From this catastrophe it never wholly recovered. It afterward passed under the sway of the Ptolemies of Egypt, and still later of the Romans, who assigned it to the government of Rhodes after their victory over Antiochus the Great of Syria (190 B. C.); it was afterward annexed to the province of Asia. On the downfall of the Roman empire it was laid in ruins, and after the knights of St. John had occupied Rhodes they built here about 1402 a castle called the "tower of St. Peter." At the final siege of the island by the Turks (1522) the knights caused this fortress to be repaired with stones taken from the ruins of the ancient city. The place was known at this time by the name of Mesy. Halicarnassus was the birthplace of the historians Herodotus and Dionysius.—The plan of the city was grand and symmetrical. From the edge of the harbor the buildings rose on terraces, formed partly by excavations from the rock and partly by walls of masonry. The first terrace was crowned by the Mausoleum, the second by the temple of Mars. Two citadels occupied volcanic hills at the upper end of the city, while the whole was enclosed by a wall which can still be traced. The palace of Mausolus and the temple of Venus and Mercury probably stood on the two points of the harbor, forming the extremities of the city. The fountain of Salmacis, a theatre

of which the ruins are yet prominent, and various beautiful temples, were among the other attractive features of the city. The most celebrated monument was the Mausoleum, which ranked among the seven wonders of the world. It was built by Pytheus in conjunction with Satyrus, and the sculptures are ascribed to Scopas, Bryaxis, Timotheus, and Leochares. The share of Timotheus, however, is assigned by some Greek writers to Praxiteles. It was still standing in the 12th century, but was overthrown either by an earthquake or by lightning before the building of the castle by the knights of St. John; and the detritus washed down from the hills, which filled the lower part of the city in some places to the depth of 20 ft., and concealed parts of the terraces, completely covered its site. In 1522 the knights, in removing some half-buried white marble, discovered a richly decorated and sculptured chamber, leading into a smaller apartment, where they found a sarcophagus and a beautiful vase, which they left untouched, but next morning they returned and found the tomb rifled. These chambers were undoubtedly the interior of the Mausoleum. The site of the ancient town was discovered in 1839 by Lient. Brook, and in 1846 the English ambassador obtained permission to remove a number of slabs, which were deposited in the British museum. Most of them had suffered severely, the heads of the figures being nearly all wanting, but a few are magnificent specimens of art. All attempts to rediscover the Mausoleum proved futile, until in 1856 Mr. Newton, the British vice consul at Mitylene, undertook a more thorough search than had yet been made. Three ships were placed by government at his disposal, and most of the excavation was done by their crews. Several experiments were made in digging before the site of the Mausoleum was reached. On Jan. 1, 1857, Mr. Newton began digging at the foot of the highest terrace, on the spot which he had himself designated in 1848 as the probable site of the Mausoleum. By the beginning of April he had cleared the entire rocky platform which formed the foundation of the building. It is almost a square, measur-

ing 472 ft. in circumference, and formed by quarrying into the solid rock. On the W. side of the platform there was a flight of steps leading to the upper terrace. The entrance to the inner tomb was probably on this side, and was closed after the corpse had been carried in by a huge stone, which was then in its place. Behind this stone was found an alabaster vase bearing two inscriptions, one in Egyptian, the other in cuneiform characters, signifying "Xerxes the great king." In the rubbish which covered the foundation were imbedded parts of friezes and colossal statues, and four slabs, representing a battle of Amazons, in excellent preservation. Extending his excavations beyond the foundation bed, Mr. New-

The Mausoleum, as restored by Fergusson.

ton unearthed a number of flat blocks of white marble, halves of two colossal horses, and portions of a chariot. The figures, more or less complete, of several lions, a leopard, a woman in beautiful drapery without head or arms, the head of a man which proved to be that of Mausolus, and some ornamented lions' heads and capitals of columns, were also found here, and parts of a chariot wheel on the other side. The relics collected from various quarters comprised a number of standing or sitting statues from 8 to 12 ft. high, many lions, parts of friezes, and a multitude of fragments, all which were removed to the British museum, where the statue of Mausolus has been reconstructed out of 63 pieces, and is nearly com-

plete. A female figure, wanting the head, has also been restored, and is one of the finest specimens of art recovered from Halicarnassus. Like all the architectural and sculptural parts of the Mausoleum, it was painted. With the aid of the partial measurements afforded by Pliny,

Mr. Newton, and subsequently Mr. Fergusson (see engraving), attempted to reconstruct the Mausoleum. The result is two designs widely differing from each other. Mr. Newton believes that it was a rectangular building surrounded by an Ionic portico of 36 columns, and surmount-

Portions of the Friezes of the Mausoleum.

ed by a pyramid rising in 24 steps, upon the summit of which was a colossal marble quadriga with a statue of Mausolus.—See Newton and Pullan's "History of Discoveries at Halicarnassus, Cnidus, and Branchidæ" (2 vols., London, 1862); James Fergusson's "The Mausoleum of Halicarnassus, restored in conformity with the Remains recently discovered" (with plates, London, 1862); and Newton's "Travels and Discoveries in the Levant" (2 vols., 1865).

**HALICORE.** See DUGONG.

**HALIFAX.** I. A S. county of Virginia, bordering on North Carolina, bounded N. and E. by Staunton river, and intersected by the Dan; area, 960 sq. m.; pop. in 1870, 27,828, of whom 16,266 were colored. The surface is hilly and the soil fertile; and there are some minerals, among which is plumbago, of which a rich mine was formerly worked. It is intersected by the Richmond, Danville, and Piedmont railroad. The chief productions in 1870 were 123,763 bushels of wheat, 387,227 of Indian corn, 168,970 of oats, 5,950 of Irish potatoes, 7,896 of sweet potatoes, and 3,838,284 lbs. of tobacco. There were 1,939 horses, 987 mules and asses, 2,713 milch cows, 1,207 working oxen, 2,557 other cattle, 3,832 sheep, and 11,157 swine; 4 manufactories of agricultural implements, and 5 saw mills. Capital, Banister, or Halifax Court House. II. A N. E. county of North Carolina, bounded N. E. by the Roanoke river; area, 680 sq. m.; pop. in 1870, 20,408, of whom 13,990 were colored. The surface is diversified and the soil fertile. The Wilmington and Weldon, the Richmond, Fredericksburg, and Potomac, the Raleigh and Gaston, and the Seaboard and Roanoke railroads traverse it. The chief productions in 1870 were 5,577 bushels of wheat, 353,808 of Indian corn, 25,367 of oats, 3,357 of peas and beans, 8,491 of Irish and 28,169 of sweet potatoes, 2,321 tons of hay, and 11,716 bales of cotton. There were 1,456 horses, 1,473 mules and asses, 2,347 milch cows, 5,300 other cattle, 2,156 sheep, and 16,464 swine. Capital, Halifax.

**HALIFAX,** a county of Nova Scotia, Canada, bordering on the Atlantic, and drained by Shubenacadie, Musquidoboit, and other rivers;

area, 2,450 sq. m.; pop. in 1871, 56,933, of whom 17,433 were of Irish, 16,409 of English, 9,947 of Scotch, 6,418 of German, 3,044 of French, and 2,188 of African origin or descent. The surface, with the exception of a belt of high broken land, from 20 to 30 m. wide, along the coast, is tolerably level, and is dotted over with lakes. The harbors are exceedingly numerous, and six or seven are spacious enough for ships of the line. A small part of the soil is fertile. Lead and slate are the most valuable minerals. The county is the most populous in Nova Scotia, and the inhabitants are engaged chiefly in commerce, ship building, and the fisheries. Capital, Halifax.

**HALIFAX,** a city, port of entry, and the capital of Nova Scotia, Canada, and of Halifax co., situated near the middle of the S. E. coast of the province, on the W. side of a deep inlet of the Atlantic called Chebucto bay or Halifax harbor; lat. 44° 39' 42" N., lon. 63° 35' 30" W.; pop. in 1790, 4,000; in 1828, 14,439; in 1861, 25,026; in 1871, 29,582. The city is built on the declivity of a hill rising 236 ft. above the level of the harbor, and, including its suburbs, is about 2½ m. long and 1 m. wide. Its plan is regular, most of the streets crossing one another at right angles; many of them are spacious and handsome. The lower part of the city is occupied by wharves and warehouses, above which rise the dwelling houses and public buildings, while the summit of the eminence is crowned by an edifice in which is fixed the town clock, and by a citadel strongly built of granite. There is little uniformity in the appearance of the houses, some of them being handsomely built of stone or brick, and others, equally attractive, of wood neatly painted, while many are stuccoed or plastered. The province building, in which are the government offices, the legislative chambers, and the city library, is 140 ft. long by 70 ft. broad, with an Ionic colonnade. The government house, admiral's residence, Dalhousie college, military hospital, lunatic asylum, workhouse, jail, penitentiary, city market, post office, theatre, assembly rooms, court house, exchange, and some of the public

schools, are the other most prominent structures. Halifax is the military headquarters of the Dominion of Canada; the troops occupy extensive and handsome barracks at the N. end overlooking the harbor. It is also the chief naval station for British North America, including the West Indies, and has a government dockyard covering 14 acres, situated in the N. portion of the town, which is thoroughly equipped and said to be inferior to few except those of England. By means of the Intercolonial and the Windsor and Annapolis railways, it has communication with Annapolis, Pictou, and St. John, N. B. The harbor of Halifax is one of the best in the world. It extends about 16 m. inland, is accessible at all times, and opposite the city, where vessels usually anchor, is about 1 m. wide. Further up it contracts to  $\frac{1}{2}$  m., and finally expands into a beautiful sheet of water called Bedford basin, comprising an area of about 10 sq. m.

more than one half of the exports of the province. Of the exports, \$2,426,980 represent the product of the fisheries. There were 55 vessels built, with an aggregate tonnage of 13,157. The Cunard line of steamers from Liverpool to Boston touches here, and steamers run to various ports of Canada, Newfoundland, the West Indies, and the United States. The manufactures are of considerable importance, embracing iron castings, machinery, agricultural implements, nails, gunpowder, cordage, boots and shoes, soap and candles, leather, tobacco, paper, cotton and woollen goods, wooden ware, &c. There are also several breweries and distilleries, a sugar refinery, six banks, two branch banks, a savings institution, and several gold-mining and other joint stock companies. The streets are lighted with gas, and water is distributed through the city. The assessed value of property in 1870 was \$16,753,872. Halifax is the seat of an asylum for

Province Building, Halifax.

A small arm, branching off from the harbor a short distance below the city, extends inland to within  $\frac{1}{2}$  m. of this basin, forming a peninsula on which the city is built. The harbor contains McNab's and three or four smaller islands, has two lighthouses, and is defended by several fortifications of considerable strength. There are two passages into the harbor, one on each side of McNab's island. The western is commanded by Fort George and several batteries; the eastern, which has sufficient depth of water only for small vessels, lies under the guns of a formidable stone fort called Fort Clarence. Halifax is largely interested in the fisheries, and has an extensive foreign and coasting trade. For the year ending June 30, 1872, the entrances were 1,387, with an aggregate tonnage of 363,847; clearances, 1,024, of 290,527 tons. The value of imports was \$10,055,579, and of exports \$4,678,684; being about five sixths of the total imports and

and the theological department of the college of the Presbyterian church of the lower provinces of British North America. There are two public libraries, a museum, 4 daily, 5 tri-weekly, and 9 weekly newspapers, 2 bi-weekly and 4 monthly periodicals, a convent, and a young men's Christian association. Halifax is the seat of an Episcopal bishop and a Roman Catholic archbishop, and contains 24 churches. The city was founded in 1749 under the auspices of the earl of Halifax. In 1859 it was visited by a destructive conflagration.

HALIFAX, a town and parliamentary borough of England, in the West riding of Yorkshire, on the Hebble near its junction with the Calder, which is navigable to this point, 36 m. S. W. of York; pop. of the town in 1871, 37,208; of the borough, 65,510. The town is well built, and contains ten churches of the English establishment, all fine structures. All Souls' church, completed in 1861, being among the

more than one half of the exports of the province. Of the exports, \$2,426,980 represent the product of the fisheries. There were 55 vessels built, with an aggregate tonnage of 13,157. The Cunard line of steamers from Liverpool to Boston touches here, and steamers run to various ports of Canada, Newfoundland, the West Indies, and the United States. The manufactures are of considerable importance, embracing iron castings, machinery, agricultural implements, nails, gunpowder, cordage, boots and shoes, soap and candles, leather, tobacco, paper, cotton and woollen goods, wooden ware, &c. There are also several breweries and distilleries, a sugar refinery, six banks, two branch banks, a savings institution, and several gold-mining and other joint stock companies. The streets are lighted with gas, and water is distributed through the city. The assessed value of property in 1870 was \$16,753,872. Halifax is the seat of an asylum for the blind, a deaf and dumb institution, and a hospital for the insane, and also contains a dispensary, house of refuge, home for the aged, two orphan asylums, the provincial and city hospital, a naval and a military hospital, the provincial poor asylum, St. Paul's almshouse of industry for girls, and two industrial schools. The educational institutions are numerous, embracing, besides 12 schools, Dalhousie college and university, with 7 professors in the classical and 12 in the medical department; St. Mary's college (Roman Catholic), with 8 professors;

finest in England. There are places of worship for Independents, Baptists, Methodists, Unitarians, and Friends; assembly rooms, a theatre, baths, and many literary, charitable, and educational institutions. The town hall, opened in 1863, was designed by Sir Charles Barry, and completed by his son. The piece hall covers more than two acres, and contains 315 rooms for the storage and sale of merchandise. The people's park is a fine pleasure ground given to the town by Sir Francis Crossley, who in 1868 gave 6,000 guineas for its maintenance. He and his relatives also founded several benevolent institutions, among which is the Crossley orphanage for 400 children, with an

Town Hall, Halifax.

annual income of £3,000. An equestrian statue of Prince Albert was erected in 1864. The town is favorably situated for manufactures and trade, having an abundance of water and coal, and water communication with Hull and Liverpool. The chief manufactures are woollen goods, in which it ranks next after Leeds, Bradford, and Huddersfield, and especially carpets. There are also extensive manufactories of cotton goods, machinery, and chemicals.

**HALIOTIDÆ.** See EAR SHELL.

**HALL.** 1. A N. E. county of Georgia, intersected by the Chattahoochee river, and drained by the sources of the Oconee; area, 540 sq. m.;

pop. in 1870, 9,607, of whom 1,220 were colored. It is hilly, and not remarkably fertile, although there is good soil in the river bottoms. Gold, silver, lead, diamonds, rubies, emeralds, and amethysts have been found. It is traversed by the Atlanta and Richmond Air Line railroad. The chief productions in 1870 were 39,665 bushels of wheat, 212,656 of Indian corn, 20,081 of oats, 3,315 of Irish and 15,315 of sweet potatoes, 14,144 lbs. of tobacco, 62,101 of butter, 110 tons of hay, and 288 bales of cotton. There were 700 horses, 545 mules and asses, 1,386 milch cows, 2,511 other cattle, 5,935 sheep, and 7,523 swine; 6 carriage factories, and 9 flour mills. Capital, Gainesville.

**II.** A S. E. central county of Nebraska, intersected by Platte river and Prairie creek; area, 576 sq. m.; pop. in 1870, 1,057. The soil is fertile. The valley of the Platte is well wooded, and is said to contain coal. The Union Pacific railroad passes through it. The chief productions in 1870 were 17,781 bushels of wheat, 49,443 of Indian corn, 44,350 of oats, 12,669 of barley, 8,355 of potatoes, and 3,753 tons of hay. The value of live stock was \$105,051. There were 4 flour mills. Capital, Grand Island City.

**HALL,** a town of Austria, in Tyrol, on the Inn, 10 m. N. E. of Innsbruck; pop. in 1870, 5,022. It has celebrated salt works, which annually produce about 300,000 cwt. The salt, dissolved in water, is conducted through wooden pipes to the works from Mount Salzstock, 5,400 ft. high, 5 m. N. of Hall. There are manufactories of sal ammoniac and chemicals.

**HALL,** or *Schwäbisch-Hall*, a town of Würtemberg, 34 m. N. E. of Stuttgart, on both sides of the Kocher; pop. in 1871, 7,793. It has a fine town hall, two public libraries, an ancient mint, a large number of sugar refineries, and a large trade in salt made in the neighborhood. It was formerly a free imperial city.

**HALL, Basil,** a British author, born in Edinburgh in 1788, died near Gosport, England, Sept. 11, 1844. He entered the navy in 1802, and in 1816 commanded the brig *Lyra*, which accompanied Lord Amherst to China. He was made post captain in 1817, and from 1820 to 1822 was stationed on the Pacific coast of America. In 1827-'8 he travelled in the United States and Canada, and afterward in various parts of Europe. In the latter part of his life his mind became impaired, and he died in an insane hospital. Besides contributions to scientific periodicals and to the "Encyclopædia Britannica," and minor works of travel, some written in conjunction with others, he published "A Voyage of Discovery to the Western Coast of Corea and the Great Loo Choo Island" (1818); "Extracts from a Journal written in 1820-'22 on the Coasts of Chili, Peru, and Mexico" (2 vols., 1823-'4); "Travels in North America" (3 vols., 1829); "Fragments of Voyages and Travels" (9 vols., 1831-'40); "Spain and the Seat of War in Spain" (1837); and "Patchwork, Travels in Stories" (1840).

**HALL, Charles Francis**, an American arctic explorer, born at Rochester, N. H., in 1821, died in Greenland, Nov. 8, 1871. A blacksmith by trade, he finally became a journalist in Cincinnati. In 1859 he went to New York, and at a meeting of the geographical society offered to "go in search of the bones of Franklin." Funds amounting to about \$1,200 were raised for this purpose, and in May, 1860, he set out from New London on board a whaling vessel commanded by Capt. Buddington, with whom he was associated in his subsequent expeditions. The whaler having become blocked up by the ice, Hall resolved to make himself acquainted with Esquimaux life. He fell in with two natives, Ebierbing and his wife Tookoolito, who had some years before visited England, where they acquired the English language. They became greatly attached to him, and were his constant companions to the close of his life. Hall remained with the Esquimaux more than two years, acquiring their language and adopting their habits; and although he learned nothing of the fate of Franklin's men, he believed it to be probable that some of them might still survive. He made his way back to the United States in September, 1862, accompanied by Ebierbing and Tookoolito, and devoted the next two years to the preparation of his book, "Arctic Researches, and Life among the Esquimaux" (New York, 1864), and to making arrangements for a new expedition. He set out upon this, July 30, 1864, on board a vessel commanded by Buddington, expecting to be absent about two or three years; but he did not return until late in 1869. He kept a full journal, with the intention of preparing it for the press after he had made one more voyage of discovery; it was never done, and of this expedition only a few fragmentary accounts have appeared. By this time it was clearly ascertained that none of Franklin's men could be living, and Hall labored to induce the government to fit out an adequate expedition, the special object of which should be to reach the supposed open polar sea, and if possible to go to the north pole. Congress having made the requisite appropriation, a steamer was purchased, fitted up for the purpose, and named the *Polaris*. The expedition was placed under the general command of Hall, Buddington going as sailing master. There were also several scientific associates. The *Polaris* sailed from New York June 29, 1871, and on Aug. 22 reached Tessuisak, the most northern settlement in Greenland, whence on the 24th she steamed up Smith sound, and on the 30th reached lat. 82° 16' N., probably the most northern point yet attained. The channel was blocked up by ice, and the *Polaris*, by the advice of Buddington and contrary to the judgment of Hall, turned back, and was laid up for the winter in a sheltered cove, to which the name of *Polaris bay* was given, lat. 81° 38' N. On Oct. 10 Hall with three others started on a sledge expedition, which went within a few miles as far north as the *Polaris* had

reached. He returned on the 24th, and was immediately seized by an illness from which he partially recovered; but a relapse took place, and he died in a few days, probably from apoplexy. There were some suspicions that he had been poisoned, but these do not appear to have been well founded. The command now devolved upon Capt. Buddington. The *Polaris* lay in winter quarters until August, 1872, meantime suffering considerable injury from floating ice. It was then determined to return, and for weeks they tried to work their way through the ice pack. On Oct. 15 the *Polaris* was in imminent peril, and preparations were made to abandon her. The boats were put on the ice, with many stores and 19 of the crew; but before the rest could be landed the vessel broke loose and drifted away, leaving these 19 on the ice, under the charge of Capt. Tyson. They drifted back and forth for 195 days, but generally southward, and were only saved from starvation by the skill of Ebierbing as a seal hunter. This party was picked up, April 30, 1873, by the *Tigress*, a Nova Scotian whaling steamer, in lat. 53° 35' N., having drifted helplessly nearly 2,000 miles. The *Polaris* meanwhile, entirely disabled, found a refuge near Littleton's island, and those who remained built a hut on the shore, where they passed the winter. In the spring they built two boats from the boards of the vessel, in which, early in June, 1873, they set sail southward. The hulk of the *Polaris* was given to a band of Esquimaux; but she afterward drifted away and went down in deep water. This party was picked up, June 23, by a Scottish whaler, and conveyed to Dundee, where they arrived Sept. 18, whence they returned to the United States.—See "Arctic Experiences," edited by E. Vale Blake (New York, 1874).

**HALL, Dominic Augustine**, an American jurist, born in South Carolina in 1765, died in New Orleans, Dec. 19, 1820. He commenced the practice of law in Charleston. In 1806 he was appointed district judge for Orleans territory, which was formed in 1812 into the state of Louisiana, Hall continuing as a United States judge, with the exception of a few months in 1813, until his death. In March, 1815, New Orleans being under martial law by a proclamation of Gen. Jackson, Judge Hall granted a writ of habeas corpus for the release of Louis Louiallier, who had been arrested on a charge of exciting mutiny among the troops by publishing on Feb. 10 a statement that a treaty of peace had been signed. Jackson, instead of obeying the writ, caused the judge to be arrested. Peace having been proclaimed, Hall summoned Jackson to answer a charge of contempt of court, and fined him \$1,000. Jackson paid the fine, which by act of congress was in 1844 refunded with interest.

**HALL, George Henry.** See supplement.

**HALL, Gordon**, an American missionary, born at West Granville (now Tolland), Mass., April 8, 1784, died in India, March 20, 1826. He

graduated at Williams college in 1808, studied theology, offered himself as a missionary to the American board, and in 1812 sailed for India, where he passed the remainder of his life. Besides ordinary missionary labor, he revised a translation of the New Testament into the Malhatta language, and published several sermons and tracts, of which the "Appeal in behalf of the Heathen" excited much attention, and in conjunction with S. Newell, "The Conversion of the World" (2d ed., 1818).

**HALL, I. James**, an American judge and author, born in Philadelphia, Aug. 19, 1793, died near Cincinnati, July 5, 1868. He began the study of law, but joined the army in 1812, and served on the northern frontier. At the close of the war he went with Decatur in his expedition to Algiers. In 1818 he resigned his commission, and resumed the study of the law at Pittsburgh, Pa., and in 1820 removed to Shawneetown, Ill., where he practised at the bar and edited a weekly newspaper. He was soon after appointed public prosecutor for a circuit which included ten counties and was infested by organized bands of counterfeiters, horse thieves, and desperadoes. He held this office four years, when he was elected judge of the circuit court, an office which was abolished three years later. He then became state treasurer, at the same time practising law and editing a newspaper at Vandalia. In 1833 he removed to Cincinnati, where he engaged in financial business and literary labors. Besides his numerous contributions to periodicals, he published "Letters from the West" (originally published in the "Port Folio," then edited by his brother, collected and published in London, 1829); "Legends of the West" (1832); "The Soldier's Bride, and other Tales" (1832); "The Harpe's Head, a Legend of Kentucky" (1833); "Tales of the Border" (1835); "Statistics of the West" (1836; reissued, with additions, as "Notes on the Western States," 1839); "Life of William Henry Harrison" (1836); "History of the Indian Tribes" (3 vols. fol., 1838-'44, written in conjunction with Thomas L. McKenney, and illustrated with 120 portraits of Indian chiefs, the price being \$120); "The Wilderness and the War Path" (1845); "Life of Thomas Posey, Governor of Indiana" (in Sparks's "American Biography," 1846); and "Romance of Western History" (1857). A uniform edition of his works has been published (4 vols., 1853-'6). **II. John E.**, an American author, brother of the preceding, born in December, 1783, died June 11, 1829. He graduated at Princeton college, studied law, and in 1805 commenced practice in Baltimore, but soon after became professor of rhetoric and belles-lettres in the university of Maryland. He was severely wounded in the Baltimore riots of 1811, and was one of the nine thrown into a heap as dead. He edited "The Practice and Jurisprudence of the Court of Admiralty" (1809), and "The American Law Journal" (1808-'17). Having removed to Philadelphia,

he was editor of the "Port Folio" from 1817 to 1827, edited "The Philadelphia Souvenir" (1827), and published "Memoirs of Eminent Persons" (1827).

**HALL, James**, an American geologist and palæontologist, born at Hingham, Mass., of English parents, Sept. 12, 1811. Destined at first for the medical profession, he soon turned his attention to natural history, which he pursued from 1831 to 1836, under Amos Eaton, in the Rensselaer polytechnic institute, Troy, N. Y., where he has since been for many years professor of geology. Being appointed one of the geologists for the survey of New York, he began in 1837 his explorations of the western district of the state. He published annual reports from 1838 to 1841, and gave in 1843 his final report in a large quarto volume, which forms one of the series of works on the natural history of New York published by the legislature. In this volume he described in a very complete and exhaustive manner the order and succession of the strata, their mineralogical and lithological characters, and the organic remains which they contain. The field work of the survey being then completed, he was appointed palæontologist to the state, and charged with the work of studying and describing the organic remains of the rocks. He still holds this post (1874), and has embodied the results of his studies in the "Palæontology of New York," one of the most remarkable monuments of scientific labor, zeal, and industry which this country has produced. It is as yet incomplete, but some idea of its extent may be given by an account of the volumes already published and those now in progress. Beginning with the lowest member of the New York system of palæozoic rocks, the first volume of the "Palæontology" (338 pp. 4to, with 100 plates, 1847) contains descriptions of all the organic remains, both of plants and animals, up to the summit of the so-called Champlain division of the system, which terminates in the Hudson river group, corresponding to the Cambrian of Sedgwick or the Cambrian and lower Silurian of Murchison. The second volume (362 pp., with over 100 plates, 1852) continues the subject up to the base of the Onondaga or Salina formation. The third volume (533 pp., with 128 plates, 1859) includes all the fossil remains of the water lime, the lower Helderberg, and Oriskany divisions, except the corals and bryozoa. The fourth (the same, 1867) includes the brachiopoda of the divisions known as the upper Helderberg, Hamilton, Portage, and Chemung, making together the Erian or Devonian. The fifth volume, now in progress (1874), will contain the lamellibranchiates of the last named divisions, besides a review of all the lamellibranchiate forms from the lower formations. The drawings and descriptions for two more volumes are also far advanced, including the gasteropoda, cephalopoda, and crustacea of the Erian, with the crinoidea, bryozoa, and corals of the same. In addition to

these, Prof. Hall has prepared for the "Palæontology" a complete revision of the palæozoic brachiopoda of North America, with about 50 plates. This great and comprehensive study of our palæozoic fauna, which it is proposed to terminate with the base of the coal formation, has demanded researches beyond the limits of New York; and Prof. Hall has extended his investigations westward to the Rocky mountains, tracing out over the region the great divisions of the New York series. It is these identifications which have served as the basis of all our knowledge of the geology of the Mississippi basin. The general results of these comparative studies will be found in the introduction to the third volume of the "Palæontology," and more fully in the first volume of the "Report on the Geology of Iowa." Having been in 1855 appointed geologist to this state, he published in 1858, in connection with Whitney and Worthen, a report in two volumes, to which, besides the geological researches just mentioned, he contributed a memoir on the palæontology of the state, with 34 plates. He subsequently performed for Wisconsin a similar service, the results of which are as yet but partly published. Prof. Hall was about this time called to take charge of the palæontology of the geological survey of Canada under Sir William Logan. This he declined, but undertook the study of the graptolites of the so-called Quebec group of Canada, which appeared in 1865 as an exhaustive monograph, with 22 plates. This work was subsequently republished by him, with additions, in the 20th report of the New York state cabinet of natural history. Various other contributions to palæontology by him will be found in most of the reports of the state cabinet and state museum, from No. 3 to No. 25. To these must be added the description of the organic remains given in the government reports of various western surveys, including the reports of Fremont, Stansbury, and the United States and Mexico boundary survey. Besides all these are numerous communications to the "American Journal of Science," and to various scientific societies and academies both at home and abroad, including the geological society of London, of which he is one of the foreign members, and which in 1858 gave him the Wollaston medal. Prof. Hall has also devoted much time to the study of crystalline stratified rocks, and was the first to point out the persistence and the significance of mineralogical character as a guide to their classification, in the manner which has since been developed and extended by Hunt. (See GEOLOGY.) While devoting himself to the study of the minute details of organic structures, and discriminating between and classifying these with the utmost precision, Prof. Hall has also successfully traced out and arranged in their true order, over vast areas of North America, the formations to which they belong; thus doing for the stratigraphical geology of our country a work second in importance

only to that which he has done for its palæontology. Carrying his investigations still further, he has attempted the solution of some of the most difficult questions of dynamical geology, and has laid the grounds for a rational theory of mountains which must be regarded as one of his most important contributions to geological science. (See MOUNTAIN.)—In his earlier palæontological publications Prof. Hall was greatly aided by his wife, who drew the figures of a large portion of the fossils. One of his sons, CHARLES EDWARD, is now (1874) engaged in geological investigations in Texas.

**HALL, John**, an American clergyman, born in the county Armagh, Ireland, July 31, 1829. He entered Belfast college when he was only 13 years old, and, notwithstanding his extreme youth, was repeatedly Hebrew prize man. He was licensed to preach at the age of 20, and at once engaged in labor as a missionary in the west of Ireland. In 1852 he was installed pastor of the first Presbyterian church at Armagh, and in 1858 he was called to the church of Mary's Abbey, now Rutland square, in Dublin. He was an earnest friend of popular education, and received from the queen the honorary appointment of commissioner of education for Ireland. In 1867 he was a delegate from the general assembly of the Presbyterian church in Ireland to the Presbyterian churches of the United States. After his return to Ireland he received by the telegraph cable a call to the Fifth Avenue Presbyterian church in New York, which he accepted, entering upon his labors on Nov. 3, 1867. The church edifice having become insufficient for his congregation, they are now (1874) building for him, at a cost of about \$900,000, a church which when completed will be the largest Presbyterian church in New York, if not in the world. Dr. Hall is often called to preach in other cities at the installation of clergymen, the dedication of churches, &c.; and he was selected to preach the funeral sermon of Chief Justice Chase, who belonged to a different denomination. He has published "Family Prayers for Four Weeks" (1868), "Papers for Home Reading" (1871), and "Questions of the Day" (1873). Dr. Hall is universally regarded as an earnest and eloquent preacher; and though he speaks extemporaneously, his sermons bear marks of great refinement and finish.

**HALL, Joseph**, an English author, born at Ashby de la Zouch, July 1, 1574, died at Higham, Sept. 8, 1656. He was educated at Cambridge, took orders, and became dean of Worcester in 1617, bishop of Exeter in 1627, and bishop of Norwich in 1641. In the latter year he joined with the bishops who protested against the validity of laws made during their forced absence from parliament, and was committed for a time to the tower. In 1643 his revenues were sequestrated and his personal property was pillaged. From 1647 to his death he lived in poverty at Higham, near Norwich. Among his prose writings are: *Mundus alter et idem*

(1607; translated into English by John Healey under the title "Discovery of a new World, or a Description of South Indies hitherto unknown," London, without date); "Contemplations on the Old and New Testaments;" "Paraphrases on Hard Texts;" "Epistles," and several volumes of sermons and devotional and polemical works. His satires, "Virgidemiarum, six Bookes" (1597-'8), have been highly praised by Pope, Warton, and Campbell, and disparaged by Hallam. An edition of his works has been published, with an autobiography, and notes by Josiah Pratt (10 vols., London, 1808), and a later and better one by Peter Hall (12 vols., Oxford, 1837-'9).

**HALL, Lyman**, one of the signers of the Declaration of Independence, born in Connecticut in 1725, died in Burke co., Ga., Oct. 19, 1790. He graduated at Yale college in 1747, studied medicine, and removed in 1752 to South Carolina, and the same year to Sunbury, Ga., where he engaged in the practice of his profession. At the opening of the revolution he was influential in inducing Georgia to join the confederacy. In 1775 he was chosen a member of congress, and was annually reelected till 1780. Georgia had in the mean time fallen under the power of the British, who confiscated all his property. He was elected governor of Georgia in 1783, and served for one term; after which he retired from public life.

**HALL, Marshall**, an English physician, born at Basford, Nottinghamshire, in 1790, died in Brighton, Aug. 11, 1857. At the age of 19 he went to the university of Edinburgh and studied medicine and chemistry. In the latter department he pointed out the distinction between all chemical bodies, which ruled their chemical affinities, caused by the presence or absence of oxygen. From his study at this time of morbid anatomy in close connection with clinical medicine resulted his "Treatise on Diagnosis." Having taken his degree of M. D. in 1812, he was for two years house physician at the royal infirmary in Edinburgh, then visited the medical schools of Paris, Berlin, and Göttingen, and settled in Nottingham in 1815. He soon obtained a large practice, was appointed physician to the general hospital of the city, and became a valuable contributor to the literature of his profession. His "Treatise on Diagnosis" (1817) has in the main stood the test of 60 years' trial. "Commentaries on various Diseases peculiar to Women" (1827) is still a standard book of reference. In 1826 he removed to London, where he prosecuted his researches. In 1853-'4 he visited the United States, Canada, and Cuba, and published "The Twofold Slavery of the United States." Among his most important discoveries is the method now known by his name for treating asphyxia. (See DROWNING.) In addition to the works already mentioned, he published "Principles of the Theory and Practice of Medicine" (London, 1837);

"Observations and Suggestions in Medicine" (2 vols. 8vo); and several important treatises on the nervous system.

**HALL, Newman**, an English clergyman, born in 1816. He studied at Totteridge and at Highbury college, and took the degree of A. B. at the London university; and in 1855 he took that of LL. B. and won the law scholarship. In 1842 he became minister of the Albion Congregational church, Hull. In 1854 he removed to London, where he became pastor of Surrey chapel, Blackfriars road, known as Rowland Hill's chapel. In 1850 he opposed the general cry against what was called papal aggression. After the close of the American civil war, during which he had advocated the cause of the Union, he visited the United States, spoke frequently in the interest of international friendship, and preached before congress. In 1866 he was elected chairman of the Congregational union. He has been an earnest advocate of total abstinence, and has established at his chapel weekly lectures on secular subjects for the common people. Although he is a non-conformist, he uses the liturgical service of the church of England. He again visited the United States in 1873, and lectured in several cities. He has published "The Christian Philosopher," an account of the death of William Gordon (London, 1849); "The Land of the Forum and the Vatican" (1853); "Lectures in America" (New York, 1868); "Sermons, and History of Surrey Chapel" (1868); "From Liverpool to St. Louis" (London, 1869); and "Pilgrim Songs," a volume of devotional poetry (1871). He has also published a number of tracts on temperance and religious subjects, of one of which, entitled "Come to Jesus," more than 1,500,000 copies have been printed in England, and it has been translated into about 30 languages. Most of his works have been republished and widely circulated in the United States. He has also edited the autobiography of his father, John Vine Hall.

**HALL, Robert**, an English preacher, born at Arnsby, Leicestershire, May 2, 1764, died in Bristol, Feb. 21, 1831. While still a boy his favorite works were Edwards "On the Will" and Butler's "Analogy," which he was able to analyze and intelligently discuss at 9 years of age. When he was 11 years old his master informed his father that he was entirely unable to keep up with his young pupil. At 16 he entered the university of Aberdeen, where he became the friend of Mackintosh, who says that he was "fascinated by the brilliancy and acumen of Hall, in love with his cordiality and ardor, and awe-struck by the transparency of his conduct and the purity of his principles," and that "from his discussions with him he learned more as to principle than from all the books he ever read." In 1783, while still continuing his studies at Aberdeen, he became assistant pastor of Broadmead church in Bristol. In 1790 he removed to Cambridge, where he became pastor of the Baptist church, and rose

at once to the highest rank of British preachers. In Cambridge some of his principal pamphlets were published, including "Christianity consistent with the Love of Freedom" (1791), "Apology for the Freedom of the Press" (1793), his far-famed sermon on "Modern Infidelity" (1800), "Reflections on War" (1802), and "Sentiments suitable to the Present Crisis" (1803). These publications were called forth by the French revolution. In 1804 he became temporarily insane, and was obliged to resign his charge at Cambridge. Upon his recovery he married, and in 1808 was settled at Leicester, and in 1826 was recalled to the church in Bristol, the scene of his early labors, where he remained until compelled by disease to relinquish his post. No man in modern times has held a higher rank as a pulpit orator. For nearly all his life he was afflicted with a mysterious disease, from which he suffered so intensely that for more than 20 years he was never able to pass an entire night in bed, and was often obliged in a single night to take 1,000 drops of laudanum. On examination after death it was found that the source of his sufferings was a rough-pointed calculus that entirely filled the right kidney. His physician said: "Probably no man ever went through more physical suffering than Mr. Hall; he was a fine example of the triumph of the higher powers of mind, enabled by religion, over the infirmities of the body." His works, edited, with a memoir, by Olinthus Gregory, have been published in 6 vols. 8vo (London, 1831-'3; several times reprinted).

**HALL. I. Samuel Carter**, an English author and editor, born at Topsham, Devonshire, in 1800. He studied law, and was called to the bar, but devoted himself to literature, was some time a parliamentary reporter, succeeded Campbell as editor of the "New Monthly Magazine," and, partly in conjunction with his wife, wrote and edited many annuals and other illustrated books. In 1839 he became editor of the "Art Journal." Apart from editorial labor, he has published accounts of the industrial exhibitions of London, 1851, and of Paris, 1867; "A Book of Memories of Great Men and Great Women of the Age" (London, 1870); and "The Trial of Sir Jasper" (1873), a poem on the evils of intemperance, which had a great success, and of which a drawing-room edition, beautifully illustrated, was issued in 1874. **II. Anna Maria Fielding**, wife of the preceding, born in Dublin in 1805. When about 15 years of age she went to London, and was soon after married to Mr. Hall, with whom she entered upon a long career of literary labor. The illustrated work on "Ireland" (3 vols., London, 1841-'3) is the best of their joint works, the larger share being hers. She has also published many volumes of novels, tales, and sketches, among which are: "Sketches of Irish Character" (1829); "The Buccaneer" (1832); "Lights and Shadows of Irish Life" (1838); "Tales

of the Irish Peasantry" (1840); "Marian" (1840); "Midsummer Eve" (1847); "Pilgrimages to English Shrines" (1850); and "Popular Tales and Sketches" (1856). Two of her dramas, "The French Refugee" and "The Groves of Blarney," have been successful on the stage.

**HALLAM. I. Henry**, an English historian, born in Windsor in 1777, died in Penshurst, Kent, Jan. 21, 1859. His father was dean of Bristol, and he was educated at Eton and at Oxford, and studied law, but did not practise. He engaged in literary pursuits in London, and his contributions to the "Edinburgh Review" soon brought him into notice and gave him a position among the best writers of the day. In 1818 he published his "View of the State of Europe during the Middle Ages" (2 vols. 4to), in which he presented in a series of dissertations, remarkable for research and learning, a comprehensive survey of the chief subjects of interest in those times. His intention was to continue this work, which became at once a standard treatise, down to about the middle of the last century; but finding that it would be a labor beyond his strength, he satisfied himself with a continuation of the history of the British constitution from the point where he left it in the eighth chapter, and in 1827 published "The Constitutional History of England from the Accession of Henry VII. to the Death of George II." (2 vols. 4to). This work possessed the characteristic merits of the first, patient research, accuracy of statement, impartiality, and liberal principles; but as it covered a period nearer our own times and touched the roots of existing controversies, it did not command the same general assent. It is now regarded as in the main an accurate deduction and a fair statement of the principles of the British constitution. After another interval he published his last great work, the "Introduction to the Literature of Europe in the 15th, 16th, and 17th Centuries" (4 vols. 8vo, 1837-'9). The preface contains a comprehensive survey of what had been done before his time in the same department, and establishes his claim to have led the way among English writers in a general survey of literary history. In 1848 he published a supplemental volume to his work on the middle ages, in which he gave in a series of annotations the result of his studies during the 30 years that had elapsed since the original publication. These works have passed through numerous editions, and have been translated into the principal languages of Europe. In 1852 he published a volume entitled "Literary Essays and Characters." **II. Arthur Henry**, son of the preceding, born in London, Feb. 1, 1811, died in Vienna, Sept. 15, 1833. He studied at Eton and at Trinity college, Cambridge, where he graduated in 1832, and in the same year entered the Inner Temple. In August, 1833, he accompanied his father to the continent, where he contracted a fatal illness. He left a number of poems and essays, which were collected by

his father and printed with a memoir for private circulation (London, 1834). His "Remains in Verse and Prose" was published in 1862. He was betrothed to a sister of Tennyson, who made him the subject of his "In Memoriam."

**HALLE**, a city of Prussian Saxony, on the right bank of the Saale, 20 m. N. W. of Leipzig; pop. in 1871, 52,639. It consists of Halle proper with five suburbs, and of the two ancient towns of Glaucha and Neumarkt. The streets, except in some modern parts, are generally crooked, narrow, and badly paved. The principal public buildings are the church of St. Mary, with four towers, built in the Gothic style about the middle of the 16th century, to which belong a library of 20,000 volumes and the so-called red tower on the market place; that of St. Maurice, also built in the Gothic style, and that of St. Ulrich; the cathedral, the city hall, the ruins of the castle of Moritzburg, anciently a residence of the archbishops of Magdeburg, the university, and the Francke institutions in the suburb of Glaucha. The university, which was founded in 1694 by the elector (afterward king) Frederick, and in 1815, after having been closed by Napoleon in 1806 and 1813, united with that of Wittenberg, was most flourishing in the beginning of this century, and counted many eminent men among its professors. There were 1,300 students in 1829, but subsequently the number declined to less than 600. In 1873, however, the number had again increased to 1,073. Among the institutions more or less closely connected with the university are a normal, philological, and theological seminary, an academy of the natu-

factories of woollen and linen goods, stockings, gloves, silk buttons, hardware, leather, and starch, and an active commerce. The extensive salt works in the city belong to a company, and those outside of it to the government. The persons employed in the latter are known as the *Halloren*, and were long supposed to be of Slavic origin, but are now regarded either as Celts or as descendants of the earliest Frankish settlers.—Halle is first mentioned, as the castle of Halla, under Charlemagne. Otho the Great gave it to the archbishop of Magdeburg, and Otho II. erected it into a city in 981. It became so powerful in the course of time as to contend in the 13th century, often successfully, with its feudal lords, and to resist in 1435 a large army under the elector of Saxony. The reformation was introduced here in its earliest period. The city suffered greatly during the thirty years' war, and came in 1648 into the possession of the house of Brandenburg by the peace of Westphalia. Handel was born here.

**HALLECK, Fitz-Greene**, an American poet, born at Guilford, Conn., July 8, 1790, died there, Nov. 17, 1867. He received his education at the grammar school of his native town, and became clerk in a store at Guilford. In 1811 he entered the banking house of Jacob Barker in New York, in which employment he remained for many years. For 16 years previous to the death of John Jacob Astor he was engaged in his business affairs, was named by him as one of the original trustees of the Astor library, and by his will received an annuity of \$200. In 1849, having as he said "been made rich with 40 pounds a year," he retired to

Guilford, to live with an unmarried sister. He wrote verses in his boyhood, some of which appeared anonymously in contemporary newspapers. The lines to "Twilight," the first in date of his collected poems, appeared in the "New York Evening Post" in 1818; and in March, 1819, he formed a literary partnership with Joseph Rodman Drake to write the "Croaker" papers, which appeared in the same journal from March to June, 1819. Drake's death in the summer of 1820 was commemorated by Halleck in one of his most

University of Halle.

ral sciences, a medical and surgical clinical institute, a school of midwifery, an anatomical theatre, a botanical garden, an observatory, and a library of 100,000 volumes. The Francke institutions comprise an orphan asylum, several schools, and a printing press. Halle has manu-

touching poems. In the latter part of 1819 he wrote his longest poem, "Fanny," a satire on the fashions, follies, and public characters of the day. It was completed within three weeks of its commencement, and from the variety and pungency of its local and personal allu-

sions enjoyed a great popularity, copies having been circulated in manuscript after the original edition had been exhausted. In 1821 a second edition appeared, enlarged by the addition of 50 stanzas. In 1822-'3 he visited Europe, and in 1827 published anonymously an edition of his poems, including "Alnwick Castle," "Burns," and "Marco Bozzaris." In January, 1864, he published in the "New York Ledger" "Young America," a poem of about 300 lines. Enlarged editions of Halleck's poems appeared in 1836, 1842, 1849, and 1858, and after his death a complete edition, including the "Croakers" and "Young America," edited with very full notes by James Grant Wilson, who has also written the "Life of Halleck." In 1832 Halleck prepared an edition of Byron, containing notes and a memoir; and in 1840 he compiled two volumes of "Selections from the British Poets." A handsome obelisk has been erected over his grave at Guilford, and a full-length bronze statue is to be erected in the Central park, New York.

**HALLECK, Henry Wager**, an American soldier, born at Waterville, N. Y., Jan. 15, 1815, died in Louisville, Ky., Jan. 9, 1872. He studied for a time at Union college, and entered the military academy at West Point, where he graduated in 1839, after which he served for a year as assistant professor of engineering, and until 1845 as assistant engineer upon the fortifications in the harbor of New York. In that year he was sent by government to study the principal military establishments in Europe. In 1846 he was ordered to California, where he served in various military and civil capacities, and was also director general of the New Almaden quicksilver mines. He resigned his commission in August, 1854, and entered upon the practice of law in San Francisco, and was also president of a railroad. On the outbreak of the civil war he was appointed a major general in the United States army, and was soon after placed in command of the military department of the West, his headquarters being at St. Louis. He directed the military operations in the west, and took the command in the field during the Corinth campaign in the spring and early summer of 1862. In July, 1862, he was called to Washington and appointed general-in-chief of all the armies of the United States, a position which he held till March 12, 1864. Grant being then made lieutenant general, Halleck received the appointment of chief of staff to the army, which he held till April, 1865, when he was placed in command of the military division of the James, his headquarters being at Richmond. In the following August he was transferred to the division of the Pacific, and in March, 1869, to that of the South, his headquarters being at Louisville. He published several works upon military and scientific topics, the principal of which are: "Bitumen, its Varieties, Properties, and Uses" (1841); "Elements of Military Art and Science" (1846; 2d ed., with critical notes on

the Mexican and Crimean wars, 1858); "The Mining Laws of Spain and Mexico" (1859); a translation, with an introduction, of "De Fooz on the Law of Mines" (1860); "International Law, or the Rules regulating the Intercourse of States in Peace and War" (1861); a translation, with notes, of Jomini's "Life of Napoleon" (1864); and "A Treatise on International Law and the Laws of War, prepared for the Use of Schools and Colleges" (1866).

**HALLEIN**, a town of Austria, in the duchy of Salzburg, near the Bavarian frontier, on the Salzach, 9 m. S. of Salzburg; pop. about 3,600. The neighboring mountains are rich in salt mines, of which there is here a government inspection. There are 17 entrances to the mines, which are very extensive, reaching some distance beyond the Bavarian frontier, the right of working them being guaranteed to Austria by the treaty of Vienna. The mines have been worked for more than 600 years, and still produce over 16,000 tons of salt annually. The town contains salt baths and extensive manufactures of cotton goods and wooden ware. The Tyrolese, under Haspinger, here encountered the French, under Lefebvre, Oct. 3, 1809.

**HALLER, Albrecht von**, a Swiss physiologist, born in Bern, Oct. 16, 1708, died there, Dec. 12, 1777. He studied theology at Tübingen, and medicine and natural sciences at Leyden, where he graduated in 1726. After having paid a prolonged visit to England and France, he studied the higher branches of mathematics in Basel under Bernoulli. His delicate health induced him to accompany his friend Johann Gessner to the Alps, where he gathered the materials for his great botanical work and one of his poems. In 1729 he returned to Bern, where he founded an anatomical theatre. In 1735 he was appointed physician of the city hospital and director of the city library, and in the following year professor of botany, medicine, surgery, and anatomy at the newly established university of Göttingen. He founded there many scientific and beneficent institutions, and in 1751 the royal academy of sciences, of which he became president for life. He was ennobled by the emperor Francis I., received complimentary invitations from Oxford, Utrecht, Halle, Berlin, and St. Petersburg, was appointed royal councillor and physician by the king of England, and member of the grand council of Halle. In 1753 he relinquished all his trusts, excepting the presidency of the royal academy, and spent the rest of his life in Bern, where he became chief magistrate.—Haller is regarded as the father of modern physiology. He established scientifically a new law, referring the animal functions to two powers, irritability and sensibility. He had evolved this idea as early as 1739, and announced it in 1747, in his *Prima Linea Physiologiae*, and expounded his system in its entire comprehensiveness in his *Elementa Physiologiae Corporis Humani* (8 vols., Lausanne, 1757-'66, with a posthumous supplement, 1782). Among his other works are *Bibliotheca*

*Botanica* (2 vols., Zürich, 1771-'2), *Bibliotheca Chirurgica* (2 vols., 1774-'5), *Bibliotheca Anatomica* (2 vols., 1774-'7), and the first part of the *Bibliotheca Medicinæ Practicæ* (4 vols., Basel, 1776-'87). His *Icones Anatomicae* (7 vols., Göttingen, 1742-'6), which he himself regarded as one of his best works, contains 46 drawings of many of the organs, and particularly of the arteries. His activity was prodigious. Besides numerous contributions to German and French scientific periodicals, he wrote 12,000 reviews for the *Commentarii Societatis Regiæ Scientiarum Gottingensis*, and many novels. His best poems are "The Alps" and "On the Origin of Evil."

**HALLEY, Edmund**, an English astronomer, born at Haggerston, near London, Oct. 29, 1656, died at Lee, near Greenwich, Jan. 14, 1742. He was educated at Oxford. His first published essay was "A Direct and Geometrical Method of finding the Aphelia and Eccentricity of Planets" (1675). In November, 1676, he sailed for St. Helena, to form a catalogue of the fixed stars of the southern hemisphere; he returned in 1678, and the next year published his *Catalogus Stellarum Australium*, containing the positions of 360 stars, and numerous other observations. In 1678 he was elected a fellow of the royal society, and in 1679, at the request of that society, went to Dantzic to settle an astronomical controversy between Hooke and Hevelius. In 1681 he set out on a continental tour, and in December, when near Paris, he discovered the comet known by his name; his prediction of its return was the first of the kind that proved correct. In 1683 he published his "Theory of the Variation of the Magnetic Compass," in which he considers the earth as a vast magnet, having four magnetic poles, two near its N. and two near its S. pole, the needle always being governed by the nearest. In the same year he was led to examine Kepler's laws of the planetary motions, and from them to infer that the centripetal force always varies inversely as the square of the distance. Visiting Newton at Cambridge, to obtain aid in proving this geometrically, he was delighted to find that the latter had perfectly demonstrated the laws of the celestial motions. He soon gave to the royal society an account of Newton's treatise *De Motu*, which was entered on their register; and at a later period he prevailed on the great philosopher to complete his *Principia*, the first volume of which was printed by Halley at his own expense. In 1686 he published an account of the trade winds and monsoons near the tropics; and among other valuable papers were one in 1691 on the circulation of watery vapors and the origin of springs, and another showing the importance of observing the conjunctions of the superior planets, as a means of determining the sun's parallax and distance from the earth. In the same year he was a candidate for the Savilian chair of astronomy at Oxford, but failed to obtain it mainly on

account of what were regarded as his infidel opinions, though it is now said that the only ground for this charge was, that he asserted the existence of a pre-Adamite earth, out of the ruins of which our present earth was made. In 1692 he published his modified theory of the changes in the magnetic variation, and to test its correctness by observation obtained from King William the appointment of captain of a vessel, in which in two successive voyages he finished his experiments; returning home in 1700, he published his chart of the compass variations, and received the title of captain in the royal navy, with half pay for life. On the recommendation of Queen Anne, and at the request of the emperor of Germany, he went twice to the Adriatic to plan the formation of a harbor. In 1703, on the death of Dr. Wallis, he was chosen Savilian professor of geometry at Oxford. Soon after he began, with Gregory, the publication of the works of the ancient geometers; and several of their treatises, translated and edited by them, appeared in 1706-'10. In 1720, after the death of Flamsteed, he was appointed astronomer royal; and though now 64 years of age, he continued for 20 years, without an assistant, to carry on the operations of the Greenwich observatory. In 1721 he published his method of finding the longitude at sea; and in 1725 drew up his tables for computing the places of the planets, which, however, as he delayed publishing that he might perfect them, did not appear till 1749, after his death. In 1737 he was struck with paralysis.

**HALLIWELL, James Orchard**, an English archæologist, born at Chelsea, June 21, 1820. He has edited and published more than 60 pamphlets relating to early English literature, especially as connected with Shakespeare. Of his other works, the principal are: "Early History of Freemasonry in England" (1844); "Letters of the Kings of England" (1846); "Dictionary of Archaic and Provincial Words" (2 vols., 1847); "Life of William Shakespeare" (1848); "Popular Rhymes and Nursery Ballads" (1849); "Curiosities of Modern Shakespearian Criticism" (1853); "Notes of Family Excursions in North Wales" (1860); "Rambles in Western Cornwall" (1861); "The Last Days of William Shakespeare" (1863); "An Account of New Place, Stratford-on-Avon" (1864); and an edition of Shakespeare, published for subscribers, of which only 150 copies were printed (16 vols. fol., completed in 1865).

**HALLOWELL**, a city of Kennebec co., Maine, on the W. bank of the Kennebec river, and on the Augusta division of the Maine Central railroad, 2 m. below Augusta, and 4 m. above Gardiner; pop. in 1860, 2,435; in 1870, 3,007. It is built on rising ground, the principal avenues running parallel to the river, and the cross streets having an ascent of about 200 ft. from the water's edge to the crest of the hill. The upper part of the city is occupied by residences, the lower by stores, factories, and warehouses.

Hallowell is at the head of ocean steamboat navigation, and the wharves are accessible by vessels of 9 ft. draught. Excellent granite is obtained in the neighborhood. It contains a cotton mill, two iron foundries, several granite works, marble works, three tanning and currying establishments, and manufactories of boots and shoes, bricks, cabinet ware, candles, carriages, floor oil cloth, lumber, machinery, putty and whiting, soap and potash, trunks, &c. There are two halls, including the city hall, a hotel, two national banks, a savings bank, a classical school, 13 public schools (including a high school), a free library of 5,000 volumes, and six churches.—Hallowell was permanently settled soon after the erection of Fort Western in 1754 on the site of the present city, although a few traders or colonists resided there a century earlier. It was incorporated as a town in 1771, at which time it included Augusta, Chelsea, the greater part of Manchester, and a portion of Farmingdale and Gardiner. A city charter was adopted in 1852.

**HALLOW EVE**, *Hallowmas Eve*, or in Scotland *Halloween*, the vigil of All Hallows or All Saints' day, Oct. 31. It has always been the occasion of certain popular usages in Christian countries, such as the performance of spells by young people to discover their future partners for life, and certain fireside revelries, as cracking nuts and ducking for apples. Halloween is thought to be a night when witches, devils, and other mischief-making beings are all abroad on their baneful midnight errands; particularly the fairies are said on that night to hold a grand anniversary. Burns's poem "Halloween" describes the superstitious customs and beliefs of the Scottish peasantry concerning this festival. (See **ALL SAINTS' DAY**.)

**HALO** (Gr. *ἅλως*, a threshing floor, originally of a round shape), a term commonly used in meteorology to include all those phenomena in which a luminous ring, either colored or uncolored, is seen around the disk of the sun or moon. There are two distinct classes of such phenomena, called coronæ and halos, and it is only for convenience that the latter term is sometimes used to include them all. Here we shall consider them under their several heads. The meteorologist Kaemtz includes under the term coronæ all cases in which, when the sky is covered with light clouds, colored circles are seen surrounding the sun or moon; also when a glory is seen around the observer's shadow on a cloud. Under the head "halos properly so called," he includes the great circles which surround the sun or moon, the diameter of which amounts to about 44°. The attendants of halos are: 1, circles having a double diameter; 2, parhelia or mock suns; and 3, various other circles. Coronæ are distinguished from halos in this fundamental respect, that the former are due to particles or vesicles of water in mist or cloud, the latter to minute crystals of ice.—*Coronæ*. All clouds which are not too dense to prevent the light of the sun or moon

from passing through, produce coronæ of greater or less intensity and regularity. When the clouds are irregular in outline, the coronæ are incomplete. When the corona is complete, the following arrangement of colors can be recognized. Close by the sun a dark blue circle can be perceived, next a white circle, and then a red; outside the series there can be seen under favorable conditions a second series, consisting of colored circles in the following order, proceeding eastward from the sun: purple, blue, green, pale yellow, and red. "More frequently," says Kaemtz, "we observe near the sun blue mingled with white, then a red circle clearly limited within, but confused outside with the others. If a second red circle exists outside this, then green is observed in the interval by which they are separated. The distance of this circle from the centre of the sun varies according to the state of the clouds and the atmosphere; I have found it from 1° to 4°." The rings of coronæ, the colors of which are those of the reflected series in thin plates, are fringes due to interference of rays which have undergone diffraction by grazing on either side of numerous minute globules of cloud or fog, that have for the time nearly the same size. An illustrative instance was first given by Necker of Geneva. When the sun rises behind a hill covered with trees or brushwood, a spectator in the shadow of the hill sees all the small branches that are nearly in the line of the solar rays, on either side, projected on the sky, not black and opaque, but white and brilliant, as if of silver; the effect of a small opaque body on the light being, in this class of cases, equivalent to that of a small opening in a dark body through which the rays should penetrate. Coronæ exist around the sun more frequently than would be supposed; but they are often not observed, on account of the brilliancy of that orb. At such times they may be detected by looking at the reflection of the sun in still water, or in black glass.—*Anthelia*. When the sun is near the horizon, and the shadow of the observer falls on any surface covered with dew, there can be perceived a glory especially round the head of the shadow. Anthelia are also seen, and more perfectly, when the observer's shadow falls on or near clouds that lie opposite the sun; or in polar regions when the shadow is cast horizontally upon a fog. Bouguer was the first to observe the phenomenon. He noticed that the shadow of his head, on clouds among the Andes, was encircled by three colored rings having diameters of 5½°, 11°, and 17°. Scoresby, who observed the phenomenon in polar regions, saw four concentric circles round the shadow of his head: the first was white, yellow, red, and purple, and had a semi-diameter of 1° 45'; the second was blue, green, yellow, red, and purple, and had a semi-diameter of 4° 45'; the third was green, whitish, yellowish, red, and purple, and had a semi-diameter of 6° 30'; the fourth was greenish,

white, and deeper at the edges, and the semi-diameter of its internal edge was  $36^{\circ} 50'$ , that of its external edge being from  $41^{\circ}$  to  $52^{\circ}$ . This fourth circle, commonly called the circle of Ulloa, or the white rainbow, is very seldom seen. Anthelia are explained upon the same principle as coronæ, with the single exception that the diffraction in this instance does not occur during the direct transmission of the solar beams through the cloud, but during the retrograde transmission of rays which, having penetrated to considerable depth in the cloud, undergo reflection, and are then diffracted by nearer globules while on their return to the eye.—*Halos proper*. In the commoner forms, one or two rings, formed in the thin, feathery cloud overspreading the sky at a great height, extend vertically about the sun or moon. The diameters of these vary somewhat, and sometimes during the same display; but when one only is seen, its distance from the sun is very near  $22\frac{1}{2}^{\circ}$ , or diameter  $45^{\circ}$ ; the latter number being also the radius or distance of the second, when seen. Of these rings, the color of the inner border, when obvious, is almost invariably red; next to this comes green or blue; the outer edge is one of the latter colors, violet, or white. Very rarely the outer border is red. The breadth is usually slightly less than that of the luminary; sometimes a ring appears as if made up of two lying side by side, and crossing each other in very acute angles at certain points of their course. As in the rainbow, the red border is most defined, the opposite being lost in a diffused light; and the sky just within these rings usually appears more dark than elsewhere. The third and largest ring, having a radius of about  $90^{\circ}$ , is usually white; but it is seldom or never complete, even in the visible portion of sky. The same obvious atmospheric conditions that show these more ordinary forms, may also give rise to a white circle having the breadth of the solar disk, through which it passes, and extending completely around the sky in a plane parallel with the horizon. A second white band of the same breadth may pass through the sun's disk in a vertical direction, while at the points in which this intersects the two ordinary rings above, tangent colored arcs may be seen curving away from the rings respectively, and tending to include the zenith.—*Parhelia and Paraselenæ*. A parhelia is an attendant image, more or less distinct, of the sun's disk, which may appear with any halo, at one, two, or more points near the sun; but which is more frequently formed in the course of the horizontal or vertical white bands, or in both, at or slightly without the intersection of these with the ordinary halos. Parhelia show the usual colors of halos, in the same order, but more brightly, and even when the latter are not perceptibly colored. They seldom appear at once at more than three or four of the intersections, and sometimes present a sort of tail in the direction opposite the luminary. Popularly, they are known as sun

dogs, or mock suns. The corresponding appearances about the moon are termed *paraselenæ*. The more complicated phenomenon, showing both the halos and mock luminaries, although somewhat rare, is still much varied in form. Among the earlier clearly recorded observations may be named an example of the solar observed by Scheiner at Rome in 1629, and of the lunar by Hevelius of Dantzic in 1660. Very brilliant halos were seen about the sun for several days in succession at Moscow in 1812, during its occupancy by the French; the most splendid instance on record occurred at Gotha, May 12, 1824.—In high northern latitudes, halos and parhelia are very frequent; Capt. Parry always saw the former about the time of full moon. But whether in higher or lower latitudes, they are only seen when there intervene between the luminary and the observer those highest thread-like forms of cloud, the cirrus or cirro-stratus. The cold prevailing in the elevated regions occupied by these clouds renders it quite certain that their particles must be in the frozen condition—a fine ice mist—such as we experience in the coldest days of winter, and which, driven against the face by a wind, actually prick the skin. These crystals incline chiefly to the form of hexagonal prisms; and to refraction and decomposition of light passing through certain angles of these, Mariotte was led to ascribe the production of halos. For any refracting angle of a prism there exists a minimum angle of deviation, dependent on the density and the angle. Now, the minimum deviation of a decomposed ray occurs when the angle of refraction is just half the refracting angle of the prism used. The refracting angle of the ice prisms being  $60^{\circ}$ , the angle of refraction giving the least deviation for the red ray from the original course of the light must be  $30^{\circ}$ ; and, the refractive index of ice being 1.31, the angle of incidence must be  $41^{\circ}$ . Then the deviation, being equal to twice this angle less the refracting angle, or  $2 \times 41^{\circ} - 60^{\circ}$ , is  $22^{\circ}$ , a result very closely agreeing with that of observation for the smallest and most common form of halo. To produce this ring, then, it is only necessary to imagine the minute prisms of ice floating or descending through the air in all positions, but, owing to the resistance presented by the air to the action of their weight, taking especially horizontal and vertical directions; then, near to the position giving a minimum deviation of the transmitted rays, a considerable turning of the crystal about its axis gives only an insignificant change in the direction of the emergent light; and hence, a far larger number of the crystals will transmit red rays deviating from their previous rectilinear course by exactly or nearly this angle of  $22^{\circ}$  than by any other. The rays from the sun or moon being in effect parallel, there should therefore be seen, at nearly this angle with the luminary, a dim circle, red and defined within, but beyond this having the colors overlapping one another, and indistinctly seen

or resulting in white. The halo of  $90^\circ$  or  $92^\circ$  may be accounted for by the refraction occurring through the angles of  $90^\circ$  at which the sides of the ice prisms meet their bases, the minimum deviation for red in this case being about  $45^\circ$ . The partial polarization of the light in a plane tangent to the ring shows it to be refracted light; that of the rainbow being polarized in a plane normal to the circle, and mainly due to reflection. Musschenbroek saw large colored halos about the moon, by looking through plates of ice formed on the panes of his window. The white horizontal and vertical bands can be explained by reflection from the vertical faces of crystals, descending in a calm air and in all possible azimuths. The parhelia may be considered as being the intensified effect at certain points of a greater condensation of the dispersed rays at the angles of minimum dispersion; so that they are to the halo what the halo itself is to the diffused light thrown on the surrounding cloud. The fact that they are usually a little without the rings has been supposed due to the greater obliquity of the crystals, at the points where they appear, to the plane of refraction. But while the explanation of these simpler parts is quite satisfactory, that of the more complicate and peculiar phenomena becomes extremely difficult; and we can only in a general way refer these to the variety of changes, including reflection and simple and double refraction, of which light is capable, and to the probable effects of extraordinary forms and combinations of the crystals. If the views taken of the phenomenon be correct, then, by consequence, halos prove what is the temperature of the highest cloud region, and the condition of cloud occupying it. Certain it is that they are closely connected with peculiar meteorological changes; and that, occurring in summer, they indicate rain, and it has been said wind, while in winter they precede snow, or it may be also frosts.

**HALS, Franciscus**, a Dutch painter, born at Mechlin in 1584, died in Haarlem, Aug. 20, 1666. He was inferior as a portrait painter only to Vandyke. He passed his whole life in the Netherlands, chiefly at Delft or Haarlem. He left a great number of paintings, and is one of the best representatives of that school of the Netherlands which made no effort to idealize, but only sought accurate representation.

**HALSTEAD, Murat**, an American journalist, born at Ross, Butler co., Ohio, Sept. 2, 1829. Until the age of 19 he passed the summers in working on his father's farm and the winters at school. He completed his education at Farmer's college, near Cincinnati, in 1851. At 18 years of age he became a contributor to newspapers, and before leaving college had acquired facility as a writer of fiction and light miscellanies. Abandoning his intention of studying law, he established himself in 1851 in Cincinnati, and started a Sunday newspaper, of which only two numbers were published. After finding employment on the "Enquirer,"

the "Columbian and Great West," and other papers, he became in March, 1852, city editor of the "Cincinnati Commercial," and a few months later was appointed its news editor. In May, 1854, he acquired a small pecuniary interest in the "Commercial," and upon the death of the principal owner in 1866 the control of the paper passed into his hands. During the 12 years preceding this event its good will alone had increased more than fourfold in value, and it had become through Mr. Halstead's efforts one of the most influential papers of the west. It is independent in politics.

**HALTON**, a county of Ontario, Canada, bordering S. E. on Lake Ontario, near its W. extremity; area, 372 sq. m.; pop. in 1871, 22,606, of whom 8,074 were of Irish, 6,993 of English, and 5,108 of Scotch origin or descent. It is traversed by the Grand Trunk and Great Western railways. Capital, Milton.

**HALYBURTON, Thomas**, a Scottish theologian, born at Dupplin, Dec. 25, 1674, died in St. Andrews, Sept. 23, 1712. He studied at St. Andrews, was for a time domestic chaplain in the family of a nobleman, became minister of the parish of Ceres in 1700, and in 1711 was appointed professor of divinity at St. Andrews. His principal works are: "Inquiry into the Principles of Modern Deists," "The Great Concern of Salvation," "Natural Religion Insufficient," "Essay on the Nature of Faith," and "Inquiry on Justification." These have been frequently republished (latest ed., London, 1835). His "Memoirs of his Life," with an introductory essay by the Rev. Dr. Young (Glasgow, 1824), has been reprinted in America.

**HALYS**, the ancient name of the Kizil Irmak (red river), the largest river of Asia Minor. It rises in the mountains which in antiquity formed the boundary between Armenia Minor and Pontus; pursues mostly a S. W. course, receiving many tributaries on its way, as far as the vicinity of Kaisariyeh (the ancient Cæsarea Mazaca); then turns N. W., and gradually N. E., and discharges itself by several mouths into the Euxine between Sinope and Samsun (Amisus). It has a circuit of about 600 m. Its ancient importance appears from the fact that Asia was often divided into *Asia cis Halyn* and *Asia trans Halyn*. It once separated the great Lydian empire from the Medo-Persian, and near its banks was fought the first battle between Croesus and Cyrus.

**HAM**, a town of France, in the department of Somme, 67 m. N. E. of Paris; pop. about 2,400. Its old castle, strengthened by modern works, has become a fortress of some importance, and has long been used as a state prison, for which it is well adapted. The central round tower or donjon is 100 ft. high and 100 ft. wide, and the walls are of masonry 36 ft. thick. It was built in 1470 by the count de St. Pol, who was afterward beheaded by Louis XI. Among the numerous eminent persons imprisoned in the castle of Ham have been Joan of Arc, who was kept there a few days before

being surrendered to the English, Mirabeau, the ministers of Charles X., Louis Napoleon (1840-'46), Cavaignac, Lamoricière, Changar-

lived there in the first half of the 11th century; another edifice is believed by the inhabitants to contain the tombs of Esther and Mordecai. There are also a synagogue and an Armenian church. The town is mostly decayed and unattractive; the tomb of Avicenna, however, draws numerous pilgrims. It has a hot mineral spring, some manufactures in silk fabrics and carpets, and a large trade with Bagdad and other cities of Persia. Hamadan was conquered by the Arabs shortly after the death of Mohammed, was destroyed and rebuilt, and was taken by the Seljuks, and by the Mongols of Genghis Khan and Tamerlane.

**HAMAH**, or *Hamath* (Heb., fortress or citadel), a city of northern Syria, situated

nier, and others. It was surrendered to the Germans, Nov. 21, 1870.

**HAM**, one of the sons of Noah, supposed to have been the youngest. The name signifies in Hebrew "hot" or "burnt," and is regarded as indicative of the regions allotted to his descendants, who, according to Gen. x., occupied the southern parts of the ancient world. The foundation of the empires of Assyria and Egypt is attributed to them, as well as that of Sidon and other Phœnician states. Egypt, in particular, is designated in poetical passages of the Scriptures as the "land of Ham," which answers to the Coptic name of that country, *Kemi* or *Khami*, the *Xῆνία* of Plutarch, and the *Chmè* of the Rosetta inscription, according to Champollion. The Canaanites formed a branch of the Biblical Hamitic race.

**HAMADAN**, a town of Persia, in the province of Irak Ajemi, at the foot of Mt. Elwend, 175 m. W. S. W. of Teheran, on the site, it is generally supposed, of ancient Ecbatana, but according to Rawlinson of one of two Median cities of that name; pop. about 40,000. It occupies a large surface on sloping ground, and has numerous gardens, bazaars, baths, caravansaries, and mosques. Near one of the last is an edifice which contains the tomb of Avicenna, the celebrated Arabian physician, who

on both sides of the Aasy or Orontes, 30 m. N. of Homs; pop. about 40,000, of whom about 10,000 are Greeks or fellahs belonging to the Greek church, about 300 Jacobites, and the remainder Moslems, the Jews having entirely disappeared. The Christian quarter in the S. W. part of the city is described by Burton as filthy and miserable. Four bridges span the river, and several huge wheels turned by the current raise the water to the level of the houses and fields. Each aqueduct and wheel is the property of a limited company. There are 24 minarets. An interesting part of modern Hamah is the castle mound, which, like that of Homs,

Fortress of Ham.

Hamah.

was probably the site of an ancient temple.—It appears from Scripture that Hamath was the capital of a kingdom at the period of the exo-

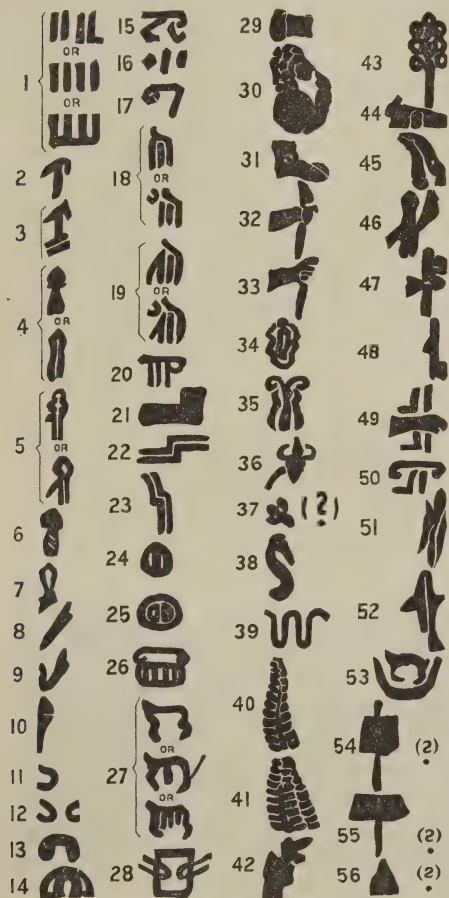

pus. Its king Toi yielded allegiance to David. Hamath was called great by Amos, and was ranked by the Assyrians among their most important conquests. According to Genesis, it was originally inhabited by the Canaanites, and it is frequently mentioned as the northern border of the promised land. Under the name Epiphania it became famous in the days of the Seleucidæ, and it is said that Seleucus Nicator kept there his stud of 500 elephants and 30,000 brood mares. Under the Moslem rule it

and Tyrwhitt-Drake, and to the United States by Lient. Steever and Prof. Paine. Copies of them have been published by the English exploration fund, by the anthropological society of Great Britain and Ireland, and by the Palestine exploration society of New York. Those issued by the last named in September, 1873, are absolute facsimiles prepared by W. H. Ward after the impressions of Steever and Paine. The inscriptions have been discussed by many eminent scholars, and notices of them have been published by Burton, Eisenlohr, Petermann, Hyde Clark, E. Thomas, Carter Blake, Staniland Wake, the Rev. Dunbar J. Heath, and others. The stones are of black basalt, and the inscriptions are in relief. The writing is of an unknown character. Some of the signs resemble the Cypriote and others the Hittite. Mr. E. Thomas has discovered that some small clay impressions of seals in the British museum are in the Hamath character; they had been attached to documents in the palace of Sennacherib at Nineveh, and date from about 700 B. C. In the Assyrian inscriptions appear a few notices of Hamath, which tend to show that the inhabitants were Semites, and that their neighbors to the north were a powerful tribe, called the Patina, who spoke a non-Semitic language. As the stones may have been removed from their original site to be used for building purposes in Hamath, it is possible that the inscriptions belong to the Patina. The various characters found in the Hamath inscriptions are shown in the preceding column.

**HAMAN**, a minister of the Persian king Ahasuerus, of the race of Agag, who, because Mordecai the Jew refused to pay him homage, resolved on the destruction of all the Jews in the Persian monarchy. He contrived to obtain a decree for this purpose; but Esther, the Jewish wife of Ahasuerus, interposed for their deliverance, and Haman was hanged on the gibbet he had prepared for Mordecai. His history is contained in the book of Esther.

**HAMANN, Johann Georg**, a German author, born in Königsberg, Aug. 27, 1730, died in Münster, June 21, 1788. He was destined for the pulpit, but became a clerk in a mercantile house, and afterward held many small public offices, devoting his leisure to study. He wrote under the *nom de plume* of "the Magus of the North." His works consist of small essays, and although his style was diffuse and obscure, their merits were recognized by Lessing, Mendelssohn, Herder, and Goethe. Fragments of his writings were published by Cramer, under the title of *Sibyllinische Blätter des Magus aus Norden* (1819), and a complete edition by Roth (7 vols., 1821-'5, with a volume of additions and explanations by Wiener, 1843). *Hamann's des Magus in Norden Leben und Schriften*, edited by Gildemeister, was published in 5 vols., 1857-'68, and a new edition of his *Schriften und Briefen*, edited by Petri, in 4 vols., 1872-'4.

**HAMBACH**, a village of Rhenish Bavaria, near Neustadt, 15 m. W. of Spire; pop. about 2,200.

Characters of the Hamath Inscriptions.

produced the celebrated scholar Abulfeda, prince of Hamah. The town has recently attracted considerable attention from the number of stones bearing inscriptions which have been found there. Burckhardt noticed these stones in 1812, but they remained in obscurity till 1870, when J. A. Johnson, consul general for the United States at Beyrout, and the Rev. S. Jessup of the Syrian mission, rediscovered them while looking through the bazaar of the old town. Copies and impressions of the inscriptions were carried to England by Burton

It contains a castle of the middle ages called Kastanienburg. A celebrated political gathering, known as the *Hambacher Fest*, was held here, May 27, 1832, by 30,000 persons, for the purpose of agitating and preparing "the regeneration of Germany as a free country." Siebenpfeiffer, Wirth, and other leaders were indicted on June 28; and a sanguinary conflict took place on the first anniversary of the gathering between the soldiery and the citizens, the Bavarian government having prohibited its celebration. The castle was presented in 1842 to the crown prince, the late king of Bavaria, and called after him Maxburg. It was greatly damaged during the revolution of 1849.

**HAMBLÉN**, an E. county of Tennessee, formed since the census of 1870, bounded N. W. by Holston river and S. E. by the French Broad; area, about 150 sq. m. It is traversed by high ridges and fertile valleys, belonging to the Alleghany range. Iron ore is found. The East Tennessee, Virginia, and Georgia, and the Cincinnati, Cumberland Gap, and Charleston railroads cross it. The assessed value of property in 1871 was \$1,451,819. Capital, Morristown.

**HAMBURG.** I. A free state of the German empire, comprising the city of Hamburg with its suburbs, the district of Geest, and the baili-

wicks of Bergedorf and Ritzbüttel; area, 158 sq. m.; pop. in 1871, 338,974, of whom the greater part are Lutherans, with 7,748 Roman Catholics and 13,796 Jews. The principal towns belonging to the territory of Hamburg are Barmbeck, Bergedorf, Borgfelde, Cuxhaven, Eilbeck, Eimsbüttel, Hamm, Hohenfelde, Ritzbüttel, and Uhlenhorst. The state has one vote in the federal council, and sends three deputies to the German Reichstag. Its army is incorporated with the Prussian army, and its burgher guard no longer exists, having been disbanded in 1868. By the constitution which went into force Jan. 1, 1861, the government consists of a senate of 18 members and a house of burgesses of 192 members. The members of the senate are elected for life, though a senator may retire after ten years. The senators elect from among themselves a first and a second burgomaster, who hold their office for one year. Nine senators must have studied law, and the other nine are usually merchants. Of the burgesses, 84 are chosen by general election, 48 are owners of real estate elected by the property holders, and 60 are representatives of the courts and the administration; their term is six years, and half the number are elected every three years. The revenue is

Hamburg.

derived mainly from direct taxes, principally the income tax, and the disbursements include the maintenance of unobstructed navigation of the Elbe, over which from the port to the mouth Hamburg has entire jurisdiction. The budget for 1873 estimated the revenue at \$4,716,000, the expenditure at \$4,924,000, and the public debt at \$9,051,000. II. One of the three free cities of Germany, on the N. bank of the Elbe, at the mouth of the Alster, 60 m. N. E.

of Bremen, and 33 m. S. W. of Lübeck; lat. 53° 32' 51" N., lon. 9° 58' 33" E.; pop. in 1871, 240,251. The Alster, a tributary of the Elbe, flows through the city and forms two basins, the outer and the inner Alster, and numerous canals intersect the city and communicate with both rivers. A magnificent bridge, begun in 1868 and finished in 1872, crosses the Elbe, and 60 other bridges span the rivers and canals. The old and new Jungfernstieg around

the inner Alster, the Alsterdamm, and the Wall are the fashionable promenades, and the environs are places of resort. One of the finest buildings is the exchange, which contains a mercantile library of 40,000 volumes. Other important edifices are the government house, with its great hall for civic feasts; the new museum, with a collection of modern pictures; the Johanneum college, containing the city library of 200,000 volumes and 5,000 manuscripts; the great hospital in the suburb of St. Georg, with accommodations for more than 4,000 patients; the orphan asylum, educating and providing for 600 pupils; the Jewish hospital, endowed by Salomon Heine in 1840, and now open to all denominations; and the *Rauhes Haus*, at Horn, near the city, founded in 1833 by Johann Heinrich Wichern, for the care and training of depraved and abandoned children. There are numerous other charitable and educational institutions, and the botanic and zoological gardens are among the most extensive in Germany. The church of St. Catharine dates from the 14th century; St. Nicholas and St. Peter are both modern Gothic edifices; St. James has a tower 343 ft. high; St. Michael is surmounted by a steeple 428 ft. high, one of the loftiest in Europe; the new synagogue for the orthodox Jews was opened in 1859.—Hamburg communicates by railway with the leading German cities, and by steamship with the principal ports of Europe, and with New York, New Orleans, Havana, and Brazil. The port is extensive; vessels drawing 14 ft. come up to the city, and their cargoes, discharged into barges, are distributed by the canals to the warehouses; larger ships discharge at Cuxhaven. The emigration, mostly to the United States, amounted in 1870 to 32,556, in 1871 to 42,224, in 1872 to 74,406; and from 1846 to 1872 the total was 740,874. At the end of 1872 the merchant marine comprised 402 vessels, including 62 steamers, of an aggregate of upward of 200,000 tons; the entrances of sea-going vessels were 5,913, of which 728 were in ballast; the clearances were 5,872, of which 2,163 were in ballast; the number of steamers was 2,749. The imports in 1871 amounted to \$442,000,000, and the maritime exports in 1872 (the official reports giving weights only) amounted to 13,448,000 cwt. The principal articles of import are cotton, wool, woollen and worsted stuffs, yarn, silk, hides, hardware, iron, coffee, sugar, wine, brandy, rum, tobacco, indigo, dye woods, tea, pepper, and coal. The exports consist of the same articles, except coal, Hamburg being mainly a centre of distribution. The manufacturing industry is important, and comprises ship building, sugar refining, distilling, calico printing, dyeing, the preserving of provisions, and the manufacture of sail cloth, ropes, leather, woollen goods, cigars, cutlery, musical instruments, carriages, furniture, hats, soap, glue, &c.; and the banking, insurance, and publishing interests are enormous.—Hamburg

is a very ancient city. Charlemagne built a castle here about 809. During its growth from a village into a town it was several times destroyed. The emperor Otho IV. (1215) made it an imperial city, and in 1241 a commercial treaty with Lübeck laid the foundation of the Hanseatic league. The reformation was formally introduced about 1529. During the early part of the 16th century, although recognized as a state of the empire, it was without a seat or vote in the diet, and was troubled by the kings of Denmark, who claimed sovereignty over it as counts of Holstein. By convention with Denmark in 1768 its rights were conceded, and in 1770 it was confirmed as a free city of the Germanic empire. In 1803 it fell under the power of the French, who after repeated exactions annexed it to the French empire as the capital of the department of Bouches d'Elbe. In 1813-'14 the French, under Marshal Davoust, sustained in it that terrible siege in which upward of 30,000 citizens were driven out in midwinter, and 1,100, whose monument is to be seen near Altona, perished of hunger. On June 8, 1815, it joined the Germanic confederation as a free Hanse town. On May 5, 1842, a conflagration broke out, and continued four days, destroying one third of the city; the rebuilding of the burnt district after a general plan has added greatly to the beauty of many of its streets and public buildings. The city hall, which escaped from that casualty, was destroyed by fire in 1859, but has since been rebuilt. The constitution of the North German confederation, and likewise that of the German empire, left Hamburg at liberty to remain outside of the Zollverein as long as it wished. When Schleswig-Holstein and Mecklenburg had joined that league, Hamburg was on all sides surrounded by the territory of the Zollverein, and therefore found it to its advantage to join it for one portion of its rural districts, embracing 124 sq. m. and 32,792 inhabitants. The remainder, in union with the neighboring Prussian city Altona, continues a free port territory.

**HAMELN**, a town of Prussia, in the province and 24 m. S. W. of the city of Hanover, on the Hamel and the Weser; pop. in 1871, 8,530. Over the Weser, which here forms an island, is a suspension bridge more than 800 ft. long. The town has a gymnasium, some manufactures of woollens and cottons, distilleries, and breweries. It was formerly fortified, and near it, in 1633, the Swedes obtained a victory over the imperial troops. It is famous as the scene of the legend of the piper of Hameln, who offered to clear the town of rats for a certain sum of money, which the authorities agreed to pay. The vermin followed him as he played on his pipe, and were all drowned in the Weser. The people, released from their torment, refused to pay the stipulated sum, and the piper vowed vengeance. On June 26, 1284, the feast of Saints John and Paul, he reappeared in the streets playing his pipe, and all the children,

charmed by his music, followed him into a cavern of the mountain, where they disappeared and were never afterward heard from. For a long time the town dated its public documents from this calamity. The legend is the subject of a poem by Robert Browning.

**HAMERLING, Robert**, a German poet, born at Kirchberg, Lower Austria, March 24, 1832. After having been a chorister, he studied medicine, philosophy, and philology. From 1855 till about 1866 he was professor at the gymnasium of Trieste, and has since resided near Gratz in the enjoyment of a pension from the government. His fame rests chiefly on his epic poems *Ahasverus in Rom* (Hamburg, 1866; 7th ed., 1871), *Sinnen und Minnen* (3d ed., 1870), and *Der König von Sion* (1868; 5th ed., 1872). A collection of his smaller poems appeared in Hamburg in 1871, and in the same year he published a drama, *Danton und Robespierre*.

**HAMERTON, Philip Gilbert**, an English author, born in Manchester, Sept. 10, 1834. His mother died when he was a fortnight old, and his father when he was ten years old, leaving his early education to be superintended by a paternal aunt, who put him in school at Doncaster. He went afterward to Barnley school, where, principally as a private pupil, he was fitted for Oxford. Becoming interested in landscape painting, he studied that art in the studio of Mr. Pettitt in London, and then went back to Lancashire, where he passed several years, devoting himself to art and literature. He published anonymously many articles in periodicals, besides "Observations on Heraldry" (London, 1851), and "Isles of Loch Awe, and other Poems" (12mo, 1855). In 1855 he became a student of William Wyld in Paris, remaining two or three years, when he returned home and entered upon a mode of life in Scotland described in his "Painter's Camp in the Highlands, and Thoughts about Art" (2 vols. 8vo, 1862), since published as two separate works. For three years he was the art critic of the "Saturday Review," and his contributions were sought by other publications. In 1859 he married a daughter of M. Frédéric Gindriez, and after living for a while in Sens, where he painted some of his best pictures, he took up his residence in Autun, where he now lives (1874). He has invented a new method of etching, which he calls the positive process. (See ENGRAVING.) His later works, several of which have been republished in the United States, comprise "Etching and Etchers" (1866); "Contemporary French Painters" (1867); "The Etcher's Handbook" (1868); "Painting in France after the Decline of Classicism" (1868); "Wenderholme, a Story of Lancaster and York" (3 vols. 8vo, 1869); "The Unknown River" (1870); "Chapters on Animals" (1873); and "The Intellectual Life" (1873). Hamerton's paintings have been praised by some critics, but they are not popular. Among the best of his efforts are "Kilchurn Castle," "Sens from the Vineyards," and "The River Yonne."

Mr. Hamerton's wife has published "Jeanne Laraguay," a novel (London, 1864).

**HAMILCAR BARCA**, or *Barcas*, a Carthaginian general, born shortly before the beginning of the first Punic war, fell in a battle in Spain, 229 B. C. The name Barca, which he had in common with many distinguished Carthaginians, is supposed to signify lightning. He first appears in history as commander of a Carthaginian army in the 18th year of the first Punic war, 247 B. C. The Romans then had the advantage. Sicily, the main scene of the war, was in their hands, with the exception of Drepanum and Lilybæum, on the W. coast, which they were blockading from the land side. Hamilcar seized the commanding position of Mount Ercte (now Monte Pellegrino), near Panormus (Palermo), where he encamped, while the bay sheltered the Carthaginian fleet. From this stronghold he made successful incursions into the interior of the island as far as the E. coast, and upon the S. coast of Italy, vanquished several Roman detachments, and took Eryx near the N. W. angle of Sicily (244). Holding this still more favorable position, he continued his incursions over the island and the peninsula. It was only the great defeat of the Carthaginian fleet under Hanno by the newly formed Roman squadron under Lutatius Catulus, near the Ægates isles (241), which compelled him to give up the struggle. He was then commissioned to conclude a peace, and with his army embarked at Lilybæum and returned to Carthage. The scene of war was then transferred to Spain, whither Hamilcar was eager to proceed; but he was delayed by a mutiny of some mercenary troops, which soon threatened the existence of the state. After the defeat of Hanno by the mercenaries, Hamilcar took the field against them, and finally succeeded in crushing the rebellion, which had raged for more than three years. He now entered upon his Spanish campaign, taking with him his young son Hannibal, whom before starting (238) he made to swear eternal enmity to Rome. The details of this new campaign are little known, but it is certain that he had conquered a part of Spain when he was overtaken by death. His conquests were continued by his son-in-law Hasdrubal, and afterward by Hannibal. He left two other sons, Hasdrubal and Mago, who both partook in the wars of their brother.

**HAMILTON**, the name of nine counties in the United States. **I. A N. E. county of New York**, drained by the head waters of Black, Hudson, Raquette, and Sacandaga rivers; area, 1,711 sq. m.; pop. in 1870, 2,960. The surface is high, hilly, and diversified with lakes; the soil is poor, and a large portion of the county, traversed by the Adirondack mountains, is still a wilderness. Timber and iron are abundant. The chief productions in 1870 were 5,781 bushels of Indian corn, 21,980 of oats, 6,392 of buckwheat, 46,317 of potatoes, 78,312 lbs. of butter, and 7,358 tons of hay. There were

606 horses, 1,063 milch cows, 1,879 other cattle, 3,748 sheep, and 519 swine. Capital, Sageville. **II.** A N. county of Florida, bordering on Georgia, bounded E. and S. by the Little Suwannee and W. by the Withlacoochee river, and intersected by the Allapaha; area, 400 sq. m.; pop. in 1870, 5,749, of whom 2,363 were colored. The surface is even, and the soil fertile. The Atlantic and Gulf railroad traverses it. The chief productions in 1870 were 83,930 bushels of Indian corn, 6,185 of oats, 7,395 of peas and beans, 2,235 of sweet potatoes, and 1,592 bales of cotton. There were 290 horses, 333 mules and asses, 800 milch cows, 2,351 other cattle, and 3,167 swine. Capital, Jasper. **III.** A N. central county of Texas, intersected by Leon river; area, 825 sq. m.; pop. in 1870, 723, of whom 17 were colored. The surface consists mostly of rolling prairies, dotted with groves of timber. There are numerous streams, the banks of which are fringed with trees. The soil is fertile. The chief productions in 1870 were 3,330 bushels of wheat, 27,150 of Indian corn, 18 bales of cotton, and 19,775 lbs. of butter. There were 991 horses, 1,653 milch cows, 9,703 other cattle, 710 sheep, and 2,216 swine. Capital, Hamilton. **IV.** A S. E. county of Tennessee, bordering on Georgia, and touching Alabama on the S. W., intersected by the Tennessee river, which is here navigable by steamboats; area, 380 sq. m.; pop. in 1870, 17,241, of whom 4,188 were colored. It abounds in coal and iron. The surface is broken by high ridges connected with the Cumberland mountains, and the soil is fertile. The Nashville and Chattanooga, the Alabama and Chattanooga, and the East Tennessee, Virginia, and Georgia railroads traverse it. The chief productions in 1870 were 103,716 bushels of wheat, 353,700 of Indian corn, 44,963 of oats, 12,912 lbs. of wool, 79,214 of butter, and 1,033 tons of hay. There were 1,875 horses, 2,393 milch cows, 5,040 other cattle, 6,741 sheep, and 15,359 swine; 1 manufactory of cars, 3 of furniture, 2 of iron, 2 of machinery, 2 flour mills, 1 tannery, 1 currying establishment, 1 planing mill, and 2 saw mills. Capital, Chattanooga. **V.** A S. W. county of Ohio, bordering on Indiana, separated from Kentucky by the Ohio river, and drained by Great and Little Miami and Whitewater rivers; area, 390 sq. m.; pop. in 1870, 260,370. It has an undulating surface and a rich soil. The grape is extensively cultivated near the Ohio river. It is crossed by the Miami and White-water canals, and by several railroads centering in Cincinnati. The chief productions in 1870 were 162,607 bushels of wheat, 1,226,726 of Indian corn, 268,089 of oats, 96,979 of barley, 562,537 of potatoes, 773,387 lbs. of butter, 126,400 of cheese, and 25,304 tons of hay. There were 8,531 horses, 12,413 milch cows, 3,254 other cattle, 3,647 sheep, and 21,165 swine. There were 2,469 manufacturing establishments, chiefly in Cincinnati, the county seat, with an aggregate capital of \$42,646,152,

and an annual product of \$78,905,980. **VI.** A central county of Indiana, drained by White river and several smaller streams; area, 400 sq. m.; pop. in 1870, 20,882. The surface is slightly diversified and the soil extremely rich. It is traversed by the Indianapolis, Peru, and Chicago railroad. The chief productions in 1870 were 548,039 bushels of wheat, 972,660 of Indian corn, 74,164 of oats, 65,094 of potatoes, 62,206 lbs. of wool, 336,215 of butter, and 9,791 tons of hay. There were 7,647 horses, 5,630 milch cows, 9,661 other cattle, 21,796 sheep, and 33,555 swine; 13 manufactories of carriages, 2 of barrels and casks, 10 of bricks, 8 of saddlery and harness, 6 of tin, copper, and sheet-iron ware, 2 of woollen goods, 11 flour mills, and 32 saw mills. Capital, Noblesville. **VII.** A S. county of Illinois, drained by branches of Little Wabash river and Saline creek; area, 395 sq. m.; pop. in 1870, 12,993. It has a well wooded surface, diversified with prairies of moderate fertility, and a great deal of swamp land in the north part. The St. Louis and Southeastern railroad and branch to Shawneetown traverse it. The chief productions in 1870 were 92,476 bushels of wheat, 735,252 of Indian corn, 203,464 of oats, 28,402 of potatoes, 34,074 gallons of sorghum molasses, 471,860 lbs. of tobacco, 42,776 of wool, 195,246 of butter, and 6,397 tons of hay. There were 4,603 horses, 3,349 milch cows, 4,974 other cattle, 20,117 sheep, and 24,842 swine; 15 carriage factories, 2 woollen factories, 9 flour mills, and 9 saw mills. Capital, McLeansborough. **VIII.** A central county of Iowa, intersected by the Boone, and containing the head waters of Skunk river; area, 576 sq. m.; pop. in 1870, 6,055. The surface is undulating and the soil good. Bituminous coal is abundant. The Dubuque and Sioux City railroad intersects the N. part. The chief productions in 1870 were 126,978 bushels of wheat, 214,818 of Indian corn, 80,206 of oats, 26,323 of potatoes, 153,755 lbs. of butter, and 14,715 tons of hay. There were 1,968 horses, 1,990 milch cows, 3,015 other cattle, and 2,920 swine; 1 manufactory of agricultural implements, and 3 saw mills. Capital, Webster City. **IX.** A S. E. county of Nebraska, bounded N. W. by the Platte river, and watered by branches of the Big Blue; area, about 530 sq. m.; pop. in 1870, 130. The value of farms was \$43,400; of farm products, \$14,645; of live stock, \$12,111. Capital, Farmer's Valley.

**HAMILTON**, a town and village of Madison co., New York, on the Chenango river, 90 m. W. of Albany and 30 m. S. W. of Utica; pop. of the town in 1870, 3,687; of the village, 1,529. The village is on the Utica branch of the New York and Oswego Midland railroad, and contains a carriage factory, a tannery, a cigar manufactory, a furnace, a cheese factory, a national bank, a hotel, a female seminary, a union school, two weekly newspapers, a bi-weekly (published by the college students), and five churches. Here are situated, under

the control of a common board of trustees, Hamilton theological seminary (Baptist), Madison university, and Colgate academy. These schools were developed out of the "Hamilton Literary and Theological Institution," founded in 1820. Madison university was chartered in 1846. Its faculty in 1873-'4 consisted of 10 professors. A scientific as well as a classical course may be pursued. The number of volumes in the libraries was 10,860. The faculty of the theological seminary consisted of four professors, who were also members of the university faculty; and Colgate academy has a principal, with three other instructors. The theological seminary had 43 students, the university 106, and the academy 60. The academy has a commodious edifice. The university buildings are Alumni hall, East college, and West college; besides which the grounds contain a president's house, a gymnasium, a boarding hall, and professors' houses. The town also contains the villages of East Hamilton, Hubbardsville, Poolville, and part of Earlville, through which the main line of the New York and Oswego Midland railroad passes.

**HAMILTON**, a city and the capital of Butler co., Ohio, on both sides of the Miami river and on the Miami canal, at the intersection of the Cincinnati, Hamilton, and Dayton, the Cincinnati, Richmond, and Chicago, and the Cincinnati, Hamilton, and Indianapolis railroads, 20 m. N. of Cincinnati, and 90 m. W. S. W. of Columbus; pop. in 1850, 3,210; in 1860, 7,223; in 1870, 11,081, of whom 3,062 were foreigners. It is surrounded by a rich and populous district, and is extensively engaged in manufacturing. The principal establishments are machine shops, iron foundries, paper mills, woollen mills, flour mills, distilleries, breweries, manufactories of carriages and wagons, boots and shoes, railroad supplies, ploughs, saws, rope, pumps, brooms, candles, boilers, &c. Abundant water power is supplied by a hydraulic canal, which gives a fall of 28 feet. There are eight hotels, and two national banks with \$200,000 capital; valuation of property in 1873, \$5,836,065. The city is divided into four wards, and is governed by a mayor and council. It has five public schools, including a high school, having in 1872 28 teachers and 1,200 pupils; a free library of 2,000 volumes, four weekly newspapers (one German), and 12 churches. The quarter on the W. bank of the river, formerly the village of Rossville, was incorporated with Hamilton when the municipal charter was granted in 1853.

**HAMILTON**, a city and the county seat of White Pine co., Nevada, situated in the S. W. part of the county, 230 m. E. of Carson City and 215 m. S. W. of Salt Lake City; lat. 39° 15' N., lon. 115° 27' W.; pop. in 1870, 3,913, of whom 160 were Chinese. It is built at the N. base of Treasure hill, 8,000 ft. above the level of the sea, and 120 m. S. of the Central Pacific railroad, in the midst of the White Pine mining district, which comprises three parallel

mountains, viz.: White Pine, 11,000 ft. high, and Babylon and Treasure hills, each 9,000 ft. high. Treasure hill contains rich chloride silver ores, while the other two yield complex ores, embracing carbonates, oxides, and sulphites. All the valuable minerals abound here except tin and platinum, and the ores assay as high as \$1,500 a ton in silver. The climate of Hamilton is rigorous, but very healthful. Insects and reptiles are unknown. Stages run daily to Palisade on the railroad and to the mining districts S. of the city, and there is a tri-weekly line to the east. It contains a court house, an Episcopal and a Roman Catholic church, a public school with two departments, a weekly newspaper, a bank, two hotels, and a brewery. In the neighborhood are nine quartz mills with 155 stamps, extensive smelting works, and an incomplete refinery. The streets are graded, and water is supplied by works erected at a cost of \$300,000.—Hamilton owes its origin to the discovery of silver in Treasure hill in 1868, followed by a great influx of population and extensive operations. But business was soon paralyzed by litigation concerning titles, coupled with the refusal of speculators to work their claims, and by the failure of the smelting works through ignorance of the proper treatment. The city consequently dwindled, until, after being nearly destroyed by fire in June, 1873, it contained only 600 inhabitants; but it is now (1874) recovering.

**HAMILTON**, a city, port of entry, and the capital of Wentworth co., Ontario, Canada, situated at the S. W. extremity of Burlington bay, at the W. end of Lake Ontario, 36 m. S. S. W. of Toronto, and 42 m. W. by N. of Niagara Falls; pop. in 1836, 2,846; in 1846, 6,822; in 1851, 10,248; in 1861, 19,096; in 1871, 26,716. The city is built on sloping ground, extending from the foot of a hill about 1½ m. to the shore of the bay, and is laid out with considerable regularity. The principal thoroughfare, King street, runs E. and W. The commercial quarter is about a mile back from the bay. There are several public squares, on which the government buildings generally front, Court House square and Market square being among the finest. The city is lighted with gas, intersected by a system of sewers, and supplied with water from Lake Ontario (6 m. distant), by means of a magnificent system of works, which cost about \$800,000. The public and private buildings are mostly either of brick or of freestone or limestone, brought from quarries in the neighborhood. The most elevated sites are occupied by residences and gardens. The banks, public offices, churches, hotels, and some of the stores, are good specimens of architecture. The Great Western and Hamilton and Lake Erie railways furnish communication with the principal points of Canada and the United States. Its situation at the head of navigation on the lake, and in a rich and populous

district, affords excellent commercial advantages. The Desjardins canal, 4 m. in length, connects it with Dundas; and the Burlington Bay canal, which cuts through the beach dividing the bay from the lake, shortens its communication with Lake Ontario. The imports for the year ending June 30, 1872, amounted to \$5,665,259; exports, \$805,526, of which \$597,820 was the value of agricultural products. The number of entrances from the United States was 207, with an aggregate tonnage of 33,584; clearances for American ports, 240, of 39,621 tons. Hamilton is the second city of Ontario in population, and the first in manufacturing industry. The manufactures embrace iron castings, machinery, agricultural implements, sewing machines, musical instruments, glassware, wooden ware, cotton and woollen goods, soap and candles, boots and shoes, leather, brooms, brushes, &c. There are also several saw and grist mills, a bank, and five branch banks. The city is divided into five wards, and is governed by a mayor and a board of 15 aldermen. It contains a deaf and dumb institution, two orphan asylums, a house of refuge, a city hospital, a convent, a boys' home, home for the friendless, and an industrial school. There are a female college, a business college, a grammar school, several primary schools, a mechanics' institute, a reading room, three daily and six weekly newspapers, and two monthly periodicals. The Great Western railway company has a library of 2,000 volumes. Hamilton is the seat of an Episcopal and a Roman Catholic bishop, and contains 23 churches. The city was laid out in 1813.

**HAMILTON**, a municipal and parliamentary borough of Lanarkshire, Scotland, near the junction of the Avon with the Clyde, 10 m. S. E. of Glasgow, with which it is connected by railway; pop. in 1871, 11,299. The most important public buildings are two fine parish churches. Manufactories of lace and muslins give employment to several thousand hands. Separated from the town by a wall and park is Hamilton palace, the seat of the duke of Hamilton. The surrounding grounds between the town and the Clyde comprise 1,460 acres, and are accessible to the public. A portion of the palace was built in 1591; but the greater part is comparatively modern. The interior decorations are magnificent, and the picture gallery is unsurpassed in Scotland. In the vicinity, on a rock 200 ft. above the Avon, are the ruins of Cadzow castle, the original seat of the Hamiltons; and near by are the remains of Cadzow forest, in which a herd of the original breed of wild cattle of Britain is still kept.

**HAMILTON**, Alexander, an American statesman, born in the island of Nevis, West Indies, Jan. 11, 1757, died in New York, July 12, 1804. His father had emigrated from Scotland and established himself in mercantile business in St. Christopher's. His mother was of French Huguenot descent; she had first been married

to a Dane named Levine, from whom she obtained a divorce. Hamilton's father failed in business, and passed the remainder of his life in poverty. His mother died in his childhood, but relatives of hers who resided at Santa Cruz took charge of the orphan, her only surviving child. There were no great advantages of education at Santa Cruz; but, possessing the French as well as the English tongue, young Hamilton eagerly read such books in both languages as fell in his way. At 12 years of age he was placed in the counting house of a merchant of Santa Cruz; but this occupation was not to his taste, and in his earliest extant letter, written to a schoolfellow, he speaks with disgust of the "grovelling condition of a clerk," and wishes for a war. But though he did not like his employment, he applied himself to it with characteristic assiduity; and the practical knowledge thus acquired was doubtless a stepping stone to his subsequent reputation as a financier. He began to use his pen early, and among other things he wrote a description of a hurricane by which St. Christopher's was visited in August, 1772. This description, published in a newspaper of that island, attracted so much attention as to induce his friends to comply with his wish for a better education than could be had at home, and to send him to New York for that purpose. He was first placed in a grammar school at Elizabethtown, N. J., where he enjoyed the acquaintance of the families of William Livingston and Elias Boudinot. After a few months he entered King's (now Columbia) college. Besides the regular studies of an undergraduate, he attended lectures on anatomy with the idea of becoming a physician. While he was thus engaged the quarrel with the mother country came to a crisis. Some differences in the city of New York as to the selection of delegates to the proposed continental congress led to a public meeting, July 6, 1774. Hamilton attended, and made a speech which first drew attention to him. Not long after he became a correspondent of "Holt's Journal," the organ of the New York patriots. A pamphlet having appeared attacking the proceedings of the continental congress, written by Samuel Seabury, afterward the first bishop of the American branch of the church of England, Hamilton replied to it in another pamphlet, written with so much ability that it was ascribed to Jay. This reply drew out an answer, to which Hamilton rejoined in a second pamphlet. These pamphlets, and another which he published in June, 1775, on the "Quebec Bill," gave him standing and consideration among the popular leaders. Meanwhile he had joined a volunteer corps, and applied himself to obtain information and instruction as an artilleryist. In March, 1776, though yet but 19 years of age, he obtained, on the recommendation of Gen. Schuyler, then in command of the northern department, a commission as captain in an artillery company raised by the state of New York. The main

body of the continental army, lately employed in the siege of Boston, had now arrived at New York, which it was expected would be the next object of attack. The mind of the young artillery captain was not, however, wholly absorbed in military matters; in the pay book of his company, which still exists, are notes which show that he was revolving in his thoughts the subject of currency, commerce, the collection of taxes, and other questions of political economy. In the campaign which followed, Hamilton bore an active part. It soon became necessary to abandon New York, and Washington retired to the upper part of the island on which that city stands. It was here that Hamilton, while employed in the construction of an earthwork, first attracted the attention of the commander-in-chief, who invited him to his quarters. Hamilton's artillery formed a part of the detachment of 1,600 men posted at Chatterton's hill, the attack upon which by the British is commonly known as the battle of White Plains. He shared in the retreat through New Jersey, and his guns helped to check the advance of Cornwallis, who with greatly superior force came upon the retreating troops as they were crossing the Raritan. He also took part in the battles of Trenton and Princeton, by all which hard service his company was reduced to 25 men. The spirit and ability of the young captain of artillery had not escaped notice. He had received invitations from two major generals to take a place in their staff. These he declined; but he accepted a similar offer from Washington, and on March 1, 1777, was announced in orders as aide-de-camp to the commander-in-chief with the rank of lieutenant colonel. What Washington most wanted in his aides-de-camp was competent assistance in the multifarious correspondence which he was obliged to carry on with congress, the governors of the states, the officers on detached service, and in regard to the exchange of prisoners and other subjects with the British commander-in-chief. He required somebody able to think for him, as well as to transcribe and to execute orders; and so much did he rely on Hamilton's judgment as to employ him, young as he was, in the most delicate and confidential duties. After the battles of Brandywine and Germantown, in which Hamilton took an active part, he was despatched on a confidential mission to Putnam and Gates, to hasten forward the reinforcements which those officers after the surrender of Burgoyne's army had been directed to send to Washington. These orders they had been in no hurry to execute, and it required a good deal of firmness on Hamilton's part to accomplish the object of his mission. He spent the following winter in the camp at Valley Forge. He was present at the battle of Monmouth, June 28, 1778, an attack which, in common with Greene, Wayne, and Lafayette, he had strongly favored, notwithstanding the opinion of Lee to the contrary. Of the challenge

which his fellow aide-de-camp Laurens sent to Lee, growing out of the incidents of that day, Hamilton was the bearer, and he acted as second to Laurens in the duel which followed. When Admiral D'Estaing arrived at Sandy Hook, Hamilton was sent by Washington to confer with him, and to make the arrangement which resulted in the attack on Rhode Island. His courtesy and tact made a very favorable impression on the French admiral. When in the autumn of the next year D'Estaing reappeared on the southern coast, Hamilton was again sent to express to him the views and wishes of Washington. He was at West Point at the time of the discovery of Arnold's treason, and strongly urged a compliance with André's last request to be shot. At the close of the year 1780 he married Eliza, the second daughter of Philip Schuyler, and by this alliance with a wealthy and influential family established for himself a permanent hold upon the state of New York. Shortly afterward he resigned his position as a member of Washington's staff. A rebuke from Washington which he thought unmerited was answered on the spot by a resignation, which he declined to withdraw, though Washington sent him an apology. But this separation did not interrupt their mutual confidence and esteem. He subsequently obtained a position in the line of the army as commander of a New York battalion, and in that capacity was present at the siege of Yorktown, where he led in the attack and capture of one of the British outworks, Oct. 14, 1781. The rest of the autumn and the winter he spent with his father-in-law at Albany, where he began to study law. After a few months' study he obtained at the July term of the supreme court, 1782, a license to practise. A few days later he was elected by the legislature of New York a delegate to the continental congress, and took his seat in November following. During the year that he sat in this body Hamilton bore an active part in the proceedings relating to the settlement with the officers of the army as to their half pay, the treaty of peace, and attempts to provide means of meeting the public debt. He had become fully satisfied of the necessity of giving increased authority to congress, and before his election had drafted a resolution which the New York legislature adopted, urging an amendment of the articles of confederation having that end in view. The city of New York having been evacuated by the British, he resigned his seat in congress, removed thither, and commenced the practice of the law. An act had been passed by the New York legislature just before, disqualifying from practice all attorneys and councillors who could not produce satisfactory certificates of attachment to whig principles; most or all the old city lawyers fell within this prohibition, which remained in force for three or four years, and enabled Hamilton and other young advocates to enter immediately on a run of practice which otherwise they might not have obtained so speedily.

There existed indeed in the New York legislature a very bitter feeling against the tories. Another act levelled against them, known as the "Trespass Act," gave occasion to a suit in which Hamilton early distinguished himself. This act authorized the owners of buildings in the city of New York, who had abandoned them in consequence of the British possession of the city, to maintain suits for rent against the occupants, notwithstanding the plea on their part that the buildings had been held under authority from the British commander. Being retained by the defendant in one of these suits, Hamilton made an elaborate plea, in which he maintained that whatever right might be given by the statute, the treaty of peace and the law of nations extinguished it. Though the popular sentiment was strongly against him, he prevailed with the court, whose decision was of the more consequence as there were many other cases depending on the same principle. The decision was denounced by a public meeting in the city; and the legislature, without waiting the result of an appeal, passed resolutions censuring the court. Hamilton defended his views in two pamphlets, and the spirit as an advocate and ability as a lawyer which he displayed in this case secured him at once a multitude of clients. He took an active part in establishing the bank of New York, the first institution of the kind in the state and the second in the Union, and was appointed one of its directors. He was one of the founders of the manumission society, the object of which was the abolition of slavery, then existing in the state of New York. By appointment of the state legislature he attended in 1786 the convention at Annapolis, and as a member of it drafted the address to the states which led to the convention the next year by which the federal constitution was framed. Having been chosen a member of the legislature of New York, he vainly urged the concession to congress of power to collect a 5 per cent. import duty, and the repeal of all state laws inconsistent with the treaty of peace. In the settlement of the long pending controversy between New York and Vermont, and the acknowledgment of the independence of Vermont by New York, he was more successful. Though the prevailing party in the New York legislature was little inclined to any material increase of the authority of the federal government, Hamilton was appointed one of the delegates to the convention to revise the articles of confederation, which met at Philadelphia, May 14, 1787. He had, however, two colleagues, Robert Yates and John Lansing, who together controlled the vote of the state, of decidedly opposite opinions. Two projects were brought forward in that body, one known as the Virginia plan, which contemplated the formation of a national government with an executive, legislature, and judiciary of its own, the basis of the constitution actually adopted; the other known as the New Jersey plan, which was

little more than an amendment in a few particulars of the existing confederation. In the course of the debate on these two plans, Hamilton delivered a very elaborate speech. As between the two plans, he preferred that which went furthest, though he doubted if even that was stringent enough to secure the object in view. He offered a written sketch of such a frame of government as he would prefer, not for discussion, or with the idea that in the existing state of public sentiment it could be adopted, but as indicating the mark to which he would desire to approach as near as possible. This scheme included an assembly to be elected by the people for three years; a senate to be chosen by electors chosen by the people, to hold office during good behavior; and a governor chosen also for good behavior by a similar but most complicated process. The governor was to have an absolute negative on all laws, and the appointment of all officers, subject to the approval of the senate. The governors of the states were to be appointed by the general government, and were to have a negative on all state laws. The power of declaring war and of ratifying treaties was to be vested in the senate. He insisted on the necessity of establishing a national government so powerful and influential as to create an interest in its support extensive and strong enough to counterbalance the state governments, and to reduce them to subordinate importance. Upon the adoption of the Virginia scheme his New York colleagues abandoned the convention in disgust. He too was absent for some time on business in New York, but returned again to the convention, and, though the constitution as reported by the committee of detail failed to come up to his ideas of energy and efficiency, he exerted himself to perfect it. He was one of the committee for revising its style and arrangement, and warmly urged its signature by the delegates present as the best that could be had. There still remained the not less serious and doubtful task of procuring for the constitution the consent and ratification of the states. The convention adjourned Sept. 17. On Oct. 27 there appeared in a New York journal the first number of a series of papers entitled "The Federalist," in support of the constitution against the various objections urged to it. These papers continued till the following June, reaching the number of 85, were republished throughout the states, and made a strong impression in favor of the new scheme of government. Five of them were written by Jay, fourteen by Madison, three by Madison and Hamilton jointly, and the rest by Hamilton. They are still read and quoted as a standard commentary on the ends and aims of the federal constitution and its true interpretation. In the convention of New York, of which Hamilton was a member, he sustained the constitution with zeal and success. The government having been put into operation under it, and congress at its first session having

passed acts reorganizing the executive departments, Washington in 1789 selected Hamilton as secretary of the treasury. At the ensuing session Hamilton presented an elaborate report on the public debt and the reestablishment of the public credit. That debt was of two descriptions, loans obtained abroad, and certificates issued for money lent, supplies furnished, and services rendered at home. As to the foreign debt, all agreed that it must be met in the precise terms of the contract. As to the domestic debt, the certificates of which had largely changed hands at a great depreciation, the idea had been suggested of paying them at the rates at which they had been purchased by the present holders. The report of the secretary took strong ground against this project. He considered it essential to the reestablishment of the public credit that the assignees of the certificates should be considered as standing precisely in the place of the original creditors; and the funding system which he proposed, and which was carried in the face of a strong opposition, was based on this idea. Another part of the system not less warmly opposed was the assumption of the debts contracted by the states in the prosecution of the late war. At the next session he proposed two other measures, both of which encountered a not less earnest resistance—an excise duty on domestic spirits, and a national bank with a capital of \$10,000,000. At the first session of the second congress Hamilton presented an elaborate report on the policy of having regard in the imposition of duties on imports to the protection of domestic manufactures, with an answer to the objections made against it—a summary of the arguments on that side of the question to which subsequent discussion has added little. The success of the funding system and the bank gave Hamilton a strong hold upon the moneyed and mercantile classes, but they also raised against him a very bitter opposition, which extended even to the cabinet, Mr. Jefferson, the secretary of state, strongly sympathizing with it. Both the funding system and the bank were denounced as instruments of corruption dangerous in the highest degree to the liberties of the people, and Hamilton as designing to introduce by their means aristocracy and monarchy. Charges of this sort, constantly iterated in a newspaper edited by a clerk in the state department, drew out from Hamilton a newspaper article under the signature of "An American," in which he charged upon Jefferson the instigation of these attacks, and urged the inconsistency of Jefferson's holding a place in an administration the policy of which he assailed. At the next session of congress a violent attack was made by Mr. Giles of Virginia upon the management of the treasury department. He moved nine resolutions of censure, but Hamilton sent in a triumphant reply, and the proceedings proved a total failure. The breaking out of the war between England and France in 1793, by raising new questions

as to the policy to be pursued toward the belligerents, aggravated the differences between Hamilton and Jefferson. Hamilton favored the policy of a strict and exact neutrality, and the right of the president to assume that position; and he defended his views in print under the signature of "Pacificus." Jefferson, finding Hamilton's influence predominant in Washington's cabinet on this question as on others, finally retired from it. The opposition to the excise law having proceeded in western Pennsylvania to the extent of armed resistance, it became necessary to call out a force to repress it; this operation was successfully conducted under Hamilton's eye in the autumn and winter of 1794. Having procured the adoption by congress of a system for the gradual redemption of the public debt, and finding his salary insufficient for his support, after six years' service, Hamilton resigned his office, Jan. 31, 1795, and resumed the practice of the law in New York. He still remained, however, a warm supporter of Washington's administration. On the question of the ratification of Jay's treaty, by which the country was soon after greatly shaken, he gave effectual aid to the president's policy of ratifying the treaty in a series of essays signed "Camillus." In the preparation of Washington's "Farewell Address," Hamilton's assistance was asked and given, precisely to what extent has been and still is a matter of controversy. About the time of Adams's accession to the presidency, the charges against Hamilton of misbehavior as secretary of the treasury were renewed in a new and aggravated shape. While Giles was hunting up matter for his abortive resolutions some opposition members of congress, of whom Monroe was one, had fallen in with two persons named Clingman and Reynolds, who intimated that they were in possession of secrets very damaging to Hamilton's character. By way of confirmation Reynolds exhibited some notes in Hamilton's handwriting as proving a confidential correspondence between them. Under the idea that they had discovered a connection between Reynolds and Hamilton for speculation in public securities, in which while at the head of the treasury Hamilton could not legally engage, Monroe and his companions waited upon Hamilton to ask an explanation. He speedily convinced them, by the production of other letters, that the correspondence between himself and Reynolds had grown entirely out of an intrigue with Reynolds's wife, into which he had been entrapped. Though Monroe and his associates admitted that their suspicions of official misconduct were wholly removed, Monroe preserved certain memoranda of their interview with Reynolds, Clingman, and Hamilton; and these, having come by some unexplained means into the hands of Callender, a pamphleteer of the opposition, were published, with the intimation (based on an opinion expressed by Clingman, in a conversation with Monroe after

the interview with Hamilton, Monroe's memorandum of which was not communicated to him) that the alleged intrigue was a falsehood invented by Hamilton and sustained by forged letters and receipts to cover up his illegal stock speculations. After a sharp correspondence with Monroe, whose explanations as to his memorandum and the credit he attached to it were not satisfactory, Hamilton published a pamphlet containing not only the correspondence with Monroe, but that also which he had exhibited to Monroe and his associates; a step into which he considered himself forced by the position assumed by Monroe. The difficulties with France consequent upon the ratification of Jay's treaty soon reached a point little short of war. A French invasion was apprehended. In the summer of 1798 additions were made to the regular army, further additions were provisionally authorized, and Washington was appointed commander-in-chief with the title of lieutenant general. He accepted with the understanding that he should not be called into active service except in the event of hostilities, and on the condition that Hamilton should be major general, thus throwing upon him the details of the organization of the army. While thus engaged Hamilton wrote in defence of the policy which had led to these military preparations. On the death of Washington, Dec. 14, 1799, Hamilton succeeded to the command in chief; but satisfactory arrangements having been made with France, the army was soon disbanded and he resumed the practice of law in New York. The appointment made by Adams, in September, 1799, of a new embassy to France contrary to the advice of his cabinet, was strongly disapproved by the more ardent federalists, and among others by Hamilton. This produced a breach in the federal party; but Hamilton and his friends, considering the strong influence of Adams in New England, could not venture openly to oppose his reelection as president. The most they could do was to endeavor by a secret understanding to secure a greater number of votes for the other candidate who might be placed on the federal ticket; candidates being voted for, as the constitution then stood, without designating whether for president or vice president, the first office falling to him who had the highest vote. Whether the federalists would be able to command a majority of the electoral votes seemed likely to depend on the political complexion of the legislature of New York, and that in its turn on the character of the delegation from the city of New York. To secure that delegation, Hamilton on the one side and Aaron Burr on the other made every possible exertion. Burr, who was a master of the arts of political intrigue, succeeded in carrying the day. Shortly after this election the breach in the federal party became fully apparent. Adams dismissed the chief members of his cabinet, whom he accused of being under Hamilton's influence and belonging with him to a British faction. Hamilton in his turn

printed a severe criticism on Adams's political character, intended for private circulation among the leading federalists, but of which the publication became necessary in consequence of extracts from it which found their way into some of the opposition newspapers. The presidential election went against the federalists, but the result showed an equal vote for Jefferson and Burr. The federalists in the house of representatives (to which body it fell to decide between them), being strong enough to control or neutralize the vote of half the states, favored the election of Burr; but Hamilton, who entertained a very unfavorable opinion of Burr, remonstrated strongly against this attempt to make him president. In the trial in 1803 of Croswell for an alleged libel on Jefferson, he supported the doctrine that to publish the truth is no libel. The court charged against him, and the jury gave an adverse verdict; but the doctrine which he maintained was adopted by the legislature in 1805, and has since prevailed throughout the United States. Burr, having lost the confidence of his party, and being unable to obtain a renomination as vice president, sought to be elected governor of New York. He hoped to receive the support of the federalists, then in a minority and unable to elect any candidate of their own. Hamilton's opinion of Burr had undergone no change, and at a federal caucus he warmly opposed the project of supporting him for governor. He took no active part in the election, but his opinions were frequently quoted by those who did. Burr was defeated by Morgan Lewis, as he believed, through Hamilton's instrumentality, and became eager for vengeance. He called on Hamilton to disavow having used pending the election any expressions derogatory to his personal honor, and finally challenged him. This challenge was accepted by Hamilton, but not in the spirit of a professed duellist. The practice of duelling he utterly condemned; indeed, he had himself already been a victim to it in the loss of his eldest son, a boy of 20, in a political duel in 1802. This condemnation he recorded in a paper which under a premonition of his fate he left behind him. It was in his character of a public man that he accepted the challenge. "The ability to be in future useful," such was his own statement of his motives, "whether in resisting mischief or affecting good in those crises of our public affairs which seem likely to happen, would probably be inseparable from a conformity with prejudice in this particular." The meeting took place, July 11, 1804, at Weehawken on the Hudson opposite New York, and at the first fire Hamilton received a wound of which he died the next day.—The object alike of bitter hatred and of the warmest admiration, Hamilton enjoyed among his contemporaries, both friends and foes, a reputation for extraordinary ability, which he still retains. He was under the middle size, thin in person, and very erect, courtly, and dignified in his

bearing. His figure, though slight, was well proportioned and graceful. His complexion was very delicate and fair, his cheeks rosy, and the whole expression pleasing and cheerful. His voice was musical, his manner frank and cordial. He excelled equally as a writer and a speaker. His widow survived him 50 years, having died in 1854 at the age of 97. His son John C. Hamilton wrote his life (2 vols. 8vo, 1834-'40), edited his works from MSS. in the state department (7 vols., 1851), and also compiled an elaborate work in several volumes under the title of "History of the Republic of the United States, as traced in the Writings of Alexander Hamilton and his Contemporaries" (1850). See also "A Collection of Facts and Documents relative to the Death of Major General Hamilton," by W. Coleman (1804); "Official Reports" (1810); his life by James Renwick (1841); "Official and other Papers," edited by Francis L. Hawks (1842); and "Hamilton's Conduct as Secretary of the Treasury Vindicated," by J. A. Hamilton (1870).

**HAMILTON, Count Anthony,** a French writer, born in Ireland about 1646, died at St. Germain-en-Laye in 1720. He belonged to an illustrious Scotch family, and on the death of Charles I. was taken to France, where he received his education. On the restoration of Charles II. he returned to England, and was presented at court, but, being a Catholic, received no official appointment. James II. gave him the command of an infantry regiment in Ireland and the government of Limerick. In 1688 he accompanied the exiled king to France, and remained one of his faithful courtiers. During this period he wrote his spirited works, which still hold a place in French literature. The best known, *Les mémoires du comte de Gramont* (1713), is a narrative of the licentious life of his brother-in-law, and a faithful picture of the court of Charles II. of England. He left also a series of tales, written to burlesque the then recently published "Arabian Nights:" *Le bétier*, *Fleur d'épine*, *Les quatre Facardins*, and *Zénéide*, first published in 1749, and several miscellaneous light poems. The *Mémoires* have been frequently translated in England, one of the best editions being that published by Bohn with notes and illustrations by Sir Walter Scott, and including the personal history of Charles and the Boscobel tracts (1853). Hamilton's tales, under the title of "Fairy Tales and Romances," have also been translated into English (1849). The best French edition of his complete works is by Renouard (3 vols., Paris, 1812).

**HAMILTON, Elizabeth,** an Irish authoress, born in Belfast, July 25, 1758, died at Harrogate, England, July 25, 1816. She spent considerable time in Scotland, as governess in the family of a Scottish nobleman, and some of her most interesting works sprang from the friendships which she formed and the observations which she made in that country. Among these are her "Letters on the Formation of Religious

and Moral Principle" (2 vols. 8vo, London, 1806), addressed to the eldest of her pupils, and her "Cottagers of Glenburnie" (1808), a tale illustrative of the habits of the Scottish peasantry of that day. The most important of her other works are: "Letters of a Hindoo Rajah, written previous to and during the Period of his Residence in England" (2 vols., 1796), a fictitious work describing English manners; "Memoirs of Modern Philosophers" (3 vols., Bath, 1800); "Letters on the Elementary Principles of Education" (2 vols., 1801-'2); "Memoirs of the Life of Agrippina the Wife of Germanicus" (2 vols., London, 1811); and "Popular Essays on the Understanding, Imagination," &c. (2 vols., 1845).

**HAMILTON, Gail.** See supplement.

**HAMILTON, Gavin,** a Scottish artist, born at Lanark about 1730, died in Rome in 1797. He studied in Rome, and spent the latter part of his life exploring the neighborhood for ancient monuments and statues, which he bought and sold, and of which he made a large and valuable collection, now in the Towneley gallery of marbles in the British museum. He published "The Italian School of Painting," with 40 superb plates (fol., London, 1773).

**HAMILTON, James,** an American statesman, born in Charleston, S. C., May 8, 1786, drowned at sea near the coast of Texas, Nov. 15, 1857. He was educated for the bar, but entered the army and served as a major in the Canadian campaign of 1812, and afterward resumed the practice of the law. For several successive years he was mayor of Charleston, and he was active in the detection of a formidable conspiracy in 1822 among the negro population, led by Denmark Vesey, a free mulatto from Hayti. In the same year he was elected to the state legislature, and was also chosen a representative in congress, where he became prominent by his opposition to the protective system. While in congress he acted as second to John Randolph in his duel with Henry Clay. He was also second to Gov. McDuffie in his duel with Col. Cummings. Jackson, on his election as president in 1828, offered him the post of secretary of war, and afterward that of minister to Mexico, with authority to negotiate the annexation of Texas, both of which he declined. In 1830-'32 he was governor of South Carolina, and recommended to the legislature the passage of the nullification act, which he supported in numerous essays and speeches. His successor, Gov. Hayne, appointed him to the command of the state militia. Some time afterward he became interested in the affairs of the republic of Texas, and in 1841 was her minister to England and France, where he procured the recognition of her independence; and in 1845 he was active in aiding her admission to the Union. On the death of Calhoun in 1850, he was appointed his successor in the United States senate, but for domestic reasons he declined the office. He had expended his fortune in the service of

Texas, and was on his way thither to seek indemnification, when he perished in a collision of steamboats, having yielded his own chance of safety to a lady to whom he was a stranger. At the time of his death he was United States senator elect from Texas.

**HAMILTON, James.** See supplement.

**HAMILTON, Robert,** a Scottish mathematician born in Edinburgh about 1742, died in Aberdeen, July 14, 1829. In 1766 he became so favorably known as a mathematician that, although but 23 years of age, he was induced to offer himself as a candidate for the mathematical professorship of Marischal college, Aberdeen. He was unsuccessful in this instance, but three years later was appointed rector of the academy at Perth. In 1779 the chair of natural philosophy in Marischal college was presented to him, and the year after he exchanged it for the professorship of mathematics. His "Inquiry concerning the Rise and Progress, the Redemption and Present State, and the Management of the National Debt of Great Britain" (1813), was the first important attempt to overthrow the sinking fund system, which had for many years been considered an axiom in financial science. Hamilton's views were subsequently adopted by the eminent political economists of the day. His remaining works are: "Introduction to Merchandise" (2 vols. 8vo, Edinburgh. 1777-'9); "Arithmetic and Bookkeeping" (London, 1788); "The Progress of Society," a posthumous work (1830); essays on "Peace and War," "Rent," &c.

**HAMILTON, William,** a Scottish poet, born at Bangour, Ayrshire, in 1704, died in Lyons, France, March 25, 1754. He was living a life of literary leisure when the young pretender raised the standard of revolt in 1745. He at once joined the cause, and celebrated the victory of Preston Pans in his stirring ode "Glads-muir." After the battle of Culloden he fled to the highlands, and made his escape to France. His friends soon procured a royal pardon for him, and he returned to Scotland; but he soon went to southern France on account of his health, and for several years previous to his death he resided at Lyons. His ballad of "The Braes of Yarrow" is the best known of his effusions. A pirated edition of his poems first appeared in Glasgow (1748); after his death a complete edition was printed from his own manuscripts (Edinburgh, 1760).

**HAMILTON. I.** Sir William, a British antiquary, born in Scotland in 1730, died in London, April 6, 1803. He was of good family, and a foster brother of George III., but poor, beginning life, as he said, with £1,000. In 1755 he married a wealthy lady, and was enabled to pursue his favorite studies in art, natural philosophy, and literature. In 1764 he was appointed English ambassador to Naples, and from his arrival in that country applied himself to collecting and illustrating the art relics with which it abounds. He was among

the first of those to whom the British public are indebted for a comprehensive knowledge of Greek, and especially Etruscan antiquities, having made a large collection, which was purchased for the British museum. He lost his wife in 1782, and in 1784 made a voyage to England, to hinder his nephew from marrying Emma Harte; he himself, however, took her back to Italy and privately made her his wife, but did not publicly present her as such till 1791, in which year he was appointed privy councillor. In 1793 he effected a treaty of alliance between the courts of St. James's and Naples, but much of the political management at the latter court in those eventful times is attributed to the influence of his wife and Lord Nelson. He contributed largely toward aiding Father Piaggi in unrolling manuscripts found in Herculaneum. He was recalled to England in 1800, at which time he lost by shipwreck a large collection of antiques, of which however drawings were preserved and published. A claim of Sir William on the British government for special services was disallowed, and he died in comparative poverty. His works are: *Antiquités étrusques, grecques et romaines, tirées du cabinet de M. Hamilton* (4 vols. fol., Naples, 1766); "Observations on Mount Vesuvius, Mount Etna," &c. (London, 1772); *Campi Phlegrei* (2 vols. fol., Naples, 1776-'7, with supplement in 1779 giving an account of the eruption of Vesuvius); and *Lettera sul Monte Volture* (Naples, 1780). Ten of his papers upon various Italian subjects were published in the "Philosophical Transactions" (1767-'95).

Many of the marbles of the Towneley gallery in the British museum were collected by him. **II. Emma Lyon,** alias HARTE, afterward Lady Hamilton, wife of the preceding, born according to some in Wales, according to others in Cheshire, about 1760, died near Calais, France, in 1815. She was the illegitimate child of a servant girl, and at the age of 13 was employed to take care of the children of a brother-in-law of the engraver Boydell. When 16 years old she was shop girl for a mercer in London, and afterward chambermaid to a lady of rank. She then became waiter in a tavern frequented by literary men, painters, actors, and artists. While here, learning that a young sailor, her cousin, had been pressed into the navy, Emma went to his captain, John Willett, to beg for his release. The captain let the cousin go, but kept the girl as his mistress. This illicit union continued for several years, during which time she acquired an excellent education. Willett, eventually becoming weary of the connection, gave her to a friend, who however quarrelled with her at the end of a month and left her in extreme poverty. A noted quack named Graham had contrived a bed of Apollo, or "celestial bed," on which, in a delicately colored light, an exquisitely beautiful woman, nearly naked, was gradually unveiled to soft music as Hygiea, the goddess of health. Graham engaged Emma for the part of the goddess, in

which she created a great sensation. Among her many conquests she soon made that of Charles Greville, of the ancient family of Warwick. By him she had three children, and fascinated him to such a degree that he determined to marry her, and would have done so but for the opposition of his uncle, Sir William Hamilton. But so soon as the latter beheld her, he in turn was fascinated. A contract was now made between uncle and nephew by which it was agreed that Emma should be transferred to the former, and that he should pay the debts of his nephew. At first his mistress, she soon blinded her new lover so completely as to become his wife, and was presented as such by him to Queen Caroline of Naples in 1791, by whom she was received into intimacy and confidence. Her extraordinary talents for political as well as personal intrigue here found a wide field for action. She soon formed an illicit connection with Lord Nelson, which her husband for expediency's sake tacitly encouraged. At this time the kingdom of Naples was critically situated, a French invasion being dreaded, while on the other hand fears were entertained lest England should ruin its trade. Charles IV. of Spain having written to his brother, the king of Naples, violently accusing the English, this letter was shown by the queen to Lady Hamilton, by whom it was sent to the British cabinet. The result was that England attacked the Spaniards, and a vast loss of lives and of treasure to the latter was caused by the violated confidence. In 1798 the arrival of the French suddenly interrupted the festivities in honor of Nelson's victory at Aboukir. A panic ensued, and the royal family, with Sir William and Lady Hamilton, took refuge in Nelson's ship, which conveyed them to Palermo. When the court returned to Naples, merciless vengeance was taken on revolutionists and liberals, and of this Lady Hamilton availed herself to punish personal enemies, Nelson's violent measures, contrary to the articles of capitulation, having been incited by her. Having returned with her husband to England, Lady Hamilton found herself generally despised on account of her relation to Nelson, who had resigned his command to enjoy her society. In England she gave birth to a daughter, whom she named Horatia Nelson, and resided at a country seat which Nelson had given her. After the death of her husband, and especially after that of Nelson in 1805, she was destitute, and left England for France, where she died in want and misery. Her daughter Horatia married a poor clergyman, and some funds were raised by subscription for the benefit of their children.

**HAMILTON, Sir William**, a Scottish philosopher, born in Glasgow, March 8, 1788, died in Edinburgh, May 6, 1856. At the university of Glasgow he took a high position in the classes, and carried off the first prizes in philosophy. From Glasgow he went to Balliol college, Oxford, where candidates for honors

were required to profess a certain number of books in history, poetry, and science. In going up for his degree, he not only took with him into the schools far more than the usual average of books in poetry and history, but in science he professed all the works extant in Greek and Roman philosophy, including the whole of Aristotle and all the works of his earlier commentators, all of Plato, the Neo-Platonists, Proclus, and Plotinus, and the fragments of the earlier and later philosophical doctrines preserved by Laërtius, Stobæus, and the other collectors. His examination in philosophy occupied two days, running through six hours each day. In 14 of his books on Greek philosophy he was not questioned, the greater part of these being declared by the masters to be too abstrusely metaphysical for examination. At this time also he had studied the earlier modern philosophers and become interested in the speculations of contemporary metaphysicians on the continent. He was admitted to the bar at Edinburgh in 1813, and began to practise as an advocate; but his time was given more to philosophical studies than to his profession. In 1816 he established his claim to a dormant baronetcy. In 1820 he was a candidate for the chair of moral philosophy in the university of Edinburgh; but his competitor John Wilson, being a tory, was elected. In 1821, by appointment of the faculty of advocates, Hamilton delivered in the university a short course of lectures on the character and history of the classic nations of antiquity. At this time phrenology was exciting especial interest in Edinburgh. For the purpose of testing its pretensions Sir William went through a laborious course of comparative anatomy, dissecting with his own hands several hundred different brains. He sawed open a series of skulls of different nations, of both sexes and all ages, to ascertain the facts in regard to the frontal sinus on which the phrenologists had founded so much. He also instituted a series of experiments for ascertaining the relative size and weight of brains. The results of these investigations were embodied in two papers which he read before the royal society of Edinburgh in 1826, maintaining that the assertions of fact by the phrenologists were utterly false. In 1829 he contributed to the "Edinburgh Review" a powerful article against the German doctrine of human omniscience, as set forth after Schelling and Hegel, though in modified form, in the lectures of Victor Cousin. This was followed by other contributions to the same review, two of which are particularly celebrated, "On the Philosophy of Perception" and "On Recent Publications in Logical Science." Many of these articles were translated into foreign languages, and in 1852 all of them were published collectively, edited by their author with notes and appendices, under the title "Discussions in Philosophy and Literature, Education, and University Reform" (enlarged ed., 1854; re-

published, with an introductory essay by Robert Turnbull, D. D., New York, 1855). In 1836 Sir William was elected professor of logic and metaphysics in the university of Edinburgh; and then began a new era in his life and in the academical life of Scotland. He entered upon his professorship with every qualification. His personal appearance was the very finest. Above the middle height, of a sinewy and well compacted frame, with a massive head, decisive and finely cut features, a dark, calm, piercing eye, perfect self-possession and reliance, finished courtesy of manners, and a voice remarkably distinct, silvery, and melodious, he stood before his hearers the perfection of a man in every physical adornment. "Whatever," says Mr. Baynes, his class assistant, "the previous expectations of Sir William's appearance might be, they were certainly realized if not surpassed; and however familiar one might afterward become with the play of thought and feeling on that noble countenance, the first impression remained the strongest and the last—that it was perhaps altogether the finest head and face you had ever seen, strikingly handsome, and full of intelligence and power. When he began to read, Sir William's voice confirmed the impression his appearance and manner had produced. It was full, clear, and resolute, with a swell of intellectual ardor in the more measured cadences, and a tone that grew deep and resonant in reading any striking extracts from a favorite author, whether in prose or poetry—from Plato or Pascal, Lucretius or Virgil, Scaliger or Sir John Davies, whose quaint and nervous lines Sir William was fond of quoting." He had methodized all his views on logic and metaphysics, and in his lectures he now put them into an admirable form for academic instruction. He disciplined his pupils by severe examinations and in the writing of essays, which excited the most intense mental activity. In 1846 Sir William published his edition of Reid's works, which was undertaken ten years before, as a book for the use of his class. It made a profound impression in Scotland, and Lord Jeffrey, in a letter to the editor of the "Edinburgh Review," expressed his admiration of "the immensity of its erudition, its vigor, completeness, and inexorable march of ratiocination." His last literary labor was an edition of the works of Dugald Stewart, in nine volumes, with a life of Stewart by Mr. John Veitch, one of his pupils. For ten years he had been enfeebled by a severe paralysis, but had never relaxed his labors as a teacher, and only lessened them as an author. He finished his lectures of the session of 1855 and 1856, and distributed the prizes to his class; and after an illness of ten days he died at his residence in Great King street.—As a metaphysician Hamilton stands among the greatest. His disquisition on the *Epistole Obscurorum Virorum* gave an example which astonished even the Germans; his polemic against phrenology, in the several papers

appended to the first volume of his "Lectures," is a wonder of experimental sagacity; and his immense erudition has quickened the scholarship of the world. The most important of his writings, next to those on philosophy, are his papers on educational reform. In one of these he made a powerful attack on Whewell's theory that mathematics is a better logical discipline than logic itself. Sir William Hamilton's philosophy, though it professes to be little more than an elucidation and elaboration of Reid's, is universally recognized and treated as his own. It accepts consciousness as an infallible witness, and therefore declares, in opposition both to idealism and to the doctrine of representative perception, that there is in reality an external world, and that we have an immediate perception of that world; it teaches also that the highest speculation is within the comprehension of this philosophy of common sense, and that there is a moral universe, known to us through our moral nature, which implies a moral order and a moral governor of all.—Many of Hamilton's notes are included in the abridgment of Reid's "Essays on the Intellectual Powers" by Dr. James Walker (Cambridge, 1850). A selection from his writings by O. W. Wight, entitled "The Philosophy of Sir William Hamilton," was published in New York in 1853, and "Metaphysics of Sir William Hamilton," edited by Prof. Francis Bowen, in Cambridge in 1861. A selection of his academical lectures, edited by Mansel and Veitch, was published in 4 vols. in 1859-'61.—See "Memoir of Sir William Hamilton," by John Veitch (Edinburgh, 1869), and "Examination of the Philosophy of Sir William Hamilton," by John Stuart Mill (2 vols., London, 1865).

**HAMILTON, William Gerard**, an English statesman, born in London in January, 1729, died there, July 16, 1796. He was educated at Westminster school and Oxford university, and in 1754 entered parliament as member from Petersfield, Hampshire. On Nov. 13 of the succeeding year he delivered the famous speech which earned him his well known sobriquet of "Single-Speech Hamilton." Of this speech no copy was ever taken. Contrary to the belief long entertained that this was his solitary oratorical effort, he spoke again in parliament in the succeeding February, and afterward at least twice in the Irish parliament. From 1761 to 1784 he held office in Ireland as principal secretary of the lord lieutenant and as chancellor of the exchequer. A posthumous work by him was published by Malone, entitled "Parliamentary Logic" (London, 1808).

**HAMILTON, William Richard**, an English archæologist, born Jan. 9, 1777, died July 11, 1859. His university education was interrupted by ill health. In 1799 he became secretary to Lord Elgin in the embassy to Constantinople. He secured for the British museum the celebrated trilingual Rosetta stone, which, undaunted by the plague which had broken out among the crew, he seized on board of the ship

where the French had concealed it, and sent to London in 1802. He displayed the same zeal in regard to the Elgin marbles; having been on board of the vessel on which part of them were shipwrecked near Cerigo, he remained in that island several months, and with the assistance of skilful divers succeeded in rescuing those famous works of art from the sea. Soon after his return to England he published "*Ægyptiaca*, or some Account of the Ancient and Modern State of Egypt" (royal 4to, London, 1810). From 1810 to 1822 he was under secretary of state for foreign affairs, and afterward was ambassador at Naples. While in Paris with Lord Castlereagh in 1815 he succeeded in bringing about the restoration to Italy of the works of art which the French had seized on various occasions.

**HAMILTON, Sir William Rowan**, a British philosopher, born in Dublin, Aug. 4, 1805, died at Dunsink, near Dublin, Sept. 2, 1865. He gave early indications of extraordinary intellectual powers, and when 13 years old he was in different degrees acquainted with 13 languages, including French, Italian, Spanish, German, Syriac, Persian, Sanskrit, Hindostanee, and Malay. At 14 years of age he addressed a letter of greeting in the Persian language to the Persian ambassador, Mirza Abu Hassan Khan. Falling in with a Latin copy of Euclid when 10 years old, he soon became interested in geometry, and at 12 he was fully confirmed in his taste for algebra. He studied the *Arithmetica Universalis* and the *Principia* of Newton, and the *Mécanique céleste* of Laplace, while in his 18th year, and about the same time entered upon his investigations in optics. In 1823 he entered the university of Dublin, where he at once gained the first place, and at every quarterly examination obtained the chief honor in science and the classics. In 1827, while still an undergraduate, he was appointed Andrews professor of astronomy in the university and astronomer royal of Ireland. In 1837 he was elected president of the royal Irish academy. The honor of knighthood was conferred upon him at the meeting of the British association for the advancement of science at Dublin in 1835, when Hamilton held the post of secretary and delivered the annual address. He engaged in numerous investigations on scientific subjects, published in the "Transactions" and "Proceedings" of the royal Irish academy and royal society, in the "Proceedings" of the British association, in the "London and Edinburgh Philosophical Magazine," &c. In 1828 he published in the "Transactions" of the royal Irish academy an "Essay on the Theory of Systems of Rays," which accomplished for optics what Descartes has done for geometry and Lagrange for mechanics; that is, the application of algebra, including the differential calculus, to those problems in the science of optics which spring from the hypothesis of transverse vibrations, or what is more generally called the undula-

tory theory of light. By a peculiar analysis, developed in this theory, he generalized the most complicated cases of common geometrical optics; and his prediction of the most singular and critical of all the results of Fresnel's theory, the conical refraction in biaxial crystals, amply rewarded his labors. Dr. Lloyd, of Trinity college, Dublin, verified this result in the case of aragonite, which is a biaxial crystal; he found the position, dimensions, and conditions of polarization of the emerging cone of light to be exactly such as Hamilton's prediction assigned. Airy has designated it as "perhaps the most remarkable prediction that has ever been made." For this discovery Sir William received the Cunningham gold medal from the royal Irish academy, and the royal gold medal of King William IV. from the royal society of London. In 1834 he published two papers in the "Philosophical Transactions" of the royal society, "On a General Method in Dynamics, by which the study of the motions of all free systems of attracting or repelling points is reduced to the search and differentiation of one central relation or characteristic function." The most elaborate of Hamilton's writings is his "Method or Calculus of Quaternions" (8vo, Dublin, 1853), which formed the subject of successive courses of lectures delivered in 1848 and subsequent years at Trinity college. He aimed in this to show that "expressions which seem, according to common views, to be merely symbolical and quite incapable of being interpreted, may pass into the world of thoughts, and acquire reality and significance, if algebra be viewed, not as a mere art or language, but as the science of pure time." The fundamental geometrical view, adopted and developed in the "Lectures," is that according to which a quaternion is considered as the quotient of two directed lines in tridimensional space; and the motive (in this view) for calling such a quotient a quaternion, or the ground for connecting its conception with the number four, is derived from the consideration, that while the relative length of the two lines compared depends only on one number, expressing their ratio, their relative direction depends on a system of three numbers—one denoting the angle between the two lines, and the two others determining the aspect of the plane of that angle, or the direction of the axis of the positive rotation in that plane. His "Elements of Quaternions" appeared in 1866.

**HAMILTON COLLEGE**, an institution of learning at Clinton, Oneida co., N. Y., 9 m. S. of Utica. Its origin is due to the generosity of the Rev. Samuel Kirkland, who was a missionary for more than 40 years among the Oneida Indians, and died in 1808. In 1793 the "Hamilton Oneida Academy" was incorporated through the influence of Mr. Kirkland, who presented its trustees with the title deed to several hundred acres of land. This academy existed 18 years, and was very prosperous. With the rapid growth of settlements in its

neighborhood, the demand grew up for a higher institution, and Hamilton college was chartered in 1812. Dr. Azel Backus, a Congregational clergyman, distinguished in Connecticut as a preacher and scholar, was chosen the first president. He died in 1817, and his successor, Dr. Henry Davis, resigned in 1833. The third president, Dr. Sereno E. Dwight, a son of Timothy Dwight, president of Yale college, held the office two years, and the fourth, Dr. Joseph Penney, four years. Dr. Simeon North, a graduate of Yale college, was chosen president in 1839, after holding the classical professorship ten years. He was succeeded in 1858 by Dr. Samuel W. Fisher, also of Yale college. The seventh president, Dr. Samuel Gilman Brown, an alumnus of and for many years a professor in Dartmouth college, was elected in 1866.—The course comprises four years, at the end of which the degree of bachelor of arts is conferred. The academic year is divided into three terms of about 13 weeks each. Applicants for admission must be at least 15 years of age, and must pass an examination in Greek, Latin, mathematics, and the common English branches. In 1873-'4 there were 10 professors besides the president and college pastor, and 152 students. There are between 1,700 and 1,800 names upon the triennial catalogue. The law department was endowed by William H. Maynard, and has recently been enriched by the valuable law library bequeathed to it by William Curtis Noyes. The agricultural department was endowed by the late Silas D. Childs of Utica. The Litchfield observatory, endowed by E. C. Litchfield of Brooklyn, N. Y., and under the charge of Prof. C. H. F. Peters, who has discovered 20 asteroids here, has an equatorial telescope with an object glass 13.5 inches in diameter and a focal length of nearly 16 feet. Geological and mineral cabinets and collections in natural history are connected with the college, embracing more than 17,000 specimens. There is also an extensive collection of North American plants made by the late Dr. H. P. Sartwell. The college library contains more than 12,000 volumes. A new library building, capable of holding 60,000 volumes, has recently been erected at a cost of \$45,000. Under the same roof is also a memorial hall and art gallery, to contain tablets, portraits, and other memorials of the friends of the college. The college grounds comprise 45 acres, on which are grouped three four-story stone buildings devoted to lodging and recitation rooms, chapel, boarding house, hall for collections in natural history, gymnasium, chemical laboratory, observatory, library hall, and president's house. The real estate and collections are valued at \$300,000, and there are besides productive funds amounting to more than \$250,000.

**HAMLET**, or **Amleth**, a prince of Denmark, whose name occurs in the mediæval histories, particularly that of Saxo Grammaticus, although nothing is known of the period when

he lived; some place it as early as five centuries B. C., others as late as A. D. 700. According to Saxo Grammaticus, in his *Danorum Regum Heroumque Historia*, published in 1514, Hamlet was the son of Horvendill, hereditary prince of Jutland, and of Gerutha, daughter of Roric, 15th king of Denmark after Danus. His story was republished with some modifications by a French writer named Belleforest, whose work, translated into English with the title of "Historye of Hamblet," undoubtedly fell under the eye of Shakespeare, who made it the basis of his "Hamlet," though with many alterations and additions. According to some historians, Hamlet was king of Denmark for several years; but many modern authorities suppose that no such person ever existed.

**HAMLIN**, an E. county of Dakota, recently formed and not included in the census of 1870; area, 720 sq. m. It is intersected by the Big Sioux river, and contains several lakes. The surface is mostly table land.

**HAMLIN**, **Hannibal**, an American statesman, born at Paris, Maine, Aug. 27, 1809. He was admitted to the bar in 1833, and continued to practise till 1848. In 1836 he was elected a member of the legislature, of which he was speaker from 1837 to 1840. In 1842 he was elected to congress as a democrat, and reelected in 1844; and in 1848 he was chosen to fill a vacancy in the United States senate, and in 1851 was elected for a full term of six years. In 1856 he withdrew from the democratic party, and was elected by the republicans governor of Maine; but he resigned that office on being reelected senator. In 1860 he was elected vice president of the United States. In 1865 he was appointed collector of the port of Boston, but soon resigned; and in 1869 he was again elected United States senator for the term expiring March 4, 1875.

**HAMLIN**, **Leonidas Lent**, an American clergyman, born in Burlington, Conn., May 10, 1797, died at Mt. Pleasant, Iowa, March 23, 1865. He was educated for the ministry of the Presbyterian church, but subsequently studied law, and was admitted to the bar at Lancaster, Ohio, in 1827. In 1830 he joined the Methodist Episcopal church, entered the ministry, and in 1840 was elected by the general conference assistant editor of the "Western Christian Advocate" (Cincinnati) and first editor of the "Ladies' Repository." He was a delegate to the general conference of 1844, when the slavery agitations resulted in the division of the church. Mr. Hamline was one of the committee of pacification or conference, and also was appointed upon the committee of nine to whom was intrusted the preparation of a plan of separation, and was himself the author of that plan. The argument which he then made on the right of the general conference to depose a bishop from office, for such good and sufficient reasons as it may determine, embodied the constitutional principles that have generally been accepted by the Methodist Episcopal church from that

time. At the same conference he was elected bishop, in which office he continued till 1852, when he resigned on account of ill health, in accordance with a principle that he had powerfully advocated in 1844, viz., that the episcopacy of the Methodist Episcopal church is not an order, but an office. From 1856 he resided at Mt. Pleasant. Bishop Hamline's writings are largely devoted to the defence and illustration of the Wesleyan doctrine of sanctification. A collection of them has been made by the Rev. F. G. Hibbard, D. D. ("Works," &c., 2 vols., New York, 1871), who had previously edited a volume of his sermons (Cincinnati, 1869).—See "Life and Letters of L. L. Hamline, D. D.," by W. C. Palmer (New York, 1868).

**HAMM**, a city of Westphalia, Prussia, at the junction of the Ahse with the Lippe, 20 m. S. S. E. of Münster; pop. in 1871, 16,914. As a point of military importance it suffered much during the thirty years' war. It was bombarded in 1761 and 1762 by the French, and dismantled in 1763. The old walls have been levelled and a promenade constructed in their place. It contains four churches, a gymnasium, manufactories of linen and other goods, tanneries, and a considerable trade. It is a central railway station between Hanover and Cologne.

**HAMME**, a town of Belgium, in the province of East Flanders, on the Durme, near its junction with the Scheldt, 17 m. E. by N. of Ghent; pop. in 1867, 10,142. The inhabitants are engaged in rope making and ship building, and there is a considerable trade in cloth and flax. In the neighborhood interesting antiquities have been discovered.

**HAMMER**, a tool for communicating force by impact. There are three varieties, those which are moved by the arm, those which are moved by their own gravity, and those which are moved by compressed steam or other power. The two latter kinds are called power hammers. The first kind comprises small or hand hammers, and sledges. The hand hammer consists of a head, to give momentum, and a small helve or handle fitted into an eye, which is usually in the middle of the head. Their weight varies from an ounce to one or two pounds. Sledges are large hammers, to be wielded by both arms, and vary in weight from 2 to 20 lbs. Large wooden hammers, bound with iron, used by woodsmen in driving wedges, are called beetles; smaller wooden hammers are called mallets.—Power hammers are of various forms, moved by water, steam, and sometimes by horse power. The common forge hammer is made of a heavy head of iron, 5 to 10 tons in weight, faced with steel, and having a helve of cast or wrought iron, or wood, the centre of motion being at the end of the helve. The hammer is raised by cams upon a wheel, the lifting force being applied near the head. The force of the blow is the momentum attained by the mass in falling through a height of from 16 to 24 in. The speed is usually from 50 to 100 strokes per

minute. Tilt hammers have much the same construction as the common forge hammer, except that the head is raised by depressing the opposite end of the helve by a cam wheel, as represented in fig. 1, the centre of motion being between the head and the point of application of power. They are lighter and move with greater rapidity, and are used for lighter kinds of work. Both kinds must be substantially supported by solid foundations. The steam forge hammer, in which steam is used as a propelling force to the hammer, patented by Mr. Nasmyth of England in 1842, and also by M. Creusot of France in the same year, is a much more efficient machine. Nasmyth's hammer is the one generally known. The hammer head is fixed to the end of a massive piston rod working vertically in a high-pressure steam cylinder, placed above, the whole being held in a strong iron frame having two standards. The hammer block weighs many tons, and must rest upon very strong and solid foundations, common to the whole. The lift or stroke of the hammer is from 5 to 9 ft., depending upon the size of the machine. The momentum will of course vary with the steam

FIG. 1.—Tilt Hammer.

pressure and length of stroke, which, from the construction of the cylinder, may be varied to suit circumstances. A monster steam hammer of a construction similar to Nasmyth's is employed in Krupp's cast-steel works at Essen, Germany. The hammer head is 12 ft. long, 5½ ft. wide, 4 ft. thick, and weighs a little over 50 tons, and has a stroke of 9 ft. The depth of the foundation is 100 ft., consisting of three parts, masonry, timber, and iron, bolted together. Four cranes, each capable of bearing 200 tons, serve the hammer with material. Smaller steam hammers of much higher speed are used in forging smaller articles, such as swords, scythes, axes, carpenters' tools, steel bars, &c. One of these, exhibited at the Vienna exposition in 1873 by Gustav Brinkmann and co. of Westphalia, is represented in fig. 2. While the frames of the large hammers have two standards, this has only one, an advantage allowed by its smaller size. The admission of the steam is effected by a simple slide valve worked by a hand lever, as shown in the engraving. In this machine, in consequence of the manner in which the steam is admitted, the length of stroke is constant; in this individual case, 7½ in. The weight of the hammer is 4 cwt., and

the average number of blows when worked with steam at a pressure of 45 lbs. per square inch is 360 per minute. The piston rod, 6½ in. in diameter, is cast steel, forming with the piston one piece. The hammer head is fastened to it by means of keys. The greatest height

FIG. 2.—High-Speed Steam Hammer.

of pieces which can be forged under the hammer is 4½ in. The bottom of the frame is 3 ft. square, and its total height to the flanges of the cylinder is 5½ ft. The total weight of the machine is 4½ tons.

**HAMMER, Julius**, a German author, born in Dresden, June 7, 1810, died at Pilsnitz, Aug. 23, 1862. In 1831 he began the study of law at the university of Leipsic, but gave special attention to philosophy and aesthetics. In 1834, in conjunction with Ludwig Tieck and Theodor Hell, he produced the successful play *Das seltsame Frühstück*, and thereafter devoted himself to literature. He wrote dramas, novels, and poems, and gave dramatic readings. Among his novels are *Adelig und Bürgerlich* (1838), *Leben und Traum* (1839), *Stadt- und Landgeschichten* (1845), and *Einkehr und Umkehr* (1856). His principal poems are *Schau um dich und Schau in dich* (1851), *Zu allen guten Stunden* (1854), and *Lerne, liebe, lebe* (1862). In his later years he devoted himself to oriental study, and published *Unter dem Halbmond* (1860), and *Die Psalmen der heiligen Schrift* (1861).

**HAMMERFEST**, a seaport of Norway, in the bailiwick of Finnmark, on the island of Kvalø, in lat. 70° 40' N., lon. 23° 42' E., 57 m. S. W. of the North cape; pop. about 1,000. It is celebrated as the most northern town in the world, and for its lively trade with Russia, England, and other countries. The cod fishery in the Hammerfest district in 1871 yielded about 5,000,000 fish, or nearly one half of the cod caught in Finnmark. Over 200 fishing boats and 100 large vessels frequent the bay annually. Cod-liver oil is largely prepared, and various skins, walrus teeth, and other articles are exported. A number of small sloops are engaged in the trade with Spitzbergen, where reindeer, walrus, and white bears are killed. Although the port is in so high a latitude, navigation is seldom interrupted. The harbor is defended by a fort. A granite pillar in the rear of the English vice-consulate marks the commencement of the great European arc measured by Russia, Sweden, and Norway, 1816-'52.

**HAMMER-PURGSTALL, Joseph von**, a German orientalist, born in Gratz, Styria, June 9, 1774, died in Vienna, Nov. 24, 1856. He studied the Arabic, Persian, and Turkish languages at the oriental academy of Vienna, and, after passing three years in Dalmatia and in travel, went in 1799 to Constantinople as interpreter to the internuncio. In the following year he was commissioned to prepare a report upon the condition of Syria and Egypt, and to inspect the consulates in the Levant. In 1801 he engaged in the Egyptian campaign as secretary-interpreter of the Anglo-Turkish generals, taking part in the conference at Jaffa, and in the surrender of Alexandria. He subsequently visited England. In 1802 he was again sent to Constantinople as secretary of legation, and in 1806 was appointed diplomatic agent at Jassy in Moldavia. He returned to Vienna in 1807, which he never again left except for short journeys. In 1815 he was sent to Paris to receive back the oriental manuscripts which had been carried thither after the occupation of Vienna in 1809, and on his return was offered the place of custodian of this collection, which he declined. In 1816 he was appointed interpreter to the court, and in 1817 aulic councillor. Inheriting the estate of the counts of Purgstall in 1837, he added that name to his own, and was created a baron. In 1847 he was elected president of the academy of Vienna, but resigned this office in 1849. His large fortune enabled him to devote himself to study. He spoke and wrote ten languages, and though his philological learning was extensive rather than profound, his works are among the most valuable authorities upon oriental history and literature. His care in the references to his authorities renders it easy to correct the errors into which he has fallen. His writings in several languages, including his contributions to the journals of various literary and scientific bodies, would make more than 100 octavo volumes. Among his chief works are: *Geschichte der*

*schönen Redekünste Persiens* (Tübingen, 1818); *Geschichte des osmanischen Reichs* (10 vols., Pesth, 1827-'34); *Geschichte der osmanischen Dichtkunst* (4 vols., 1836-'8); *Geschichte der Goldenen Horde im Kiptschak* (1840); and *Literaturgeschichte der Araber* (7 vols. 4to, Vienna, 1850-'57). A posthumous autobiography, *Denkwürdigkeiten aus meinem Leben*, and others of his posthumous writings, were published in 1858.

**HAMMERSMITH**, a village of Middlesex, England, on the Thames,  $3\frac{1}{2}$  m. W. of London; pop. in 1871, 24,520. It has a handsome suspension bridge, many elegant houses and villas, a grammar school endowed by Bishop Latimer, with an annual revenue of £800, several churches and charitable institutions, and a Catholic school and nunnery established in the reign of Charles II. The vicinity is chiefly occupied by nurseries and market gardens, which supply the metropolis with flowers and vegetables.

**HAMMOND, James Hamilton**, an American statesman, born at Newberry, S. C., Nov. 15, 1807, died at Beach Island, S. C., Nov. 13, 1864. His father, Elisha Hammond, a native of Massachusetts, became in 1802 professor of languages in South Carolina college, and afterward president of that institution. The son graduated there in 1825, was admitted to the bar, and in 1830 became editor of the "Southern Times" at Columbia. He married a lady of large fortune, and devoted himself to agriculture and politics. He wrote much, made many public addresses in behalf of nullification, and took an active part in organizing the military force which South Carolina raised in 1833 to resist the federal government. In 1835-'7 he was a member of congress, and in 1842 governor of South Carolina. In 1844 he published a letter to the Free church of Glasgow, Scotland, on slavery in the United States, and in 1845 two others in reply to an anti-slavery circular by Thomas Clarkson; these with other essays on the same subject were collected in a volume, "The Pro-Slavery Argument" (Charleston, 1853). Besides essays on agriculture, manufactures, railroads, and finance, he published an elaborate review of the life, character, and public services of John C. Calhoun. In November, 1857, he was elected to the senate of the United States to fill the vacancy occasioned by the death of A. P. Butler. In March, 1858, he made a speech in the senate in which he called the laboring classes "mudsills," a phrase which provoked much comment. In the same speech he said, "Cotton is king, and no power upon earth dares make war upon it." On the secession of South Carolina in December, 1860, he withdrew from the senate, but during the civil war ill health compelled him to remain quietly at home.

**HAMMOND, Samuel**, an officer in the American revolution, born in Richmond co., Va., Sept. 21, 1757, died at Horse Creek, Ga., Sept. 11, 1842. In his boyhood he served in wars against the Indians. In 1775 he raised a com-

pany, and took part in the battle of Longbridge; and in 1779 he was at the battle of Stono Ferry, S. C. After the fall of Charleston he kept the field with a small cavalry force, pursuing an active partisan warfare. He distinguished himself in the actions at Cedar Springs, Musgrove's Mill, Ramsay's Mills, King's Mountain, Blackstocks, Cowpens, Guilford Court House, and Eutaw, and participated in the siege of Augusta in 1781. He settled in Georgia, and in 1793 led a volunteer regiment against the Creek Indians; in 1802 was elected to congress; in 1805 was appointed by Jefferson to the civil and military command of upper Louisiana; and in 1824 removed to South Carolina, where he became surveyor general of the state in 1827, and secretary of state in 1831.

**HAMMOND, William Alexander**, an American physician, born at Annapolis, Md., Aug. 28, 1828. He graduated in the medical department of the New York university in 1848, and from 1849 to 1850 was an assistant surgeon in the army. In October, 1860, he was appointed professor of anatomy and physiology in the university of Maryland. He was reappointed assistant surgeon in the army, May 28, 1861, and was surgeon general from April, 1862, to August, 1864, when he was dismissed by sentence of a court martial. He then removed to New York, and is now (1874) professor of diseases of the mind and nervous system, and of clinical medicine, in the Bellevue hospital medical college, and physician-in-chief to the New York state hospital for diseases of the nervous system. He has published "A Treatise on Hygiene, with special reference to the Military Science" (8vo, Philadelphia, 1863); "Physiological Memoirs" (1863); "Lectures on Venereal Diseases" (1864); "On Wakefulness, with an Introductory Chapter on Sleep" (1865); "Insanity in its Medico-Legal Relations" (New York, 1866); "Sleep and its Derangements" (12mo, Philadelphia, 1869); "Physics and Physiology of Spiritualism" (12mo, New York, 1870); "Treatise on Diseases of the Nervous System" (1871); and "Insanity in its Relations to Crime" (1873). He has also edited "Medical and Surgical Essays" (1864); and translated from the German Meyer's "Electricity in its Relations to Practical Medicine" (1869; new ed., 1874).

**HAMON, Jean Louis**, a French painter, born at Plouha, May 5, 1821, died May 29, 1874. He escaped from a monastery in 1840 to study painting under Paul Delaroche. In 1848 he exhibited two paintings, "Over the Gate" and the "Tomb of Christ," at the museum of Marseilles. After 1849 he worked at the painting of Sèvres china, producing some specimens which gained him a medal at the world's fair in London in 1851. In 1852 he returned to oil painting, and exhibited his "Comedy of Humanity" and *Ma sœur n'y est pas*; the latter was purchased by the government. He has since produced a number of pictures, several of them representing scenes in the East. Among

the best known are "The Maidens of Lesbos" (1861) and "The Muses at Pompeii" (1866).

**HAMPDEN**, a S. W. county of Massachusetts, bordering on Connecticut, intersected by the Connecticut and drained by Westfield and Chicopee rivers; area, 670 sq. m.; pop. in 1870, 78,409. It has a rough, hilly surface, and a fertile soil, the river valleys being particularly rich. Small steamboats navigate the Connecticut to Springfield, and the county is traversed by the New Haven, Hartford, and Springfield, the Connecticut River, the New London Northern and the Ware branch, the Athol and Enfield, the New Haven and Northampton and the Holyoke branch, and the Boston and Albany railroads, and by a canal which is not now in use. The chief productions in 1870 were 2,045 bushels of wheat, 63,518 of rye, 145,728 of Indian corn, 74,617 of oats, 11,484 of buckwheat, 267,762 of potatoes, 1,095,423 lbs. of tobacco, 35,103 of maple sugar, 18,737 of wool, 716,979 of butter, 242,046 of cheese, and 51,859 tons of hay. There were 3,585 horses, 10,200 milch cows, 2,718 working oxen, 9,023 other cattle, 6,751 sheep, and 4,210 swine. The county contained 687 manufacturing establishments, chiefly in Springfield, the county seat, and in Chicopee and Holyoke, having an aggregate capital of \$16,942,490, and an annual product of \$30,008,006.

**HAMPDEN, John**, an English statesman, born in London in 1594, died at Thame, Oxfordshire, June 24, 1643. He was the son of William Hampden, a member of Queen Elizabeth's parliament, and Elizabeth Cromwell, aunt of the protector. His father left him large estates, and after studying at Oxford he was admitted a student of the Inner Temple in 1613. In 1619 he married Elizabeth Symeon. For several years he freely engaged in field sports and other amusements, "from which," says Clarendon, "he suddenly retired to extraordinary sobriety and strictness, and to a more reserved and melancholy society." On Jan. 30, 1621, he took his seat in parliament as member for the borough of Grampound, Cornwall. In the first parliament of Charles I. he sat for Wendover. He had not hitherto taken any prominent part in public affairs; his attention had been given mainly to the details of parliamentary business and to the local interests of his own country. But when the king, after the angry dissolution of two parliaments (1625 and 1627), attempted to raise money by a forced loan, apportioned among the people according to a previous rate of assessment, Hampden refused to lend a farthing, and was imprisoned. His example was followed by 76 other landed gentlemen, who were also arrested, while recusants of a lower rank were pressed into the fleet or forced to serve in the army. A new parliament was summoned; and Hampden, having been liberated, was immediately reelected for Wendover. The "Petition of Rights" and other important concessions having been extorted from the king, and parliament having

been again dissolved for protesting against his violation of them, Hampden retired to rural life, and devoted himself to literary pursuits. Eleven years passed without a parliament; the royal promises were unscrupulously violated, and the Puritans were persecuted. Among other arbitrary measures, Charles resorted to "ship money," a tax which the maritime counties had sometimes paid in time of war instead of furnishing ships for the navy, but which was now, in time of peace, demanded from the inland counties. Hampden, the first to resist the forced loan, was also one of the first to resist this unjustifiable proceeding, and resolved to bring to a solemn hearing the great controversy between the people and their oppressor. Toward the close of the year 1636 the cause came on in the exchequer chamber before the twelve judges, seven of whom pronounced against the disputant. The only effect of the decision of this small majority was to exasperate the people. Strafford meanwhile declared that Hampden, and others like him, should be "well whipped into their right senses;" and so intense became the hatred of the king's counsellors, that the person of Hampden was scarcely safe. This decision of the exchequer chamber placed the property of every individual at the disposal of the crown. The persecuted party felt that there was no alternative but to seek their homes in other countries; but an order was issued by Charles's council, prohibiting shipmasters from carrying passengers from the kingdom without special license. It has been said that Hampden and his cousin Oliver Cromwell had taken passage in a ship ready to sail for America, and were actually on board when they were stopped by this decree; seven other ships crowded with emigrants were stopped at the same time. The Scottish rebellion followed, and the expenses of the war rendered it imperative for the king to obtain larger supplies. A parliament was summoned to meet in April, 1640; it was soon dissolved, and another, the long parliament, met in November. Hampden was at this time the most popular man in England, and by universal consent was the member who exercised a paramount influence alike over legislature and people. He was one of the committee of twelve to conduct the memorable trial which led to Strafford's execution. He was one of the five members accused of treason, whose persons were demanded by Charles; but he was not arrested, in spite of the most strenuous efforts of the king. Almost the entire people were ready to protect and conceal Hampden and his confederates. "From this moment," says Clarendon, "his nature and carriage seemed fiercer than before." He was made a member of the committee of public safety, and the power of the sword being at length asserted, he prepared to take the field as a soldier. The king raised his standard against the parliamentary troops at Nottingham, Aug. 22, 1642. Hampden commanded a

regiment of volunteer infantry, which he had raised in his native county, and was so distinguished by his intrepid conduct in the succeeding movements, that a wish was expressed that he should take command of the whole army. On the evening of June 17, 1643, Prince Rupert set out for Oxford with 2,000 men, on one of his expeditions. Hampden hastened with a body of volunteers to intercept his return, and overtook the enemy at Chalgrove. A skirmish ensued, and in the first charge Hampden was struck in the shoulder by two balls, which lodged in his body. After six days of acute suffering he expired, uttering with his latest breath a prayer for England.

**HAMPDEN, Renn Dickson**, an English bishop and scholar, born in the island of Barbadoes in 1793, died in London, April 23, 1868. He studied at Oriel college, Oxford, graduated in 1813, and became fellow in 1814, tutor in 1828, and public examiner in classics in 1830. He preached the Bampton lectures in 1832, his subject being "The Scholastic Philosophy considered in its relation to Christianity." These lectures were regarded as very learned and profound, but of rather suspicious orthodoxy. In 1833 Dr. Hampden was appointed principal of St. Mary's hall, and the next year professor of moral philosophy in the university. Against much opposition, based on the work above named, and his published views as to dissent in England, he was in 1836 appointed regius professor of divinity; and in 1847, notwithstanding increased opposition, on the part mainly of the high Anglican or tractarian party, he was made bishop of Hereford. Besides the Bampton lectures, and the articles on Aristotle, Plato, and Socrates in the "Encyclopædia Britannica" (collected, "The Fathers of Greek Philosophy," Edinburgh, 1862), his principal works are: "Philosophical Evidence of Christianity" (1827); "Lectures on Moral Philosophy" (1836); "Lecture on Tradition" (1841); "Sermons before the University" (1836 and 1847); and "Life and Writings of Thomas Aquinas," in the "Encyclopædia Metropolitana."

**HAMPDEN SIDNEY COLLEGE**, an institution of learning in Prince Edward co., Va., about 70 m. W. S. W. of Richmond, under the charge of the Presbyterians. It was founded in 1775 and chartered in 1783, and in 1873-'4 had 5 professors, 86 students, and libraries containing about 7,000 volumes. The Presbyterian union theological seminary was established near this college in 1823 and chartered in 1866, and in 1873-'4 had 4 professors, 61 students, a library of 7,500 volumes, and an endowment of more than \$100,000.

**HAMPSHIRE. I.** A W. central county of Massachusetts, intersected by the Connecticut river, and drained by several mill streams, among which are the head waters of Chicopee and Westfield rivers; area, 524 sq. m.; pop. in 1870, 44,388. Its surface is irregular, and in some parts mountainous; the soil, especially near the Connecticut, is very fertile. It is

traversed by the New London Northern and its Ware branch, the Athol and Enfield, the New Haven and Northampton, and the Connecticut River railroads. The Boston and Albany railroad touches the S. W. portion. The chief productions in 1870 were 4,847 bushels of wheat, 36,706 of rye, 157,939 of Indian corn, 64,572 of oats, 274,608 of potatoes, 3,720,587 lbs. of tobacco, 43,832 of wool, 1,003,427 of butter, 136,086 of cheese, and 61,734 tons of hay. There were 4,478 horses, 9,514 milch cows, 2,034 working oxen, 10,771 other cattle, 10,173 sheep, and 5,062 swine. The county contained 433 manufacturing establishments, having an aggregate capital of \$7,053,085, and an annual product of \$13,445,772. One of the three large reservoirs on the upper part of Mill river in this county burst on May 16, 1874, and the waters destroyed the principal factories at Williamsburg, Leeds, Haydenville, and Skinnersville, causing the death of over 150 persons, and a loss of property estimated at nearly \$2,000,000. Capital, Northampton. **II.** A N. E. county of West Virginia, bordering on Maryland, from which it is separated by the Potomac, and on Virginia, drained by Great and Little Cacapon rivers, and by the S. branch of the Potomac; area, 750 sq. m.; pop. in 1870, 7,643, of whom 640 were colored. It is traversed by ranges of the Alleghany chain, has numerous fertile valleys, and abounds in coal and iron. The Baltimore and Ohio railroad passes along the N. boundary. The chief productions in 1870 were 76,832 bushels of wheat, 21,885 of rye, 120,325 of Indian corn, 46,769 of oats, 13,800 of potatoes, 26,658 lbs. of wool, 114,948 of butter, and 4,587 tons of hay. There were 2,380 horses, 6,557 cattle, 8,317 sheep, and 4,763 swine. Capital, Romney.

**HAMPSHIRE, Hants, or Southampton**, a maritime county of England, including the isle of Wight, bordering on Berkshire, Surrey, Sussex, the English channel, Dorsetshire, and Wiltshire; area, 1,667 sq. m.; pop. in 1871, 543,387. It is one of the most agreeable counties in England, the surface being a beautiful alternation of hill and dale, and the climate remarkably mild and healthful. The soil is of various quality. The N. districts are hilly and poor; the S. W. portion is chiefly occupied by the New forest and extensive heaths; but in the central sections the land is fertile and produces heavy crops of hay and corn. The principal vegetable productions are wheat, barley, oats, beans, turnips, and peas. Sheep are raised on the light lands; and the breeding and fattening of pigs is an important part of the husbandry, Hampshire being celebrated for its bacon. Ringwood is noted for its strong beer, and the paper mills of Romsey and Overton have supplied the bank of England with note paper since the reign of George I. The principal rivers are the Itchen, Avon, and Anton. There are two canals, the Basingstoke and the Andover. The most important towns

are Portsmouth, Southampton, and Winchester. Aldershot, on the borders of Surrey, has become a place of some note from the formation of a military station there.

**HAMPSTEAD**, a suburb of London, in Middlesex, situated on a range of hills, 4 m. N. W. of the city; pop. in 1871, 32,281. It has a pleasant and healthy situation. In former times Hampstead was renowned for its mineral springs, and at present it is one of the most popular resorts of Londoners. Hampstead heath, on the summit of the principal hill, is crowded with people on fine days, and particularly on Sunday, when excursions on donkeys are made and picnic parties assemble there. The village proper is irregularly built, but in its vicinity are fine villas, and there are many schools. Hampstead has always been a favorite resort of poets, including Pope and Byron. The upper Flask inn on Hampstead heath, once the place of meeting of the Kit-cat club, of which Addison and Steele were members, is now a private residence. At the present day there are many famous taverns, especially Jack Straw's, which was much frequented by Dickens and his friends.

**HAMPTON**, a town and the county seat of Elizabeth City co., Virginia, on the W. bank of Hampton river, a small inlet of Hampton roads, about  $2\frac{1}{2}$  m. from Fortress Monroe, and 75 m. S. E. of Richmond; pop. in 1870, 2,300, of whom 1,840 were colored. Before the civil war it was a fashionable watering place. It was burned by the confederates under Gen. Magruder in August, 1861, but is now steadily recovering. It is the seat of the Hampton normal and agricultural institute, designed especially to train colored youth as teachers of their own race, by giving an English and an industrial education, while affording students an opportunity to defray a portion of their expenses by labor. The grounds, comprising a farm of 125 acres bordering on the river  $\frac{1}{2}$  m. below the village, were purchased by the American missionary association in 1867, at the instance of Gen. S. C. Armstrong, then superintendent of a department of the freedmen's bureau at Hampton, and since principal of the institute. It was incorporated in 1870, and in 1872 the state awarded to it one third (\$95,000) of the proceeds of the congressional land grant for the support of an agricultural and mechanical college, with a portion of which 72 acres more of land have been purchased. The hall containing the school

rooms, printing office, and boys' dormitories, erected in 1870, chiefly by the aid of the freedmen's bureau, is in the form of a Greek cross, three stories high and 110 ft. long by 85 ft. wide, and was constructed, partly by the labor of the students, of brick made on the farm. The corner stone of another hall, for the girls' dormitories, chapel, &c., to be 190 ft. in front and 40 ft. wide, with a wing running 100 ft. to the rear, was laid in 1873. About 150 acres of the farm are under cultivation by the boys. Tuition and room rent are free. The printing office was opened in November, 1871, and has been successfully operated by the students. The first number of the "Southern Workman," a monthly illustrated periodical devoted to the industrial interests of the freedmen, was issued on Jan. 1, 1872. The girls find employment in the laundry and kitchen, and in various kinds of needlework. The number of instructors in 1873-'4 was 18; of students, 226, of whom 149 were males and 77 females. The course is three years. The Butler school house, belonging to the institute, in which was organized one of the earliest of the freedmen's schools, is used by the county as a free school, and contains about 200 pupils. Adjacent to the grounds is the national cemetery, containing a chapel, a handsome granite monument, and the graves of 5,123 Union soldiers; and near by is the national home for disabled soldiers, once a flourishing female seminary, which in 1872 provided for 538 veterans at an expense of \$62,923 17.

**HAMPTON**, a parish of Middlesex, England, 12 m. W. S. W. of London, on the N. bank of the Thames, near its junction with the Mole; pop. in 1871, 6,122. In the vicinity is the palace of Hampton Court, once a favorite resi-

Hampton Court.

dence of the Tudors and the Stuarts, and now with its gardens a very popular holiday resort of the Londoners. The gardens in their pres-

ent form were laid out by William III., and comprise 44 acres. They are in the formal Dutch style, with elevated terraces, long shady arcades, and a curious maze or labyrinth. The palace consists of three quadrangles, two of which were erected by Cardinal Wolsey, who presented them when finished to Henry VIII. The great eastern and southern fronts were erected by Sir Christopher Wren. This palace contains a fine collection of pictures, including the famous cartoons of Raphael, open to the public free of charge, and is occupied in part by persons of rank in reduced circumstances. Edward VI. was born here, and here his mother Queen Jane Seymour died. Charles I. was for some time imprisoned here.

**HAMPTON. I. Wade**, an American soldier, born in South Carolina in 1755, died at Columbia, S. C., Feb. 4, 1835. During the revolutionary war he served under Sumter and Marion, and he was elected to congress in 1794, and again in 1802. In 1808 he was appointed a colonel in the United States army, and placed in command of one of the new regiments raised in apprehension of a war with Great Britain. In 1809 he was made brigadier general, and subsequently was placed in command at New Orleans, but in 1812 was superseded by Wilkinson. In 1813 he was raised to the rank of major general, and was soon after placed in command of the army on Lake Champlain. He did not succeed, and resigned his commission in 1814, and returned to South Carolina. He acquired a large fortune by speculations in land, and at his death was supposed to be the most wealthy planter in the United States, being, as it was said, the owner of more than 3,000 slaves.

**II. Wade**, a confederate soldier, grandson of the preceding, born at Columbia, S. C., in 1818. He graduated at the university of South Carolina, studied law, and was successively a member of the house and of the senate in the state legislature. At the commencement of the civil war he entered the confederate service, and commanded the Hampton legion of cavalry at the battle of Bull Run, where he was wounded. He was made brigadier general, served in the Chickahominy campaign, and was again wounded in the battle of Seven Pines. He afterward commanded a cavalry force in the army of northern Virginia, and was again wounded at Gettysburg. In 1864 he was made lieutenant general, and commanded a body of cavalry in Virginia. He was afterward sent to South Carolina, and in February, 1865, commanded the rear guard of the confederate army at Columbia. Large quantities of cotton had been stored here, and upon the approach of the Union army under Gen. Sherman, this was piled in an open square ready to be burned. Fire was set to it, which resulted in a conflagration by which a great part of the city was destroyed. A sharp discussion subsequently arose between Hampton and Sherman, each charging the other with the wilful destruction of Columbia. The fact

appears to be that, as far as either was concerned, the conflagration was purely accidental. (See COLUMBIA, and CONFLAGRATION.)

**HAMPTON ROADS**, an arm of Chesapeake bay, lying between Hampton and Norfolk, Va., forming the estuary of James river. It has a depth of from five to seven fathoms. The channel is commanded by Fortress Monroe, situated on a point of land on the N. shore near the entrance.—A naval action took place here, March 8, 1862, between the confederate ironclad Virginia and the Union frigates Cumberland, Congress, and Minnesota; and another on the 9th between the Virginia and the turret ship Monitor. In April, 1861, the steam frigate Merrimack, lying at Norfolk, was seized by the confederates, set on fire, and then scuttled and sunk. She was subsequently raised, her hull plated with railroad-iron bars, and named the Virginia. Early in March, 1862, there were lying in Hampton roads the United States frigates Cumberland and Congress, the ship St. Lawrence, and the steam frigates Minnesota and Roanoke, the last named being partially disabled by the breaking of her shaft. On the morning of the 8th the Virginia, attended by two small steamers, came down from Norfolk, passed the Congress, receiving a harmless broadside, which was effectively returned, and steered directly for the Cumberland, which she struck with her iron-plated bow, making a large hole, and then opened fire from her battery. The Cumberland sank in 45 minutes after being struck. The Congress endeavored to escape into shoal water, where the Virginia could not follow, but ran aground, while the Virginia took up a position close under her stern, and poured in a heavy fire, by which the frigate was soon disabled and set on fire. In eight hours the flames reached the magazine, and the vessel was blown up. The St. Lawrence and Roanoke had meanwhile got off and gone down the bay. The Minnesota lay fast aground, and was attacked by the three confederate vessels; but the draft of the Virginia would not permit her to come within a mile, and only one shot from her struck the Minnesota. As night came on, the confederate vessels withdrew. Besides the two frigates, the Union loss was 286; of whom the Cumberland lost 121 killed or drowned, the Congress 100 killed, 26 wounded, and 20 prisoners, and the Minnesota 3 killed and 16 wounded. On the Virginia there were 2 killed and 8 wounded; on the other confederate steamers, 4 killed and several wounded. Early the next morning the Virginia again approached the Minnesota, which was still fast aground. But in the mean while the Union ironclad Monitor, the first turreted vessel ever brought into action, had arrived from New York, and interposed between the Virginia and the Minnesota. The vessels opened fire, but without giving or receiving damage, the armor of each affording perfect protection. The Virginia now again assailed the Minnesota, and received a full broadside at almost point-blank range, which

did no harm. The Monitor kept steaming around the Virginia, searching for a vulnerable point; but her 168-lb. shot glanced off harmlessly. The Virginia then ran down the bay, as if in retreat, followed by the Monitor, but turned suddenly, and attempted to run down her antagonist, which was hardly one fifth her size. But a blow like that which had pierced the Cumberland made no impression upon the Monitor; and the prow of the Virginia having been slightly damaged, she gave up the battle and steamed toward Norfolk. In this action no one appears to have been injured on the Virginia. Lieut. (after Commodore) Worden, the commander of the Monitor, was badly hurt by particles of cement thrown into his eyes by the concussion of shots which struck the turret, and two sailors were partially stunned by the same concussion. The Monitor remained unharmed. This action is notable as the first in which iron-clad vessels took part.

**HAMSTER**, a rodent of the rat family, or *muridae*, and the genus *cricetus* (Cuv.). The incisors are  $\frac{3}{2}$ , and the cheek teeth  $\frac{3}{2}$ - $\frac{3}{2}$ , or 16 in all, as in the rats; there are internal cheek

Hamster (*Cricetus vulgaris*).

pouches, in which they carry grain and seeds to their subterranean abodes; the head is thick, the ears oval and round, the body rat-like, the legs short, and the tail about  $1\frac{1}{2}$  in. long, covered with hair. There are several species in Europe and northern Asia, of which the best known is the common hamster (*C. vulgaris*, Cuv.); it is a little larger than a rat, reddish gray above, black underneath, with three yellowish white spots on each side, a white spot on the throat, and another under the chest; legs whitish. It is sometimes almost entirely black. The grooves and tubercles of the molars are more regular than in the rat; the fore feet are four-toed with the rudiment of a thumb, and the hind feet five-toed, free, and furnished with long claws adapted to digging; the eyes are small but prominent; the fur fine and long. The hamster commits great havoc among the grain, by the large quantities which it carries to its burrows; these are dug 3 or 4 ft. deep in light sandy soil, having two or more entrances and apartments, and each animal occupies its own; it thus lays up a store for winter, a part of which

it passes in a state of lethargy; though its food is principally vegetable, it will devour flesh. It is ferocious and untamable, fighting with its mates, and biting the hand that feeds it. The burrows are often very complicated, and so capacious and well filled that it is an object with the farmer to collect their contents. Gestation lasts about four weeks, and occurs three or four times a year, each litter varying from six to twelve. It is very cleanly in its habits, and is an excellent climber, but a poor walker and runner. Other species are found in Siberia.—The Canada hamster, and others so called, with external cheek pouches, have been described under **GOPHER**; the genus *cricetus* is not found in America. An American mouse of the genus *hesperomys* (*H. myoides*, Gapper), resembling the white-footed species, is sometimes called hamster mouse from its having internal cheek pouches; in no other character does it approach *cricetus*; it is found in Canada, Vermont, and New York.

**HANAU**, a town of Prussia, in the province of Hesse-Nassau, at the junction of the Main and the Kinzig, 10 m. E. of Frankfort; pop. in 1871, 20,278. It contains an ancient castle, now the seat of the Wetteravian society of natural history, one Catholic and three Protestant churches, an academy of design, and several schools. There are manufactories of silks, cottons, carpets, leather, iron ware, pottery, and jewelry, and a large trade in woods, drugs, and dyes. In the vicinity are the mineral baths of Wilhelmsbad. Here, on Oct. 30, 1813, Napoleon, on his retreat from Leipsic, defeated the Germans under Marshal Wrede. During the middle ages it was the capital of the sovereign counts of Hanau. In 1451 the county was divided into two states, Hanau-Münzenberg and Hanau-Lichtenberg, the rulers of both of which were made princes in 1696. In 1736 the house of Hanau became extinct, when Hanau-Münzenberg was united with the electorate of Hesse-Cassel, and Hanau-Lichtenberg with Hesse-Darmstadt; but in 1785 this division too was incorporated in the electorate. As a part of the latter Hanau was annexed to Prussia in 1866.

**HANCOCK**, the name of ten counties in the United States. **1.** A S. E. county of Maine, bordering on the Atlantic, and bounded W. in part by Penobscot river and bay; area, 2,000 sq. m.; pop. in 1870, 36,495. It is watered by Union river and several mill streams. The surface is uneven, and diversified with hills and lakes; the seacoast, including a number of islands, among which is the island of Mt. Desert, is broken by many good harbors; the soil is fertile. Many of the inhabitants are engaged in cod and mackerel fishing. The chief productions in 1870 were 2,999 bushels of wheat, 5,971 of Indian corn, 34,396 of oats, 32,798 of barley, 221,379 of potatoes, 72,827 lbs. of wool, 531,997 of butter, and 32,653 tons of hay. There were 1,958 horses, 5,777 milch cows, 2,399 working oxen, 5,103 other

cattle, 20,084 sheep, and 1,444 swine; 2 manufactories of wooden boxes, 10 of bricks, 3 of carriages, 15 of barrels and casks, 6 of marble and stone work, 6 of fish oil, 6 of saddlery and harness, 6 of sails, 9 tanneries, 1 planing mill, 35 saw mills, 4 establishments for curing and packing fish, 9 for building and repairing ships, and 6 for wool carding and cloth dressing. Capital, Ellsworth. **II.** The N. county of West Virginia, forming the extremity of the "Panhandle," bordering on Pennsylvania, and separated from Ohio on the N. and W. by the Ohio river; area, about 100 sq. m.; pop. in 1870, 4,363, of whom 27 were colored. It has a hilly surface and a fertile soil, and contains coal and fire clay. The chief productions in 1870 were 34,270 bushels of wheat, 83,180 of Indian corn, 68,494 of oats, 34,578 of potatoes, 128,642 lbs. of wool, 70,558 of butter, and 4,351 tons of hay. There were 835 horses, 869 milch cows, 1,001 other cattle, 26,353 sheep, and 1,892 swine; 2 manufactories of stone and earthen ware, 14 of brick, and 2 saw mills. Capital, Fairview. **III.** An E. central county of Georgia, bounded W. by the Oconee river, and E. by the N. fork of the Ogeechee; area, 440 sq. m.; pop. in 1870, 11,317, of whom 7,672 were colored. The surface and soil are diversified. It is well timbered, and contains granite, gold, agate, chalcidony, opal, kaolin, galena, zircon, and other minerals. The Macon and Augusta railroad passes through it. The chief productions in 1870 were 8,078 bushels of wheat, 141,630 of Indian corn, 17,794 of oats, 26,404 of sweet potatoes, 87,229 lbs. of butter, and 9,624 bales of cotton. There were 656 horses, 938 mules and asses, 1,430 milch cows, 3,174 other cattle, 1,634 sheep, and 5,893 swine; 1 cotton factory, and 2 saw mills. Capital, Sparta. **IV.** An extreme S. county of Mississippi, bounded S. by the gulf of Mexico, and W. by Pearl river, which separates it from Louisiana; area, about 1,000 sq. m.; pop. in 1870, 4,239, of whom 1,186 were colored. The surface is hilly in the N. and nearly level in the S.; the soil is moderately fertile. Pine forests abound. The New Orleans, Mobile, and Texas railroad passes through it. The chief productions in 1870 were 3,394 bushels of Indian corn; value of live stock, \$51,075. There were 8 saw mills. Capital, Shieldsborough. **V.** A N. E. county of Tennessee, bordering on Virginia, and drained by Clinch and Powells rivers; area, 480 sq. m.; pop. in 1870, 7,148, of whom 585 were colored. It is mountainous, well timbered, and thought to be rich in iron ore. The chief productions in 1870 were 22,956 bushels of wheat, 204,190 of Indian corn, 41,308 of oats, 10,453 of potatoes, 13,967 lbs. of wool, and 55,029 of butter. There were 1,263 horses, 1,514 milch cows, 2,540 other cattle, 7,365 sheep, and 10,690 swine. Capital, Sneedsville. **VI.** A N. W. county of Kentucky, separated from Indiana by the Ohio river; area, about 500 sq. m.; pop. in 1870, 6,591, of whom 729 were colored.

It has a hilly and undulating surface, the uplands being generally fertile, and the river bottoms extremely rich. The chief productions in 1870 were 12,354 bushels of wheat, 376,915 of Indian corn, 23,930 of oats, and 1,679,384 lbs. of tobacco. There were 1,961 horses, 1,249 milch cows, 1,622 other cattle, 5,099, sheep, and 9,449 swine; 3 flour mills, 1 manufactory of furniture, and 4 saw mills. Capital, Hawesville. **VII.** A N. W. county of Ohio, drained by branches of Auglaize and Portage rivers; area, 536 sq. m.; pop. in 1870, 23,847. It has a level surface and a rich soil, and abounds in limestone. It is traversed by the Lake Erie and Louisville, and the Findlay branch of the Cincinnati, Sandusky, and Cleveland railroads. The chief productions in 1870 were 514,183 bushels of wheat, 701,222 of Indian corn, 286,822 of oats, 80,763 of potatoes, 19,832 of flaxseed, 240,468 lbs. of wool, 91,849 of maple sugar, 765,744 of butter, and 32,903 tons of hay. There were 9,313 horses, 8,078 milch cows, 11,672 other cattle, 56,622 sheep, and 28,299 swine; 10 manufactories of carriages, 2 of clothing, 8 of furniture, 1 of engines and boilers, 1 of linseed oil, 8 of saddlery and harness, 4 of tin, copper, and sheet-iron ware, 1 of woollen goods, 2 of boots and shoes, 2 of iron castings, 12 flour mills, 1 planing mill, 20 saw mills, and 4 tanning and currying establishments. Capital, Findlay. **VIII.** A central county of Indiana, drained by Blue river and smaller streams; area, 312 sq. m.; pop. in 1870, 15,123. The surface is nearly level, and the soil is fertile. Timber is abundant. The Pittsburgh, Cincinnati, and St. Louis, the Cincinnati, Hamilton, and Indianapolis, and the Cleveland, Columbus, Cincinnati, and Indianapolis railroads traverse it. The chief productions in 1870 were 440,212 bushels of wheat, 810,496 of Indian corn, 42,050 of oats, 47,149 of potatoes, 141,244 lbs. of wool, 234,379 of butter, and 6,308 tons of hay. There were 5,246 horses, 3,986 milch cows, 5,364 other cattle, 18,449 sheep, and 22,042 swine; 15 manufactories of carriages, 6 of saddlery and harness, 5 of bricks, 3 flour mills, and 12 saw mills. Capital, Greenfield. **IX.** A W. county of Illinois, bordering on Missouri and Iowa, from which it is separated by the Mississippi river; area, 720 sq. m.; pop. in 1870, 35,807. It has an undulating surface, with alternate tracts of timber land and prairie, and a rich, well tilled soil. It is traversed by the Chicago, Burlington, and Quincy, and the Carthage branch, and by the Toledo, Peoria, and Warsaw, and the Toledo, Wabash, and Western railroads. The chief productions in 1870 were 414,028 bushels of wheat, 133,533 of rye, 1,510,401 of Indian corn, 579,599 of oats, 92,863 of Irish potatoes, 74,586 lbs. of wool, 443,770 of butter, and 36,062 tons of hay. There were 14,115 horses, 2,258 mules and asses, 9,437 milch cows, 17,009 other cattle, 20,582 sheep, and 44,561 swine; 9 manufactories of agricultural implements, 38 of carriages, 9 of barrels and casks,

6 of furniture, 12 of saddlery and harness, 13 of tin, copper, and sheet-iron ware, 1 of chewing tobacco, 2 of woollen goods, 1 distillery, 1 brewery, 14 flour mills, and 2 planing mills. Capital, Carthage. **X.** A N. county of Iowa, drained by the sources of Boone river and other streams; area, about 500 sq. m.; pop. in 1870, 999. The surface is mostly undulating prairie, and the soil fertile. It contains several small lakes and extensive deposits of peat. It is traversed by the McGregor and Missouri River railroad. The chief productions in 1870 were 18,918 bushels of wheat, 19,541 of Indian corn, 30,231 of oats, and 2,087 tons of hay. There were 377 horses, 967 cattle, 411 sheep, and 416 swine. Capital, Upper Grove.

**HANCOCK, John**, an American statesman, born in Quincy, Mass., Jan. 12, 1737, died there, Oct. 8, 1793. He graduated at Harvard college in 1754, and shortly after entered the counting house of an uncle, on whose death in 1764 he received a large fortune, and soon became a prominent merchant. In 1766 he was chosen to the Massachusetts house of representatives from Boston. The seizure of his sloop, the *Liberty*, occasioned a riot in 1768, when the royal commissioners of customs narrowly escaped with their lives. After the affray known as the "Boston massacre," in 1770, he was a member of the committee to demand of the royal governor the removal of the troops from the city; and at the funeral of the slain he delivered an address so glowing and fearless in its reprobation of the conduct of the soldiery and their leaders, as greatly to offend the governor, who eventually endeavored to seize Hancock and Samuel Adams, both of whom in 1774 became members, and the former president, of the provincial congress at Concord. This was one of the objects of the expedition to Concord in April, 1775, which led to the first battle of the revolution, after which Gov. Gage offered pardon to all the rebels except these two, "whose offences," he adds, "are of too flagitious a nature to admit of any other consideration but that of condign punishment." In the same year Mr. Hancock was chosen president of the continental congress, and in 1776 signed the Declaration of Independence. Leaving congress in 1777, on account of ill health, he returned to Massachusetts, where he was a member of the convention for framing a constitution for the state, and under that constitution was in 1780 chosen first governor; to which office, with an interval of two years, he was annually reelected till his death. He was a man of strong common sense and decision of character, of polished manners, easy address, affable, liberal, and charitable. In his public speeches he displayed a high degree of eloquence. As a presiding officer he was dignified, impartial, quick of apprehension, and always commanded the respect of congress. He employed his large fortune for useful and benevolent purposes, and was a liberal donor to Harvard college.

**HANCOCK, Winfield Scott**, an American soldier, born in Montgomery co., Pa., Feb. 14, 1824. He graduated at West Point in 1844, served mainly on frontier duty till 1846, and afterward in the war with Mexico. He was brevetted as first lieutenant for gallant and meritorious conduct in the battles of Contreras and Churubusco. From 1848 to 1858 he was again on frontier duty in various parts, and from 1859 to 1861 was quartermaster of the southern district of California. At the breaking out of the civil war he was recalled to Washington, and was made brigadier general of volunteers, Sept. 23, 1861. During the peninsular campaign he was especially conspicuous at the battles of Williamsburg and Frazer's Farm. He took an active part in the subsequent campaign in Maryland, at the battles of South Mountain and Antietam. Having been made major general, he commanded a division at Fredericksburg and Chancellorsville. On July 1, 1863, the first day of the battle of Gettysburg, he was sent by Gen. Meade to decide whether a decisive battle should be given there, or whether the army should fall back. He reported that Gettysburg was the place to fight, and took immediate command until the arrival of Meade. In the decisive action of July 3 he commanded on the left centre, which was the main point assailed by the confederates, and was severely wounded. For his conduct at Gettysburg he received (May 30, 1866) the thanks of congress. Having been disabled by his wound, he was on sick leave until March, 1864, being meanwhile engaged in recruiting the second army corps, which was placed under his command. He took the active command of this corps at the opening of the campaign of 1864, and bore a prominent part in the battles of the Wilderness (May 5, 6), Spottsylvania Court House (May 9-20), and North Anna (May 23, 24), the second battle of Cold Harbor (June 3), and the operations around Petersburg until June 19, when, his wound breaking out, he was for a short time on sick leave. He afterward resumed command, and took part in several actions until Nov. 26, when he was called to Washington to organize the first corps of veterans. After the close of the war he was placed successively in command of the middle department (1865-'6), the department of Missouri (1866-'7), of Louisiana and Texas (1867-'8), of Dakota (1870-'72), and, on the death of Gen. Meade in November, 1872, of the department of the East. In the democratic national convention held at New York in July, 1868, he was a candidate for the presidential nomination, receiving on the 1st ballot 33½ votes out of 317, which number gradually increased to 144½ on the 18th; this being, with the exception of 145½ cast for Pendleton on the 12th ballot, the greatest number of votes given to any candidate for the nomination until the 22d ballot, when Horatio Seymour received the unanimous vote of the convention.

**HAND**, a S. E. county of Dakota, recently formed, and not contained in the census of 1870; area, about 1,000 sq. m. It is watered by affluents of the Missouri and of the Dakota or James river. The N. W. portion is occupied by the "Plateau du Coteau du Missouri."

**HANDEL**, or **Händel**, **Georg Friedrich**, a German composer, born in Halle, Feb. 23, 1685, died in London, April 13, 1759. His father was the chamberlain and surgeon of a Saxon prince and also of the elector of Brandenburg, and was 63 years old when the boy was born. His predilection for music was so strong that his father, who wished him to become a lawyer, thought it necessary to lay his interdiction upon the study of the art. In his necessity the boy was fain to practise organ music by night upon one of the small clavichords of that period. About 1693 the father was called to Weissenfels by the duke upon business, and the child, then eight or nine years old, was taken with him. A grandson of the elder Handel held at the time some post in the family of the duke, by whom the talents of young Handel were made known to the members of the musical chapel. Upon a Sunday he was taken into the organ loft, and at the close of the service was placed in the organist's seat to play the voluntary. The duke remained to hear him play, and afterward asked who the child was. "Little Händel from Halle, my grandfather's youngest son," was the reply. The duke's views of music and musicians, and his arguments in their favor, were such as to abate the father's prejudices, and on returning to Halle music was added to the other studies of the child. The teacher chosen was Friedrich Wilhelm Zachau, the first organist and instructor in Halle, a thorough master of the old Saxon school. While pursuing the usual school studies then required of boys intended for the gymnasium and the university, he was kept by Zachau upon contrapuntal and fugal exercises, to steady practice upon the organ and harpsichord, and gradually brought to a familiar practical knowledge of the then principal instruments of the orchestra, the string quartet, the flute, and the oboe. To develop his feeling for musical form, he copied specimens of the style of the principal masters of his time, particularly of the old organists. At least as early as 1696, when the boy was 11 years old, a friend of the father took him to Berlin and presented him to the elector, afterward Frederick I. of Prussia, who was so much struck by his talents as to offer to take charge of his education and send him to Italy; a favor, however, wisely declined by his father. During his stay in Berlin the young musician had opportunity of hearing other and far higher music than before, the brothers Bononcini and the composer Atilio being in Frederick's service, and music being in a highly flourishing condition, through the influence of the electress, herself a fine musician. He returned to Halle, to school, and to Zachau, and was afterward bound to

home by new and stronger ties; for on Feb. 11, 1697, his father died, and the mother could not part with her only son. No immediate change in the plans laid for the son by the deceased father was made. The boy pursued his studies with such zeal and success as to matriculate in the university of his native city, Feb. 10, 1702. He was already an extraordinary performer upon the harpsichord and organ, a good violinist, and familiar with the instruments then in use. Ten years of constant practice had brought him to that skill in composition by which his musical ideas were thrown upon paper with as much facility as he wrote his native German; but as yet he was not emancipated from the forms of the schools, and wrote a fugue with more ease and elegance than a melody. On March 13, 1702, Handel, having just completed his 17th year, was formally installed organist of the *Domkirche* at Halle, with a regular salary and a right of free house rent, amounting in the aggregate to \$50 per annum. At the end of the first year he resigned. A new prospect had opened before him. His mother had allowed her son with her blessing to abandon the law. In March, 1703, Handel made music his profession. There was nothing more for him to learn in Halle or Leipsic; but in Hanover the greatest of the Italians then in North Germany, Abbé Steffani, was chapelmaster; and in Hamburg Reinhard Keiser, the greatest German operatic composer of his day, was astonishing the public by his inexhaustible fund of pleasing popular melody. To these cities the youth bent his steps. Hawkins records Handel's own account of his reception in Hanover: "When I first arrived at Hanover I was a young man under 20. I was acquainted with the merits of Steffani, and he had heard of me. I understood somewhat of music, and could play pretty well on the organ. He received me with great kindness, and took an early opportunity to introduce me to the princess Sophia and the elector's son, giving them to understand that I was what he was pleased to call a virtuoso in music; he obliged me with instructions for my conduct and behavior during my residence at Hanover; and being called from the city to attend to matters of public concern, he left me in possession of that favor and patronage which himself had enjoyed for a series of years." In June, 1703, Handel, doubtless by advice of Steffani, was in Hamburg. During the short opera season, ending in August, he played second violin in the orchestra, and gave lessons in music. He soon had an opportunity of showing his powers. The harpsichordist being one evening absent, the youthful violinist was persuaded to take the seat, to the astonishment of all the orchestra. Handel's first work of importance in Hamburg was a sort of oratorio on the "Passion," which Chrysander dates during the spring of 1704; his second, the opera *Almira*, composed in the summer and autumn of the same year. On the evening of Dec. 5,

Mattheson's *Cleopatra* was performed, the author, a tenor singer, taking the part of Antony. As composer he had the right to direct, and had at previous performances, after the death of the hero, come into the orchestra and taken the direction. On this evening Handel, being at the instrument, refused to give up his seat. On leaving the theatre they drew their swords upon each other in the open market place. The contest ended by the springing of Mattheson's weapon upon a broad metal button of Handel's coat. On Christmas day Keiser and others mediated between them, friendship was restored, Handel dined with Mattheson, and in the evening they attended together the rehearsal of *Almira*, which was produced Jan. 8, 1705. It ran 20 nights, until replaced by another work from the same pen, *Nerone*, Handel's second work for the stage. It was given but two or three times, owing to the interruption of Lent. Another work, with a most wretched text, completes the list of those which he wrote for the Hamburg stage; but it was not given till 1708, when the author had been long in Italy, and then owing to its length was divided into two, *Florinda* and *Dafne*. During the latter part of his residence in Hamburg Handel's time was fully occupied by his pupils and his studies. In three years he had saved 200 ducats. One invitation to visit Italy without expense in the train of a prince he had declined. The winter of 1706-7 he passed in Florence with a Tuscan nobleman who had known him and heard his *Almira* in Hamburg. A *Dixit Dominus* of his composition shows that he was in Rome in April, 1707. In the autumn he returned to Florence and composed *Rodrigo*, his first Italian opera, which was received with great applause. In April, 1708, he was again in Rome, as the date upon his oratorio *Risurrezione* proves, which was followed by a cantata, *Il trionfo del tempo e del disinganno*. No opera being allowed at that time in Rome, his works there are confined to oratorios and church music. His refusal to change his religion alone prevented him from attaining the highest honors possible for the musical artist in Rome. In the summer of 1708 he was in Naples, where he composed the original Italian *Acis*, *Galatea e Polifemo*, and other works of less importance. For the carnival in Venice in the spring of 1709 he composed the opera *Agrippina*, which was performed with extraordinary success. Being appointed chapelmaster by the elector of Hanover, afterward George I. of England, which office he accepted on condition of being allowed to visit London, he returned to Germany, spent a year there, and arrived in England near the close of 1710. He was not yet 25 years old, but was already famous as a performer on the organ and harpsichord, and as a composer of Italian operas. On Feb. 24, 1711, *Rinaldo* was given, which is said to have been composed in a fortnight, and was so much admired that the publisher cleared £1,500 by the sale of the songs and airs. The season closed June 2, and

Handel returned to Hanover for a time, during which he composed most of his chamber duets; probably also a large proportion of his instrumental music may be referred to this period. In the summer of 1712 he returned to England, where he produced, on Nov. 26, the short pastoral opera *Il pastor fido*; Jan. 10, 1713, *Teseo*; Feb. 6, "Ode on Queen Anne's Birthday;" and in the summer, the "Utrecht Te Deum," which he had completed in January preceding, and for which the queen settled upon him a pension of £200 per annum. This "Te Deum," which celebrated an event distasteful to the elector, together with Handel's prolonged stay in London, cost him for a time the favor of George. With the exception of *Silla*, a short opera, written for private performance at Burlington house, he composed no extensive score until the *Amadige* in 1715. Meantime Anne had died, and the elector had been crowned king of England, at whose court Handel dared not appear. By advice of Baron Killmansegge and Lord Burlington, he prepared a set of instrumental pieces, employing all the instruments then in use, which were performed, Aug. 22, 1715, on occasion of a grand boat procession on the Thames in which the king took part. This music is the well known "Water Music," and its striking beauties restored the composer to royal favor. Another £200 was added to his salary, which was again increased by a like amount a few years later, when he undertook the musical instruction of the young princesses. In 1716 Handel went with the court to Hanover, and the only important work of this year was the music to Brockes's German poem on the "Passion of Christ." On returning to London he accepted the place of music director to the duke of Chandos, for whose chapel during the next three years he composed the noble works, in three, four, and five parts, known as the "Chandos Anthems," and for whom were written his first English oratorio, "Esther," performed Aug. 29, 1720, and the English "Acis and Galatea." In February, 1719, he wrote to his brother-in-law, saying that he was detained in England by business upon which his future career depended. This business was an attempt to place Italian opera in London upon a firm foundation, under the name of the "Royal Academy of Music," by a subscription of £50,000 from the king and nobility. He went to the continent, engaged a company of singers, and the royal academy opened April 2, 1720. His *Radamisto*, first performed here April 27, achieved great success; but his Italian colleagues now conspired against him, the duchess of Marlborough and her influential wing of fashionable society siding with Bononcini. To settle the rival claims, it was decided that the latter and another Italian and Handel should each compose one act of a new three-act opera, which resulted in their joint production of *Muzio Scevola*, performed in April, 1721. Although the greatest merit was award-

ed to the third act, composed by Handel, he and his enterprise were nevertheless subjected to continued hostility. His subsequent operas composed for the royal academy are: *Floridante*, Dec. 9, 1721; *Ottone*, Jan. 12, 1723; *Flavio* and *Giulio Cesare*, 1723; *Tamerlano*, 1724; *Rodelinda*, 1725; *Scipione*, 1726; *Alessandro*, May 7, 1726; *Admeto*, 1727; *Siroe* (Cyrus), 1728; *Tolommeo*, 1728. Twelve operas and a transcendent third act of another, together with his labors as royal chapel-master and director of the opera, would seem to be enough for the productiveness of eight years; but in 1727 he had added to the list of his minor works the noble anthems for the coronation of George II. But with the production of *Tolommeo* in 1728, the £50,000 subscription was exhausted, and the royal academy was bankrupt. Handel had now saved £10,000, and determined to risk it in the attempt to carry on an enterprise in which the nobility had signally failed. He therefore formed a partnership for three years with Heidegger of the Haymarket theatre; visited Germany, thence went on to Italy, taking his old friend and monitor Abbé Steffani with him, and returned to London with an excellent company in June, 1729. The season opened Dec. 2. For this enterprise Handel's operative works were: *Lotario*, Dec. 2, 1729; *Partenope*, Feb. 24, 1730; *Poro*, Feb. 2, 1731; *Ezio*, Jan. 25, 1732; *Sosarme*, Feb. 15, 1732; *Orlando*, Jan. 27, 1733; *Ariadne*, Jan. 26, 1734; *Parnasso in festa* (serenata partly new), March 13, 1734; *Pastor fido* (completely rearranged), June 4, 1734. In addition to his operative labors, during this time he entered upon a path peculiarly his own. In consequence of certain semi-public performances of his oratorio "Esther," for the benefit of persons who had surreptitiously obtained a copy of the score, Handel, in Lent, 1732, "by his majesty's command" brought it upon the stage of the Haymarket (without action of course), having thoroughly revised it and made several additions. The king and all the royal family were present. It was given five times, and proved a powerful spur to Handel in that direction in which he stands above all other composers. The proprietors of the English opera, too, had recently brought out his "Acis and Galatea" with action, which led him to produce it also with large additions from his Italian serenata on the same subject, making of it a medley of both languages. The success of "Esther" induced him to try oratorio again, and he prepared "Deborah," which was given March 17, 1733. In July he conducted the performance of his third English oratorio, "Athaliah," at Oxford. During the same season the conduct of Senesino, his principal singer, was such that Handel discharged him; and as the composer refused to recall him, a coalition was formed against him, and a rival opera established, with Senesino, Farinelli, and Cuzzoni as principal vocalists, and Porpora and

Arrigoni as composers. Handel posted to Italy, engaged a good troupe, and opened the season of 1734 with three operas, the music of which was but arranged with new recitatives by him: *Semiramide*, *Cajo Fabrizio*, and *Arbace*. The season ended with the *Pastor fido*, and with it Handel's engagements with Heidegger. Oct. 5, 1734, he opened at Lincoln's Inn fields with revivals of *Ariadne* and *Pastor fido*, but soon removed to Covent Garden. The first work, mostly original, was *Terpsicore*, a sort of ballet interspersed with vocal music, followed by *Ariodante*, an opera, Jan. 8, 1735. During Lent he gave his three oratorios with organ concertos between the acts, and was ready on April 16 with another opera, *Aleina*. In the autumn Carestini, his first singer, was called by previous engagements to Italy, and during the succeeding winter Handel was forced to depend upon performances of "Esther" and "Acis and Galatea," with one new work, his magnificent music to Dryden's "Alexander's Feast." But succeeding in engaging Conti, a new singer of high reputation, he returned again to opera, producing *Atalanta*, May 12, 1736; *Arminio*, Jan. 12, 1737; *Giustino*, Feb. 16, 1737; and *Berenice*, May 18, 1737. Handel had tried every honorable means to achieve success. He had given old favorite operas revised, and new ones with extraordinary scenic effects; had prepared a *pasticcio* or two from the most popular music of his earlier works; had resorted to oratorio, and to the performance of concerts upon harpsichord and organ, wherein he was acknowledged by all to be absolutely without a rival. But London, which had not supported a single exotic opera, could not now, when the novelty was exhausted, encourage two; and with the failure of the *Berenice* his £10,000 were at an end, and his enemies had the satisfaction of having at length crushed him. But they too were exhausted. Handel closed his theatre in May; they followed in September. Farinelli had deserted them, and they closed their accounts with a loss of £12,000. Before Handel finally gave way to the pressure against him, his health had failed, and soon after the catastrophe an attack of paralysis prostrated him. His friends persuaded him to visit Aix-la-Chapelle; and once there his constitution triumphed; in six weeks he was restored, and returned to London to face his creditors and engage in gigantic labors to discharge his debts. On Nov. 1 he was again in London; on the 15th he began the opera *Faramondo*, for the younger Heidegger; on the 20th Queen Caroline died, and the king ordered a funeral anthem, which was completed in five days, one of Handel's grandest and most touching works; he then took up the opera again, and on Dec. 24 it was completed. *Faramondo* was produced in January, 1738, but was unpopular. On Feb. 25 *Alessandro Severo* followed, arranged from his other works, and on April 15 *Serse* (Xerxes), a new work. The great pub-

lie did not desert the composer in his trouble, although it refused to sustain the operatic enterprise of Heidegger. At a concert given "for the benefit of Mr. Handel," March 28, the net receipts were £800. At this period he was engaged to compose music for Vauxhall gardens, and the popularity of his music was such that Tyers, the proprietor, erected to his honor a marble statue by Roubiliac. Heidegger's operatic enterprise closed June 6, not to be renewed; and Handel gave his attention to other studies, preparing several of his organ concertos for publication, and composing the oratorios "Saul" and "Israel in Egypt," which were completed before the close of October. These two immense works were produced in the series of 13 oratorio performances of the succeeding winter and spring, the former Jan. 16, the latter April 4, 1739. For his 13 concerts in Lincoln's Inn fields during the season of 1739-'40 the new works were Dryden's "St. Cæcilia Ode" (not the "Alexander's Feast"), and Milton's "L'Allegro" and "Il Penseroso." The season of 1740-'41 comprised 14 performances, the new works being *Imeneo* (Hymen) and *Deidamia*, Italian operas which did not succeed. This closed his attempts to produce opera. The public would support neither him nor any other person at that time in giving opera in a foreign language. Discouraged at length, he determined to accept a long standing invitation from the lord lieutenant and other notables of Ireland and visit Dublin. For performances there he composed a new work to a text selected from the Bible. This was the "Sacred Oratorio," now known as the "Messiah." He reached Dublin Nov. 18, 1741, and began his first series of six concerts Dec. 23. A sacred series of six began Feb. 6, 1742, after which four supplemental performances were given, the second and fourth of which, April 13 and June 3, were the first public productions of the immortal "Messiah." The greatness of the work was immediately appreciated, and its author enjoyed once more the pleasure of a triumphant success. After a stay of nine months in Ireland, Handel returned to London crowned with success and honor. He seems now to have indulged for a time in a period of rest and inactivity; but in the spring of 1743 he gave a series of twelve oratorio performances (the "Messiah" occupying three, and a new work, "Samson," eight), with great success. For his season of 1744 the new works were the "Dettingen Te Deum," "Semele," and "Joseph and his Brethren;" for that of 1744-'5, for which he had taken the Haymarket theatre, "Hercules," "Belshazzar," and a revival of "Deborah." But the faction of the nobility, especially a set of titled women, who placed Senesino higher than Handel, succeeded so far in curtailing the list of his subscribers as to render him unable to meet the great expenses he had incurred in producing his works upon the large stage of the Haymarket,

and on a scale of then unknown grandeur; and in the spring of 1745, after the 16th of the 24 performances advertised, he was forced to close his doors and again suspend payment. During the spring of 1746 he gave only the eight performances which were due to the subscribers of the year before, with but one new work, the "Occasional Oratorio," which, so far from being a *pasticcio*, as is often represented, contains in 37 pieces only six from older works. From this time onward Handel abandoned the plan of depending upon the subscriptions of the higher classes, throwing himself upon the generosity and musical taste of the general public. During the remainder of his life he gave every spring a series of 10 to 13 concerts, and with such success that he paid his debts to the uttermost farthing, and in little more than ten years accumulated £20,000. The new works of these latter years were: "Judas Maccabæus," 1747, which he gave six times; "Alexander," 1748; "Joshua," 1748; "Susannah," 1749; "Solomon," 1749; "Theodora," 1750; "Choice of Hercules," 1751; "Jephthah," 1752, the last of this stupendous series of dramatic oratorios. While at work on "Jephthah," which he began Jan. 15, 1751, and ended Aug. 30, his sight began to fail. Three operations were performed upon his eyes without success, and when the work was produced the next year, the grand old man was led into the orchestra blind. Thenceforward his pupil, John Christian Smith, aided him in conducting his oratorios, and acted as his amanuensis in the additions and changes which he still occasionally made in them. This was the case with the translation, with much added matter, of the *Il trionfo del tempo e del disinganno* of his youth, into the fine work, "The Triumph of Time and Truth." During the winter of 1758-'9 his health failed again; but although he felt himself rapidly drawing near the close of his life of intense activity, he opened his usual series of oratorios, March 2, with "Solomon," with "new additions and alterations." "Susannah," also with new additions and alterations, followed. "Samson" was given on the 14th, 16th, and 21st of the same month, and "Judas Maccabæus" on the 23d and 28th; on March 30 and April 4 and 6, the "Messiah." The performance on the 6th was the last at which the composer was present. On reaching his house he went to bed quite exhausted, and never rose from it. On the 17th anniversary of his first performance of the "Messiah," a little before midnight, he breathed his last, seven weeks after completing his 74th year. He was buried in Westminster abbey, and his statue is conspicuous among the monuments of the "poets' corner" of that edifice.—During the lifetime of the composer Pope called him the "giant Handel," an epithet the justice of which to this day every musician feels. His greatness was fully acknowledged by his contemporary Bach, and by the greatest that

have followed them in the musical profession. Beethoven did not hesitate to call him the greatest composer that ever lived. Handel possessed an inexhaustible fund of melody, of the richest and noblest character; an almost unparalleled power of musical expression; an unlimited command of all the resources of contrapuntal and fugal science; a power of wielding huge masses of tone with the most perfect ease and felicity. But perhaps his leading characteristic was the grandeur, majesty, and sublimity of his conceptions. He carried the old forms of opera to their highest perfection; infused a new life and power into English ecclesiastical music; was as an instrumental composer equalled by none but Bach, and in one direction surpassed all others who have written. We refer to the dramatic oratorio, of which, if not the creator, he was the perfecter, and reached a height in the "Messiah," "Israel in Egypt," "Samson," and "Judas Macabæus," whereon he stands alone. The problem he undertook to solve was that of giving such dramatic force and expression to the music in which he clothed his sacred texts, as to be able to dispense with all scenic and stage effects, and this he did with marvellous success. Making all due allowance for the thinness of his scores in comparison with those written for the modern orchestra, and for his occasional adaptations from other works, still the rapidity with which he produced his greatest compositions has hardly a parallel in musical history: "Atalanta" in 19 days; "Rinaldo" in a fortnight; "Alexander's Feast" in 17 days; concertante for nine instruments in one day; the "Messiah" in 23 days; and "Samson," begun only eleven days afterward, in 35.—Victor Schoelcher's elaborate biography of Handel appeared in London in 1857, and one by Chrysander at Leipsic (3 vols., 1858-'67). Mrs. Bray's "Handel, his Life, Personal and Professional," was published in London shortly after the great Handel festival at the crystal palace in June, 1857. The centennial anniversary of his death was celebrated in London on a gigantic scale in 1859. Many editions of his works, more or less complete, have been published; all others have been superseded by that of the German Handel society (25 vols., 1858-'66 *et seq.*). See also *Händel und Shakespeare* (Leipsic, 1868), and *Händel's Oratorientexte* (1873), both by Gervinus.

**HANEBERG, Daniel**, a German theologian, born at Tanne, June 17, 1816, died June 17, 1876. He became a priest and professor in the university of Munich in 1839. He was a successful instructor in the Old Testament, and a favorite preacher. In 1850 he entered the Benedictine monastery of St. Bonifacius at Munich, became its abbot in 1854, and in 1871 was elected bishop of Spire. Among his writings are: *Ueber die arabische Psalmenübersetzung des Saadia* (1840); *Die religiösen Alterthümer* (1842; 2d ed., 1866); *Ueber Schulwesen der Mohammedaner* (1850); *Geschichte der bi-*

*blischen Offenbarung* (1850; 3d ed., 1864); *Erörterungen über Pseudo-Wakidi's Geschichte der Eroberung von Syrien* (1860); *Ueber die Theologie des Aristoteles* (1863); and *Renan's Leben Jesu*, a criticism (1864).

**HANGCHOW**, or *Hangchow-foo*, a city of China, capital of the province of Chekiang, 2 m. from the Tsientang and about 40 m. from its mouth, 110 m. S. W. of Shanghai. It is situated on a plain at the S. terminus of the imperial canal, giving it water communication with Peking and a large internal trade, while the river, 4 m. broad opposite the city, affords communication with the southern parts of the empire. Until recently it was one of the largest and richest cities of China, with an estimated population of 700,000, of whom more than 60,000 were employed in silk manufactures. Till 1861 it was the great resort for literary and religious men, and colleges and temples were numerous. But a small portion of the people, including a garrison of 7,000 troops, reside within the walls, the rest living in the suburbs, which are extensive and beautiful, and in boats, with which the adjacent waters are thronged. The streets, though narrow, are well paved and clean; arches and public monuments abound, and the shops once vied with those of European capitals in the display of gold and silver ornaments, and silks and embroideries, for which the city was particularly famous; while the residence of the court and the immense trade passing through it increased its wealth and importance. During the latter part of the Sung dynasty (960-1279) it was the metropolis of the country. Marco Polo describes it at the end of the 13th century as "preëminent above all cities in the world in point of grandeur and beauty." Until it was captured by the rebels, Dec. 28, 1861, it was the residence of the governor and general of Chekiang and Fokien, and of the governor of the province. The rebels held it three years, during which they plundered and impoverished the place and drove out a great number of the inhabitants. The imperialists recovered it, March 31, 1864, and since then many of the inhabitants have returned, and the city is recovering something of its former prosperity.

**HANG-NEST.** See BALTIMORE BIRD.

**HANGÖ**, or *Hangö-Udd*, a seaport of Russia, on the coast of Finland, about half way between Helsingfors and Abo, on a tongue of land the extremity of which forms Hangö Head or Cape Hangö. The population is small, but the place derives importance from its harbor being free from ice excepting during about one month of the year, owing to the warm currents from the gulf of Bothnia. It has been declared a free port, and a railway connecting it with St. Petersburg was opened Oct. 8, 1873. The mole is built of granite, and runs out into the harbor for 150 yards, with a depth of 40 ft. on both sides. Owing to the natural advantages of the railway and to the cheapness of labor, it carries freight at a lower rate than the shorter routes

from Revel and the Baltic ports.—The Swedes were defeated here in 1713 by the Russians.

**HANIFAH** (commonly called **ABU HANIFAH**), the founder of the Hanifites, the most ancient of the four sects of orthodox Mussulmans, born at Kufah in 699, poisoned in 767. He early gained distinction from his knowledge of theology and law, but was equally eminent for his personal qualities. He did not accept the doctrine of absolute predestination, and was thrown into prison by the caliph. Subsequently he opposed the caliph's persecution of the inhabitants of Mosul, and was compelled to take poison. A mausoleum was built for him in 1092. He taught that the sins of the faithful are not annulled, and that it is possible for them to fall into transgression. He wrote a famous commentary on the Koran, entitled *Saved*, or "The Help."

**HANKA, Venceslav**, a Bohemian philologist, born at Horzeniowes, June 10, 1791, died Jan. 12, 1861. He had made himself popular by several poetical productions in Czechic, when he became famous by the discovery in 1817 (the genuineness of which is, however, still contested) of the "Manuscript of Königinhof" (*Rukopis kralodvorsky*), a collection of Czechic poems supposed to have been written about the beginning of the 14th century. He was appointed in 1818 librarian of the national museum of Prague, and in 1849 professor at the university. He is the author of a number of important grammatical, lexicographical, and critical works on the Bohemian and other Slavic languages and literature.

**HANKEL, Wilhelm Gottlieb**, a German natural philosopher, born at Ermsleben, May 17, 1814. In 1833 he entered the university of Halle, where he began the study of theology, but soon devoted himself to science. In 1835 he became assistant in the cabinet of the university, and in 1836 teacher of science in the school of the orphan house. In 1847 he was appointed extraordinary professor in the university of Halle, and in 1849 ordinary professor at Leipsic. He is especially noted in connection with electricity and magnetism, and has published *Elektrische Untersuchungen* (parts 1-6, Leipsic, 1856-'65).

**HANKOW**, a city of China, in the province of Hupeh, on the Yangtse-kiang, 470 m. W. of Shanghai; pop. estimated at 800,000. The river Han, which here falls into the Yangtse, separates Hankow from Hanyang, and opposite both, on the other bank of the Yangtse, is Wochang, the capital of Hupeh. These three towns are said to have had, before they were almost wholly destroyed by the Taepings, an aggregate population of 5,000,000. In consequence of its flourishing trade, Hankow is now again one of the first commercial cities of the Chinese empire, and in particular the centre of the commerce of the provinces of Hupeh, Honan, Sechuen, and Kweichow. It is one of the treaty ports opened to foreign commerce. Two regular lines of steamships connect it with

Shanghai. For the trade with Russia, Hankow is next to Tientsin the most important place. The imports in 1871 were valued at \$187,000, the exports at \$5,112,000. The most important articles of export are tea, China grass, hemp, tobacco, and rhubarb; of import, Russian cloth and velvets. The number of vessels entering the port in 1869 was 286, tonnage 185,226; cleared, 350, tonnage 191,088.

**HANLAN, Edward**. See supplement.

**HANLEY**, a town of Staffordshire, England, forming with the township of Shelton a municipal borough, 1 m. N. of Stoke-upon-Trent, and 149 m. N. W. of London; pop. in 1871, 39,976. It is in the centre of the pottery manufacturing district, in which business the inhabitants are chiefly employed, and to which the rapid increase of population (which in 1831 was only 7,121) is mainly due. The town, situated on a rising eminence, has wide, well paved streets, and is lighted with gas and supplied with water. It has a handsome town hall, public library, mechanics' institute, and several large markets. An important cattle market is held here every fortnight.

**HANNAY, James**, a British author, born in Dumfries, Scotland, Feb. 17, 1827, died in Barcelona, Spain, Jan. 9, 1874. He entered the navy at the age of 13, but left it after five years, and devoted himself to literature. He contributed to various periodicals, and from 1860 to 1864 was editor of the "Edinburgh Courant." In 1857 he was an unsuccessful candidate for parliament for Dumfries. In 1868 he was appointed consul at Barcelona. His works include "Biscuit and Grog" (1848), "Hearts are Trumps" (1848), "King Dobbs" (1849), "Singleton Fontenoy" (1850), "Satire and Satirists" (1853), "Sand and Shells" (1854), "Eustace Conyers" (1857), "A Course of English Literature" (1866), and "Three Hundred Years of a Norman House" (1867).

**HANNIBAL**, a city of Marion co., Missouri, on the W. bank of the Mississippi, 132 m. above St. Louis, and 90 m. N. N. E. of Jefferson City; pop. in 1850, 2,020; in 1860, 6,505; in 1870, 10,125, of whom 1,616 were colored and 1,632 foreigners. It is the eastern terminus of the Hannibal and St. Joseph and the Missouri, Kansas, and Texas railroads, one of the western termini of the Toledo, Wabash, and Western, and the Chicago, Burlington, and Quincy lines, and a station on the Mississippi Valley railroad. Hannibal is the only point on the Mississippi S. of Keokuk where a bridge adapted for both railroad and wagon travel spans the river. It is favorably situated for commerce, is rapidly increasing, and is the shipping point for large quantities of tobacco, pork, flour, and other produce. Coal and limestone abound in the vicinity, and the manufacture of lime is a prominent business. With the exception of St. Louis, it is the most extensive lumber market W. of the Mississippi, and has a large trade in this article with Kansas and Texas. It contains a city hall, two banks with

a capital of \$250,000, a savings bank, several large tobacco factories, pork-packing houses, flour mills, saw mills, foundries and car works, and 14 extensive lumber yards. Hannibal college was established in 1868, under the auspices of the Methodist Episcopal church South, and in 1872 had 5 professors and 35 preparatory and 73 collegiate students. There are 6 public schools, including a high school, having in 1872 25 teachers and 1,035 pupils; several private schools, a Roman Catholic seminary, a daily and weekly newspaper, a monthly periodical, and 13 churches.

**HANNIBAL**, or **Anibal** (in Punic, probably, "favorite of Baal"), a Carthaginian general and statesman, born in 247 B. C., died in Nicomedia, Bithynia, in 183. He was the son of Hamilcar Barca, the Carthaginian hero of the first Punic war and leader of the popular party in his state; and the first years of his life were spent amid the impressions caused by the achievements of his father, the disasters which terminated that protracted struggle against Rome, and the horrors of the military mutiny which followed it. Having quelled this mutiny, and prepared for the conquest of Spain, Hamilcar, designing to take with him his son, then a boy of nine years, led him before their departure to an altar, and made him swear eternal enmity to the Romans. Spain, which Hamilcar and his son-in-law and successor in command Hasdrubal conquered as far as the Ebro, was an excellent school of war for Hannibal; and when the young general took the command, on the death of his brother-in-law (221), he possessed all the qualities which could promise success to the great military and political schemes of the house of Barca. His first task was to complete the conquest of the country south of the Ebro. After a few victories, Saguntum (now Murviedro in Valencia) alone remained to be subdued. This city, a Greek colony, was an ally of Rome; but this was only another inducement for Hannibal to attack it, and at the head of 150,000 men he was strong enough to undertake the siege against the will of his government and the wish of the predominant party in Carthage. Saguntum, after a defence of eight months, characterized by that desperate valor which has marked the struggles of so many cities in ancient as well as modern Spain, fell while Rome was still deliberating on its rescue (219). Hannibal stained his victory by cruelty, but the rich booty sent to Carthage silenced the accusations of his enemies and augmented the number of the friends of war. Rome demanded in vain the surrender of the young general, and at last through her envoy, Quintus Fabius Maximus, declared war. Thus the second Punic war was begun. Unlike the first, which was waged chiefly for the possession of the islands of the Mediterranean, the genius of Hannibal made it a struggle for the destruction of Rome, which he hoped to achieve by an invasion of Italy from the north, and with the assistance of the

half subdued subjects of the tyrannical republic, of whom the Insubrian and Boian Gauls had secretly promised a revolt. Having secured the coasts of Africa by an army of Spaniards, and Spain by another of Africans under his brother Hasdrubal, he started from New Carthage (now Cartagena) in the spring of 218, with 90,000 foot, 12,000 horse, and 37 elephants, crossed the Ebro, subdued in a series of bloody struggles the warlike tribes of northeastern Spain, and passed the Pyrenees, leaving Hanno to guard the passes, and dismissing thousands of native Spanish troops to show his confidence of success. His army was now reduced to 59,000 men, with whom he speedily traversed the country between the Pyrenees and the Rhône, crossed that river, unchecked by the hostile Massiliotes, old allies of Rome, and their warlike Gallic neighbors, and, avoiding the cavalry of P. Cornelius Scipio the elder, who had landed on the coast of Gaul, marched up the Rhône and Isère, and through the comparatively level peninsula of the Allobroges between those two rivers to the Alps. It is now generally believed that he crossed the Graian range by the Little St. Bernard, which agrees with the relation of Polybius; but some still hold that his route was across the Cottian range by Mt. Cenis (as Livy relates), or Mt. Genève. The stormy autumn weather and the treachery of the Centrones, a Gallic tribe, greatly augmented the natural horrors of this 15 days' passage of an army consisting in part of horsemen and elephants along narrow paths, between precipices and avalanches, over rocky peaks and ice fields lightly covered with snow. But the spirit of the general proved equally ingenious in baffling the unexpected assaults of the Gauls, and in contriving artificial means for transporting the army with its trains. Of this, however, no more than 20,000 foot and 6,000 horse could be mustered in the valleys of the Dora Baltea. But the Insubrians and Boians had kept their promise and risen against the Romans; they now readily joined his banners. Having captured Taurinium (Turin), which was hostile to the Insubrians, he defeated Scipio, who had returned with a part of his army from Gaul to meet him on his descent from the Alps, in a cavalry engagement on the Ticino. It was his first battle against Romans, and the first in Italy; and knowing the importance of the first impression, he had inspired his brave Numidian cavalry by a fiery speech. The consul retreated toward the fortified town of Placentia (Piacenza), but could not prevent his colleague T. Sempronius, after his arrival from Sicily, from accepting a battle on the Trebia, in which the Romans were entrapped into an ambushade by Mago, the younger brother of Hannibal, and completely routed. Only a part of their army escaped toward the fortresses of the Po. The campaign of the year 218 had thus been a succession of triumphs for Hannibal from the Ebro

to the Trebia. The Romans now armed to defend the lines of the Apennines, sending Servilius and Flaminius, the new consuls of the year 217, to Umbria and Etruria, on either of which an attack was expected. Hannibal chose a western passage over the mountains, where he lost all his remaining elephants but one, and having crossed the marshy environs of the Arno, during which perilous march he lost his right eye, he passed by the camp of Flaminius at Arretium (Arezzo), and finally enticed him from his position into a defile between Cortona and Lake Trasymenus (now the lake of Perugia), where the Romans were suddenly attacked by the Carthaginians in front and rear. Half of the Roman army, together with the consul, perished by the sword or in the lake, and the other half was captured. Four thousand horsemen, the vanguard of Servilius, who was hastening from Umbria to aid his colleague, arrived only to meet the same fate. Rome trembled, and imagined Hannibal already before its gates. (*Hannibal ante portas* became afterward a proverb.) Q. Fabius Maximus Verrucosus was proclaimed dictator by the senate, and the city was fortified. But the conqueror, who knew Rome and the power of its despair, having made an unsuccessful attempt to besiege Spoleto, resolved to detach the subjects and allies of Rome from its interest before attacking the city itself. He therefore crossed over to Picenum, and carried terror and devastation into the lands of the faithful confederates of Rome in central Italy. Fabius now marched against him, and, with that cautious slowness which won him the surname of Cunctator (the Delayer), closely followed all his motions, hovering around him like "a cloud on the mountains," deterring the towns from defection, but carefully avoiding the risk of a decisive battle. By thus keeping Hannibal continually at bay, he procured Rome time for greater armaments. Once he had even the good fortune to surround him closely in a narrow mountain pass; but Hannibal saved himself by having 2,000 oxen with burning fagots around their horns driven upon an eminence, which, making the enemy believe that a sally was intended on that side, induced him to quit one of his main positions. Dissatisfied with the slowness of Fabius, Minucius, his master of the horse, attacked the enemy in his absence at Geronium, and for a trifling success was rewarded by the people of Rome with an equal share in the supreme command. This emboldened him to attempt another attack, and he was soon ensnared and routed by Hannibal, being saved from total ruin only by Fabius, who hastened to the rescue of his rival. Hannibal regarded this as a defeat by Fabius. "I told you," he said, "the cloud of the mountains would shed its lightnings." He wrote to Carthage for reinforcements and money; the government refused to send any, for none were needed, his enemies said, after such victories. Hasdru-

bal, his brother, was fully engaged in Spain by the brothers P. Cornelius and Cneius Scipio. A decisive battle was deemed necessary by Hannibal to destroy the Roman confederacy. The rashness of C. Terentius Varro, one of the consuls of the year 216, soon offered an opportunity for striking a great blow, of which Hannibal well knew how to avail himself. The battle was fought in Apulia, near Cannæ, on the banks of the Aufidus (Ofanto). The two consuls, L. Æmilius Paulus and Varro, commanded more than 80,000 men; the Carthaginian generals, Hannibal, Mago, Maharbal, Hanno, and another Hasdrubal, 50,000. Skillful disposition, stratagem, and the Numidian cavalry decided the day in favor of the Carthaginians. Æmilius Paulus, who died the death of a hero, 21 military tribunes, 80 senators, and numberless knights were among the 50,000, or, according to others, 70,000 Roman victims of the carnage. Only scattered remnants escaped, among them Varro, who now received the thanks of the senate *quod de republica non desperasset*. This indomitable spirit of the Romans, as well as his own heavy loss, still prevented Hannibal from following the advice of Barca to march immediately upon Rome. He was for the present satisfied with the possession of southern Italy, and entered Capua, which opened its gates, to give rest to his troops. But the rich and luxurious metropolis of Campania proved fatal to their discipline and health, and desertion thinned their ranks. Hannibal had passed the zenith of his good fortune. Marcellus, the sword of Rome, while Fabius continued to be its shield, repulsed him from Nola, and besieged and conquered Syracuse (214-212), a newly gained ally of Hannibal, while another ally, Philip of Macedon, was prevented from fulfilling his promises of aid. Hasdrubal in Spain fought with varying success, P. Cornelius Scipio, the son, recovering what his father and uncle had lost when they fell. Sardinia and the whole of Sicily were soon in the hands of the Romans, who began to harass the coasts of Africa. While Hannibal was effecting his successful march to Tarentum and its occupation (212), other towns were lost. Capua was besieged and hard pressed. Unable to dislodge the besiegers, he suddenly marched toward Rome, and really appeared before its gates (211), but this diversion remained fruitless. The siege of Capua was not raised, and both that city and Tarentum were lost; and after a victory at Herdonea (210), Hannibal had to keep himself on the defensive in Apulia, Lucania, and Bruttium. His most dangerous enemy, Marcellus, however, fell into an ambuscade near Venusia, and was slain (208). This was one of Hannibal's last achievements in Italy. His hopes rested on the approach of his brother from Spain with a mighty army; but the consuls Livius and Claudius Nero, the latter of whom secretly hastened from the south, where he was observing Hannibal, to aid his colleague in the north, de-

stroyed in the battle on the Metaurus (207) the new army and every hope of Carthaginian success. Hannibal, into whose camp the head of his brother was thrown by the Romans, now despaired of the result, but still continued the struggle, at least for the military honor of his country, in Bruttium, the southernmost peninsula of Italy, until he was recalled in 203 to Africa, which was now invaded by Scipio, the conqueror of Spain. Immediately on his return, after so many years of absence and victories, he created a new cavalry, and defeated Masinissa of Numidia, the ally of Scipio, but tried to induce the latter to negotiate. The statement that an interview occurred between Hannibal and Scipio is discredited by some historians. At all events, if they had an interview, it was without results. Hannibal was obliged to accept a battle at Zama (202), in which his large but motley host of Carthaginians, Libyans, Ligurians, Gauls, and Macedonians succumbed to the less numerous but well organized and disciplined army of Scipio. The terror of an eclipse of the sun, and a panic among the mercenaries, chiefly caused this crushing defeat. The second Punic war was soon over; Rome dictated cruel and humiliating terms of peace, and Carthage accepted them (201). But Hannibal's career was not yet ended. Removed from military command through the influence of the Romans, he soon rose to the highest civil dignity in his state, and as *suffete* he evinced the same energy, boldness, and genius which distinguished him as a general. He detected, denounced, and abolished inveterate abuses, reformed the judiciary, reorganized the finances, restored the resources of the republic, and concluded new alliances. But his hostility to the embezzlers of the public revenues and monopolizers of offices increased and embittered his personal enemies, who denounced his patriotic schemes at Rome, and with a Roman commission sent to Africa even concerted a plot against his life. He sought safety in flight, escaped from the city, sailed to Tyre, and thence went to the court of Antiochus the Great of Syria, whom he soon induced to declare war against the Romans. But though the king treated him with the utmost honor, he was prevented by intrigues, and by jealousy of Hannibal's glory, from adopting his grand plans of a combined attack on Rome in Italy, as well as from giving him a proper share in the execution of his own. He was made commander of a fleet sent against the Rhodians, but failed in the expedition, though he personally distinguished himself. The Romans, having compelled Antiochus to an inglorious peace, asked the surrender of their old enemy, who was, however, informed in time to escape. He repaired to the court of Prusias, king of Bithynia (187), passing, it is said, through Gortyna in Crete, where he saved his treasures by placing sealed casks filled with lead under the protection of the avaricious inhabitants, while his gold lay concealed in hollow statues on the open

floor of the vestibule. Anxious to induce Prusias to aid him in his plans against Rome, he is said to have gained a victory over the fleet of his enemy Eumenes of Pergamus. There, too, the Romans persecuted him; and no less a person than T. Q. Flaminius was sent to ask his surrender, and the Bithynian king was weak enough to command the arrest of his guest. But Hannibal was not unprepared, and determined to die a free enemy, and not a slave of the Romans. He took poison, and in his last hour expressed his contempt of his victorious but degraded enemies, and uttered imprecations on Prusias, their treacherous accomplice. He had kept his oath.

**HANNO**, a Carthaginian navigator of the 5th or 6th century B. C. He was commissioned by the government of Carthage to explore the western coast of Africa, and to plant colonies there. Setting sail accordingly with 60 penteconters (vessels of 50 oars each), carrying 30,000 men and women, he passed the pillars of Hercules, and voyaged along the African coast as far as lat. 8° N., according to some writers. On returning to Carthage he caused an account of his voyage to be inscribed on a tablet, and then dedicated it in the temple of Saturn. It seems to have been written in the Punic language; the version of it which remains is only a Greek translation. According to this tablet, known as a *Periplus*, it appears that one city was built not far from the strait of Gibraltar, and a few others along the coast, reaching to Cape Bojador. The first edition of Hanno's *Periplus* appeared at Basel in 1534, as an appendix to the edition of Arrian by Gelenius. It has also been published by Hudson in the first volume of his *Geographi Minores* (Oxford, 1698); and in 1797 an English translation of it by Falconer was issued from the Oxford press. It is still an open question at what time this Hanno lived, whose son he was, and how much of the statements of the *Periplus* can be regarded as trustworthy. Some authorities believe him to be either the father or the son of the Hamilcar who fell at Himera in 480 B. C. Others compute that the voyage was made about 570. The *Periplus* has recently been cited as evidence of the existence of the gorilla in those days.

**HANNO**, surnamed the Great, a Carthaginian general and statesman, contemporary with Hamilcar Barca and Hannibal, died in old age, after the battle of Zama, 202 B. C. While yet a very young man he commanded a division of the Carthaginian army in Africa during the first Punic war, and took Hecatompylus, an opulent city of that continent. When the mercenaries returned from Sicily after the termination of the first Punic war, Hanno was deputed to propose to them that they should waive their right to a part of the arrears due them; and when they refused to accede to this and took up arms to enforce their claim, he was appointed to command the army sent to subdue them. His military abilities were not equal to the accomplishment of the enterprise,

and in a little time Hamilcar, his political rival and opponent, was associated in the command with him. Hanno was afterward superseded by the suffrages of the soldiers, and a new colleague given to Hamilcar. This new general being soon after taken prisoner and killed by the mutineers, a formal reconciliation was effected between the two rivals, and Hanno was restored to his command. The fortune of war now turned against the mercenaries, who were defeated in a great battle, stripped of their strongholds, and at length completely subdued. From the termination of this war Hanno figures rather as a politician than a warrior. He was the head of the aristocratic party at Carthage, and the great enemy of Hamilcar and his sons, whose policy he invariably opposed.

**HANOVER**, an E. county of Virginia, drained by North Anna and South Anna rivers, which unite on its N. E. border to form the Pamunkey; area, 400 sq. m.; pop. in 1870, 16,455, of whom 8,562 were colored. The surface is uneven, and the soil much diversified and capable of being improved. The Richmond, Fredericksburg, and Potomac, and the Chesapeake and Ohio railroads traverse the county. The chief productions in 1870 were 122,593 bushels of wheat, 225,517 of Indian corn, 119,211 of oats, 29,278, of Irish and 35,775 of sweet potatoes, 439,434 lbs. of tobacco, and 72,013 of butter. There were 1,468 horses, 983 mules and asses, 2,175 milch cows, 1,303 other cattle, 2,260 sheep, and 8,426 swine; 15 flour mills, and 4 saw mills. Capital, Hanover Court House.

**HANOVER. I.** A town of Grafton co., New Hampshire, on the E. bank of the Connecticut river, opposite Norwich, Vt., with which it communicates by a bridge, 50 m. N. W. of Concord; pop. in 1870, 2,085. The surface is in some parts uneven, but the greater portion is admirably adapted for agriculture. The soil is fertile, and there is probably less waste land in Hanover than in any other part of the county. The Moose mountain, an elevated ridge, runs across the town from N. to S. about 5 m. from the Connecticut. The Connecticut and Passumpsic Rivers railroad passes on the opposite side of the river. The principal village is situated about  $\frac{1}{2}$  m. from the river, on an elevated plain, and is built around a public square of six acres, on which front the principal edifices. It is the seat of Dartmouth college. (See DARTMOUTH COLLEGE.) The town contains a national bank, a hotel, two post offices (Hanover and Hanover Centre), 18 public schools (two graded), a monthly periodical published by the college students, and four churches. **II.** A town of Jefferson co., Indiana, on the Ohio river, 5 m. below Madison, and 80 m. S. E. of Indianapolis; pop. in 1870, 564. It occupies a healthy situation on a high bluff, and is surrounded by fine scenery. It is the seat of Hanover college (Presbyterian), established as Hanover academy in 1827, and chartered as a university in 1833. The college grounds embrace more than 200

acres, and contain the president's house, a professors' residence, and a college building 200 ft. long by 80 ft. in breadth. The property and endowment amount to \$275,000. The college embraces a collegiate and a preparatory department, each comprising a classical and a scientific course. Tuition is free. In 1872-'3 there were 9 professors, 2 tutors, and 134 students; total number of graduates, 403.

**HANOVER** (Ger. *Hannover*). **I.** A N. W. province of Prussia, between lat. 51° 17' and 53° 51' N., and lon. 6° 40' and 11° 32' E. It is bounded mainly by the North sea, the grand duchy of Oldenburg, the province of Schleswig-Holstein, the grand duchy of Mecklenburg-Schwerin, the provinces of Brandenburg and Saxony, the duchy of Brunswick, the provinces of Saxony, Hesse-Nassau, and Westphalia, and the kingdom of the Netherlands. Area, 14,856 sq. m.; pop. in 1871, 1,963,618, of whom about 230,000 were Roman Catholics, 12,000 Jews, and the remainder Protestants. More than one half the population are engaged in agriculture, and about one fourth in mining and manufactures. The surface is flat, except in the S. part, which is covered by the Hartz mountains, some of the peaks of which reach an elevation of 3,000 ft. The principal rivers are the Elbe, which with its tributaries drains the N. E. boundary, the Ems, traversing the W. portion, and the Weser, with its tributaries draining the E. portion. Among the lakes are the Dümmersee, the Steinhudermeer, and the Seeburgersee. The climate generally is mild, except in winter in the high regions of the south. The greatest heat is 93° F., the greatest cold -29°, and the mean temperature 45°. About one sixth of the surface is covered with forests, chiefly oak, beech, and fir; the alluvial flats are natural meadows yielding large crops of hay, or are grazing grounds for vast herds of cattle; more than one fourth of the surface is arable, and is carefully cultivated. The moors and heaths of the lowlands in the north have deep peat beds, which provide fuel for nearly the whole population, and \$200,000 worth of it is sent yearly to Hamburg and Bremen. The chief agricultural products are barley, rye, oats, buckwheat, flax, hemp, potatoes, chicory, garden vegetables, and some fruit. The domestic animals, generally of good breeds, in 1869 numbered 212,905 horses, 863,362 cattle, 572,366 hogs, 158,203 goats, and 2,156,920 sheep, of which 244,095 were merinos. Bee keeping is an important industry, and in 1869 there were 213,870 hives. Poultry is plentiful, and immense numbers of geese are reared in the marshes. Game abounds in the Hartz mountains. Of river fish, the sturgeon is the most valuable; the sea fisheries of herring and haddock are extensive. The mineral wealth of the southern districts is considerable; in 1869 the coal mines yielded about 1,000,000 tons; the value of iron, zinc, copper, silver, and lead ores mined was \$1,500,000, but this does not

represent the exact value, as the profits of a portion of the Hartz mines are divided by Prussia and Brunswick in the proportion of 4 to 3. The annual yield of asphaltum is about 2,500 tons, and some gold is found. In some localities rock salt is mined in large quantities; and there are also extensive slate and sandstone quarries. There are large smelting works and foundries in the vicinity of the mines. The export of linen goods in 1869 amounted to \$7,000,000. The province has more than 1,000 breweries and distilleries, nearly 200 manufactories of woollen goods, several large cotton factories, 20 glass works, besides many manufactories of mirrors, 110 tanneries, 40 paper mills, chemical works which furnish immense quantities of vitriol, sulphuric acid, sal ammoniac, and sugar of lead, India-rubber works, and powder mills. The gun makers of Hanover and Herzberg, and the physical, optical, and mathematical instrument makers of Göttingen, have a European reputation. The province has 95 m. of canals, 650 m. of navigable rivers, and 565 m. of railways. In 1871 the merchant marine of Hanover consisted of 881 sailing vessels of 112,976 tons, 4 steamships of 823 tons, 563 coasters of 21,120 tons, and 2,246 river vessels of 71,982 tons. The principal ports are Harburg, Geestemünde, Norden, and Emden. The principal educational institution is the university of Göttingen. The Protestants have 3,200 public schools, with 4,050 teachers and 280,000 pupils; the Roman Catholics, 425 public schools, with 500 teachers and 35,000 pupils; the Jews, 80 schools, with 90 teachers and 1,750 pupils. For administrative purposes the province is divided into 6 *Landdrosteien* and 37 circles; the head of each of these administrative divisions is appointed by the Prussian government. The province has a local government of 75 elected assemblymen, with 6 hereditary members, under a president appointed by the crown, and this body legislates on all provincial matters.—The early history of the territory now included in the province will be found under SAXONY. Charlemagne introduced Christianity with his sway, and his family held the Saxon duchy till 951, when it passed to Hermann Billung, in whose family it remained till the death of Magnus in 1106. It was then bestowed by the emperor Henry V. on Lothaire of Suppligenburg, who became his successor in the empire, and died in 1137. His son-in-law Henry, duke of Bavaria, of the house of Guelph, succeeded in Saxony, and by marriage into the house of Billung acquired the duchy of Lüneburg, and subsequently he added Brunswick, Göttingen, and other principalities. His son, Henry the Lion, made considerable additions to the territory. After his death in 1195, of his three sons who succeeded, only the third, William, left male heirs, through whom were formed in the 13th century the houses of Brunswick-Wolfenbüttel and Brunswick-

Lüneburg. (See BRUNSWICK, HOUSE OF.) A prince of the latter house, Ernest Augustus, was created elector of Hanover in 1692. His wife, Sophia, daughter of the elector palatine Frederick V. and of Elizabeth, daughter of James I. of England, was declared next heir to the British crown, after Mary, William III., Anne, and their descendants. His son, George Lewis, succeeded in 1698, and in 1714 became king of Great Britain as George I.; and his successors retained both governments till the accession of Victoria. In 1715 Hanover purchased the principalities of Bremen and Verden. Hanover coöperated with Maria Theresa in the wars of 1740-'45, with England in the seven years' war (1756-'63), and was occupied by the French in 1757. In 1801 it was occupied by the Prussians, and in 1803 by the French, who ceded it to Prussia in 1805, retook it in 1806, and annexed part of it to the kingdom of Westphalia in 1810; after the battle of Leipsic in 1813 it was restored to the elector-king. In 1814 the congress of Vienna made it a kingdom and enlarged its territory. On the accession of Victoria to the throne of Great Britain in 1837, Hanover by the Salic law was separated from the British crown, and Ernest Augustus, brother of William IV., became king. The fifth and last king of Hanover was his son George V., who succeeded in 1851. In the war of 1866 Hanover sided with Austria, and was occupied by Prussia in June. The Hanoverians defeated the Prussians at Langensalza on June 27, but surrendered on June 29. Hanover was annexed to Prussia in September. (See GEORGE V.) II. A city, capital of the province, at the confluence of the Ihme and the Leine, 64 m. S. E. of Bremen and 84 m. S. by W. of Hamburg; pop. in 1871, 87,641. The river Leine divides the old and new towns, which are connected by 11 bridges. The old town was formerly fortified, but the ramparts were demolished in 1780. After the city became the royal residence in 1837, it was greatly improved, and since it fell to Prussia in 1866 the old town is rapidly disappearing, the quaint structures of former years giving place to warehouses and modern residences. Among the noteworthy public buildings are the Kreuzkirche and the Marktkirche, built in the 14th century, the city hall, built about 1455, and the Aegidienkirche, probably 400 years old, restored in 1827. Some of the finest buildings are in the vicinity of Waterloo square, which contains a column about 170 ft. high, surmounted by a statue of Victory and inscribed with the names of the Hanoverians who fell at Waterloo. On the N. side of the square is the former royal palace, built in 1640, from which the treasures were removed by the ex-king to Vienna in 1866. The city has a public library of 40,000 volumes, a royal library of 150,000 volumes and 2,000 manuscripts, a number of Lutheran and Roman Catholic churches, a synagogue, many charitable and educational institutions, and numerous manufactories.

**HANOVER COURT HOUSE, Battle of.** See CHICKAHOMINY, vol. iv., p. 411.

**HANSEATIC LEAGUE** (Old Ger. *Hansa*, a union), a commercial alliance of certain Germanic cities in the middle ages, for the protection of trade. In the early part of the 13th century society in northern Europe was in a rude stage. The shores of the Baltic were occupied by Slavic tribes. Commerce, where it existed, was viewed by the sovereigns as something to supply their own rapacity, rather than as a benefit to the realm. Petty lords followed the example of the sovereigns and levied exactions under the pretence of giving protection. The maritime cities of Germany were the chief sufferers, especially those on the Elbe. The Genoese and Venetians possessed the monopoly of the Mediterranean and the East, and made those cities the depots of their northern traffic. The rich cargoes continually passing gave birth to swarms of pirates, who infested the Baltic. In 1239 an agreement was entered into between Hamburg, Ditmarsh, and Hadeln, to take means to keep the course of the Elbe and the adjacent sea free of marauders. This was the beginning of the Hanseatic league, although it is usually dated from the compact between Hamburg and Lübeck, in 1241, to provide ships and soldiers to clear the traffic way between the rivers Elbe and Trave, and the waters from Hamburg to the ocean, and further to promote their mutual interests. When this partnership had been in operation six years, the city of Brunswick joined it. Other cities speedily sought admission, with their quota of men and money. The progress of the league was rapid. By 1260 it had so expanded that a convention was summoned to regulate its affairs, and thereafter its diet assembled triennially, with an extraordinary meeting decennially to renew the league. Lübeck was named the capital of the Hansa, and depository of the common treasury and archives. Usually the meetings were held at Lübeck, but occasionally at Hamburg, Cologne, and elsewhere. The cities of the alliance were organized for administrative purposes into four circles: 1, the Vandalic or Wendish towns of the Baltic; 2, the Westphalian, Rhenish, and Netherlandish towns; 3, the Saxon and Brandenburg towns; 4, the Prussian and Livonian. The capitals of these circles were Lübeck, Cologne, Brunswick, and Dantzic. The number of cities belonging to the league fluctuated, but at the height of its power it comprised the following 85: Andernach, Anklam, Aschersleben, Bergen, Berlin, Bielefeld, Bolsward, Brandenburg, Braunsberg, Bremen, Brunswick, Buxtehude, Campen, Colberg, Cologne, Cracow, Culm, Dantzic, Demmin, Deventer, Dorpat, Dortmund, Duisburg, Eimbeck, Elbing, Elburg, Emmerich, Frankfort-on-the-Oder, Gollnow, Goslar, Göttingen, Greifswald, Groningen, Halberstadt, Halle, Hamburg, Hameln, Hamm, Hanover, Harderwyk, Helmstedt, Hervorden, Hildesheim, Kiel, Königsberg, Kösfeld, Lemgo, Lixheim, Lübeck, Lüneburg, Mag-

deburg, Münden, Münster, Nimeguen, Nordheim, Osnabrück, Osterburg, Paderborn, Quedlinburg, Revel, Riga, Roermond, Rostock, Rügenwalde, Salzwedel, Seehausen, Soest, Stade, Stargard, Stavoren, Stendal, Stettin, Stolpe, Stralsund, Thorn, Uelten, Unna, Yenloo, Warburg in Sweden, Werben, Wesel, Wisby, Wismar, Zutphen, and Zwolle. These cities were represented by delegates. The edicts of the assembly were communicated to the magistrates at the head of each circle, and were enforced with the strictness of sovereign power. Besides the ordinary members of the league, other cities were more or less affiliated with it, but without representation or share in the responsibilities. Among the latter were Amsterdam, Antwerp, Dort, Ostend, Rotterdam, Bruges, Dunkirk, Bayonne, Bordeaux, Marseilles, Rouen, St. Malo, Barcelona, Cadiz, Seville, Lisbon, Naples, Leghorn, Messina, and London; but in the 14th century the kings of France and other potentates of the south ordered their merchants to withdraw from the association. The objects of the league were in the beginning the protection and expansion of commerce, the prevention of piracy and shipwreck, the increase of agricultural products, fisheries, mines, and manufactures. With these views they established four great factories or depots of trade: at London, in 1250; Bruges, 1252; Novgorod, 1272; and Bergen, 1278. From these centres they were able almost to monopolize the trade of Europe. Their factories were conducted with all the rigor of monastic establishments, the officers being bound, among other things, to celibacy and common board. The London factory, with branches at Boston and Lynn, gave the Hansards, as the merchants of the league were called, command both of the import and export market of Britain, while it enabled them to engross much of the carrying trade to the exclusion of British ships. As it was difficult in the state of navigation at that time to make a voyage from the Mediterranean to the Baltic and back in one season, Bruges became the intermediate depot for the rich traffic with Italy and the Levant. Novgorod was the entrepot between the countries E. of Poland and the cities of the league; while Bergen secured to them the products of Scandinavia. The league was at its greatest power during the 14th and first half of the 15th century, but its objects were professedly different from those with which it set out, being now: 1, to protect the cities of the Hansa and their commerce from prejudice; 2, to guard and extend foreign commerce and to monopolize it; 3, to administer justice within the confederacy; 4, to prevent injustice, by means of assemblies, diets, and tribunals of arbitration; 5, to maintain the rights and immunities received from foreign princes, and, where possible, to extend them. Further, the league claimed to exercise a general judicial power, and to inflict the greater and lesser ban. In this change of principle may be traced the seeds of dissolution.

The association framed for defence had become a confederation exercising a sovereign power, aiming at monopoly, negotiating treaties, and declaring war or peace. In 1348 it fought and defeated the kings of Sweden and Norway, and Waldemar III. of Denmark. It subsequently deposed Magnus, king of Sweden, and gave his crown to his nephew Albert, duke of Mecklenburg. Again, in 1428, it declared war on Denmark and fitted out a fleet of 248 ships, carrying 12,000 troops. To such extent did it carry its arrogance that Niederhoff, a burgomaster of Dantzic, himself declared war against Christian I. of Denmark. When citizens of London, jealous of the privileges of the Hanse factory, insulted the employees of that institution, the league declared war against England, and compelled Edward IV. to grant yet more extravagant concessions. But influences were growing up which destroyed the league as rapidly as it rose. Its own efforts had abolished piracy, and left commerce safe on the ocean. Its own example, too, had taught states the value of the commerce they had hitherto disregarded. The league, in short, had laid the foundation of that commercial policy which has since become the basis of all political relations. Sovereigns, naturally jealous of a power whose military force rivalled their own, began by modifying their previous grants, and ended by repealing them. Such was the case with England, which about 1597 withdrew all privileges from the Hansard merchants. The English and Dutch, finding themselves now strong enough to compel the right to trade in the Baltic, entered into it with little care for the interests of the Hansards. Meantime the league, finding its monopolies slipping away, made desperate efforts to retain them; and the cost becoming heavy the maritime towns of the Baltic, so soon as direct trade was opened with the Dutch and English, seceded from the association. The discovery of America and of the passage to India *via* the cape of Good Hope turned the tide of commerce into new channels, and was the finishing blow to the existence of the league. Its last meeting was held in 1630 for the purpose of receiving the secession of the remaining members. Hamburg, Lübeck, and Bremen, to which was afterward added Frankfort-on-the-Main, formed a new association under the name of the free Hanse towns. Napoleon in 1810 embodied them as a Hanseatic department of the French empire; their independence was acknowledged again in the act for the establishment of the Germanic confederation (1815), and they obtained a joint vote in the federal diet as the free Hanseatic cities. Frankfort was annexed to Prussia in 1866; the three other cities joined the North German confederation in the same year. Lübeck was subsequently added to the German customs union, while Hamburg and Bremen remained free ports. Each of these three cities now constitutes a state of the German empire, and is represented in the diet.—See Sartorius,

*Geschichte des Ursprungs der deutschen Hanse* (3 vols., Göttingen, 1802–8), continued by Lappenberg (2 vols., Hamburg, 1830); Barthold, *Geschichte der deutschen Städte* (4 vols., Leipsic, 1850–52); and Falke, *Die Hanse als deutsche See- und Handelsmacht* (Berlin, 1862).

**HANSEN, Peter Andreas**, a German astronomer, born in Tondern, Schleswig, Dec. 8, 1795, died in Gotha, April 1, 1874. He early excelled in astronomical studies, and in 1825 became director of the Seeberg observatory near Gotha. The new observatory in the suburb Erfurt of that town was built under his direction in 1859. He wrote a number of works on the problems of physical astronomy, including geodesy. His *Fundamenta nova Investigationis Orbitæ veræ, quam Luna perlustrat* (Gotha, 1838), formed the basis on which he subsequently calculated his celebrated *Tables de la lune* (London, 1857), for which the British government awarded him, on account of their practical value to navigators, a prize of £1,000. In explanation of the methods of calculation which he had employed in computing the perturbations of the moon, given in his tables, he published *Darlegung der theoretischen Berechnungen der in den Mondtafeln angewiesenen Störungen* (Leipsic, 1862–4). Other works of importance are: *Berechnung der absoluten Störungen der Planeten* (Leipsic, 1856–9); *Geodätische Untersuchungen* (1865–8); *Tafeln der Egeria* (1868); and *Die kleinsten Quadrate in ihrer Anwendung auf die Geodäsie* (1868).

**HANSON**, a S. E. county of Dakota, recently formed, and not included in the census of 1870; area, 432 sq. m. It is intersected by the Dakota or James river. The surface is somewhat diversified, and the soil fertile.

**HANSSENS, Charles Louis**, a Belgian composer, born in Ghent in 1802, died April 12, 1871. He was a nephew of the composer Charles Louis Joseph Hanssens (1777–1852), and became connected with various theatres, and in 1855 professor at the Brussels conservatory of music. His best known opera, *Le siège de Calais*, was performed in Brussels in 1861, and he produced many ballets and other pieces.

**HANSTEEN, Christopher**, a Norwegian astronomer, born in Christiania, Sept. 26, 1784, died there in April, 1873. He studied at the university of Copenhagen, and in 1815 was appointed professor of astronomy and mathematics at Christiania. His *Magnetismus der Erde* (1819) recapitulated all the authentic facts on terrestrial magnetism, from the earliest times; and in his charts of the lines of equal dip, published soon after, he showed that there is but one true magnetic pole in each hemisphere. The results of his investigations of the effects of time and temperature in altering the magnetism of needles are published in his *De Mutationibus Virgæ Magneticæ* (1842). He made numerous observations in the north of Europe, and between 1828 and 1830 travelled in Siberia for the purpose of examining the region of con-

vergence of the needle. On his return he superintended the erection of an observatory in Christiania, of which he became director in 1833. He had charge of the triangulation of Norway, and was a member of the commission for the establishment of a scientific system of measures and weights, for which he furnished the fundamental principles. In a memoir on the secular change of the dip (Copenhagen, 1855; in French, Brussels, 1865), he argued that the annual diminution of the dip is decreasing, and consequently that a minimum of dip will occur in Europe before the close of this century. His most important works are *Resultate magnetischer Beobachtungen auf einer Reise nach Sibirien* (1863), and "Observations on Magnetic Inclination between the years 1855 and 1864" (Christiania, 1865; in French, Brussels, 1865).

**HANTS**, a central county of Nova Scotia, Canada, bounded N. W. by Minas basin, an inlet of the bay of Fundy, and N. E. by the Shubenacadie river; area, 1,176½ sq. m.; pop. in 1871, 21,301, of whom 8,589 were of English, 5,728 Irish, and 5,051 of Scotch origin or descent. The surface is diversified with mountains and valleys. The underlying rock is the Permian sandstone of the coal measures, and gypsum is abundant. The Windsor and Annapolis railroad traverses it. Capital, Windsor.

**HANWAY, Jonas**, an English author, born in Portsmouth in 1712, died in London, Sept. 5, 1786. The earlier part of his life was passed in mercantile pursuits in St. Petersburg, during which he visited Persia, and published a "Historical Account of British Trade over the Caspian Sea, with a Journal of Travels," &c. (4 vols. 4to, London, 1753-'4). In 1756 he published a "Journal of Eight Days' Journey from Portsmouth to Kingston-upon-Thames; to which is added an Essay upon Tea and its Pernicious Consequences," which caused Dr. Johnson to remark that "Jonas acquired some reputation by travelling abroad, but lost it all by travelling at home." He wrote nearly 70 pamphlets, mostly devoted to philanthropic schemes. He was mainly instrumental in founding the London marine educational society, and the Magdalen society. He was the first man in England who ventured to brave public opinion by carrying an umbrella. There is a monument to him in Westminster abbey.

**HAPSBURG** (Ger. *Habsburg*; originally, it is supposed, *Habichtsburg* or Hawk's Castle), a ruined castle of Switzerland, near Brugg, canton of Aargau, on the Wülpselberg, on the right bank of the Aar. It was built early in the 11th century, and has given its name to the imperial house of Austria. The first count of Hapsburg was Werner II., a nephew of Werner, bishop of Strasburg, who is represented by genealogists as a descendant of Ethico I., a duke of Alemannia in the 7th century. The descendants of Count Werner augmented the possessions of their house until their acquisitions were divided by the brothers Albert IV.

and Rudolph III. in 1232. Rudolph became the founder of the Lauffenburg line, which again separated into the Hapsburg-Lauffenburg and Kyburg branches, of which the former became extinct (in its male line) in 1408, and the latter in 1415. The line of Albert IV., on the other hand, became flourishing through his son Rudolph, who in 1273 was elected emperor of Germany, and, having conquered Ottocar of Bohemia, gave his provinces, Austria, Styria, and Carniola, to his sons Albert, afterward the first German emperor of that name (died in 1308), and Rudolph, on whose death in 1290 his share also reverted to Albert. Under the grandsons of the latter the line again separated into two branches, one of which, numbering among its members the emperor Albert II. (died 1439), became extinct in 1457, with the death of his son Ladislas, king of Hungary, and the other ascended the throne of Germany in the person of Frederick III. (died 1493), whose descendants were now, after the acquisition of the Burgundian dominions, strong enough to make the German imperial dignity stationary and almost hereditary in their house down to the last hour of the German empire (1806). The successors of Frederick III. in that dignity were, of the male line, Maximilian I. (died 1519), Charles V. (abdicated 1556), Ferdinand I. (died 1564), Maximilian II. (1576), Rudolph II. (1612), Matthias (1619), Ferdinand II. (1637), Ferdinand III. (1657), Leopold I. (1705), Joseph I. (1711), and Charles VI. (1740); of the female line (Hapsburg-Lorraine), Francis I. of Lorraine, husband of Maria Theresa, daughter of Charles VI. (1765), Joseph II. (1790), Leopold II. (1792), and Francis II., who, having assumed the title of emperor of Austria in 1804 as Francis I., resigned the German imperial dignity in 1806. His successor in Austria was his son Ferdinand I. (1835-'48), after whose resignation his nephew Francis Joseph, son of the archduke Francis Charles, was declared emperor, Dec. 2, 1848. His son, Rudolph Francis Charles Joseph, born Aug. 21, 1858, is the heir to the crown. Through Charles V. (I.), who was the son of Philip, son of Maximilian I., and of Juana, daughter of Ferdinand and Isabella, the house of Hapsburg also ascended the throne of Spain, uniting with it the possessions of the house of Burgundy in the Low Countries; while his brother Ferdinand I. succeeded in attaching to the German line the crowns of his brother-in-law Louis II., king of Hungary and Bohemia, after the death of the latter in the battle of Mohács against the Turks (1526). The Spanish line was continued by Philip II., Philip III., Philip IV., and Charles II., with whom it became extinct in 1700, and was succeeded, after a great struggle involving half of Europe in war, by the Bourbons. The chief Swiss possessions of the house were lost as early as the first quarter of the 14th century, when the Swiss confederation was formed; the rest were ceded to various cantons at later periods, the

last as late as 1802.—One of the counts of Hapsburg, Geffery (Gottfried), settled in England in the 13th century, served Henry III. in his wars, and assumed the surname of Feilding from the county of Rinfildig (Rheinfelden) in Aargau, then belonging to Germany. He became the progenitor of the Denbigh family, and among the titles of the present earl of Denbigh are those of Viscount and Baron Feilding and count of Hapsburg-Laffenburg and Rheinfelden in Germany. Henry Fielding, the novelist, was a member of this family.

**HARAFORAS**, or *Alfoera*, a savage people living in Celebes, the Molucca islands, and the interior of Papua. In general appearance they resemble the Malays, but are darker in color, with hair not straight like that of the Malays, nor woolly like that of the Papuans, but crisp. Their clothing is a strip of the inner bark of a tree, beaten with stones until it becomes white, and appears like rough white paper. Each warrior is armed with a *parang* or cleaver, which he carries in his right hand, while on his left arm he bears a shield 3 or 4 ft. long, but only 4 or 5 in. wide. The most remarkable characteristic of this people is their head-hunting. Every young man must cut off at least one human head before he can marry. The head of a child will do; that of a woman is better; a man's still better; while a white man's head is the most glorious trophy. In one of their villages were found three times as many skulls as the whole population. The Haraforas of Booro live not in villages, but scattered over their whole territory. Their houses consist of little more than a roof of palm leaves resting on four poles, with a kind of platform a foot or two above the ground, where they sit and sleep. Some of them acknowledge a Mohammedan rajah as their superior. It is said that they believe in one supreme being, who sent men a teacher, who left precepts of morality, taught the immortality of the soul, instituted circumcision, and finally ascended to heaven. Wallace thinks that the Haraforas are a distinct race from the Malays, and kindred to the Papuans, between whom and the Malays they form the boundary line. In Ceram they are the predominant type.

**HARALSON**, a N. W. county of Georgia, bordering on Alabama, and watered by the Tallapoosa river; area, about 325 sq. m.; pop. in 1870, 4,004, of whom 319 were colored. The surface is hilly or undulating. The chief productions in 1870 were 17,780 bushels of wheat, 86,352 of Indian corn, 7,209 of oats, 6,772 of sweet potatoes, 49,947 lbs. of butter, and 308 bales of cotton. There were 354 horses, 900 milch cows, 1,411 other cattle, 1,992 sheep, and 5,456 swine. Capital, Buchanan.

**HARAR**, *Hurrar*, or *Adari*, a small country, with an important town of the same name, in E. Africa, lat. 9° 20' N., lon. 42° 17' E., 165 m. S. S. W. of Zeylah on the gulf of Aden; pop. estimated at 8,000. The town is situated on a gentle slope about 5,500 ft. above the sea. On

the east are cultivated fields; the W. ridge is laid out in orchards; the N. side is covered with tombs; and on the south is a low valley traversed by a mountain torrent. It is surrounded by a wall of stone and mud, about 12 ft. high and 3 ft. thick, and kept in good repair. The wall has five gates flanked by oval towers, and encloses an area about a mile long and half a mile broad. The streets are narrow winding lanes, in many places nearly choked up with rubbish. The houses are generally built of rough stone cemented with clay, and whitewashed. The emir and the principal inhabitants have houses of two stories, with flat roofs, and openings high up for windows. These houses stand at the end of large court-yards, which are entered through gates of holcus stalks. There are numerous *gambisa*, bell-shaped thatched cottages, for the poorer classes. The principal buildings are mosques, the finest being the *jami*, or chief mosque, which was built by Turkish architects. The town is supplied with water from numerous springs in its vicinity. The inhabitants are a distinct race, and speak a dialect which is heard nowhere else. They are rigid Mohammedans, and enforce a law which forbids a white man to enter the town. The features of the men are coarse; many squint; others are disfigured by small-pox, scrofula, and other diseases. The women are nearly as ill-looking as the men. There is a proverb current in eastern Africa, "Hard as the heart of Harar." High and low indulge freely in intoxicating drinks. The principal occupation of the people is tilling the soil, which for several miles around is highly cultivated, producing coffee, wheat, jowari, barley, and a variety of fruits and vegetables. The *kaat*, a small plant of an intoxicating quality, is very abundant. Coffee is the most important article produced, and large quantities of it are annually exported. Other exports are slaves, ivory, tobacco, *wars* (safflower, or bastard saffron), tobies and woven cottons, holcus, wheat, *karanji* (a kind of bread), ghee, honey, gums, tallow, and mules. The hand-woven tobies form an important branch of native industry, and are considered equal to the celebrated cloths of Shoa. The tobe consists of a double length of eleven cubits by two in breadth, with a border of bright scarlet, and the average value of one in the city itself is about \$8. It is made of the long fine-stapled cotton which grows upon the hills, and is soft as silk, and warm enough for winter wear. The thread is spun by women with two wooden pins; the loom is worked by both sexes. The lances made in Harar are held in high estimation. Caravans arrive at all seasons. The principal are those which pass between Harar and Berbera and Zeylah, which may be considered as the ports of Harar. The March caravan is the largest, and usually consists of 2,000 camels. As of old, Harar is still the great half-way house for slaves from Zangaro, Gurague, and the Galla tribes. Harar is gov-

erned as an independent sovereignty by an emir, who rules despotically, and seeks to hide his Galla extraction by claiming descent from the caliph Abubekr. The only white man known to have visited the place is the English traveller Richard F. Burton, who penetrated thither in 1855, and who described it in his "First Footsteps in East Africa, or an Exploration of Harar" (London, 1856).

**HARBAUGH, Henry**, an American clergyman, born near Waynesborough, Pa., Oct. 28, 1817, died at Mercersburg, Pa., Dec. 28, 1867. In his youth he worked successively as a farmer, carpenter, miller, and teacher. In 1840 he entered Marshall college, Mercersburg, afterward studied theology, and in 1843 became pastor of a German Reformed church in Lewisburg, in 1850 in Lancaster, and in 1860 in Lebanon, Pa. In 1864 he was appointed professor of theology in the theological seminary of Mercersburg. He was known as an exponent of the so-called Mercersburg school of theology. In 1850 he originated the "Guardian," a monthly magazine, which he continued to edit till the end of 1866, when he became editor of the "Mercersburg Review." His principal works are: "Heaven, or an Earnest and Scriptural Inquiry into the Abode of the Sainted Dead" (1848); "The Heavenly Recognition" (1851); "The Heavenly Home" (1853); "The Birds of the Bible" (1854); "The Fathers of the German Reformed Church" (3 vols., 1857-'8); "The True Glory of Woman" (1858); "Plea for the Lord's Portion of a Christian's Wealth" (1858); "Poems" (1860); "Christological Theology" (1864); *Das alt Schulhaus*, a poem in the dialect of the Pennsylvania Germans; and *Harfe, Gedichte in Pennsylvanisch-Deutscher Mundart* (1870). Nearly all his works have passed through many editions.

**HARBOR GRACE**, a town and port of entry of Newfoundland, capital of a district of the same name, and the second town in population and importance in the colony, situated in the S. E. part of the island, on an inlet of the W. shore of Conception bay, 30 m. W. N. W. of St. John's; pop. in 1869, 6,770. It presents a handsome appearance from the harbor. The principal public building is the Roman Catholic cathedral, the dome of which is a prominent object upon entering the port; the interior is profusely decorated. The circuit court holds two sessions here annually, and a local court sits daily. The town contains several hotels, a grammar school and several elementary schools, a telegraph office, and a weekly newspaper. The harbor, which is about 5 m. in extent, is mostly exposed to the sea, but the portion where the wharves are built is sheltered by a beach, and is secure in all weathers. The cod and seal fisheries and commerce in their products are the principal business. The chief exports in 1872 were 72,508 quintals of cod-fish, 85,282 seal skins, 144,900 gallons of cod oil, 297,108 of seal oil, and 12,949 bbls. of herrings.

**HARBURG**, a town of Prussia, in the province of Hanover, on the Elbe, 6 m. S. of Hamburg; pop. in 1871, 16,506. It has glass works, sugar refineries, and manufactories of tobacco, sail cloth, and chemicals. The Elbe is now navigable for ocean vessels up to Harburg, and the rapid growth of the town is chiefly due to the development of its maritime trade. There is a newly built fort and large wharves. A railway connects the town with Hanover, and steamers ply between it and Hamburg.

**HARCOURT, Sir William George Granville Vernon**, an English lawyer, born Oct. 14, 1827. He graduated at Cambridge in 1851, was called to the bar in 1854, became queen's counsel in 1866, and professor of international law at Cambridge in 1869. In 1868 he was returned to parliament for the city of Oxford, and in November, 1873, became solicitor general and was knighted, going out of office with the Gladstone ministry in February, 1874. He has contributed to periodical literature, but as a writer is chiefly known by essays on the civil war in America and international law, published in the London "Times" under the signature of "Historicus."

**HARDEE, William J.**, an American soldier, born in Savannah, Ga., in 1818, died at Wytheville, Va., Nov. 6, 1873. He graduated at West Point in 1838, served during the Florida war, and in the war with Mexico was brevetted lieutenant colonel for gallant and meritorious conduct. He was on frontier duty till 1856, when he became commandant of cadets and instructor in tactics at West Point, and in 1860 was appointed lieutenant colonel of cavalry. He resigned Jan. 31, 1861, and entered the confederate service as brigadier general. He took part in the battles of Shiloh, Perryville, Stone River, Chickamauga, and Chattanooga, commanded at Savannah and Charleston at the time of their occupation by the Union forces, and afterward surrendered in North Carolina, with the remainder of Johnston's army. He aided in compiling "Rifle and Light Infantry Tactics," mainly translated from the French by Lieut. Benet, which was adopted in 1855 for the use of the army and militia.

**HARDEMAN. I.** A N. W. county of Texas, separated from the Indian territory on the N. E. by the S. fork of Red river, and intersected by Pease river; area, 1,650 sq. m.; still unsettled. The surface is generally very broken, with high hills and narrow intervening valleys. The water, being impregnated with gypsum, is unpalatable. The county is better adapted for stock raising than for agriculture. **II.** A S. W. county of Tennessee, bordering on Mississippi, and traversed by Hatchie river; area, about 550 sq. m.; pop. in 1870, 18,074, of whom 6,854 were colored. It has a generally level surface and a fertile soil. The Hatchie river is navigable at high water from its mouth in the Mississippi to this county, which is crossed by the Mississippi Central and the Memphis and Charleston railroads. The chief productions in

1870 were 32,930 bushels of wheat, 586,508 of Indian corn, 19,799 of oats, 15,138 of Irish and 32,143 of sweet potatoes, 83,872 lbs. of butter, and 7,884 bales of cotton. There were 2,684 horses, 2,202 mules and asses, 3,146 milch cows, 7,298 other cattle, 7,139 sheep, and 34,936 swine. Capital, Bolivar.

**HARDENBERG, Friedrich von**, baron, better known under his *nom de plume* of NOVALIS, a German author, born at his family estate of Wiederstedt, Saxony, May 2, 1772, died there, March 25, 1801. He was educated at the gymnasium of Eisleben, and at the universities of Jena, Leipsic, and Wittenberg. He studied philosophy and jurisprudence, and prepared himself for the practice of the law, but accepted an appointment as auditor in the salt works of Weissenfels, of which his father was director. His delicate and sensitive mind received a fatal shock from the death in 1797 of a young lady, Sophie von Kuhn, with whom he was in love. The moral beauty of his life, the spiritual penetration and suggestiveness of some of his writings, and his enthusiastic love for the chivalric periods of Christianity and history, made him the idol of his friends; and although his works are but few and fragmentary, he holds a position in German literature as one of the chief representatives of the romantic school. A full collection of his writings was prepared by Friedrich von Schlegel and Tieck, with a biography by Tieck, and published in Berlin in 1802 (5th ed., 1838). An English translation of his *Heinrich von Ofterdingen* appeared in Cambridge, Mass., in 1842.

**HARDENBERG, Karl August von**, prince, a German statesman, born at Essenroda, Hanover, May 31, 1750, died in Genoa, Nov. 26, 1822. He received a brilliant education, travelled extensively abroad, and on his return to Hanover in 1778 entered the civil service. Shortly afterward he was sent on a diplomatic mission to London. The discovery of an intrigue between his wife and an English prince caused him to leave Hanover after having separated from her, and to enter the service of the duke of Brunswick. In 1786 he was deputed to deliver the will of Frederick the Great, which had been deposited with the duke, to his successor, Frederick William II. At that sovereign's recommendation he became in 1790 minister of the margrave of Anspach and Baireuth, at the time when the French actress Clairon, who had ruled the margrave and his people for 17 years, was supplanted in his affections by Lady Craven, who, however, could only be won by marriage. In 1791 Hardenberg effected the arrangement by which the territory of the margrave was ceded to Prussia, in consideration of a large annuity, which enabled that prince to reside with Lady Craven in affluence in England, and Hardenberg was made minister of state and governor of the ceded provinces. After the breaking out of the war with France in 1792, the king appointed him administrator of the army, and in 1795, as an ambassador for

Prussia, he signed the treaty of peace at Basel. In 1797, on the accession of Frederick William III., he was intrusted with the direction of the affairs of Franconia. In 1804, after Bernadotte's invasion of Hanover, Hardenberg became prime minister for a short time. His bold rebuke of Napoleon's invasion of the German territory irritated the emperor; and when the victory of Austerlitz and the treaty of Presburg, in December, 1805, had strengthened Napoleon's position, and humbled the power of Prussia, the king, through fear of war, sacrificed his minister, and Haugwitz was appointed in his stead. For a time Hardenberg continued in the ministry of foreign affairs, but Napoleon declared, July 4, 1807, that he would not conclude the peace of Tilsit unless Hardenberg was dismissed, and the latter withdrew accordingly, and passed some time in exile in Russia. Returning to Berlin in 1810, he became chancellor of state, and carried out with zeal the policy of reforms shortly before inaugurated by Stein. Permission was granted to citizens and agricultural laborers to acquire and possess real estate, and to the nobles to engage in industrial and commercial pursuits without prejudice to their dignity. The burdens which hitherto lay exclusively upon the humbler classes were removed, the estates of the clergy were appropriated for the liquidation of the public debts, new resources were developed for the replenishment of the exhausted treasury, the army was reorganized, a new and improved system of national education was introduced, and harmony was restored between king, nobles, and people by an equal distribution of taxes and privileges. Finally, serfdom was abolished. Hardenberg aided powerfully in rousing the enthusiasm of the Germans in 1813 against Napoleon, signed the treaty of peace in 1814 as the representative of Prussia, and in reward for his services was raised to the rank of prince (June 3), and presented with the rich domain of Neuhausen. He accompanied the allied sovereigns to London, attended the congress of Vienna, and took part in the treaties of Paris in 1815. In 1817 he organized the council of state, of which he became president, and was present on behalf of Prussia at the congresses of Troppau, Laybach, and Verona (1820-'22). In the latter part of his administration he reformed the system of taxation, and regulated the national archives. He left memoirs of his times from 1801 to the peace of Tilsit, which were deposited in the national archives, not to be opened until 50 years after his death. The *Mémoires d'un homme d'état* (Paris, 1828; German, Leipsic, 1828), containing some of his despatches, has been erroneously ascribed to him; Alphonse de Beauchamp is supposed to be the author. His biography was published by Klose in Halle in 1851.

**HARDERWYK**, or **Harderwijk**, a town of the Netherlands, in the province of Gelderland, on the E. shore of the Zuyder Zee, 30 m. E.

of Amsterdam; pop. about 5,500. It was formerly one of the Hanse towns. It was taken by Charles V. in 1522, by the Dutch in 1572, and in 1672 occupied by the French, who burnt it on their departure in 1674. It is fortified toward the land, and is surrounded with pleasure gardens and arable and meadow land. The harbor was formerly used for fitting out vessels in the East India trade, but is now available only for fishing vessels. Seafaring, fishing, and herring smoking are the principal occupations.

**HARDHACK.** See SPIRÆA.

**HARDHEAD.** See MENHADEN.

**HARDICANUTE, Hardacanute, Hardecanute, or Hardiknut,** the last of the Danish dynasty of English kings, born about 1017, died in Lambeth, June 8, 1042. He was the son of Canute the Great by Emma, daughter of Richard I., duke of Normandy, and widow of the deposed Saxon king Ethelred II., and previous to the death of his father was made viceroy of Denmark. Upon the death of Canute he neglected to assert his right to the throne of England, and allowed his half brother Harold to obtain Mercia and Northumbria, while Emma governed Wessex as the vicegerent of her son. Emma was finally obliged to retire to Bruges, and Harold held the whole country under obedience, Hardicanute meanwhile remaining in Denmark. Urged by his mother to dispossess the usurper, he was about to sail to England for that purpose, when he was met by a deputation of English nobles, who informed him of the death of Harold, and offered him the crown. He reigned from 1040 to 1042, and died of apoplexy, by which he had suddenly been rendered speechless four days before at a marriage feast. He was a good-natured glutton, was never married, and was succeeded by his half brother Edward the Confessor.

**HARDIN,** the name of six counties in the United States. **I.** A S. E. county of Texas, bounded E. by Neches river, and watered by Pine Island bayou and Big Sandy river, all navigable streams; area, 1,832 sq. m.; pop. in 1870, 1,460, of whom 242 were colored. Most of the surface is timbered, only a small portion being under cultivation. The chief productions in 1870 were 26,385 bushels of Indian corn, 15,240 of sweet potatoes, 280 bales of cotton, 6 hogsheds of sugar, 5,235 gallons of molasses, and 5,320 lbs. of rice. There were 492 horses, 1,246 milch cows, 4,592 other cattle, 600 sheep, and 5,701 swine. Capital, Hardin. **II.** A S. W. county of Tennessee, bordering on Alabama and Mississippi, and intersected by the Tennessee river; area, 768 sq. m.; pop. in 1870, 11,768, of whom 1,447 were colored. The surface slopes on either hand toward the river, which is here navigable by steamboats. Iron ore and timber are abundant, and the soil is fertile in some parts. The chief productions in 1870 were 35,566 bushels of wheat, 484,721 of Indian corn, 15,151 of oats, 86,918 lbs. of butter, and 2,026 bales of cotton. There were

1,993 horses, 870 mules and asses, 2,670 milch cows, 1,383 working oxen, 4,094 other cattle, 8,044 sheep, and 21,235 swine; 5 tanneries, 5 currying establishments, 5 flour mills, 3 planing mills, and 8 saw mills. Capital, Savannah. **III.** A N. W. county of Kentucky, bounded N. E. by Salt river and Rolling fork, and watered by branches of Green river; area, about 500 sq. m.; pop. in 1870, 15,705, of whom 2,276 were colored. It has a hilly or undulating surface and a fertile soil. It is crossed by the Louisville and Nashville and the Elizabethtown and Paducah railroads. The chief productions in 1870 were 138,463 bushels of wheat, 566,836 of Indian corn, 114,127 of oats, 284,178 lbs. of tobacco, 30,149 of wool, 115,363 of butter, and 3,483 tons of hay. There were 4,693 horses, 3,108 milch cows, 4,547 other cattle, 14,758 sheep, and 35,853 swine; 4 carriage factories, 8 flour mills, and 5 saw mills. Capital, Elizabethtown. **IV.** A N. W. county of Ohio, intersected by the Scioto river; area, 476 sq. m.; pop. in 1870, 18,714. The surface is nearly level, and most of the soil is excellent. It is traversed by the Cincinnati, Sandusky, and Cleveland, the Pittsburgh, Fort Wayne, and Chicago, and the Cleveland, Columbus, Cincinnati, and Indianapolis railroads. The chief productions in 1870 were 250,817 bushels of wheat, 270,909 of Indian corn, 147,562 of oats, 33,717 of potatoes, 140,021 lbs. of wool, 277,668 of butter, and 20,665 tons of hay. There were 5,385 horses, 4,272 milch cows, 7,151 other cattle, 42,402 sheep, and 15,212 swine; 3 manufacturing of boots and shoes, 6 of carriages, 3 of cooperage, 5 of furniture, 4 of saddlery and harness, 6 of tin, copper, and sheet-iron ware, 4 tanneries, 4 flour mills, 2 planing mills, and 35 saw mills. Capital, Kenton. **V.** A S. E. county of Illinois, separated from Kentucky by the Ohio river; area, 260 sq. m.; pop. in 1870, 5,024. It has a high, broken surface, with a fertile soil, and abounds in lead and iron ores. The chief productions in 1870 were 32,319 bushels of wheat, 172,651 of Indian corn, 26,991 of oats, and 105,707 of potatoes. There were 1,201 horses, 1,057 milch cows, 2,393 other cattle, 3,390 sheep, and 8,072 swine. Capital, Elizabethtown. **VI.** A central county of Iowa, intersected by Iowa river; area, 576 sq. m.; pop. in 1870, 13,684. It is well timbered, has excellent prairie land, and contains coal, red sandstone, and fine white limestone. The Dubuque and Sioux City railroad and the Central railroad of Iowa intersect it. The chief productions in 1870 were 496,347 bushels of wheat, 640,510 of Indian corn, 250,139 of oats, 45,077 of potatoes, 256,357 lbs. of butter, and 18,185 tons of hay. There were 5,191 horses, 4,153 milch cows, 6,900 other cattle, 3,857 sheep, and 10,557 swine; 7 flour mills, and 1 woollen factory. Capital, Eldora.

**HARDING, Chester,** an American portrait painter, born in Conway, Mass., Sept. 1, 1792, died in Boston, April 1, 1866. His family, who were poor, removed to Caledonia, N. Y., wher

he was 14 years old, and he was early thrown upon his own resources for support. He became in turn hired boy, peddler, agent, and chairmaker, and eventually a house painter in Pittsburgh, Pa. He worked at this occupation a year, when acquaintance with a travelling portrait painter led him to attempt art. Having succeeded in producing a crude portrait of his wife, he devoted himself enthusiastically to the profession. He painted several other portraits at Pittsburgh, and then went to Paris, Ky., where he finished 100 portraits in six months at \$25 each. After receiving slight instruction in Philadelphia, he established himself prosperously in St. Louis. In August, 1823, he went to London, and spent three years in studying and painting. He resided next in Boston, where he became very popular. In 1843 he went to England again, and afterward resided in Springfield, Mass., spending his winters frequently in St. Louis or in some of the southern cities. Among the distinguished persons who sat to him were Presidents Madison, Monroe, and J. Q. Adams, Chief Justice Marshall, Charles Carroll, William Wirt, Henry Clay, Daniel Webster, John C. Calhoun, Washington Allston, the dukes of Norfolk, Hamilton, and Sussex, Samuel Rogers, Sir Archibald Alison, Lord Aberdeen, and David Ricardo. His last work was a portrait of Gen. Sherman. He wrote "My Egotistography," which has been printed, but not published.

**HARDINGE.** **I. Henry**, viscount, an English soldier, born in Wrotham, Kent, March 30, 1785, died at Southport, near Tunbridge Wells, Sept. 24, 1856. He entered the army in 1798, became lieutenant in 1802, and captain in 1804. He served throughout the peninsular war, being part of the time on the staff of the commander-in-chief. From 1809 to 1813 he was deputy quartermaster general of the Portuguese army. He took part in several battles in the peninsula, and was twice wounded. On the renewal of hostilities in 1815 he was again on the staff of Wellington. At the battle of Ligny, where he acted as brigadier general with the Prussian army, he lost his left arm, which prevented his presence at Waterloo. On his return to England he received a pension, and was made a knight commander of the bath. He was returned to parliament for Durham in 1820, and again in 1826. In 1828, when Wellington came into power, he was made secretary at war, which office he exchanged for the chief secretaryship for Ireland two years later. When Wellington went out Hardinge resigned, but was reinstated in office by Sir Robert Peel during his first term of power (1834-'5), and again in 1841. In April, 1844, he was appointed governor general of India. He originated the policy which ended in the annexation of Oude under his successor Lord Dalhousie. When the Sikhs invaded the British territory from Lahore, he collected a force of 32,000 men and 68 guns, and marched with it toward the threatened portion of the territory. On Dec.

13, 1845, learning that a large Sikh army had crossed the Sutlej, he issued a proclamation, and followed it up by immediately attacking the invaders. The battles of Moodkee, Ferozeshah, Sohraon, and Aliwal closed this short campaign of about six weeks, during which Hardinge served as a volunteer under Sir Hugh Gough. For his services he received the thanks of parliament and a pension of £3,000 a year, and was raised to the peerage with the title of Viscount Hardinge of Lahore; the East India company also gave him a pension of £5,000. He received 16 medals for service in as many pitched battles. In January, 1848, he was superseded in the Indian government by Lord Dalhousie. In February, 1852, he was appointed master of ordnance, and on the death of the duke of Wellington, in September of the same year, he became commander-in-chief of the forces. In October, 1855, he was advanced to the rank of field marshal. Having become paralytic, he resigned in July, 1856. **II. Charles Stewart**, viscount, son of the preceding, born Sept. 12, 1822. He was educated at Eton and Christchurch, Oxford, was his father's secretary in India, and took part in the battles with the Sikhs. From 1851 to 1856 he sat in parliament for Downpatrick. Under Lord Derby's second administration (1858-'9) he was under secretary at war. He is an artist of much merit, and has published elaborate "Views in India" (imp. fol., 1847).

**HARDOUIN, Jean**, a French Jesuit, born in Quimper, Brittany, in 1646, died in Paris, Sept. 3, 1729. He entered the order of Jesuits, and after teaching rhetoric for some time, went to Paris to finish his classical studies. He prepared Pliny's "Natural History" for the Delphin series of classics (5 vols. 4to, 1685); and in his *Chronologia ex Nummis Antiquis restituta* (2 parts, 1693 and 1697) he maintained that of all the ancient classics none are genuine but Homer, Herodotus, Cicero, Pliny the Elder, the Georgics of Virgil, and the satires and epistles of Horace; and that with the aid of these the monks of the 13th century had fabricated all the others, and reconstructed ancient history. The *Æneid* he regarded as an allegory of the progress of Christianity. His work was suppressed by order of parliament, but was surreptitiously reprinted. In 1708 he was compelled to recant his opinions, but he reproduced them in subsequent works. In 1715 he published his great *Conciliorum Collectio* (12 vols. fol.), embracing the councils held from the year 34 to 1714, including more than 20 whose acts had not before been published; but Père Hardouin is accused of having suppressed some important pieces and replaced them by apocryphal passages. At the request of six doctors of the Sorbonne the parliament arrested the sale of the work, and caused a number of leaves to be cancelled. Among his other works are *Nummi Antiqui Populorum et Urbium* (1684); *De Nummis Antiquis Coloniarum et Municipiorum* (1689); *De Nummis Samaritanis*, and

*De Nummis Herodianum* (1691); *Chronologia Veteris Testamenti* (1697); *Opera Selecta* (1709); and his posthumous *Opera Varia* (1733).

**HARDWICK, Charles**, an English theologian, born at Slingsby, Yorkshire, Sept. 22, 1821, died Aug. 18, 1859, while ascending the Pyrenees near Bagnères de Luchon. He was a fellow of St. Catharine's hall, Cambridge, where he resided and held the office of Christian advocate in the university. In 1853 he was appointed professor of theology in Queen's college, Birmingham; in 1855, divinity lecturer at Cambridge; and a few months before his death, archdeacon of Ely. Among his works are: "Historical Inquiry relative to St. Catharine of Alexandria" (1849); "History of the Articles on Religion" (1851); "Twenty Sermons for Town Congregations" (1853); "History of the Christian Church during the Middle Ages" (1853); "History of the Christian Church during the Reformation" (1856); "History of the Preston Strikes and Lock-outs" (1857); and "Manual for Patrons of Friendly Societies" (1859). He commenced an elaborate work, "Christ and other Masters," comparing Christianity with other forms of religion, of which four parts were published (1855-'7; 2d ed., 1863). He also prepared an edition of the Anglo-Saxon and Northumbrian version of the Gospel of St. Matthew.

**HARDWICKE, Earls of. I. Philip Yorke**, first earl, an English jurist, born in Dover, Dec. 1, 1690, died in London, March 6, 1764. His grandfather, Simon Yorke, was a wealthy merchant of Dover, where his father, Philip, became a solicitor. He was educated for the law, and while a student at the Middle Temple became acquainted with Chief Justice Parker (afterward earl of Macclesfield), who employed him as companion and tutor to his sons, and used his influence to push him forward in his profession. He was called to the bar in 1715, and when his patron was made lord chancellor he entered parliament in 1719 as member for Lewes, the expenses of his election being defrayed by the government. The next year he was appointed solicitor general; soon afterward he was knighted; in 1724 he became attorney general, in 1733 lord chief justice of the king's bench and Baron Hardwicke of Hardwicke, and in 1737 lord chancellor. During the whole period of his public life he enjoyed the highest reputation for integrity and wisdom. Only three of his chancery judgments were appealed from, and those were confirmed. During the king's absence in 1740, '48, and '52, he was one of the justices chosen to administer the government; and in 1746 he was named lord high steward of England to preside at the trial of the rebel Scottish lords, Kilmarnock, Cromartie, Balmerino, and Lovat. In 1754 he was created Viscount Royston and earl of Hardwicke. In November, 1756, he resigned the great seal and passed the rest of his life in retirement. His life, with selections from his correspon-

dence, speeches, and judgments, was published in 1847. **II. Philip Yorke**, second earl, son of the preceding, born Dec. 9, 1720, died May 16, 1796. In 1741 he was returned to parliament for Reigate, and in 1747, 1754, and 1761 for the university of Cambridge, and was in 1762 made chancellor of the university. He was one of the writers of the "Athenian Letters, or the Epistolary Correspondence of an Agent of the King of Persia residing at Athens during the Peloponnesian War" (4 vols. 8vo, 1741-'3; 4to, 1781; 2 vols. 8vo, 1789; 2 vols. 4to, 1798 and 1810; besides which, several spurious editions were published). He edited the "Correspondence of Sir Dudley Carleton" (1775), and "Miscellaneous State Papers, from 1501 to 1726" (2 vols. 4to, 1798), and wrote a "Letter on the Subject of Ministerial Negotiation" (1785). **III. Philip Yorke**, third earl, nephew of the preceding, born May 27, 1757, died Nov. 18, 1834. He was lord lieutenant of Ireland from 1801 to 1806. Of his three sons, two died in infancy, and the other was lost in a storm off Lübeck, April 1, 1808. **IV. Charles Philip Yorke**, fourth earl, nephew of the preceding, born April 2, 1800, died Sept. 17, 1873. He entered the navy in 1815, and in 1816 served as midshipman under Lord Exmouth at the bombardment of Algiers. From 1831 to 1834 he was a member of the house of commons, and from 1841 to 1847 lord in waiting to the queen. During the revolutionary period of 1848 and 1849 he commanded the frigate Vengeance at Genoa, and in the latter year contributed toward preserving that city, then in revolt, for Victor Emanuel; and in 1863 he was made an admiral. In the mean time he distinguished himself as a member of the house of lords, and in 1852, and again in 1858, was lord privy seal under Lord Derby.

**HARDY**, a N. E. county of West Virginia, bordering on Virginia, drained by Cacapon river and the S. branch of the Potomac; area, about 800 sq. m.; pop. in 1870, 5,518, of whom 616 were colored. It has a mountainous, rocky surface, being crossed by ridges of the Alleghanies, and contains valuable mines of iron ore and many fertile valleys. The chief productions in 1870 were 33,442 bushels of wheat, 114,567 of Indian corn, 13,283 of oats, 13,566 lbs. of wool, 39,057 of butter, and 2,651 tons of hay. There were 1,163 horses, and 13,177 cattle, sheep, and swine. Capital, Moorefield.

**HARDY, Thomas**. See supplement.

**HARE**, the name of the small rodents of the family *leporidae*, and the genus *lepus* (Linn.), which includes also the rabbits. This has fewer species than most other families of rodents, and presents the exceptional characters of large openings of the skull, an imperfect condition of the palate, the nasal process of the superior maxillary perforated, large orbits meeting in the middle line of the cranium, small temporal fossæ, and an increased number of incisor and molar teeth; the scapular spine has a long acromion process, sending down a considerable

branch at right angles; there are five toes on the fore feet and four on the hind; the ears are very large, as long as or longer than the head; the tail short and bushy, either rudimentary or carried erect; hind legs much longer than the anterior, and formed for leaping; the stomach is simple, or partially divided internally, and the cæcum very long and divided into numerous cells by tendinous bands; a part of the inner surface of the cheeks is clothed with small hairs. Hares are found in all parts of the world except Australia, but most abundantly in North America, and are chiefly confined to the northern hemisphere, extending even into the polar regions. There are only two genera of the family, *Lepus* and *lagomys*; the latter will be described under *PIKA*. The genus *lepus* has the following dental formula: incisors  $\frac{1}{1}$ , and molars  $\frac{3}{3}$ , a larger number than in other rodents; two small incisors are placed behind the principal pair, which are grooved in front, all being white, and not implanted as deeply as

European Hare (*Lepus timidus*).

usual in the alveoli; the molars are rootless. There seems no osteological difference between hares and rabbits; the latter, however, are gregarious and make burrows in which the young are raised, while the former are more or less solitary, and merely make "forms" of grass on which they sit; rabbits are born blind and naked, but hares are said to have the eyes open and the body covered with hair at birth. The distinction being based chiefly on habits, there are hardly any species in America like the rabbit of Europe (*L. cuniculus*, Linn.), unless they be the gray rabbit (*L. sylvaticus*, Bach.) and the jackass rabbit (*L. callotis*, Wagler); and it is not certain that any other old world *lepus* has the habits and peculiarities of *L. cuniculus*. The last three species will be noticed under *RABBIT*. The common hare of Europe (*L. timidus*, Linn.) has ears longer than the head, fringed anteriorly with long hair; the fur mottled with black and ochrey brown, with rufous tints on the neck and outer side of limbs; the abdomen, inner side of

limbs, and tail white; upper surface of tail and ears black; length from tip of nose to root of tail, along the curve of the back, 23 in.; weight, 8 to 12 lbs. Black and white varieties sometimes occur, but the color is not changed in winter as in the varying northern hares. This species is found generally throughout Europe, except in the coldest parts. The timidity of the hare is proverbial, and its speed has made it a favorite object of the chase from the times of the Romans; the principal use of the greyhound is to pursue this animal. The eyes are lateral and prominent, and vision extends to objects on all sides at once; a very acute sense of hearing and smell and great speed are given for further protection against its numerous enemies; the palms of the feet are covered with hair; the nostrils are circular, almost hidden by a fold which may be closed; the upper lip is cleft; the opening of the ears can also be closed; the mammae are 10. They are able to reproduce at a year old; the period of gestation is 30 days, and from two to five are produced at a birth. They remain quiet during the day in their form or seat, which is a mere depression in the ground near some bush, coming out toward evening in search of food; the color so much resembles that of the objects among which they rest, that, as if conscious of the resemblance, they will generally remain quiet in their form until they are almost trodden upon. This species readily takes to the water, and swims well; it sits upon its tarsi, and uses its fore paws in holding food and cleansing its fur, though, from its incomplete clavicles, less perfectly than in the clavicated rodents; it drinks lapping, and can bite severely. Early in spring the sexual appetite is very strong, and the animal acts so strangely that to be "as mad as a March hare" has become a proverb. Its intelligence is small, but its instincts in avoiding its enemies are remarkable. The hare and rabbit were ranked among ruminating animals by the Mosaic law, but were forbidden to the Jews because the hoofs were not divided; Moses probably called the hare a ruminant from the partial division of the stomach, and the evident lateral movement of the lower jaw. The food of the hare is entirely vegetable, and its flesh is delicate, nutritious, and universally esteemed.—The varying hare (*L. variabilis*, Pall.) is smaller than the common species, with smaller and less black ears, shorter tail, and without the mottled appearance and white mark on the cheek of the latter; in summer the general color is rusty brown, finely pencilled with black and rufous yellow above, and impure white below; tail white, grayish above. In winter the fur is white, with ears black-tipped, the change of color being due to the cold of the season in the northern regions which it inhabits. It is found in northern Europe and Asia as far as the arctic ocean, but is wanting in central Europe except in Alpine regions. Twenty other species of hare are described by Waterhouse in

Europe, Asia, and Africa.—Among the American species which grow white in the winter is the polar hare (*L. glacialis*, Leach), the largest of the family, exceeding a large cat; it measures about 2 ft. to the root of the tail, the latter being about  $3\frac{1}{2}$  in., and the ears about 4 in. The color in winter is pure white, with the ears black-tipped before and behind, and the soles dirty yellowish white; in summer it is light brownish gray above, varied with black, rump and upper surface of tail dark plumbeous, ears glossy black with whitish posterior margin, and below whitish with a sooty tinge; the head is arched and wide, the ears broad, the tail short and hardly perceptible amid the dense hair; the fur is soft, fine, and full. This much resembles the European *L. variabilis*, and is distinguished chiefly by greater blackness of the ears; it is found in arctic America, and as far south as Newfoundland, in the most desolate and sterile regions; it feeds on berries, bark, twigs, and evergreen leaves; it is not very shy, though difficult to take in its favorite snowy localities; its range probably extends from Greenland to Behring strait. Indians, trappers, and arctic travellers have often been saved from starvation by this animal. Its eyes are adapted for the twilight and auroral light of the polar countries, which, with the brightness of the pure snow, are always sufficient for its needs; its flesh is said to be delicious. From the shortness of the arctic summer this species produces young but once a year, from three to six at a birth; the fur is softer than the finest wool; its summer pelage does not last more than three or four months. The weight, in good condition, is from 10 to 14 lbs.—The northern hare, sometimes called white rabbit (*L. Americanus*, Erxl.), is a little smaller than the last; the color in winter is whitish, but the hairs at the root are gray and

Northern Hare (*Lepus Americanus*).

pale yellow in the middle; in summer the general hue is reddish brown, pencilled with black above, and the under parts white, very much like that of the European hare. It is found in the eastern portions of America from Virginia as far north as lat.  $68^{\circ}$ ; its favorite haunts

are thick woods, where it is hunted with difficulty by dogs; its food consists of grasses, bark, leaves, young twigs, buds, and berries, and, in a domesticated state, of vegetables and fruits. This is the swiftest of the American species, and has been known to clear 21 ft. at a single leap; like other hares and rabbits, it is in the habit of beating the ground with the tarsi, when alarmed or enraged; it is fond of pursuing a beaten path in the woods, and is often snared in such places. Its flesh is not much esteemed. Its enemies, besides man and dogs, are the lynx and other carnivorous mammals, hawks, owls, and even the domestic cat. It is more fierce than the rabbit, and will bite and scratch severely. The skin is very tender, and the fur little valued by furriers; the hind feet are used by the latter in finishing his fabrics.—The swamp hare (*L. aquaticus*, Bach.) is as large as the northern species, with long ears and tail; dark grayish brown above and white below; it is strong and swift; the fur is coarse and glossy; the feet are not densely clothed with hair, but the toes are slender, with small pads, pointed, and with visible claws. This species prefers low marshy places, in the vicinity of water, to which it is fond of resorting; it is an excellent swimmer, subsisting chiefly on the roots of the iris and other aquatic plants; when started, it suddenly leaps from its form, and makes for the nearest water, seemingly conscious that in that element all traces of its scent will be soon lost; it is fond of hiding beneath the roots of trees overhanging the water, in hollows under river banks, and in decayed trees. It is most abundant in the swampy tracts bordering on the Mississippi and its tributaries in the southwestern states; it has not been seen E. or N. of Alabama, according to Bachman.—The marsh hare (*L. palustris*, Bach.) is smaller than the rabbit, with short ears and tail; the legs are short and the feet are thinly clothed with hair; the general color above is yellowish brown, beneath gray; the eyes are remarkably small. It is found in the maritime districts of the southern states, especially in the neighborhood of rice fields. It is an excellent swimmer, and is perfectly at home in the miry pool and boggy swamp; it runs low on the ground, and is rather slow and clumsy in its motions. Its flesh is considered superior to that of the gray rabbit. Like other species of the genus, it is infested in the summer and autumn with the larvæ of an *æstrus*, which penetrate the flesh and keep the animal lean from constant irritation. Its food consists principally of roots, bulbs, and twigs of plants growing in marshes. It breeds several times a year, having from five to seven at a birth; the young are placed in a kind of nest, made of rushes and lined with hair.—Several other species of hare are described by Waterhouse and Baird.

**HARE.** I. *Julius Charles*, an English clergyman, born at Herstmonceaux, Sussex, in 1796, died there, Jan. 23, 1855. He was a son of

the Rev. Robert Hare, rector of Herstmonceux, and grandson of Bishop Francis Hare. After passing some time on the continent, he studied at the Charterhouse school, and was removed in 1812 to Trinity college, Cambridge, where he remained, with a brief interval, for 20 years; he became a fellow in 1818, and assistant tutor in 1822. During this period he applied himself especially to classical and philological learning, German literature, and the writings of Coleridge and Wordsworth. In 1827 appeared the first series of "Guesses at Truth, by Two Brothers," a volume of miscellaneous apophthegms and reflections, the joint production of himself and his elder brother, Augustus William. A second edition appeared in 1838 with additions by himself, and from the posthumous papers of his brother; a second series was published in 1848, and several editions have since been issued. At Cambridge he united with Thirlwall in translating the first two volumes of the second edition of Niebuhr's "History of Rome" (1828-'32), and he published in 1829 a vindication of the work from the charges of the "Quarterly Review." He also contributed largely to the "Philological Museum." He became rector of Herstmonceux in 1832, archdeacon of Lewes in 1840, prebendary of Chichester in 1851, and chaplain to the queen in 1853. Soon after settling at Herstmonceux he married the sister of his friend the Rev. F. D. Maurice, and began his intimacy with Bunsen, who dedicated to him the first volume of "Hippolytus and his Age." His collected works would form a commentary on the leading events of a quarter of a century having special reference to the church of England. Besides several volumes of sermons and miscellaneous pamphlets on church questions, his principal later publications were: "The Means of Unity, a Charge, with Notes" (1847); "The Duty of the Church in Times of Trial" (1848); "The True Remedy for the Evils of the Age" (1850); "A Letter to the Hon. R. Cavendish, on the recent Judgment of the Court of Appeal as affecting the Doctrine of the Church" (1850); "The Contest with Rome" (1852); "A Vindication of Luther against some of his recent English Assailants" (1854); and an edition of the "Essays and Tales of John Sterling, with a Memoir" (2 vols., 1848). **II. Augustus William**, brother of the preceding, born at Herstmonceux in 1793, died in Rome, Feb. 18, 1834. He was a fellow of New college, Oxford, and became rector of Alton Barnes in 1829. He was associate author of the first series of "Guesses at Truth," and published "Sermons to a Country Congregation" (2 vols., London, 1837). **III. Augustus Julius Charles**, nephew of the preceding, born in Rome, March 13, 1834. He has published "Epitaphs for Country Churchyards" (1856); "Winter at Mentone" (1862); "Walks in Rome" (1871); "Wanderings in Spain" (1873); and "Memorials of a Quiet Life" (1872), which are records of the Hare family.

**HARE, Robert**, an American physicist, born in Philadelphia, Jan. 17, 1781, died there, May 15, 1858. His father, an English emigrant, settled in Philadelphia, and established there an extensive brewery, and his son in early life managed the business. His tastes, however, led him to scientific pursuits. He attended the courses of lectures on chemistry and physical sciences, and before he was 20 years of age joined the chemical society of Philadelphia, to which in 1801 he communicated a description of his important scientific invention, the oxyhydrogen blowpipe, which he then called the hydrostatic blowpipe, and which was afterward named by Prof. Silliman the compound blowpipe. (See BLOWPIPE.) At this period the subject of combustion was very imperfectly understood, and even Lavoisier, who had discovered that heat sufficiently intense to fuse alumina might be obtained by directing a jet of oxygen upon charcoal, and who had burned the elements of water together to produce this fluid, failed to discover that by this union of hydrogen and oxygen in combustion the most intense degree of heat known might be obtained. By means of this apparatus Hare was the first to render lime, magnesia, iridium, and platinum fusible in any considerable quantity. In addition to these discoveries he first announced that steam is not condensable when combined in equal parts with the vapor of carbon. In 1818 he was appointed professor of chemistry in the medical school of the university of Pennsylvania, and continued in this office till his resignation in 1847. His course of instruction was marked by the originality of his experiments and of the apparatus he employed. His instruments, often designed and sometimes made by himself, were always of large dimensions and of the most perfect plans; no expense nor personal labor being spared to render every piece of apparatus as complete as possible. The great collection which he accumulated he bestowed, after resigning his office in the university, upon the Smithsonian institution. One of the most useful small instruments of his invention is the valve cock or gallows screw, by means of which perfectly air-tight communication is made between cavities in separate pieces of apparatus. To his zeal and skill in devising and constructing improved forms of the voltaic pile, American chemists are indebted for the success they attained in applying the intense powers of extended series of voltaic couples long in advance of the general use of similar combinations in Europe. In 1816 he invented the calorimotor, a form of battery by which a large amount of heat is produced with little intensity. With the modified form of it called the deflagrator, devised in 1820, Prof. Silliman succeeded in 1823 in volatilizing and fusing carbon. The perfection of these forms of apparatus was acknowledged by Faraday, who adopted them in preference to any forms he could devise. It was with these batteries that

the first application of voltaic electricity to blasting under water was made. This was in 1831, and the experiments were made under the direction of Dr. Hare. (See **BLASTING**.) He contributed numerous papers to the "American Journal of Science," and other periodicals, and published "Brief View of the Policy and Resources of the United States" (1810), "Chemical Apparatus and Manipulations" (1836), and "Compendium of the Course of Chemical Instruction in the Medical Department of the University of Pennsylvania." In his later years he became a believer in spiritual manifestations, and wrote "Spiritualism Scientifically Demonstrated" (1855).

**HAREBELL**, the common name in this country and England for a beautiful wild perennial plant, *campanula rotundifolia*. The genus *campanula* is a large and very ornamental one; the flowers are bell-shaped, as is expressed by the name, which is the diminutive

Harebell (*Campanula rotundifolia*)

of the Italian *campana*, a bell. The specific name (round-leaved) was not happily chosen by Linnaeus, as it is only the root leaves which are round; and as these usually decay by the time the plant flowers, the only leaves generally found upon it are those of the stem, which are linear or narrowly lanceolate. The stem is seldom a foot high, often half that, and bears from one to ten small bell-shaped flowers of the most beautiful bright blue color. The harebell is common in Europe and northern Asia, as well as in America, and is most frequent on shaded rocky banks, especially on mountains, which it ascends to great elevations. It is one of the wild flowers frequently alluded to in poetry, and one deserving of more attention from cultivators than it has received. It will grow in the ordinary soil of the borders, but its most appropriate place is upon the rock-work. There is a double-flowered variety in the French gardens; and an upright, rigid, wild

form has been described as a distinct species, *C. linifolia*. In England the flowers, treated with alum, are used to make a green dye.

**HARE LIP**, a congenital fissure of the upper lip, on one or on both sides, giving to the mouth very much the appearance presented by the cleft upper lip of the hare. It is sometimes accompanied by a fissure of the hard and soft palate in which the cavities of the mouth and nose communicate; when the teeth and the gums project through the fissure, the deformity is much increased. In the infant it interferes with the process of sucking, and in the adult renders speech imperfect; when fissure of the palate coexists, not only is articulation indistinct and nasal, but the passage of food and drink from the mouth to the nose, and of the nasal secretions into the mouth, is a source of great annoyance and mortification. This deformity is in most cases capable of removal by a very simple surgical operation, which has been practised successfully upon infants a few weeks old. The operation consists merely in paring the edges of the fissure with a knife or scissors, and keeping the cut surfaces in apposition by needles and sutures, strengthened by sticking plaster or collodion. When the hare lip is double, both sides are generally operated on at the same time. It is usual to extract projecting teeth, or to remove any too prominent portion of the jaw by cutting forceps. Bleeding is generally slight, and restrained by pressure or simple contact of the cut surfaces. In infants, adhesive straps are often necessary to prevent the edges being drawn asunder by crying or sucking; in adults, strict silence and liquid food are enjoined for four or five days. Fissure of the soft palate is remedied on the same principle of paring the edges and keeping them in contact by various kinds of sutures and needles; this operation, called *staphyloraphy*, can only be performed on a patient old enough to aid the proceedings of the surgeon. It is attributed to intra-uterine disease, producing an arrest of development; when single, it is said to be most common on the left side. In very rare instances it occurs upon the median line.

**HAREM** (Arabic, *el-harim*, the sanctuary), a term applied to the holy cities, Mecca and Medina, which are jointly called "the harems," and to the temple of Mecca, which is termed *mesjid el-harim*, the sacred mosque; but which in its more general use signifies throughout the Mohammedan world the females of a family, and more particularly that part of a dwelling house which is appropriated to their use. It is also commonly used by the Greeks, Armenians, and Jews of the Turkish empire, though the seclusion of their women is not so strict as that of the Mohammedans, and is founded on customs of remote antiquity in the East. Its prevalence among the Mohammedans has been established by the following passage of the Koran: "And speak unto the believing women, that they restrain their eyes,

and preserve their modesty, and discover not their ornaments, except what necessarily appeareth thereof; and let them throw their veils over their bosoms, and not show their ornaments, unless to their husbands, or their fathers, or their husbands' fathers, or their sons, or their husbands' sons, or their brothers, or their brothers' sons, or their sisters' sons, or their women, or unto such men as attend them and have no need of women [eunuchs], or unto children." The apartments of the women are generally in the upper stories, and so contrived as to secure the utmost privacy. They have commonly a separate entrance, and care is taken to place the windows so that they shall not be seen from the windows of any other house or from the street. In a harem containing several wives, it is usual to assign to them separate suites of apartments. In some places the harem is often superbly furnished and decorated, while the more public part of the dwelling exhibits every sign of poverty. The inmates of the harem consist of a wife or wives and of any number of female slaves, some of whom are kept merely as servants to cook, to clean the rooms, and to wait upon the wives and concubines. It is estimated, however, by the best informed travellers, that only one man in 20 has more than one wife. It is only the very rich that maintain populous harems, and many of these are content with one wife. In frequent instances the wife who will not tolerate a second spouse in the harem will permit the husband to keep concubines for the sake of having them to wait upon her. It is said that Mohammedan women do not dislike the seclusion in which they are kept, but take a pride in it as an evidence of their value. If the husband permits them to be freely seen by other men, they regard his liberality as indicative of indifference.—The Christian travellers most familiar with oriental life have passed very opposite judgments on the nature and effect of the harem system. Lady Mary Montagu, who visited the harems of the great officers of the Turkish empire, has left gorgeous pictures of what she saw. She describes the harems as glittering with splendor and inhabited by lovely girls magnificently attired, leading a gay and happy life. Harriet Martineau, who visited some harems of the higher class in Cairo and Damascus in 1847, gives a very different picture. In a harem at Cairo she found 20 women, some slaves, nearly all young, some good-looking, but none handsome. Some were black, Nubians or Abyssinians, and the rest Circassians with very light complexions. She saw no trace of intellect in these women, except in a homely old one. Their ignorance she describes as fearful, and their grossness as revolting. At Damascus she saw the seven wives of three men in one harem, with a crowd of attendants. Of the seven, two had been the wives of the head of the household, who was dead; three were the wives of his eldest son, aged 22; and the remaining two were the wives of his second son, aged 15. Of

the five younger, three were sisters, children of different mothers in the same harem. They smoked, drank coffee and sherbet, sang to the accompaniment of a tambourine, danced in an indecent manner, and all the while romping, kissing, and screaming went on among old and young. She pronounces them the most studiously depressed and corrupted women she ever saw. Lady Shiel, wife of the British minister to Persia in 1849, who lived four years in that country, says that Persian women of the upper class lead a life of idleness and luxury, and enjoy more liberty than the women of Christendom. They consume their time by going to the bath and by a constant round of visits, and frequently acquire a knowledge of reading and writing, and of the choice poetical works in their native language. Cooking, or at least its superintendence, is a favorite pastime. In populous harems the mortality among children is very great, owing to the neglect, laziness, and ignorance of the mothers and nurses. An American lady, Mrs. Caroline Paine, who travelled in the Turkish empire, says in her "Tent and Harem" (New York, 1859) that she made the acquaintance of Turkish women who were "wonderful instances of native elegance, refinement, and aptness in the courtesies, ordinary civilities, and prattle of society." She says: "Turkish women are by no means confined to a life of solitude or imprisonment, and they would be scarcely tempted to exchange the perfect freedom and exemption from the austere duties of life, which is their acme of happiness, for all the advantages that might be gained from intellectual pursuits or a different form of society." Capt. Burton, who travelled extensively in Mohammedan countries in the disguise of a native, and who in the character of a physician saw something of the interior of the harem, says that the oriental is "the only state of society in which jealousy and quarrels about the sex are the exception and not the rule of life." Since Abdul-Aziz succeeded to the throne of Turkey (1861), in some of the harems of Constantinople and other cities European ideas and manners have been engrafted upon Asiatic splendor, and the women, under attendance, now go into the streets and bazaars, covering the lower parts of their faces with a single white veil, so thin that it does not conceal the features, while the eyes and eyebrows are entirely exposed. The majority of the harems, however, in the cities and in the interior, still rigidly and religiously retain all the ancient rules and customs. The two ladies of W. H. Seward's party, in his tour around the world, in May, 1871, visited the harem in the palace of the khedive's mother (the princess *valideh*) at Cairo. After traversing a succession of saloons superbly furnished with velvet carpets, lace and damask curtains, satin-covered sofas and divans, large French mirrors, and crystal chandeliers, they were presented to the princess, who was surrounded by the ladies of the

harem and Circassian slave girls. The princess wife of the khedive wore a green silk dress with lace, hat, gloves, boots, and fan, all from London or Paris, and her light brown hair was dressed in the latest Parisian style. The ladies of the harem, many of them displaying diamond solitaires of immense size, confessed their partiality for European modes, and all of them had ordered outfits from London, with the request that they might be counterparts of the trousseau of the princess Louise. The princess mother said that "since the ladies of the harem were allowed to see the European opera and ballet at the theatre in Alexandria, they have become quite disgusted with the native performances of their own country." She explained the condition of the slave women; they were brought from their native land when quite young, were provided with husbands and dowries, and were "very lucky." But the system as a domestic institution is summed up by Mr. Seward as follows: "The Mohammedan provision for woman is a prison in which her sufferings from jealousy are consoled by the indulgence of her vanity. She is allowed the society of her own sex with far less restraint than is ordinarily supposed, and she displays before her visiting friends with pride the wealth and ornaments which lighten her chains." She goes abroad only in a carriage, and under strict surveillance; "she never reads, and, so far as possible, is required never to think."—The harem, under various regulations, is found in all eastern countries where polygamy and concubinage are permitted or practised. While the Japanese generally have but one wife, the princes and nobles keep as many concubines as they please, securing them in harems, but much less rigorously than is done in Mohammedan countries. At Hiogo, in October, 1870, Mr. Seward saw a gay Japanese yacht on board of which was a daimio surrounded by numerous retainers and a bevy of highly painted and elegantly dressed young women. The daimio was "giving his harem a picnic." In Siam the law allows but one wife, except to the king; concubinage, however, is limited only by the means of the man. Within the capital, Bangkok, stands enclosed in a double wall the city of the Nang Harm, or veiled women, which is fully described by Mrs. Leonowens in "The Romance of the Harem" (Boston, 1873): "In this city live none but women and children. Here the houses of the royal princesses, the wives, concubines, and relatives of the king, with their numerous slaves and personal attendants, form regular streets and avenues, with small parks, artificial lakes, and groups of fine trees scattered over miniature lawns and beautiful flower gardens. In the southern part of this strange city the mechanical slaves of the wives, concubines, and princesses live, and ply their trades for the profit of their mistresses." This woman's city has its own laws, and its female judges, guards, police, prison keep-

ers, executioners, merchants, brokers, teachers, and mechanics in every trade. No man can enter the city except the king and the priests, who may be admitted every morning under amazon guard. The slave women can go out to see their husbands, or on business for their mistresses; the mistresses can never leave it, except by the covered passages to the palaces, temples, and gardens, until age and position have given them a certain degree of freedom. No fewer than 9,000 women, it is asserted, are thus secluded, and the Nang Harm presents the most extensive and rigorous instance of the harem system.

**HARFLEUR**, a town of France, in the department of Seine-Inférieure, on the small river Lézarde, about 2 m. W. of the Seine, 4 m. N. E. of Havre, and 4 m. S. W. of Honfleur, with which it is occasionally confounded; pop. in 1866, 1,966. It was once a bulwark against foreign invasion and an important port, but deposits brought down by the Lézarde have spoiled the harbor by forming a fringe of land, gradually increasing the distance to the mouth of the Seine. The vicissitudes of war, the revocation of the edict of Nantes, and especially the rise of Havre, gave a final blow to Harfleur, and the fortifications have been demolished. It has one of the most renowned later Gothic churches of Normandy, with a famous belfry; a modern château with a beautiful park; and in the vicinity are delightful promenades. It continues also to have a considerable coasting trade, and possesses a number of manufactories. The fisheries are likewise prosperous.—Henry V. of England captured Harfleur in 1415, expelling many of the inhabitants, whom he replaced with English settlers. The English were driven from the town in 1433 by the neighboring people of the territory (*pays*) of Caux, but the English subsequently reoccupied it for a number of years, their domination finally terminating in 1450. Vauban designed a canal to connect Harfleur with Havre, which remains unfinished.

**HARFORD**, a N. E. county of Maryland, bordering on Pennsylvania, bounded N. E. by the Susquehanna river, and S. E. by Chesapeake bay; area, 480 sq. m.; pop. in 1870, 22,605, of whom 4,855 were colored. The N. W. part is hilly, and contains limestone, granite, and iron. The surface near the bay is level. The soil is fertilized by the use of lime and guano. It is crossed by the Tide-Water canal and the Philadelphia, Wilmington, and Baltimore railroad. The chief productions in 1870 were 244,835 bushels of wheat, 659,789 of Indian corn, 303,164 of oats, 140,523 of potatoes, 209,140 lbs. of tobacco, and 16,927 tons of hay. There were 4,247 horses, 5,718 milch cows, 7,558 other cattle, 5,612 sheep, and 11,676 swine; 1 manufactory of drugs and chemicals, 1 of fertilizers, 1 of pig iron, 2 of lime, 2 saw mills, and 4 flour mills. Capital, Belair.

**HARGRAVES**, Edmund Hammond, the discoverer of the gold fields of Australia, born at Gos-

port, England, about 1816. At the age of 14 he went to sea on board a merchant ship, and during the succeeding three years visited almost every part of the world as a sailor. In 1834 he settled in Australia, where he married, and engaged in farming and stock raising. In 1849 he went to California, where he worked in the gold diggings, and was struck with the similarity between the geological structure of California and that of Australia. In January, 1851, he returned to Australia, and on Feb. 5 set out from Sydney on horseback to cross the Blue mountains and explore for gold on the Macquarie river and its tributaries. Having concluded his investigations, he wrote to the colonial secretary, April 30, 1851, naming various places in the district of Bathurst where gold might be found. Within the year following this disclosure gold was exported from New South Wales and Victoria to the amount of nearly \$20,000,000. Hargraves was appointed commissioner of crown lands; the legislative council of New South Wales voted him £10,000; a gold cup worth £500 was presented to him at a public dinner; and he received various other public and private rewards. In 1854 he returned to England, where he published a volume entitled "Australia and its Gold Fields" (8vo, London, 1855).

**HÄRING, Wilhelm**, better known under his *nom de plume* WILIBALD ALEXIS, a German novelist, born in Breslau, June 23, 1797, died at Arnstadt, Dec. 16, 1871. He served in the army as a volunteer, and studied jurisprudence. Having gained reputation by historical novels, he became especially known by writing a romance entitled *Walladmor*, in compliance with a wager to produce an imitation of Walter Scott's works. De Quincey undertook to translate this romance into English, but his version, though published with the title of "Walladmor" (London, 1824), was so much modified as to be nearly an original work. He wrote several books of travel, and was engaged in various branches of literature, but most successfully as a writer of historical novels. The best of them are: *Schloss Avalon* (Leipsic, 1827); *Cabanis* (6 vols., Berlin, 1832), containing a military song which was set to music and became very popular; *Der Roland von Berlin* (3 vols., Leipsic, 1840); *Der falsche Waldemar* (3 vols., Berlin, 1842); *Die Hosen des Herrn von Bredow* (2 vols., 1846-8); *Ruhe ist die erste Bürgerpflicht* (5 vols., 1852); *Isegrimm* (1854); and *Dorothee* (1856). A complete edition of his works was published in Berlin in 1861-'6, in 18 vols. In concert with Hitzig he prepared 28 of the 36 volumes of *Der neue Pitaval* (Leipsic, 1842-'65), a collection of historical sketches of criminal cases (new series by Vollert, 7 vols., 1866-'72).

**HARINGTON, Sir John**, an English poet, born at Kelston, near Bath, in 1561, died in London in 1612. His mother was an illegitimate daughter of Henry VIII., his father an officer of the court, and Queen Elizabeth was his god-

mother. He was educated at Eton and Cambridge. In 1591 he published a translation of Ariosto's "Orlando Furioso," which gained him considerable reputation. In 1599 he accompanied the earl of Essex to Ireland, and attended him also in his precipitate return to England. While he was in Ireland, Essex knighted him on the field, to the great displeasure of Elizabeth; but James I. made him a knight of the bath in 1603. He wrote a satiric poem called the "Metamorphosis of Ajax" (1596), after the manner of Rabelais, in which he embellished a trivial subject with a vast store of learning, wit, and humor. The author was refused a license to print it, and was punished for its publication by exclusion from the court. In the same year he published an "Apologie" for the "Metamorphosis." "The Englishman's Doctor, or the Schoole of Salerne," a poem, appeared in 1608 or 1609. A collection of his "Most Elegant and Wittie Epigrams" was appended to an edition of his "Orlando Furioso" in 1633; and a miscellany of original papers in prose and verse by Harington and others of his time, under the title of *Nugæ Antiquæ*, was published in 1769-'79. A new edition with a life of Harington was edited by Thomas Park (London, 1804).

**HARIRI, Abu Mohammed Kasem ben Ali**, an Arabian poet, born in Bassorah about 1050, died there in 1121 or 1122. The name Hariri, "dealer in silk," is believed to refer to the occupation of the poet or one of his ancestors. For a while he held a political office, having the title of *sahab al-khabar* (news officer). He had passed the age of 50 when Syria and a part of Mesopotamia were conquered by the Christians of the first crusade, and an incident of this expedition is said to have inspired him with the idea of writing the *Makamat* (plural of *makama*, resting place, assembly). A detachment of crusaders surprised the town of Seraj, pillaged and burned it, massacring the men and carrying away the women. Among the few who escaped was Abu Seid, who appeared in rags before Hariri and his friends, and made a deep impression upon the poet by the elegance of his recital. This man served as a model for the hero of the *Makamat*, who received his name, Abu Seid of Seraj, while the poet seems to have painted himself in the person of the narrator, Hareth ben Hammam. Abu Seid, who appears in the 50 tableaux or novelettes of the poem, is a scholar and poet, eager to enjoy life, careless of the restrictions of custom, and nowise ashamed of his poverty. The Arabs regard the *Makamat* as the great treasury of their language. Having consecrated his last *makama* to the glorification of his native city, and to the recollections of his youth, Hariri makes his Abu Seid, now grown old, vow repentance and devotion to the cares of eternity. He continued, however, to revise and correct his work till his death. He is also the author of numerous grammatical works, of which the *Molhat al-Irab* is a versified essay

on the syntax of the Arabian language. Of this, as well as of *Dorrat al-Gawas*, on idioms, fragments are contained in Sylvestre de Sacy's *Anthologie grammaticale arabe*. Single makamas of Hariri have been translated by Golius, Albert Schultens, Reiske, Rosenmüller, Jahn, Sylvestre de Sacy, Munk, Theodore Preston, and others. The work of the last mentioned translator, containing 20 makamas in English, appeared in London in 1850, and another collection by T. Chenery in 1867. A complete Latin translation was published by Peiper (2d ed., Leipsic, 1836). But neither of these equals the German translation of the *Makamat* by Friedrich Rückert, entitled *Die Verwandlungen des Abu Seid von Sarug, oder die Makamen des Hariri, in freien Nachbildungen* (2 vols., Stuttgart, 4th ed., 1864). One of the best editions of the original is that of Sylvestre de Sacy (2 vols., Paris, 1821-'2), with a commentary mostly collected from Arabian writers; others have been published at Calcutta (3 vols., 1809-14), at Cairo, with notes (1850), and by Reinaud and Dernburg (Derembourg) at Paris (2 vols., 1847-'53). Partial editions with notes are numerous.

**HARLAN.** I. A S. E. county of Kentucky, bordering on Virginia, watered by Cumberland river and its head streams, and bounded S. E. by Cumberland mountain; area, about 600 sq. m.; pop. in 1870, 4,415, of whom 99 were colored. It has a rugged surface, and is rich in coal, iron, and timber. The chief productions in 1870 were 2,266 bushels of wheat, 158,410 of Indian corn, 12,207 of oats, 12,636 of potatoes, 10,324 lbs. of wool, and 58,558 of butter. There were 779 horses, 1,609 milch cows, 3,151 other cattle, 5,933 sheep, and 10,310 swine. Capital, Harlan. II. A S. county of Nebraska, bordering on Kansas, and intersected by Republican river and its branches; area, 576 sq. m. It is not included in the census of 1870. Capital, Melrose.

**HARLAY, Achille de**, a French jurist, born in Paris, March 7, 1536, died there in October, 1616. He belonged to an ancient family, and married a daughter of De Thou, whom he succeeded in 1582 as first president of the Paris parliament. His admirers called him the Christian Cato, on account of his virtues and piety, and he was equally distinguished by his devotion to the crown during one of the most stormy periods of French history. He published *La coutume d'Orléans* (Paris, 1583).

**HARLEM.** See HAARLEM.

**HARLEQUIN** (Ital. *arlechino*; Fr. *arlequin*), a pantomimic character, transplanted from the Italian stage to other countries, traceable to the earliest times, and more immediately identified with the ancient Roman mimes, who appeared before the public with their heads shaved, a sooty face, unshod feet, and a coat of many colors. The general term *zany* (It. *zanni*), which includes most sorts of harlequins, is derived from the Latin *sannio*, a buffoon. Conspicuous among the characters or masks of the

Italian extemporized comedy were the ancient heroes of pantomime, the two *zanni*. One of them was converted into Harlequin, and the other into Scapino, both satirizing the roguery and drollery of the Bergamese, who were proverbial for their knavery, while other characters were introduced who parodied the Venetians, the Bolognese, and the rival inhabitants of other Italian cities. Harlequin generally figured as a servant of Pantalone, the comic representative of Venetian foibles, and as the lover of Colombina or the *arlechinetta*; while Scapino was in the service of the *dottore*, the loquacious pedant and the burlesque type of the academical pretensions of Bologna. The principal inventor of the pantomimes in which the harlequin was introduced was Ruzzante, who flourished about 1530; and many of the actors who represented the harlequin were artists of distinction. Rich, in the 18th century, introduced Harlequin on the English stage, and performed the character under the feigned name of Lun. In France Harlequin was converted into a wit, and even into a moralist, and is the hero of Florian's compositions. The German Hanswurst was originally intended as a caricature of the Italian Harlequin, but corresponded more particularly with the Italian Maccaroni, the French Jean Potage, the English Jack Pudding, and the Dutch Pickelherring. The German Hanswurst was as noted for his clumsiness as the Italian Harlequin for his elasticity or the French for his wit, and the Spanish Gracioso for his drollery. Both Hanswurst and Harlequin were gourmands; but the difference between the German and Italian buffoon was, that the latter could eat a great deal without having a glutton-like appearance, while the former grew to Falstaffian dimensions. Gottsched in the middle of the 18th century drove the Hanswurst from the German stage, and the Harlequin of the Italian became under Goldoni's hand an entirely new character.

**HARLESS, Gottlieb Christoph Adolf**, a German theologian, born in Nuremberg, Nov. 21, 1806. He graduated in theology at Erlangen in 1829, and in 1836 was made ordinary professor of theology at the same university. As a deputy to the Bavarian diet in 1842-'3 he opposed the order which required all persons connected with the army to bow the knee to the sacramental host. The government consequently removed him from his professorship in March, 1845, but appointed him a councillor of the consistory at Baireuth. In the same year he was called to Leipsic as professor of theology, and in 1847 became also pastor of a church in that city. In 1850 he was appointed chief court preacher, councillor in the ministry of public worship, and vice president of the consistory at Dresden. In November, 1852, he was appointed president of the Protestant consistory at Munich and member of the Bavarian state council. Among his writings are: *Commentar über den Brief an die Epheser* (1834); *Die christliche Ethik* (1842); *Sonntagsweihe*, a

collection of sermons (2d ed., 4 vols., 1860); *Kirche und Amt nach lutherischer Lehre* (1853); *Das Verhältniss des Christenthums zu Cultur- und Lebensfragen der Gegenwart* (1863); and *Jakob Böhme und die Alchymisten* (1870).

**HARLEY, Robert**, earl of Oxford, a British statesman, born in London, Dec. 5, 1661, died May 21, 1724. He was of an old Puritan family of Herefordshire, his father and grandfather having taken arms on the parliamentary side in the civil war, although they subsequently favored the restoration. He made his first appearance in public life in 1688 as a supporter of the prince of Orange, in whose behalf he aided his father in raising a body of horse. He entered the first parliament which met after the revolution, and for a time acted with the most ultra section of the whigs. Subsequently, however, from being an intolerant and vindictive whig he became an equally intolerant high churchman and tory. He gained the confidence of both dissenters and churchmen, who combined in February, 1701, to elect him speaker of the house of commons. He was chosen to the same office in the two succeeding parliaments, but resigned it in 1704 upon being appointed secretary of state. His promotion was due, according to the account given by the duchess of Marlborough, to the exertions of Miss Abigail Hill, whom he subsequently assisted in becoming Mrs. Masham, and whose influence with Queen Anne was considerable. Godolphin, Marlborough, and the whigs lost no opportunity of weakening Harley's power, and in this were favored by the discovery that one of his clerks named Gregg was carrying on a secret correspondence with the French court. Although there was no evidence of the complicity of Harley in this matter, and Gregg signed a paper exculpating him, he became the object of so much popular odium that the queen was constrained in 1708 to dismiss him. In August, 1710, the whigs went out of office, and he was appointed chancellor of the exchequer. The attempt of a French abbé, Guiscard, to assassinate him in March, 1711, caused a popular reaction in his favor; and upon his recovery from his wounds, which were slight, he received the congratulations of both houses of parliament. In May he was created earl of Oxford and Mortimer and appointed lord high treasurer of Great Britain. He was now at the height of his power; the whole direction of affairs was in his hands; the Marlborough party was completely discomfited, while his own influence with the queen was constantly increasing; and to add to the éclat of his administration, the treaty of Utrecht was concluded in April, 1713. Soon after this the intrigues of Bolingbroke, his ministerial coadjutor and political associate, began to undermine his position; and on July 27, 1714, after a stormy session of the privy council, he received his dismissal. He was treated with marked coldness at court on the accession of George I., and in August, 1715, was impeached

by the house of commons for high treason and committed to the tower. He was attended thither by an immense multitude, crying, "High church and Oxford for ever!" After nearly two years' confinement he was brought to trial in June, 1717, on his own petition, and the house of commons not appearing to prosecute their impeachment, he was acquitted. The researches of Sir James Mackintosh among the Stuart papers prove that at this very time Harley was carrying on a treasonable correspondence with the pretender James at Versailles. He thenceforth lived in retirement. He left a library of books, pamphlets, and manuscripts of immense value. The manuscripts, amounting to nearly 8,000, and known as the Harleian collection, are now deposited in the British museum. This collection, as well as those of the books and pamphlets, the latter, it is said, numbering 400,000, was completed by Edward Harley, his son and successor. The books and pamphlets were sold to T. Osborne for less than the cost of binding, and Dr. Johnson, Oldys, and Maittaire made a catalogue of them in 5 vols. 8vo (1743-'5). From them was compiled "The Harleian Miscellany" of rare pamphlets, tracts, &c., with annotations by William Oldys (8 vols. 4to, 1744-'6; enlarged, 13 vols. 4to, 1808). Harley's own writings, consisting of a "Letter to Swift on Correcting and Improving the English Tongue," an "Essay on Public Credit," an "Essay on Loans," a "Vindication of the Rights of the Commons of England," and other miscellaneous pamphlets, have little merit. A few days before his dismissal, he wrote, in a letter to the queen, an account of his own administration, which is published in Tindal's history and elsewhere. He was the intimate friend of Pope, Swift, Arbuthnot, Parnell, Prior, and Gay, and aspired himself to the character of a wit and poet, sending to his friends verses which, Macaulay says, were "more execrable than the bellman's." Notwithstanding the important official stations he occupied, and his intimate relations with literary men, he was naturally slow of intellect, an awkward speaker, and possessed, according to Macaulay, "that sort of industry and that sort of exactness which would have made him a respectable antiquary or king-at-arms." According to the same authority, his influence in parliament was altogether out of proportion to his abilities; and his erudition, his gravity, his avoidance of show, and a certain affectation of mystery and reserve which he could assume on occasions, must account for the position he occupied during his long career.

**HARLINGEN**, a fortified seaport town of the Netherlands, in the province of Friesland, on the North sea, 16 m. W. by S. of Leeuwarden, with which it is connected by a canal, and 60 m. N. N. E. of Amsterdam; pop. about 10,000. It has an active trade with England, Norway, and the Baltic, being the principal commercial town of Friesland, and manufactures sail cloth,

gin, bricks, paper, salt, &c. The principal exports are cattle, butter, cheese, fruit, vegetables, flax, hemp, and wool; the chief imports are corn, timber, tar, pitch, coal, chalk, and earthenware. It occupies a site where in 1134 a whole town was destroyed by an inundation of the sea. It is protected by one of the largest dikes in Holland, and contains a monument to the Spanish governor Robles, who first introduced an improved method of constructing these sea walls.

**HARLOW, George Henry**, an English painter, born in London, June 10, 1787, died there, Feb. 4, 1819. He studied under Sir Thomas Lawrence, who used to employ him to prepare pictures in the dead coloring and to advance copies. He had so large a share in painting the much admired lap dog of a fashionable lady, that he claimed the work as his own, and Lawrence dismissed him. In 1818 Harlow visited Rome, and astonished the artists of that city by completing an effective copy of Raphael's "Transfiguration" in 18 days. Canova exhibited one of his pictures at his house, and procured his election as a member of the academy of St. Luke. His best original works are two designs from Shakespeare, "Hubert and Prince Arthur" and the "Trial of Queen Catharine." The principal characters in the latter are portraits of the Kemble family.

**HARMATTAN**, a dry, hot wind, which, blowing from the interior of Africa toward the Atlantic ocean, prevails in December, January, and February along the coast of that continent, from Cape Verd to Cape Lopez. It comes on at any time, continues sometimes one or two and sometimes even 15 or 16 days, and is accompanied by a fog which obscures the sun, rendering it of a mild red color. All vegetation is checked, young or tender plants are destroyed, and grass is turned to hay. It affects the human body also, making the eyes, nostrils, and lips dry, and at times causing the skin to parch and peel off; but it checks epidemics, and cures persons afflicted with dysentery, fevers, or cutaneous diseases. The harmattan is the same in its character as the *sirocco* of Italy and the *kamsin* of Egypt.

**HARMER, Thomas**, an English clergyman, born in Norwich in 1715, died at Wottesfield, Suffolk, in November, 1788. He was educated in London, and in his 20th year was ordained minister of the Independent church in Wottesfield. He published in 1764 "Observations on Various Passages of Scripture," illustrating them by quotations from books of oriental travel. An enlarged edition appeared in 2 vols. in 1776. The 5th and best edition was published under the editorial care of Dr. Adam Clarke (4 vols., 1816). His other works are "Outlines of a New Commentary on Solomon's Song, drawn by the Help of Instructions from the East" (1768), and a volume of miscellaneous writings, edited by Youngman (1823).

**HARMODIUS AND ARISTOGITON**, two Athenians, commonly reckoned among the martyrs

of liberty. Aristogiton had conceived a passion for Harmodius, a beautiful youth, in which Hipparchus, one of the Pisistratidæ, was his rival. Stung by jealousy, in conjunction with Harmodius and others, he formed a conspiracy to destroy the tyrant during the Panathenaic festival, at which the conspirators were present, with their swords concealed in garlands of myrtle. The plot succeeded; but Harmodius was slain by the guards, and Aristogiton arrested, 514 B. C. When subjected to torture by Hippias, the brother of Hipparchus, he named as his accomplices the best friends of the tyrant, who were immediately put to death. On the expulsion of Hippias in 510, the Athenians paid distinguished honors to Harmodius and Aristogiton, erecting statues and singing hymns to their memory, and decreeing that no slave should bear their names. In 307, when the Athenians wished to pay the highest honors to Antigonus and his son Demetrius Poliorcetes, they placed their statues near those of Harmodius and Aristogiton. To the mistress of Harmodius, who refused to disclose the names of the conspirators, was erected a tongueless statue, to commemorate the victory gained by woman over her love of talking.

**HARMONICA**, or *Armonica*, a musical instrument, in which the tone is produced by the vibration of bell-shaped glasses, caused by friction from the moistened finger. It was first contrived by Mr. Packeridge, an Irish gentleman, was improved by Mr. E. Delaval, a member of the royal society, and still further by Dr. Franklin, whose instrument had a compass of three octaves from G to g. The glasses, carefully tuned in semitones, were revolved by a pedal movement and touched by the tips of the fingers, occasionally moistened with water. Once tuned, it did not vary from the pitch, and the volume of tone was swelled or diminished by a greater or less pressure. The quality of the tone is exceedingly pure and sweet, but of such a penetrating character that it is painful to the ears of many sensitive persons. A somewhat similar application of glass vessels for musical instruments is described in the *Mathematische und philosophische Erquickungsstunden*, published at Nuremberg in 1677; and a harpsichord harmonica, in which a key action was substituted for finger pressure, was made by Röllig at Vienna, and by Klein at Presburg. In one made by Abbate Mazzuchi, the friction was produced by a hair bow; and Stein, the celebrated organ builder, invented a stringed harmonica, in which strings were used instead of glasses, with a kind of spinet attachment, the effect of which was thought remarkable. Still another modification was the substitution of steel pegs for the glasses. The construction of Franklin's harmonica is fully described by him in his letters. His enthusiasm evidently expected for the harmonica an extended use, which none of the forms of the instrument have ever attained; nor has it been regarded by musicians or composers as

entitled to any higher rank than that of a musical curiosity or toy.

**HARMONISTS.** See RAPP, GEORG.

**HARMONY** (Gr. *ἀρμονία*, agreement or concord), in music, the agreeable sensation produced on the ear by the simultaneous sounding of various accordant notes. The discussion of this subject in its more general bearings would include the consideration of the whole theory of music; but we shall confine ourselves to an account of the conditions necessary to produce harmonious effects, and to an explanation of the reason of those conditions. From the days of Pythagoras to the year 1862 no true explanation had been given of the facts that the sounding together of notes forming certain musical intervals gives rise to agreeable sensations, while the simultaneous sounding of the notes of other intervals causes disagreeable or dissonant effects. It is true that Pythagoras, 2,400 years ago, had shown the relations existing between harmonious chords and the lengths of the vibrating strings producing their constituent notes. About the same time Tso-kin-ming, a friend of Confucius, taught that the five sounds of the ancient Chinese gamut corresponded to the five elements of their natural philosophy, water, fire, wood, metal, and earth, and that the numbers 1, 2, 3, and 4 are the source of all perfection. In the middle ages "the music of the spheres" of Pythagoras played an important part in the discussions on harmony; and according to Athanasius Kircher, music is the product of both the "macrocosm" and the "microcosm." Even a mind so profoundly scientific as that of Kepler was entangled in such mysticism; and such occult relations even in these days charm many musicians, more disposed to the pleasures of the imagination than to the toil of scientific reasoning. Euler, in his *Tentamen Novæ Theoriæ Musicæ* (1739), attempts to explain the facts of musical harmony by the hypothesis that the mind takes a delight in the sentiment of simple ratios of vibration. After Euler, D'Alembert, in his *Éléments de musique* (1762), adopted and developed the hypothesis of Rameau, who thought that he saw in the harmonics which exist in nearly all sounds suitable for music a rational explanation of the main principles of harmony. Another system of harmony was brought out in 1754 by Tartini, the celebrated violinist, who rediscovered the resultant tones of Sorge, and fancied that he had found in them a clue to the long sought explanation of consonance and dissonance. The honor attending the solution of this problem was reserved for H. Helmholtz, professor of physiology in the university of Heidelberg. In 1862 he published a work entitled *Die Lehre von den Tonempfindungen als physiologische Grundlage für die Theorie der Musik*, in which is laid the true physical basis of musical harmony, founded on a minute study of the auditory sensations. The main distinction between his views and the hypotheses of those who preceded him

is, that he refers the causes of consonance and dissonance to the sensations produced by continuous and discontinuous sounds, while all before him referred the facts of harmony to a psychological cause.—In order fully to appreciate Helmholtz's discovery, it will be necessary to preface an account of it with a few considerations on the causes and nature of sound; on the distinction between a simple and a composite sound; on the phenomena of interference and beats; and on the power of the ear to analyze a composite sound into its sonorous elements. Sound is the sensation caused by tremors sent from rapidly vibrating bodies through the air or other elastic medium to the ear. The vibrating body at the source of the sound, and the elastic medium between that body and the ear, may be of either solid, liquid, or gaseous matter; but generally the vibrating body is either a solid, as a string or tuning fork, or a mass of air, as in the case of organ pipes and nearly all wind instruments. But only vibrations the number of which in a second is comprised within a definite range can produce on the ear the sensation of sound. This range is between about 40 and 40,000 vibrations per second, the pitch of sounds rising with the number of vibrations producing them. As the velocity of sound in air having a temperature of 32° F. is 1,090 ft. per second, it follows that if we divide 1,090 by the number of vibrations the sounding body makes in one second, we shall have the distance from the sounding body through which the air is affected, or vibrated, after the body has made its first vibration; and here we take a vibration in the German and English sense, as a motion to and fro, and not to or fro as it is understood by the French. Thus, suppose a body to make one vibration in  $\frac{1}{40}$  of a second, and then instantly to come to rest; the air in front of this vibrating body will be moved to a depth of  $\frac{1.090}{40}$ , or 27 $\frac{1}{4}$  ft.; and this depth of air affected by one vibration is called a wave length of sound. The half of this wave length nearest the body was formed by the body receding from the air in front of it, and therefore this half of the wave length is composed of rarefied air, or air the molecules of which are separated by more than their natural distances, while the other half of the wave is formed of condensed air, or air the molecules of which are forced near together. But this wave progresses forward with a velocity of 1,090 ft. per second, and as it passes through the air it causes those molecules over which it passes to oscillate once forward and once backward; and it follows that the air touching the drum of the ear will force this membrane inward and then outward, and thus a tremor is given to the fibrillæ of the auditory nerve. But if, instead of making only one vibration, the body continuously vibrates, then the waves succeed each other with perfect regularity, and, producing continuous oscillations in the air and ear, cause the continuous sensation necessary for the perception of a mu-

sical sound. If the body, instead of making 40 vibrations, made 8,000 per second (which corresponds to the highest note used in music), the wave length would amount to only  $1\frac{6}{10}$  inch; yet this very short wave and the long one of  $27\frac{1}{2}$  ft. travel with the same velocity of 1,090 ft. per second. The sounds produced by these vibrations are either simple or composite. A simple sound is a sound having only one pitch, while a composite sound is one composed of two or more definite and separable sounds having pitches generally in the ratio of 1 : 2 : 3 : 4 : 5, &c. This series of sounds is called the harmonic series. Thus, the sound of a tuning fork when mounted on its resonant box, or that of a gently blown closed organ pipe, is simple, for the ear can distinguish but one pitch in these sounds; while the sounds of piano or violin strings, or of reed organ pipes, are highly composite, and the ear can separate them into simple sounds whose numbers of vibration are to each other as 1 : 2 : 3 : 4 : 5, &c. For example, if we take a reed pipe giving C below the middle C of the piano (which note we will designate as  $C_2$ ), we can separate the sound of this pipe into the following simple sounds:  $C_2$ ,  $C_3$ ,  $G_3$ ,  $C_4$ ,  $E_4$ ,  $G_4$ ,  $B\frac{b}{4}$ ,  $C_5$ ,  $D_5$ ,  $E_5$ ; or, expressed in musical notation :

These simple sounds all coexist in the sound of the reed pipe, but their relative intensities diminish as they ascend in pitch; that is, the lowest in pitch is the loudest, and serves to designate the position of the pipe in the musical scale. Now it has for a long time been known that those musical sounds which were best adapted to render the effects of musical composition, and which we distinguish for their brilliant or plaintive qualities, are always composite, and contain besides the fundamental sound the harmonic series; and indeed the *timbre* of a sound depends entirely on the number and relative intensities of its harmonics. On minute examination it has been found that a simple sound is produced only when the air near the ear oscillates forward and backward with the same kind of motion as exists in a freely swinging pendulum. If, however, the ear experiences the sensation of a composite sound, the air near it has a reciprocating motion, which is the resultant of as many pendulum vibrations as there are harmonics in the sound. Yet the ear is a powerful and subtle instrument for decomposing such complex motions into their simple vibratory components; for the ear, properly aided, can separate the composite sound of a reed pipe or of a vibrating string into 12 and more distinct simple harmonic vibrations. Those who are interested in this

subject of the analysis and synthesis of sound will find a full description of various experimental methods in a paper by Prof. A. M. Mayer "On an Experimental Confirmation of Fourier's Theorem, as applied to the decomposition of the vibrations of a composite sonorous wave into its elementary pendulum vibrations," &c., in the "American Journal of Science" (1874). According to Helmholtz, the ear accomplishes this analysis of sound by means of 3,000 little rods or cords, existing in the *ductus cochlearis* of the inner ear, and known as the rods of Corti. These rods are of graduated lengths and thicknesses like the strings in a piano, and appear to be tuned to 3,000 simple notes, equally distributed throughout the range of the seven octaves of musical sounds. Each rod is connected with a filament of the auditory nerve. The mode of action of this highly organized part of the auditory apparatus is as follows: the vibrations of a composite sound reaching the rods of Corti, each rod, being in tune with a simple sound or harmonic existing in the composite sound, enters into vibration and shakes its attached nerve filament, and thus the ear receives a sensation formed of as many simple sounds as really existed in the composite vibration. Indeed, it appears that the rods of Corti are set in vibration exactly as the strings of a piano vibrate to the elements of a note when we sing over the strings of the instrument.—We may now consider the manner of production of beats, and the effects they produce on the ear; and then we shall be in possession of the main facts necessary to explain the fundamental principles of musical harmony. When two sounds nearly in unison fall upon the ear, they produce alternate risings and fallings in the intensity of their resultant effect on the ear. These alternations of intensity are called beats, and are caused in the following manner: Suppose two sounds, produced by two bodies, one giving 2,000 vibrations in a second, the other 2,001. It is evident that if both bodies vibrate together at the beginning of a second, they will again vibrate together at the end of the second; therefore at these two instants the action of one of them on the air conspires with the action of the other, and thus we have an impression given to the air which is the sum of the two vibrations; but at the half seconds the motions of the two bodies are opposed, and therefore at these instants they will neutralize each other's action if their intensities of vibration are equal, and at the instant of the half seconds we shall have entire silence. Hence it follows that the number of beats per second given by any two vibrations will equal the difference in the number of vibrations these bodies separately give in one second. Their beats produce on the ear an intermittent action similar to that experienced by the eye when successive flashes of light fall upon it. These intermittent actions on the sensorium are always unpleasant, and even irritating. The

degree of unpleasantness, however, depends on the number of the beats or flashes per second, and also varies with the pitch of the sound or the color of the light. But when the beats have reached a certain number in a second, they no longer produce intermittent effects on the nerves; for the action produced by one beat lasts, without perceptible diminution, until the arrival of the following one, and the sensation becomes continuous; in other words, when the beats follow with sufficient rapidity, they blend together and form a smooth, sonorous effect, like a simple musical sound. This relation between discontinuous and continuous impressions on the nerves, and unpleasant and pleasant sensations, is at the foundation of Helmholtz's theory of musical harmony.—We must now consider the effects resulting when, instead of producing only simple sounds together, as above, we simultaneously produce composite sounds differing slightly in pitch. If we sound two tuning forks, each giving the middle C of the piano, we shall have two simple sounds in unison. Now gradually elevate one of them in pitch and observe the changing sensations. The harshness increases until they are separated about a tone; then the disagreeable sensation diminishes, and entirely vanishes when the notes have been separated by an interval equal to a minor third. But if, instead of sounding the forks, we use two reed pipes giving the same notes, we observe that the slightest departure from unison at once causes a very unpleasant sensation; the reason of this is, that besides the beats of the fundamental simple sounds of the pipes, we have the sensations produced by the beating of some 20 harmonics of their fundamentals. Therefore the tuning of reed pipes is difficult, but their intervals are defined with an extraordinary degree of sharpness. It is here also to be remarked that the number of beats per second given by any pair of harmonics is directly as their height in the harmonic series. Thus if the fundamental or first harmonics give 3 beats per second, the sixth harmonics will give 18 beats per second. Therefore, in sounding two such pipes, each giving 20 harmonics, we should have produced on the ear 632 beats per second, 3 belonging to the first pair of harmonics, and 60 to the 20th pair.—Helmholtz's discovery consists in the demonstration of the fact that the degree of smoothness or consonance of any given chord depends entirely on the number of elementary harmonics and resultant tones which beat together in the given notes, on the intensities of these beats, and on the number per second of beats produced by each dissonant pair of harmonics. This fact he proved by nearly every means known to modern science, and thus established a real physical cause for the harmonious or dissonant sensations we experience on combining various notes. We can best illustrate the truth of Helmholtz's theory and show his main results by giving in

musical notation the principal intervals of fundamental notes, indicated in minims, with their accompanying harmonics written over them in crotchets. Only the first six harmonics are indicated, because those of higher order are generally either absent from a musical sound, or exist with such feeble intensity as not greatly to affect the degree of consonance. The respective harmonics which beat we have connected together by straight lines, so that at a glance one can approximately determine the degree of consonance of a given interval. The intervals here given are the true intervals of the natural scale, and not the false intervals of the tempered scale. On the latter scale the only consonant interval is the octave. The intervals we have selected are the octave, the fifth, the fourth, the major third, the major sixth, and the minor seventh; the ratios of the vibrations giving the notes of these intervals are respectively as 1 : 2, 2 : 3, 3 : 4, 4 : 5, 3 : 5, and 9 : 16.

No dissonance here occurs because the harmonics of both notes are in unison.

We have here two pairs in unison, 3-2 and 6-4; but a slight departure from perfect smoothness of effect is caused by the third harmonic of the higher note beating with the fourth and fifth of the lower. If the vibrations of the two fundamental notes of this interval are not rigorously as 2 : 3, there will be discord. Hence, on all instruments of fixed equal-tempered scales, as the organ or piano, even the interval of the fifth is slightly dissonant, only the octave intervals being in tune.

The dissonance of this interval is greater than in the case of the fifth, because the harmonics 3-2 are both vibrations of intensity, and therefore give louder beats than the pairs 3-4 and 3-5 of the fifth. In the fourth we have also the additional beats of pairs 6-4 and 6-5.

#### THE MAJOR THIRD AND THE MAJOR SIXTH.

The major third and the major sixth are written together as they are about equally consonant, for the dissonance caused by the beats of pair 3-2, separated by a tone, in the sixth, about equals that of the weaker beating pair 4-3, separated by a semitone, in the major third.

The minor seventh is the smoothest of that class of chords sometimes denominated dissonants, and is less dissonant than the minor sixth. Besides the beats of the harmonics existing as described in the above intervals, we have also the influence of the beats of the resultant tones, which are the products of the combined vibrations of the fundamental notes and of their harmonics. These resultant tones can produce beats either with harmonics or with other resultant tones. These resultant tones are of two kinds, viz.: difference tones and summation tones. Difference tones were discovered by Sorge in 1740, and their pitch is equal to the difference of the two vibrations of the sounds producing them. Summation tones were discovered by Helmholtz, and their pitch is equal to the sum of the vibrations of the two sounds producing them. It will be observed that Helmholtz's work is to a great extent merely qualitative; and although he indicates the existence of beats as the cause of discord, yet he does not give laws capable of quantitative expression, by which to determine beforehand the degree of consonance or dissonance existing in any given chord.—The recent research of Prof. Mayer of Hoboken, N. J., "On the Experimental Determination of the Law connecting the Pitch of a Note with the Duration of the Residual Sensation it produces in the Ear" (American Journal of Science, 1874),

first gave the duration in absolute time of the sensation of sounds after the exciting vibrations had ceased to exist outside the ear, and thus afforded the means of determining with quantitative exactness the smallest number of beats that two sounds must produce in order that they form a consonant interval. This latter condition will of course be fulfilled when the beats become just rapid enough in their succession to produce a continuous sensation in the ear. The following is the important law discovered by Prof. Mayer: If  $N$  equal the number of vibrations producing any given note, and  $D$  equal, in the fraction of a second, the duration of the residual sensation (that is, the time during which the sensation remains after the vibrations outside the ear have ceased), then

$$D = \left( \frac{58248}{N + 23} + 24 \right) \cdot 0001.$$

The denominator of the (vulgar) fraction thus determined will be the smallest number of beats per second which the simple sound must make with another in order that harshness or dissonance shall entirely disappear from the interval. Thus the simple note giving the middle  $C$  of the piano makes 264 vibrations per second, and the residual sensation of its sound remains on the ear  $\frac{1}{8}$  of a second; therefore the note which will make 48 beats per second with this  $C$  will form an interval free from all harshness. The number of vibrations of this note will be  $264 + 48$ , or 312, which is  $D\sharp$ , and forms with  $C$  the interval of the minor third. Hence the nearest note to this  $C$  which will form with it a harmonious combination is its minor third. If we in like manner calculate the nearest interval to form

Curve showing the Relation of Pitch and Duration.

a consonance with the  $C$  below the middle  $C$ , we shall find it to be the major third. This nearest consonant interval contracts as the pitch ascends, so that for the  $C$  of the fifth octave above the middle  $C$  (the highest octave used in music) the interval has contracted to

$\frac{1}{10}$  of a semitone. Prof. Mayer has also determined the other limit of the effects of beats by ascertaining in the different octaves the number of beats which produce the greatest harshness or dissonance on the ear. We give above a curve which at a glance shows the connection between the pitch of a note and the duration of the residual sensation. The curve approaches closely to an equilateral hyperbola (which latter curve is also given in a dotted line as a means of comparison); it would indeed coincide with the hyperbola if the duration of the residual sensation were simply inversely as the pitch. The units of division on the horizontal line equal 64 vibrations per second, while the units on the vertical line equal  $\frac{1}{256}$  of a second. To find by means of this curve the duration of a simple sound, obtain the point on the horizontal line corresponding to its number of vibrations, and then erect from this point a perpendicular reaching to the curve. The length of this perpendicular in units of the vertical scale will give the duration of the residual sensation of the sound in the fraction of a second; and the denominator of this (vulgar) fraction gives the number of beats which the note will have to make with a neighboring one to form the smallest consonant interval.—Although the science of counterpoint is based upon the principles of harmony, yet the discussion of this subject leads into the higher æsthetic principles of musical composition; we therefore refer to the article *MUSIC* for information on that subject.

**HARMS, Claus**, a German theologian, born at Fahrstedt, Holstein, May 25, 1778, died in Kiel, Feb. 1, 1855. He was the son of a miller, and for some time followed his father's business. He became chief pastor of the church of St. Nicholas and provost at Kiel in 1835, and councillor of the supreme consistory in 1842. Having lost his sight, he resigned his office in 1849. He celebrated the jubilee of the reformation in 1817, by propounding 95 new theses, in which the doctrines of the total depravity of man and the indispensable necessity of faith were maintained. Against him Baumgarten-Crusius wrote the *XCV. Theses Theologicae contra Superstitionem et Profanationem*. The theses and theological works of Harms gave the first strong impulse to a great revival of the orthodox Lutheran theology in Germany. He published *Pastoral Theologie* (3 vols., 2d ed., 1837); *Weisheit und Witz* (1850); *Selbstbiographie* (2d ed., 1851); and *Vermischte Aufsätze* (1853).

**HARNESSE, William**, an English clergyman, born about 1784, died in November, 1869. He was lame, besides suffering from severe illness at Harrow, where Lord Byron, his schoolmate and friend, offered him protection with these words: "Harness, if any one bullies you, tell me, and I'll thrash him if I can." He afterward studied at Cambridge, took orders, and held several preferments in London. He wrote dramas and poems, and published "The Con-

nection of Christianity with Human Happiness" (2 vols., 1823), a variorum edition of Shakespeare (8 vols., 1825), "Parochial Sermons" (1838), and other works. His "Literary Life," by the Rev. A. G. L'Estrange (1871), contains much matter relating to Byron and other celebrities of his time.

**HARNETT**, a central county of North Carolina, intersected by Cape Fear river, and watered by Little river; area, 675 sq. m.; pop. in 1870, 8,895, of whom 3,038 were colored. The surface is hilly, and the soil in parts productive. Tar and turpentine are largely produced. It is intersected by the Western railroad of North Carolina. The chief productions in 1870 were 8,571 bushels of wheat, 125,410 of Indian corn, 64,290 of sweet potatoes, and 334 bales of cotton. There were 588 horses, 1,791 milch cows, 3,788 other cattle, 3,793 sheep, and 10,194 swine. Capital, Summerville.

**HARNETT, Cornelius**, an American revolutionary statesman, born in England, April 20, 1723, died at Wilmington, N. C., April 20, 1781. He came in early life to America, and prior to the disputes with Great Britain was a man of wealth and distinction, residing on a large estate near Wilmington, N. C. He was one of the earliest to denounce the stamp act and kindred measures. In 1770-'71 he was representative of the borough of Wilmington in the provincial assembly, and chairman of the most important committees of that body. In 1772 he was appointed by the assembly, with Robert Howe and Maurice Moore, to prepare a remonstrance against the appointment, by the royal governor Martin, of commissioners to fix the southern boundary of the province. Josiah Quincy, who visited him in the following year, called him "the Samuel Adams of North Carolina;" and, as the revolution approached, he was its master spirit throughout the Cape Fear region. He was elected to the provincial congress in 1775, and to the congress at Halifax, on the Roanoke, in 1776, and drew up the instructions to the North Carolina delegates in the continental congress. When in 1776 Sir Henry Clinton appeared with a British fleet off Cape Fear, Harnett and Howe were excepted, as arch-rebels, from the terms of a general pardon. On the arrival of the Declaration of Independence at Halifax, July 26, 1776, Harnett read it to a great concourse of citizens and soldiers, who took him on their shoulders and bore him in triumph through the town. In the autumn he was on the committee for drafting a state constitution and bill of rights, and afterward as member of the continental congress he signed the articles of confederation. When in 1780-'81 the British held possession of the country around Cape Fear, Harnett was made a prisoner, and died while a captive.

**HAROLD I.**, king of the Anglo-Saxons, surnamed HAREFOOT from his swiftness in running, died at Oxford, March 17, 1040. He was the second of three sons of Canute the Great, who

had expressed the wish to bestow his kingdoms of Norway, England, and Denmark severally upon his sons Svend, Harold, and Hardicanute. At the council which met at Oxford upon the death of Canute (1035), to elect a new sovereign for England, the chiefs of Danish descent preferred Harold; the Saxons preferred Hardicanute, because he was the son of the widow of their late king, Ethelred. Harold got possession of London, and of the country north of the Thames; and Hardicanute, who claimed the west, and by the marriage contract of his mother ought to have succeeded to the crown (his brother being illegitimate), was soon after deposed, through the intrigues of Earl Godwin, upon the promise of Harold to espouse the daughter of that nobleman. Harold and Godwin meantime conspired to destroy the Saxon princes, Alfred and Edward, sons of Ethelred, and they were inveigled from their retreat in Normandy. Alfred was hurried to the isle of Ely and condemned to lose his eyes, and died of the wounds; but his brother, afterward Edward the Confessor, escaped back to Normandy. Harold, having now seized the treasure of his father's widow, who escaped to Bruges, was soon master of all England. His reign was unmarked by other notable events. He was buried at Westminster; but his body, disinterred by order of Hardicanute, who succeeded him, was cast into the Thames. It was recovered by a fisherman, and secreted in a Danish cemetery in London.

**HAROLD II.**, king of the Anglo-Saxons, and the last king of that lineage, second son of Godwin, earl of Wessex, killed in battle, Oct. 14, 1066. He was a leader in the armies of Edward the Confessor, and did good service in battles with the Welsh. About 1065 he was shipwrecked on the coast of Ponthieu and made prisoner by the earl Guy, who delivered him over to William of Normandy. William detained him until he had taken an oath to support the Norman's pretensions to the English crown after the death of Edward; but when that event took place (Jan. 5, 1066), he caused himself to be proclaimed by an assembly of the thanes and the citizens of London, and was crowned in London the next day. Edward, it is asserted, had willed the succession to the duke of Normandy, but had been prevented from taking steps for the security of his testament. Harold claimed a similar testamentary right. Harold's brother Tostig, a man of great talent and activity, and filled with deadly hatred against his brother for fancied wrongs, appealed to Harold Hardrada of Norway, who promised to invade England. Tostig collected a force in Flanders, after planning operations also with William, and ravaged the southern coasts. He was defeated afterward by the earls of Mercia and Northumbria, and retired to Scotland to await the arrival of his allies. William meanwhile sent an embassy to Harold demanding the crown of England. The new king gave a disdainful reply, and prepared to

receive the invaders. His attention appears to have been directed chiefly to the side of Normandy; for the king of Norway, accompanied by Tostig, landed unopposed at Scarborough. They were met near York by the northern earls, who were defeated, and, retreating to York, were besieged in that city. A few days later Harold arrived to their relief (Sept. 25, 1066), and a battle was fought in which the king of Norway and Tostig were killed. The Norwegians, escaping to their ships, were suffered to withdraw unmolested from the coast. Three days afterward the duke of Normandy landed at Bulverhithe, and advanced to Hastings, where on Oct. 14 the famous battle was fought by which Harold lost his life, and William became king of England. (See **HASTINGS**.)

**HAROUN AL-RASHID** (Aaron the Just), fifth caliph of the dynasty of the Abbassides, born in Rei about A. D. 765, died in Tus early in the spring of 809. He was the grandson of Abu Jaffar, surnamed Al-Mansour, and the son of the caliph Mahdi by the slave Khaizeran. In the reign of his father he led an army of 95,000 Persians and Arabs against the Byzantine empire, then ruled by Irene. He traversed Asia Minor, defeated the Greek general Nicetas, penetrated to the Bosphorus (781), encamped on the heights of Chrysopolis (now Scutari), opposite Constantinople, and forced the empress to engage to pay an annual tribute of 70,000 dinas of gold, and to prepare the roads for his return to the Tigris. In 786 he succeeded his elder brother Hadi, who had vainly attempted to exclude him from the throne, and had even given orders for his execution, which was only prevented by his own sudden death. By his conquests and vigorous internal administration Haroun raised the caliphate to its greatest splendor, and made his reign esteemed the golden era of the Mohammedan nations. His favorite ministers were Yahya and his son Jaffar, of the ancient Persian family of the Barmecides, whose ancestors had for many generations been hereditary priests at the fire temple of Balkh, and who now rapidly exalted the family to the highest dignities under the caliphate. While Haroun was occupied in fortifying the frontier provinces against the Greeks, Musa the Barmecide captured the chiefs of two hostile factions in Syria, brought them to Bagdad, and ended their dissensions; Fadhl, son of Yahya, conquered Cabool and pacified a rebellion in Dailem; and Jaffar joined to the office of vizier that of governor of Syria and Egypt. The whole internal administration of the empire fell into the hands of the Barmecides. They adorned the court with luxury, patronized letters and science, gave festivals, and made a prodigal use of the riches which they amassed. The reign of Haroun is chiefly sullied by the sudden disgrace which he inflicted on them in 803, condemning those from whose talents and services he had most profited to imprisonment or death. (See **BARMECIDES**.) He had devastated the Byzantine ter-

ritories as often as Irene had declined payment of the annual tribute. In 803 her successor Nicephorus demanded restitution of all the sums the empress had paid. The caliph replied: "In the name of the most merciful God, Haroun al-Rashid, commander of the faithful, to Nicephorus, the Roman dog. I have read thy letter, O thou son of an unbelieving mother. Thou shalt not hear, thou shalt behold, my reply." He immediately traversed and ravaged a part of Asia Minor, laid siege to Heraclea, brought Nicephorus to acknowledge himself a tributary, and retired triumphant to his favorite palace of Racca on the Euphrates. The peace being violated in 806, he returned rapidly in the depth of winter, and at the head of 135,000 men defeated Nicephorus in Phrygia, in a battle in which the Greek emperor was three times wounded and 40,000 of his subjects were slain. Again the tribute was refused, and Haroun returned in 808 with 300,000 men, desolated Asia Minor beyond Tyana and An-cyra, demolished Heraclea, devastated the islands of Rhodes, Cyprus, and Crete, and imposed a humiliating treaty on Nicephorus. It was soon broken, and Haroun again returned, took Sebaste, and swore never again to make peace with so perfidious an enemy. A revolt breaking out in Khorasan, the caliph died while on his march thither. In his latter years he corresponded with Charlemagne, and in 807 he sent him a tent, a clepsydra, an elephant, and the keys of the holy sepulchre. He performed the pilgrimage to Mecca nine times, cultivated poetry and the arts and sciences, protected many illustrious scholars, and is the principal hero of the Arabian tales. He selected ministers under whose wise administration prosperous towns sprang up, commerce flourished, and Bagdad was enlarged and adorned and made the centre of Arabic civilization.

**HARP** (Sax. *hearpa*, Ger. *Harfe*), a musical stringed instrument of a triangular shape, the chords of which are distended in parallel directions from the upper limb to one of the sides, and are set in vibration by the action of the thumb and fingers. Its origin cannot be ascertained; but it was familiar to the Hebrews in the time of the earlier prophets, and, as appears by the sculpture in a tomb near the pyramids of Gizeh, was known to the Egyptians probably as early as 2000 B. C. The researches of recent travellers show that the Egyptians attained great perfection in the construction of the harp, which was frequently richly ornamented and of elegant form, having from 4 to 21 chords, and in the later specimens strikingly resembled those in present use. In the Paris collection of Egyptian antiquities is a triangular harp of 21 chords, which, like all other Egyptian harps of which we have representations, has no pole or pillar to support the upper limb of the instrument. That the omission was intentional there seems no doubt; but it is difficult to conceive how the tension of the strings could have been resisted. To

the Greeks it seems always to have been unknown, and the Romans probably had no knowledge of it in anything like its present form. It was common to the northern races of Europe in the early centuries of the Christian era, and in the opinion of many antiquaries was original among them. In Ireland and in Wales harps of many strings and of elegant form were in use as early as the 5th and 6th centuries, and in the former it was adopted as the national emblem. In Wales it is still cherished as the national instrument, and annual trials of skill in its use take place. The introduction of pedals, whereby it became possible to modulate into all keys, first gave the harp a higher position than that of an instrument of accompaniment, and the improvements of Sébastien Érard have made it capable of performing any music written for the pianoforte. His double action harp, perfected in 1808, has a compass of six octaves, from E to E, with all the semitones, and even quarter tones. Its form and tone have long made it a favorite instrument for the drawing room. In the orchestra it is more sparingly used.

**HARP** (*harpa*), a genus of gasteropod mollusks of the family of whelks or *buccinidae*. The shell is ventricose, with numerous ribs at regular intervals, the shape and the ribs resembling the outline and the strings of a harp; the aperture is large, notched in front, and without operculum. The foot is very large, crescent-

Harpa ventriculata.

shaped in front, and deeply divided from the posterior part. There are about a dozen species, inhabiting deep water and soft bottoms in the East Indies and the Pacific islands; they are carnivorous; the shells are finely colored and of elegant shape, generally about three inches long. Four fossil species have been found in the eocene strata of France.

**HARPER**, a S. county of Kansas, bordering on the Indian territory, and drained by branches of the Nescatunga and Arkansas rivers; area, 1,152 sq. m.; still unsettled.

**HARPER, Robert Goodloe**, an American lawyer and statesman, born near Fredericksburg, Va., in 1765, died in Baltimore, Md., Jan. 15, 1825. His parents during his childhood removed to Granville, N. C. In his 15th year he joined a troop of horse, and under Gen. Greene served during the latter part of the southern revolutionary campaign. He graduated at Princeton

college in 1785, studied law in Charleston, S. C., settled in the interior of the state, and became known by a series of newspaper articles on the proposed change in the state constitution. He was soon after elected to the legislature, and in 1794 to congress, where he supported the administrations of Washington and John Adams, and was regarded as one of the leaders of the federal party. In 1801 he retired from congress, and, having married a daughter of Charles Carroll of Carrollton, removed to Baltimore. At the Maryland bar he attained great eminence, and was associated with Joseph Hopkinson as counsel for Judge Chase of the supreme court, when under impeachment, the trial resulting in an acquittal, March 5, 1805. In 1815 he was elected United States senator. In 1819-'20 he visited Europe, and on his return resumed the practice of his profession. Selections from his writings and speeches were published in Baltimore in 1814.

**HARPER AND BROTHERS**, a firm of American printers and publishers, originally consisting of JAMES, born in 1795, died in New York, March 17, 1869; JOHN, born in 1797, died April 22, 1875; JOSEPH WESLEY, born in 1801, died Feb. 14, 1870; and FLETCHER, born in 1806, died May 29, 1877. They were the sons of a farmer at Newtown, Long Island. At the age of 16 James and John were apprenticed to different printers in New York. Having concluded their apprenticeship, they established themselves in business, at first only printing for booksellers, but soon began to publish upon their own account. Wesley and Fletcher Harper were apprenticed to their elder brothers, and as they became of age were admitted as partners; and the style of the firm was about 1825 changed from "J. and J. Harper" to "Harper and Brothers." They soon became the leading publishers in America. In 1853 their establishment occupied nine contiguous buildings in Cliff and Pearl streets, filled with costly machinery and books. On Dec. 10 of that year the whole was burned to the ground, in consequence of a workman engaged in repairs having thrown a burning paper into a tank of benzine, which he mistook for water. Most of their stereotype plates were stored in vaults, and were saved; but the loss in buildings, machinery, and books amounted to \$1,000,000, upon which there was only \$250,000 insurance. The next day they hired temporary premises, and employed the principal printers and binders in New York, Boston, and Philadelphia in reproducing their books. Before the ruins of the fire could be cleared away the plans for their new edifice were prepared. It covers about half an acre of ground, extending from Cliff street to Franklin square in Pearl street, and, including cellars, the structure is seven stories high. It is absolutely fire-proof, and constitutes probably the most complete publishing establishment in the world, all the operations in the preparation and publication of a book being carried on under a single roof,

and the regular number of employees in the premises being about 1,000 of both sexes. Besides the books published, they issue three illustrated periodicals: "Harper's Magazine," established in 1850, a monthly, devoted to literature and the arts; "Harper's Weekly," established in 1857, devoted to literature and topics of the day; and "Harper's Bazar," established in 1867, devoted to the fashions, literature, and social life.—James Harper was in 1844 elected mayor of the city of New York for the succeeding year, and he was subsequently put forward for the governorship of the state; but he preferred to conduct the business of the firm rather than engage in public life. In March, 1869, while driving in Fifth avenue, his horses took fright, and he was thrown from his carriage; he was taken up insensible, and died two days afterward. Wesley Harper, who for many years had charge of the literary department, died after a long illness. After the death of his two brothers John Harper withdrew from active business; and the firm was reorganized by the admission of several of the sons of the original partners. These, after receiving a careful education, several of them at Columbia college, entered the house, each serving a regular apprenticeship in some branch of the business. The firm now (1879) consists of Philip J. A. Harper, son of James, born in 1824; Fletcher, jr., born in 1829; Joseph Wesley, jr., born in 1830; the two sons of John, John Wesley, born in 1830, and James Abner, born in 1833; and several other members of the family.

**HARPER'S FERRY**, a town of Jefferson co., West Virginia, on the Potomac river, which forms the boundary of the state with Maryland, and at the mouth of the Shenandoah, where the united streams force their passage through the Blue Ridge, 45 m. N. W. of Washington; pop. about 2,500. It is built around the base of a hill, and is connected by a bridge with the opposite bank of the Potomac. The Baltimore and Ohio and the Winchester, Potomac, and Strasburg railroads unite here, and the Ohio and Chesapeake canal runs along the Maryland bank. Before the civil war it was the seat of an extensive and important United States armory and arsenal. It has a large flouring mill, a college for colored youth, five or six schools, and five churches. It has not yet recovered from the effects of the war. The scenery around Harper's Ferry is celebrated for its striking beauties. Thomas Jefferson pronounced the passage of the Potomac through the Blue Ridge "one of the most stupendous scenes in nature, and well worth a voyage across the Atlantic to witness."—The place acquired some notoriety just previous to and during the civil war. On Oct. 16, 1859, John Brown, at the head of a small party of abolitionists, seized upon the town and armory buildings, of which he held possession for more than a day, when he was captured. (See BROWN, JOHN.) On April 18, 1861, the arsenal was

seized by a party of insurgents, and the workshops were partly burned. The place was afterward alternately in the hands of both parties. In September, 1862, a Union force of about 12,000 men, under Col. Miles, was stationed here. On the 12th, four days before

the battle of Antietam, a strong confederate force under Jackson and A. P. Hill appeared before Maryland heights on the Maryland shore, and early in the morning of the 13th drove the Union troops stationed there behind their breastwork. This was soon after taken,

Harper's Ferry.

when the federals withdrew across the river. On the same day the confederates established batteries on Loudon heights on the Virginia shore, and on the 14th they opened fire both from these and Maryland heights, renewing it at daybreak of the 15th from seven commanding points. The federal guns returned fire from Bolivar heights, but ineffectually, and Col. Miles surrendered his force (being mortally wounded almost in the act), the cavalry of which alone had escaped in the night. The confederates made about 11,000 prisoners, and captured 73 guns, 13,000 small arms, and a considerable amount of stores.

**HARPIES** (Gr. *Ἄρπυιαι*, from *ἀρπάζειν*, to snatch), in Greek mythology, fabulous monsters, said to have been the daughters of Neptune and Earth, or, according to Hesiod, of Thaumias and Electra. In Homer they are merely personified storm winds, who were believed to have carried off any person that had suddenly disappeared. In Hesiod they are fair-haired and winged maidens who surpass the winds in swiftness, and are called Aëlo and Ocypete; but in later writers they are represented as disgusting monsters, with heads like maidens, faces pale with hunger, and claws like those of birds. The harpies ministered to the gods as the executors of vengeance. They were two or three in number, and dwelt in the Strophædæan isles, in the Ionian sea. The most celebrated myth in which the harpies figure is that of

the blind Phineus, whose food they had been commissioned to snatch away as often as it was placed before him. The Argonauts arrived at his residence while he was thus tormented, and freed him from the persecution. In the famous harpy monument discovered in Lycia by Sir C. Fellowes, and now in the British museum, the harpies are represented in the act of carrying off the daughter of Pandaræus.

**HARPOCRATES.** See **HORUS**.

**HARPOCRATION, Valerius**, a Greek philologist, who according to some flourished in the 2d century A. D., and according to others about the middle of the 4th. He was a native of Alexandria in Egypt, and the author of a valuable lexicon, still extant, to the works of the Attic orators. The earliest edition was published at Venice in 1503; the most recent is that of Bekker, which appeared at Berlin in 1833.

**HARPSICHORD**, a keyed musical instrument, somewhat in the form of a grand piano, in which the sounds are produced by the action of oblong slips of wood called jacks, furnished with crowquill plectrums, and moved by finger keys, upon a series of stretched wires, resembling a horizontal harp. It was provided with stops for increasing or diminishing the power of the strings, and with a swell; and the best instruments had a compass of five octaves, from double F below the base to F in altissimo. The harpsichord was in use as early as the 15th century, and gradually took the place of the spinet

and virginals, on which it was an improvement. It remained the highest form of the keyed instrument until the introduction of the pianoforte into general use in the latter part of the 18th century.

**HARPY**, in mythology. See **HARPIES**.

**HARPY**, a bird of prey, of the subfamily *aquilinæ* or eagles; the *harpyia destructor* (Cuv.) or *thrasaëtus harpyia* (Linn.), and the crested, crowned, royal, tyrant, and destructive South American eagle of authors. The bill is strong, much curved at the acute tip; the wings moderate, reaching beyond the base of the tail, the fourth, fifth, and sixth quills the longest; tail long, broad, and slightly rounded; tarsi short and very thick; toes robust, armed with powerful claws. The length is from 2½ to 3 ft., and the spread of the wings 5 to 6 ft. The bill is black, the head crested; the general color is dark brown above and white below, the feathers of the breast very long and loose; the tail barred with brown and black, and the vent and thighs with black and white. Several varieties of plumage occur, which have been made characters of different species, but Gray describes only one in the genus. The harpy eagle lives in the dark forests of intertropical America, especially near the borders of great rivers; it preys on sloths, monkeys, large birds, and on young deer and other quadrupeds of that size.

Harpy (*Thrasaëtus harpyia*).

Its strength and courage are such that it will attack very large animals, and even man himself, if the Indians are to be believed.

**HARRIER**, a variety of the hound (*canis sagax*, Linn.), used in hare hunting. The ancient harrier (*chien courant* of the French) had a moderately long, broad muzzle; thick and rounded head; large, long, and pendent ears; robust body, stout limbs, erect tail, and short hair, varied with black, brown, and yellowish spots. The modern improved harrier is a miniature fox hound, with shorter ears, an acute sense of smell, great speed, and a height of about 18 in. The old harrier was larger,

slower, and more inclined to dwell on the scent; the modern breed does not generally allow the hare to double on its tracks, but forces it into a straight course, running it down in about 20 minutes. The pack of Sir John Dashwood King, considered the model of this

Harrier.

dog, originated from a small fox hound of pure breed, which was so celebrated that he was sold for the enormous sum of £700. The old harrier came near the beagle in appearance and manner of hunting. There are several breeds, of more interest to the sportsman than to the zoölogist.

**HARRIER**, a hawk of the subfamily *cercinæ* of Gray and *milvinae* of later ornithologists, and of the genus *circus* (Lacépède). The genus is characterized by a rather large head and a face partially encircled by a ring of short prominent feathers as in the owls; bill short, compressed, curved from the base, with the lateral margins festooned; nostrils large; wings long and pointed, with the third and fourth quills nearly equal and longest; tail long, wide, and rounded on the sides; tarsi long and slender, toes moderate, and claws rather slender and weak. About 15 species are described in various parts of the world, generally found in open uncultivated countries, in marshes, and along barren sea coasts. The flight is not very swift, but easy and graceful, and generally performed in a sailing manner within a few feet of the ground. The American harrier, marsh or hen hawk (*C. hudsonius*, Linn.), has in the male a length of about 18 and an extent of wings of 44 in., and in the female a length of 21 and a spread of about 47 in. The form is rather long and slender; the general color above is pale bluish cinereous, which prevails also on the breast; the upper tail coverts white; dark fulvous tinges on the back of the head; under parts white, with more or less heart-shaped spots and longitudinal marks of reddish fulvous; quills brownish black, tinged with ashy on the outer webs, and the inner mostly white; tail cinereous, nearly white on the inner webs, and obscurely banded with brown, its under

surface and the under wing coverts white. In the young birds the upper parts are dark brown, with dull rufous edges to many of the feathers; under parts reddish white, with brown stripes, and upper tail coverts white. It is found throughout North America from Mexico to the arctic regions, from the Atlantic to the Pacific, and in Cuba. It breeds in most parts of the United States, and is often seen in flocks of 20 or 30. When paired, the sexes keep together, and assist each other in the care of the young. The nest is generally made on the ground, previously scooped out, of dried grasses, and of considerable bulk; sometimes they build in low bushes. The eggs, about four, are rounded, smooth,  $1\frac{1}{2}$  by  $1\frac{1}{4}$  in., bluish white, with a few marks of pale reddish brown. The bird skims over the open fields, diligently searching for food, which consists of crickets, lizards, frogs, snakes, and small birds and quadrupeds; it is fond of visiting remote poultry yards after young chickens and gos-

Ring-tailed Harrier (*Circus cyaneus*).

lings, though a hen of ordinary courage is usually able to drive it off; it rarely strikes its victims on the wing. The ring-tailed harrier of Europe is the *C. cyaneus* (Linn.); there are also Montagu's harrier (*C. cineraceus*, Mont.) and the moor or marsh harrier (*C. aeruginosus*, Linn.), having similar habits with the American species.

**HARRING, Harro Paul**, a German author, born at Ibensdorf, near Husum, in Schleswig, Aug. 28, 1798, died by his own hand in the island of Jersey, May 25, 1870. He was the son of a landed proprietor of Friesland, but received only a scanty education, and was obliged to accept a small clerkship in the custom house. Subsequently he devoted himself to painting and literature in various places, and after publishing two volumes of poetry at Schleswig in 1821 he wrote a sketch of his adventurous life and travels entitled *Rhonghar Jarr, Fahrten eines Friesen in Dänemark, Deutschland, Ungarn, &c.* (4 vols., Munich, 1828). In 1828

he joined a Philhellenic expedition to Greece, but soon went to Rome, and next to Warsaw, where he served for a few months in the army. His Polish experiences were embodied in his novel *Der Pole* (3 vols., Baireuth, 1831), and in his *Memoiren über Polen unter russischer Herrschaft* (2 vols., Nuremberg, 1831; French, Strasburg, 1833). On account of his revolutionary tendencies he was subsequently expelled from Bavaria and Saxony, and in 1836 he was arrested in Bern and sent to England, where in 1837 he was wounded in a duel. He next attempted to publish in Heligoland revolutionary songs for circulation in Germany, but was arrested and sent back to England. On returning to that island in 1839 he was sent as a prisoner on a vessel bound to England, but jumping overboard he was picked up by a French ship, and afterward lived successively in England, Brazil, and the United States. In 1849 he arrived in Norway, whence he was expelled in the following year. He then became a member of the European central democratic committee in London, to which city he returned in 1856 after having been in 1854 under arrest in Harburg, and after having spent again some time in Brazil. Although he occasionally received assistance from his friends at subsequent periods, misery and discontent made him commit suicide. His publications comprise, besides poems, plays, and miscellaneous writings, many novels, of which "Dolores," the scene of which was in South America, written in English and published in New York in 1844 (German, 4 vols., Basel, 1858-'9), is considered the best.

**HARRINGTON, James**, an English political writer, born at Upton, Northamptonshire, in January, 1611, died in Westminster, Sept. 11, 1677. He entered Trinity college, Oxford, in 1629, and after leaving the university travelled on the continent, visiting France, Italy, and the Hague, where he entered Lord Craven's regiment, then quartered in that city. On his return to England he lived for a time in retirement, but in 1646 was appointed to wait upon Charles I. during his confinement. The king became strongly attached to him, and made him groom of the bedchamber; and Harrington, though a republican in theory, became loyal to the person of the monarch, following him even to the scaffold. After the death of Charles he composed his great work, the "Oceana," which was seized by order of Cromwell while in the press; but he was finally permitted to publish it in 1656, and even to dedicate it to Cromwell himself. The "Oceana" is a kind of political romance, like Plato's "Republic" and the "Utopia" of Sir Thomas More, in which Harrington describes an imaginary ideal republic. It attracted much attention, and was answered by several persons, the principal work written in reply being Baxter's "Holy Commonwealth." In 1659 Harrington published an abridgment of his work, under the title of "The Art of Law-giving," and instituted a club called the "Rota"

for the propagation of his principles, which was dissolved in February, 1660. He was arrested on a charge of treason, Dec. 28, 1661, being suspected of an intent to overthrow the government and establish a republic. His health was impaired and his mind became deranged by his imprisonment, and after a time he was liberated through the intercession of the earl of Bath. He went to London, where he partially recovered his bodily health, but never regained the full vigor of his intellect. Besides the "Oceana," Harrington published "The Grounds and Reasons of Monarchy Considered," "The Prerogative of Popular Government," "A Model of Popular Government," several political tracts, and a number of minor works, among which is a translation of part of the works of Virgil. His political writings have been several times republished; an edition, with his life by Toland, in 1700, in 1 vol. fol.; the best by Thomas Brand Hollis in 1771.

**HARRINGTON, Sir John.** See HARINGTON.

**HARRIOT, Thomas,** an English mathematician, born in Oxford in 1560, died in London, July 2, 1621. He received the degree of B. A. at Oxford in 1579, and was a member of Sir Walter Raleigh's expedition to Virginia in 1584, writing on his return an account of the country, under the title of "A Brief and True Report of the new-found Land of Virginia," which was republished in vol. iii. of Hakluyt's "Voyages." He was introduced by Raleigh to the earl of Northumberland, received from him a pension of £300, and afterward devoted himself to mathematical researches, which were published in 1631 by his friend Walter Warner, under the title, *Artis Analyticae Praxis ad Aequationes Algebraicas Resolvendas*. He corresponded with Kepler upon the theory of the rainbow, and it appears from his manuscripts that he observed the spots upon the sun before he could have known of Galileo's discovery of them.

**HARRIS. I.** A W. county of Georgia, separated from Alabama by the Chattahoochee, and drained by several small branches of that river; area, about 440 sq. m.; pop. in 1870, 13,284, of whom 7,493 were colored. It has a greatly diversified surface; the E. part is traversed by the Pine and Oak mountains, and large tracts of land are covered with forests. The chief productions in 1870 were 24,226 bushels of wheat, 255,976 of Indian corn, 62,914 of sweet potatoes, and 8,163 bales of cotton. There were 964 horses, 1,537 mules and asses, 2,647 milch cows, 4,015 other cattle, and 9,613 swine. Capital, Hamilton. **II.** A S. E. county of Texas, bordering on Galveston bay, bounded N. and E. by San Jacinto river, and intersected by Buffalo bayou, both of which are navigable by steamboats; area, 1,832 sq. m.; pop. in 1870, 17,375, of whom 6,509 were colored. The surface is a fertile alluvial plain, nearly destitute of timber except along the streams, and covered with rich savannas which pasture large numbers of horses and cattle.

The Houston and Texas Central, the Houston and Great Northern, the Galveston, Houston, and Henderson, the Galveston, Harrisburg, and San Antonio, the Texas and New Orleans, and the Houston Tap and Brazoria railroads traverse it. The chief productions in 1870 were 99,977 bushels of Indian corn, 38,895 of sweet potatoes, and 1,064 bales of cotton. There were 2,833 horses, 4,561 milch cows, 1,204 working oxen, 27,544 other cattle, 5,713 sheep, and 5,434 swine. It has a number of manufacturing establishments, chiefly in Houston, the county seat.

**HARRIS, James,** an English philologist, born in Salisbury, July 20, 1709, died Dec. 22, 1780. He was educated at Oxford as gentleman commoner, and thence passed as a student of law to Lincoln's Inn. His father died when he was 24 years of age, leaving him a fortune, so that he abandoned the law, retired to his native town, and devoted himself to more congenial pursuits. He was elected to parliament for the borough of Christchurch in 1761, and filled that seat during the rest of his life. In 1762 he was appointed one of the lords of the admiralty, and in the following year a lord of the treasury, but went out of office with the change of administration in 1765. In 1774 he was appointed secretary and comptroller to the queen. In 1744 he published "Three Treatises: I. Art; II. Music, Painting, and Poetry; III. Happiness;" and in 1751 his famous work, "Hermes, or a Philosophical Inquiry concerning Universal Grammar," which has been considered a model of ingenious analysis and clear exposition, Lowth claiming for it that it is the best specimen of analysis since the time of Aristotle. In 1775 Harris published "Philosophical Arrangements," as part of a projected work upon the "Logic" of Aristotle. His "Philological Inquiries" was published after his death, in 1781. His collected works were published in 1792; a fine edition, with a biography, was published by his son, Lord Malmesbury, in 1801 (2 vols. 4to, London).

**HARRIS, John,** an English clergyman, born at Ugborough, Devonshire, in 1804, died in London, Dec. 21, 1856. He studied divinity in Hoxton Independent college, and became pastor of the Independent church in Epsom. When in 1850 it was determined to consolidate the various Independent colleges in and about the metropolis into one, he was chosen principal of the new institution, called New college, in which he was also professor of theology. While at Epsom he wrote his prize essay against covetousness under the title of "Mammon" (1836). Other works written for prizes were "Britannia" (1837), an appeal in aid of the objects of the British and foreign sailors' society, and "The Great Commission" (1842), an essay on Christian missions. His most important works are "The Pre-Adamite Earth" (1847), "Man Primeval" (1849), and "Patriarchy, or the Family, its Constitution and Probation" (1855).

**HARRIS, Thaddeus William**, an American naturalist, born in Dorchester, Mass., Nov. 12, 1795, died in Cambridge, Jan. 16, 1856. He graduated at Harvard college in 1815, studied medicine, and practised his profession at Milton Hill till 1831, when he was appointed librarian of Harvard college. For several years he gave instruction in botany and general natural history in the college, and he originated the Harvard natural history society for the students. He was chiefly distinguished as an entomologist. In 1837 he was appointed one of the commissioners for a zoological and botanical survey of Massachusetts, the result of which was his "Systematic Catalogue of the Insects of Massachusetts" appended to Prof. Hitchcock's report. In 1841 appeared his "Report on Insects Injurious to Vegetation," published by the legislature. It was reprinted in 1852, somewhat enlarged; and a new and enlarged edition, by Charles L. Flint, with engravings drawn under the supervision of Prof. Agassiz, by direction of the legislature, appeared in 1862.

**HARRIS, Thomas Lake**, an American reformer, born at Fenny Stratford, England, May 15, 1823. He was brought to America when four years old by his father, who engaged in mercantile pursuits in Utica, N. Y. By his mother's death and financial reverses he was thrown from boyhood on his own efforts for education and support. At an early age he exhibited strong religious tendencies and poetic imagination. At 17 he began to write for the press, and soon after became known through contributions to newspapers and periodicals. In his 21st year he renounced his inherited Calvinistic faith and entered the ministry of the Universalist denomination, settling at once over a parish in Minden, N. Y. After a few months, on account of failing health, he went to Charleston, S. C., whence in the following year he removed to New York to become pastor of the fourth Universalist society; but after one or two years he was again prostrated and resigned his charge, in which he was succeeded by the Rev. Dr. Chapin. In the ensuing year he took the position which he has since maintained of an independent religious and social teacher, and organized the "Independent Christian Society" in New York, to which he continued to minister till after the outbreak of spiritualism in 1850. He then joined a community at Mountain Cove, Va., and after a few months employed in spiritual investigations he preached and lectured in the principal cities of the Union till 1855. In philosophy a Platonist, in spiritual science agreeing with Swedenborg, and in sociology accepting the economical views of Fourier, he sought in these labors to turn the public interest in spiritualism in behalf of this larger and higher range of thought. In 1855 he resumed his ministry among his friends in New York, and established a periodical devoted to his religious and social doctrines. In March, 1857, as he affirms in his "Arcana of Christianity," he was sub-

jected to severe temptations from evil spirits, whom he saw plainly and talked with. The result of the conflict with these demons was that he triumphed over them and gained the power of internal respiration, so that now, as he says, "I inhale with equal ease and freedom the atmosphere of either of the three heavens, and am enabled to be present, without the suspension of the natural degree of consciousness, with the angelic societies, whether of the ultimate, the spiritual, or the celestial degree." In 1858 he visited England and Scotland, and preached and lectured several months each in London, Manchester, Edinburgh, and Glasgow. Returning in 1861, he retired to his farm in Amenia, Dutchess co., N. Y. Here he was followed by a few friends, interested in or experiencing the new respiration, and seeking to realize a purer social life. As his spiritual family enlarged he purchased property in the neighboring village of Amenia, organized a national bank, and engaged in milling and other branches of business at that place and elsewhere; and now the family grew into a society, since known as the "Brotherhood of the New Life." He returned to Europe in the interests of the brotherhood in 1866, and in 1867 removed to Portland, Chautauqua co., N. Y., where he purchased for his own account a tract of 1,000 acres suitable for vineyard and agricultural purposes, and adjoining farms of about the same extent for account of other members of the society. Among those who had joined him previous to this were Lady Oliphant and her son Mr. Laurence Oliphant, M. P., and several Japanese of distinction, one of whom is now a foreign minister, and another in high official rank in his own country. Members of the society who hold real estate cultivate it on their own account. No property is held in common. Mr. Harris's own estate affords a place of retreat and means of rest and recuperation to members of the fraternity in impaired health, or to those who visit him from Asia and Europe; while its cultivation gives employment to such of his friends as find in it a congenial pursuit; but nearly all the members of the brotherhood are engaged in active commercial, industrial, or diplomatic pursuits in their respective countries. The "Brotherhood of the New Life" has no written creed, covenant, or form of government. It is said that it numbers more than 2,000 members, mostly in Great Britain and on the continent, in India and Japan, and that it is held in its entirety simply by the principle of fraternal love, and by an inspiration working through internal respiration, and that its growth, since it never employs proselytism, is by means of its inherent vitality and assimilative power. They claim for this new breath that it descends through the heavens from the Divine Spirit, and that it replaces the former and natural mode of breathing by a respiration which is divine-natural, in fulfilment of the statement which Swedenborg alleges to have been made to him by the angels in the last century, that

the existing order of Christendom was in its last stages and should be followed by another resulting from a "new respiration, breathed through the heavens by the Lord." They believe that inmosty God dwells with all men, but that personally and corporeally all are *en rapport* with good and evil spirits; that self-love and self-indulgence corrupt and degrade the person till the divine likeness is effaced and the man becomes a devil; that salvation is neither by natural progression, nor philosophical self-culture, nor justifying faith, but that man only becomes free from his evils, and from the tyranny and inspiration of evil spirits, through self-renunciation and motherhood, and that all who become angels find their counterparts of sex and become two-in-one to eternity; hence they recognize in marriage not only a pure ordinance, but the symbol of the holiest of divine mysteries. They hold that the Christian church of the future will not be an ecclesiasticism, but a pure and free society, not communistic, but fraternal and coöperative. Mr. Harris's principal prose works are: "Wisdom of Angels" (1856); "Arcana of Christianity" (1857, 1866); "Truth and Life in Jesus" (1859); "Modern Spiritualism, its Truths and Errors" (1860); "Sermons and Lectures" (1860); "Millennial Age" (1860); "Breath of God with Man" (1866). His poetical works are: "Starry Heavens" (1853); "Lyric of the Morning Land" (1854); "Lyric of the Golden Age" (1856); "Regina" (1859); "Hymns of Spiritual Devotion" 1856-58); "The Great Republic" (1866).

**HARRIS, William**, an American clergyman, born in Springfield, Mass., April 29, 1765, died Oct. 18, 1829. He graduated at Harvard college in 1786, was ordained priest in the Episcopal church in 1792, and took charge at once of the church and academy in Marblehead, Mass. In 1802 he became rector of St. Mark's church in New York, where he established a classical school. He was chosen in 1811 to succeed Bishop Moore as president of Columbia college, and for six years retained his rectorship in connection with this office. He was assisted in the duties of the presidency by Dr. J. M. Mason, under the title of provost, an office which was abolished in 1816; from which time until his death Dr. Harris devoted himself entirely to the college.

**HARRIS, William Torrey**, an American philosopher, born in Killingly, Conn., Sept. 10, 1835. He entered Yale college in 1854, but did not graduate. The degree of A. M. was conferred upon him by the college in 1869. In 1857 he went to St. Louis, and in the following year became a teacher in one of the public schools. Ten years later he was made superintendent of schools, a post which he still holds (1874). He was one of the founders of the philosophi-

cal society of St. Louis in 1866, and in 1867 established the "Journal of Speculative Philosophy," a quarterly magazine which he continues to edit, and to which he has contributed many philosophical articles of his own, besides translations of the principal works of Hegel. The "Journal" has also published translations from Leibnitz, Descartes, Kant, Fichte, and Schelling, and from recent German and Italian philosophers, and many remarkable papers on art. In 1874 Mr. Harris was elected president of the "National Teachers' Association."

**HARRISBURG**, a city, county seat of Dauphin co., Pennsylvania, and capital of the state, situated on the E. bank of the Susquehanna river, here spanned by a public and a railroad bridge, 95 m. W. by N. of Philadelphia; lat. 40° 16' N., lon. 76° 50' W.; pop. in 1850, 7,884; in 1860, 13,405; in 1870, 23,104, of whom 2,795 were foreigners. The river at this point is a mile wide, and is divided by an island in the middle. The city is handsomely built, and is surrounded by magnificent scenery. The state house, finely situated on an eminence near the centre, is a handsome brick building, 180 ft. long by 80 ft. wide, with a circular Ionic portico in front surmounted by a dome commanding a fine view. It was begun in 1819, and occupied for the first time on Jan. 28, 1822. There is a smaller building of similar design on each side of it, devoted to government uses. The county court house, in Market street, is a stately brick edifice, surmounted by a dome. The state lunatic asylum, N. of the city, was opened in 1851, and in 1874 had 408 inmates. The other principal public buildings are the market houses, county prison, eight large brick school houses, a fine masonic hall, and several churches. Front street, overlooking the river, affords the most attractive promenade in the city, and contains many of the finest residences. Harris park is a handsome public square, and at the intersection of State and Second streets is a monument erected in memory of the soldiers of the county who fell in the civil war. Harrisburg is surrounded by a fertile region, abounding in coal and iron ore, and has ample means of communication with Philadelphia, Baltimore, and the west by the Pennsylvania canal, and the Pennsylvania Central, the Cumberland Valley, the Northern Central, the Lebanon Valley, and the Schuylkill and Susquehanna railroads. The manufactures, particularly of iron, are extensive. The principal establishments are 10 iron foundries, 2 machine shops, a rolling mill, a manufactory of nails, 2 of steam engines, one each of files, cars, coaches, cement pipe, pottery, brooms, soap, and hose and belting, 4 of carriages, 2 of cigar boxes, a cotton mill, a knitting mill, 4 planing and saw mills, 2 tanning and currying establishments, and 6 breweries. The Lochiel iron company manufactures bar and railroad iron. There are six banks, with an aggregate capital of \$650,000. The city is divided into 9 wards, and is governed by

a mayor and a common council of 25 members. The streets are well paved and drained, and lighted with gas. Water is supplied from the river, by works erected at a cost of \$2,000,000, and having a capacity of 10,000,000 gallons a day. The taxable valuation of proper-

ty in 1874 was \$6,000,000; city debt, \$600,000. The public schools in 1872 numbered 51 (2 high, 15 grammar, and 34 primary), having 73 teachers and an average attendance of 2,339 pupils. There are also an academy, a female seminary, and an English and German

Harrisburg, from the west bank of the Susquehanna.

Catholic school. Four daily and eight weekly (two German) newspapers and two monthly periodicals are published. The state library contains 30,000 volumes. There are 32 churches, viz.: 4 Baptist, 1 Episcopal, 1 Evangelical, 1 Jewish, 6 Lutheran (2 German), 4 Methodist (1 Welsh), 4 Presbyterian, 2 Reformed (1 German), 2 Roman Catholic (1 German), 2 United Brethren, and 5 miscellaneous.—The first permanent white settlement on the site of Harrisburg was made about 1726, by an Englishman named John Harris, who, in December, 1733, obtained from the proprietaries of Pennsylvania a grant of 300 acres of land near his residence, and purchased of other grantees 500 acres adjoining. He carried on a considerable trade with the Indians of the vicinity. In 1753 the Penns granted to his son, John Harris, jr., the right to establish a ferry over the Susquehanna, and the place was long known as Harris's Ferry. In 1785 the town was laid out, and it became the seat of justice of the new county taken from Lancaster and called Dauphin, after the French crown prince; the town also received, in honor of Louis XVI., the name of Louisbourg, but in 1791 it was incorporated as a borough under its present name. It became the capital of the state in 1812, and received a city charter in 1860.

**HARRISON**, the name of eight counties in the United States. **I.** A N. W. county of West Virginia, drained by the W. fork of Mononga-

hela river; area, 440 sq. m.; pop. in 1870, 16,714, of whom 655 were colored. It has a hilly surface and fertile soil, and abounds in timber, coal, and iron. The Parkersburg division of the Baltimore and Ohio railroad passes through it. The chief productions in 1870 were 83,473 bushels of wheat, 327,261 of Indian corn, 56,183 of oats, 26,028 of potatoes, 45,662 of wool, 276,955 of butter, and 16,901 tons of hay. There were 5,040 horses, 4,906 milch cows, 15,855 other cattle, 15,812 sheep, and 8,951 swine; 1 manufactory of boots and shoes, 1 of iron castings, 2 of machinery, 5 tanneries, 5 currying establishments, 3 flour mills, and 5 saw mills. Capital, Clarksburg. **II.** A S. E. county of Mississippi, bordering on the gulf of Mexico, and drained by Biloxi and Wolf rivers and branches of the Pascagoula; area, 870 sq. m.; pop. in 1870, 5,795, of whom 1,427 were colored. The surface is level and mostly covered with pine woods, and the soil is light and sandy. The New Orleans, Mobile, and Texas railroad passes through it. The chief productions in 1870 were 9,345 bushels of Indian corn, 12,625 of sweet potatoes, and 98,750 lbs. of rice; value of live stock, \$78,135. There were 16 saw mills. Capital, Mississippi City. **III.** A N. E. county of Texas, bordering on Louisiana, bounded N. by Big Cypress bayou and Caddo lake, and S. by Sabine river; area, 964 sq. m.; pop. in 1870, 13,241, of whom 8,931 were colored. The surface is diversified

by prairies and forests, and the soil is fertile. Coal and iron ore are found on the Sabine river, and there are several mineral springs. The Texas and Pacific railroad passes through it. The chief productions in 1870 were 233,019 bushels of Indian corn, 23,004 of sweet potatoes, and 8,165 bales of cotton. There were 899 horses, 1,095 mules and asses, 2,396 milch cows, 3,953 other cattle, 2,463 sheep, and 8,269 swine. Capital, Marshall. **IV.** A N. E. county of Kentucky, drained by Licking river and its S. branch; area, 356 sq. m.; pop. in 1870, 12,993, of whom 2,378 were colored. The surface is diversified by hills and tracts of rich rolling land, the soil is fertile and well adapted for grazing, and blue limestone is abundant. The Kentucky Central railroad passes through it. The chief productions in 1870 were 61,669 bushels of wheat, 42,386 of rye, 719,315 of Indian corn, 85,914 of oats, 20,604 of potatoes, 281,704 lbs. of tobacco, 31,961 of wool, and 153,756 of butter. There were 5,966 horses, 1,924 mules and asses, 2,845 milch cows, 5,590 other cattle, 8,697 sheep, and 16,098 swine; 10 carriage factories, 1 woollen factory, 13 distilleries, 5 flour mills, and 2 saw mills. Capital, Cynthiana. **V.** An E. county of Ohio, drained by branches of the Ohio and Tuscarawas rivers; area, 420 sq. m.; pop. in 1870, 18,682. It has a hilly surface and a rich soil. Limestone and iron are found. The Pittsburgh, Cincinnati, and St. Louis railroad and Cadiz branch traverse it. The chief productions in 1870 were 155,688 bushels of wheat, 588,216 of Indian corn, 283,959 of oats, 67,996 of potatoes, 820,615 lbs. of wool, 616,628 of butter, and 31,652 tons of hay. There were 4,844 horses, 4,477 milch cows, 6,515 other cattle, 180,189 sheep, and 9,067 swine; 7 manufactories of carriages, 10 of clothing, 2 of woollen goods, 7 tanneries, 7 currying establishments, 2 planing mills, and 3 saw mills. Capital, Cadiz. **VI.** A S. county of Indiana, separated from Kentucky by the Ohio river, and bounded W. by Blue river; area, 478 sq. m.; pop. in 1870, 19,913. It has an uneven surface, broken by "knobs" and hills, and based partly on carboniferous limestone. It abounds in natural caverns, one of which, called Pitman's cave, extends more than 2 m. under ground. Near it is a remarkable spring 60 ft. in diameter, and several hundred ft. deep. The soil is mostly good. The chief productions in 1870 were 255,847 bushels of wheat, 507,072 of Indian corn, 171,700 of oats, 156,259 of potatoes, 37,403 lbs. of wool, 196,377 of butter, and 7,212 tons of hay. There were 6,155 horses, 5,226 milch cows, 5,633 other cattle, 15,769 sheep, and 29,139 swine; 16 manufactories of barrels and casks, 6 of furniture, 1 of tin, copper, and sheet-iron ware, 15 flour mills and 12 saw mills. Capital, Corydon. **VII.** A W. county of Iowa, separated from Nebraska by the Missouri, and crossed by Boyer and Soldier rivers and other streams; area, about 480 sq. m.; pop. in 1870, 8,931.

The surface is somewhat diversified, and the soil fertile. Timber is found along the streams. The Chicago and Northwestern and the Sioux City and Pacific railroads traverse it. The chief productions in 1870 were 194,591 bushels of wheat, 664,510 of Indian corn, 103,207 of oats, 42,167 of potatoes, 223,615 lbs. of butter, and 22,661 tons of hay. There were 3,451 horses, 4,202 milch cows, 7,027 other cattle, 5,222 sheep, and 9,274 swine; 2 flour mills, 4 saw mills, and 1 woollen factory. Capital, Magnolia. **VIII.** A N. W. county of Missouri, bordering on Iowa, and watered by affluents of Grand river; area, 754 sq. m.; pop. in 1870, 14,635, of whom 10 were colored. It consists in large part of prairies, and has much fertile soil near the rivers. The chief productions in 1870 were 109,571 bushels of wheat, 756,607 of Indian corn, 210,521 of oats, 55,400 of potatoes, 86,415 lbs. of wool, 20,075 of tobacco, 370,359 of butter, and 7,902 tons of hay. There were 7,781 horses, 5,989 milch cows, 12,308 other cattle, 31,609 sheep, and 31,393 swine; 2 flour mills, 7 saw mills, and 2 wool-carding and cloth-dressing establishments. Capital, Bethany.

**HARRISON, Benjamin**, an American statesman, one of the signers of the Declaration of Independence, born in Berkeley, Va., about 1740, died in April, 1791. He entered public life in 1764 as a member of the Virginia house of burgesses, of which he soon became one of the leaders. During the agitation of the stamp act question, the governor of Virginia unsuccessfully attempted to secure his support by offering him a seat in the executive council. He was a member of the first continental congress, and served as chairman of the board of war and on other important committees until the close of 1777, when he returned to Virginia. He was elected to the house of burgesses, over which he presided till 1782, when he was chosen governor. In 1785, after having been twice reelected governor, he returned to private life. He was a member of the state convention which met in 1788 to ratify the federal constitution, and of the state legislature. He was the father of William Henry Harrison.

**HARRISON, Frederick.** See supplement.

**HARRISON, John**, an English mechanician, born at Faulby, Yorkshire, in 1693, died in London in 1776. He was the son of a carpenter, and in his youth worked in his father's shop. A taste for mechanical pursuits led him to study the construction of clocks, and in 1726 he effected improvements which insured much greater accuracy than had previously been attained in timepieces. In 1714 parliament offered prizes of £10,000, £15,000, and £20,000 respectively for a method of ascertaining longitude within 60, 40, or 30 miles. Mr. Harrison constructed a chronometer which was satisfactorily tested on a voyage in 1736, and by successive improvements on it secured the highest prize in 1767. His inventions, the gridiron pendulum, the going barrel, the compensation

curb, and the remontoir escapement, were considered the most remarkable in the manufacture of watches of the last century. (See CLOCKS AND WATCHES.)

**HARRISON, John**, an English regicide, executed in London in October, 1660. He was a colonel in the parliamentary army, and superintended the removal of Charles I. from Hurst castle to Windsor, Dec. 19-23, 1648. The king had been told that Harrison was appointed to assassinate him, and, struck with his soldierly appearance, told him his suspicion, when Harrison replied that the parliament would not strike the king secretly. On Jan. 19, 1649, he escorted Charles from Windsor to London for trial. He was appointed major general, and was one of a conference of the chief men at the house of the speaker of the commons, in 1651, to decide upon the policy of the government. When Cromwell was about to dissolve the long parliament, the same year, he told Harrison, who advised against haste. In 1653 he was considered by the Anabaptists as their leader. Upon the restoration, in 1660, he was executed with nine others.

**HARRISON, William Henry**, ninth president of the United States, born in Berkeley, Charles City co., Va., Feb. 9, 1773, died in Washington, April 4, 1841. He was the third and youngest son of Governor Benjamin Harrison. At the age of 19 years, with the commission of ensign, he joined the army employed first under St. Clair, and afterward under Wayne, against the western Indians, becoming aide-de-camp of the latter. In 1795 he was made captain and placed in command of Fort Washington, on the site of the present city of Cincinnati, laid out on grounds owned by John Cleves Symmes, whose daughter Capt. Harrison married. In 1797 he resigned his commission and was appointed secretary of the territory N. W. of the Ohio, from which in 1799 he was chosen a delegate to congress. The Northwestern territory having been divided, Harrison was appointed in 1801 governor of the new territory of Indiana, embracing the present states of Indiana, Illinois, Michigan, and Wisconsin. Almost the whole of it was then in possession of the Indians, with whom as superintendent he made several important treaties in which large cessions of territory were obtained. The agitation among the Indians caused by Tecumseh and his brother the prophet having resulted in hostilities, Harrison in the autumn of 1811 advanced against the prophet's town at the head of 800 men, partly regulars and partly volunteers. His camp at Tippecanoe was unsuccessfully attacked on the night of Nov. 7. The defeated Indians were at first inclined to treat, but the breaking out of the war with Great Britain made them again hostile. After Hull's surrender, Harrison was appointed, in September, 1812, to the command of the N. W. frontier, with a commission as brigadier general. It was not till the next year, by which time he was promoted to the rank of major general,

that he was able to commence active operations. Several mishaps grew out of the inexperience of his subordinate officers, but the victory of Perry on Lake Erie enabled him to recover from the British the American territory which they had occupied, and to pursue them into Canada, where on Oct. 5 they were totally routed in the battle of the Thames. A peace with the N. W. Indians soon followed. Not long after, in consequence of misunderstandings with Armstrong, the secretary of war, Harrison resigned his commission in the army. In 1816 he was elected from the Cincinnati district a member of congress, in which body he sat for three years. In 1819 he was elected a member of the state senate of Ohio, and in 1824 United States senator. He was appointed chairman of the military committee in place of Gen. Jackson, who had just resigned his seat in the senate. In 1828 he was appointed by President John Q. Adams minister plenipotentiary to Colombia, but was recalled immediately on Jackson's accession to the presidency in 1829. For several years after his return he took no active part in political affairs, but lived retired on his farm at North Bend on the Ohio, a few miles below Cincinnati, and was for 12 years clerk of the county court. In 1836, as the close of Jackson's second term of office drew near, the opposition were somewhat at a loss for a candidate for the presidency. The success of Gen. Jackson gave rise to the idea of adopting a candidate who had military reputation. Harrison, while in command of the N. W. department during the war of 1812, had enjoyed a high popularity in the west, and was now brought forward as a presidential candidate. He received 73 electoral votes, a greater number than Clay had obtained four years before, though Massachusetts, which now voted for Mr. Webster, then voted for him. The financial crisis which followed the election of Mr. Van Buren greatly strengthened the opposition. The prospect of defeating his reelection was very strong if the opposition could unite upon a candidate. Mr. Clay was again brought forward and strongly urged. Gen. Scott was also proposed. In the national convention which met at Harrisburg, Dec. 4, 1839, Gen. Harrison received the nomination. A very ardent and exciting canvass followed. On the part of the supporters of Harrison every means was employed to arouse the popular enthusiasm. Mass meetings and political processions were now first brought into general use, and this canvass marks an era in the style of conducting elections. The slur which had been cast upon Harrison that he lived in a "log cabin," with nothing to drink but "hard cider," was seized upon as an electioneering appeal. Log cabins became a regular feature in political processions, and "hard cider" one of the watchwords of the party. Harrison received 234 electoral votes to 60 for Van Buren. He was inaugurated president, March 4, 1841. His cabinet was judiciously

composed, and great expectations were formed of his administration; but within a month, and before any distinctive line of policy could be established, he died, after an illness of eight days, brought on, it was supposed, by fatigue and excitement incident to his inauguration.

**HARRODSBURG**, a town and the capital of Mercer co., Kentucky, situated on a small branch of Salt river, 8 m. S. W. of the Kentucky river, and 30 m. S. of Frankfort; pop. in 1870, 2,205, of whom 1,101 were colored. Built on high ground and surrounded by fine scenery, it is an attractive summer retreat, and enjoys a reputation for its mineral waters. The Harrodsburg springs were formerly among the most fashionable places of resort in the western states, and are still visited by invalids. They were purchased a few years ago by the United States government as the site of a military asylum, but this institution is not now in operation. An important trade is carried on in horses, cattle, and other live stock. The town contains a weekly newspaper, a national bank, and several factories. It is the seat of Daughters' college (Christian), founded in 1856, and having in 1873-'4 8 instructors, 140 students, and a library of 3,000 volumes. It is essentially a female normal school, and many of its graduates are engaged in teaching. Bacon college has been removed to Lexington, and merged in the Kentucky university. Harrodsburg is said to be the oldest town in Kentucky, the first cabin having been built in 1774 by Capt. James Harrod.

**HARROGATE**, or **Harrowgate**, a village of Yorkshire, England, 20 m. W. by N. of York; pop. in 1871, 10,829. It has chalybeate and sulphurous springs, and is the principal watering place in the north of England. It contains public baths, hotels, lodging houses, a theatre, promenade rooms, ball rooms, and libraries.

**HARROW**, or **Harrow-on-the-Hill**, a village of Middlesex, England, 10 m. N. W. of London; pop. in 1871, 10,867. It contains an ancient parish church having a lofty tower and spire, places of worship for Baptists and Methodists, and a free grammar school which was founded in 1571 by John Lyon, a wealthy yeoman of the parish. This school was originally intended for the gratuitous instruction of poor boys belonging to the parish of Harrow; but as the education is almost wholly classical, few boys belonging to the parish take advantage of it,

and it is now principally attended by the sons of the nobility and gentry, and is in high repute. Among the celebrated men who have been educated there are Sir William Jones, Dr. Parr, Lord Byron, and Sir Robert Peel. Harrow school chapel has been much improved

Harrow School.

since 1856, a new aisle being added from funds subscribed by the masters and the parents of the pupils, and a beautiful chancel erected at the expense of the head master, Dr. Vaughan.

**HART. I.** A N. E. county of Georgia, separated from South Carolina by the Savannah river, and watered by several of its small branches; area, about 350 sq. m.; pop. in 1870, 6,783, of whom 1,942 were colored. The surface is uneven. The chief productions in 1870 were 18,986 bushels of wheat, 112,656 of Indian corn, 11,566 of oats, 12,158 of sweet potatoes, and 1,320 bales of cotton. There were 871 horses, 1,522 milch cows, 2,335 other cattle, 3,437 sheep, and 4,529 swine, and 1 cotton factory. Capital, Hartwell. **II.** A central county of Kentucky, in the region called "the barrens," watered by Green river, which is here navigable by steamboats; area, 432 sq. m.; pop. in 1870, 13,687, of whom 2,192 were colored. The surface is diversified by small hills thinly covered with oak and other timber, and is perforated by many limestone caverns; the soil is fertile. The Louisville and Nashville railroad passes through it. The chief productions in 1870 were 81,923 bushels of wheat, 449,286 of Indian corn, 62,785 of oats, 2,315,212 lbs. of tobacco, 26,250 of wool, and 132,382 of butter. There were 3,801 horses, 2,830 milch cows, 3,513 other cattle, 13,365 sheep, and 22,249 swine. Capital, Munfordsville.

**HART, James McDougal**, an American painter, brother of William Hart, born in Kilmarnock, Ayrshire, Scotland, in 1828. His parents having removed to Albany, N. Y., he commenced life as a coach painter at Troy, and was induced

by a natural taste for art to adopt the profession of a landscape painter. He went in 1851 to Düsseldorf, where he spent nearly a year under the instruction of Schirmer. He returned to Albany in 1852, and in 1856 removed to New York. In 1857 he was elected an associate of the academy of design, and in 1859 an academician. He is particularly noted as a painter of cattle and sheep. Some of his principal paintings are, "Woods in Autumn," "Moonrise in the Adirondacks," "Coming out of the Shade," and "On the March," a piece containing cattle and sheep.

**HART, Joel T.**, an American sculptor, born in Clark co., Ky., about 1810, died in Florence, Italy, March 1, 1877. He had only a quarter's schooling, but he read all the books he could obtain. In 1830 he entered a stone cutter's shop in Lexington, and soon began to model busts in clay, making good likenesses of many influential persons, among whom were Gen. Jackson and Cassius M. Clay. The latter gave him his first commission for a bust in marble. The work was so satisfactory that the artist was commissioned by the "Ladies' Clay Association" of Virginia to execute a marble statue of Henry Clay, which now stands in the capitol square at Richmond. He went to Florence in 1849 to execute this order, but the work was delayed in consequence of the loss of his model by shipwreck and by other circumstances, and it was not till 1859 that the statue was shipped to the United States. Mr. Hart afterward made the colossal bronze statue of Henry Clay which now stands at the intersection of St. Charles and Canal streets in New Orleans. He continued to reside in Florence, where he executed many busts of eminent men and a number of ideal works. Among the latter are "Angelina," "Il Penseroso," and "Woman Triumphant."

**HART, John**, a signer of the Declaration of Independence, born in Hopewell township, N. J., in 1708, died there in 1780. He was the son of a farmer, and spent the greater part of his life on his own farm near Trenton. He was several times a member of the provincial congress of New Jersey, and was prominent especially in legislation for local improvements. On June 21, 1776, he was elected, with four others, to the continental congress, to fill the vacancy caused by the resignation of the New Jersey delegation, who, elected the previous February, were unwilling to assume the responsibility imposed by Lee's resolution. Of the number who resigned was John De Hart, who has frequently been confounded with the signer of the Declaration. In 1777 and 1778 John Hart was a prominent member of the New Jersey council of safety. When the state was invaded by the British, his farm was laid waste and every effort made to capture him. He left his family and wandered through the woods, constantly hunted, and never venturing to sleep twice in the same house. The capture of the Hessians at Trenton made it safe

for him to return to his farm, where he passed the remainder of his life.

**HART, John Seely**, an American author, born at Stockbridge, Mass., Jan. 28, 1810, died in Philadelphia, March 26, 1877. His family settled near Wilkesbarre, Pa. He graduated at Princeton in 1830, and after teaching for a year at Natchez, Miss., he became in 1832 tutor and in 1834 adjunct professor of ancient languages at Princeton, where from 1836 to 1841 he had charge of the Edgehill school. From 1842 to 1859 he was principal of the Philadelphia high school, and from 1863 to 1871 of the New Jersey state normal school at Trenton. In 1872 he became professor of rhetoric and of the English language at Princeton. He contributed largely to periodicals, and edited several journals and illustrated annuals. Besides some text books and religious works, he published "Class Book of Poetry" and "Class Book of Prose" (1844), "Spenser and the Fairy Queen" (1847), "Female Prose Writers of America" (1851), "In the School Room" (1868), "Manual of Composition and Rhetoric" (1870), "Manual of English Literature" (1872), "Manual of American Literature" (1873), and "Short Course in Literature, English and American" (1874).

**HART, Solomon Alexander**, an English painter of Jewish descent, born in Plymouth in April, 1806. He commenced his career by painting miniatures, but in 1828 turned his attention to historical subjects, and at once achieved a reputation by some scenes from the Jewish ceremonial. He next painted scenes from Scott and Shakespeare, and again, between 1845 and 1850, recurred to Jewish subjects. He has also shown a strong partiality for subjects illustrating the ceremonials of the Roman Catholic church. In 1840 he became an academician, and in 1854 succeeded Leslie as professor of painting in the royal academy, to which in 1865 he was appointed librarian.

**HART, William**, an American landscape painter, born in Paisley, Scotland, in 1823. He came with his parents to America in 1831, and settled in Albany, N. Y. In his youth he was employed in coach painting in Troy, and soon gave evidence of great ability in landscape and portrait painting. In 1848 he exhibited some of his works at the national academy of design, and they were favorably received. In 1850 he revisited Scotland, and spent three years there in study, settling in New York city on his return. In 1856 he was made an associate of the national academy, and two years later an academician. Mr. Hart is a successful teacher of his art as well as a popular painter. He was for some time president of the Brooklyn academy of design. Among his principal pictures are "The last Gleam," "The Golden Hour," "Sunset from Dark Harbor, N. B.," "Opening in the Elands" (a coast scene), and "Up in the Glen. White Mountains." He is especially distinguished for his numerous representations of American au-

tumn scenery. He was one of the first to encourage the establishment of the American water-color society, and for three years was its president. His water-colors as well as his oil paintings are remarkable for the beauty of their skies.

**HARTE, Francis Bret**, an American author, born in Albany, N. Y., Aug. 25, 1839. His father, who was a teacher in a girls' seminary, died when he was very young. In 1854 Bret went to California, where for three years he wandered about among the mining camps, digging for gold, teaching school, and finally acting as an express messenger, but meeting with very little pecuniary success in any of these occupations. In 1857 he went to work in San Francisco as a compositor in the office of the "Golden Era." To this journal he contributed sketches of California life, many of which he himself put into type. After a time he was transferred to the editorial room, and still later he became editor of the "Californian," a literary weekly. In 1864 he was appointed secretary of the United States branch mint in San Francisco, which office he held for six years. Several of his short poems, contributed to San Francisco papers during this time, were widely copied and universally admired. Among them are "The Society upon the Stanislaw," "The Pliocene Skull," and "John Burns of Gettysburg." In July, 1868, the "Overland Monthly" was commenced, with Harte as its editor. To the August number he contributed "The Luck of Roaring Camp," a story of mining life idealized, which marks the beginning of his highest work as a writer. In January, 1869, appeared in the same magazine "The Outcasts of Poker Flat," more realistic and in some respects more artistic than its predecessor. These were followed by numerous other stories in the same vein, but none of which have been quite so successful. In September, 1870, appeared his humorous poem entitled "Plain Language from Truthful James," popularly known as "The Heathen Chinee," which was very widely copied and quoted, and of which several illustrated editions and a facsimile of the original manuscript have been published. About this time he was appointed professor of recent literature in the university of California; but in the spring of 1871 he resigned that chair, as well as the editorship of the "Overland," and visited the Atlantic cities, fixing his residence at New York. His "Condensed Novels," originally contributed to the "Californian," in which he parodied the styles of the leading writers of fiction, were collected and published in New York in 1867 (new ed., Boston, 1871). His other independent publications are: "Poems" and "Luck of Roaring Camp and other Sketches" (Boston, 1870); "East and West Poems" and "Poetical Works," illustrated (1871); "Mrs. Skaggs's Husbands" (1872); and illustrated editions of single poems. Since 1871 he has been a frequent contributor to the "Atlantic Monthly" and other periodicals.

**HARTE, Walter**, an English author, born about 1700, died in Bath in 1774. He was educated at Oxford, took orders, and, after establishing a reputation as a preacher, became vice principal of St. Mary's hall, Oxford. He travelled some years on the continent as tutor to the son of Lord Chesterfield, and was afterward appointed canon of Windsor. He early formed an intimacy with Pope, whose style he imitated. In 1727 he published a volume of "Poems on several Occasions;" in 1730 an "Essay on Satire," in 1735 on "Reason," and in 1764 on "Husbandry." His principal work is the "History of the Life of Gustavus Adolphus" (2 vols. 4to, London, 1759; 2 vols. 8vo, corrected and improved, 1763; new ed., 1807), which was translated into German, with notes, by J. G. Böhme. He left unfinished in manuscript a "History of the Thirty Years' War."

**HARTEBEEST.** See ANTELOPE.

**HARTFORD**, a N. county of Connecticut, bordering on Massachusetts, divided into two unequal parts by the Connecticut river, and watered by Farmington, Mill, Podunk, Scantic, and other rivers; area, 750 sq. m.; pop. in 1870, 109,007. The surface is much diversified, part of the river valleys being alluvial and subject to inundation, while other portions of the county are hilly and even mountainous. Most of the soil is fertile and highly cultivated; the E. part is famous for excellent dairy farms. The Connecticut river is navigable by sloops to Hartford, and by small steamboats through the county, which is also intersected by several railroads. The chief productions in 1870 were 6,458 bushels of wheat, 69,387 of rye, 217,502 of Indian corn, 119,335 of oats, 450,158 of potatoes, 1,301,352 lbs. of butter, 103,406 of cheese, 5,830,209 of tobacco, 25,925 of wool, and 95,615 tons of hay. There were 7,062 horses, 16,657 milch cows, 5,742 working oxen, 13,283 other cattle, 8,009 sheep, and 9,645 swine. There were 1,031 manufacturing establishments, with an aggregate capital of \$21,259,828; annual value of products, \$35,039,324. The most important were 7 manufactories of agricultural implements, 18 of carriages, 17 of clock cases and materials, 3 of clocks, 72 of clothing, 4 of cotton goods, 6 of cotton thread, &c., 6 of cutlery, 5 of axes and edge tools, 3 of firearms, 1 of gunpowder, 34 of hardware, 9 of hosiery, 23 of iron castings, &c., 26 of machinery, 27 of paper, 7 of plated ware, 21 of saddlery and harness, 3 of silk goods, 61 of tobacco and cigars, 10 of wood work, 12 of woollen goods, 36 of bricks, 12 of furniture, 30 flour mills, 2 planing mills, 26 saw mills, 3 bookbinderies, and 12 printing establishments. Capital, Hartford.

**HARTFORD**, a city in the town of the same name, seat of justice of Hartford co., and capital of Connecticut, the second city in the state in point of population, situated on the W. bank of the Connecticut river, at the head of sloop navigation, 50 m. by the river from Long Island sound, 33 m. N. E. of New Haven, 100 m.

N. E. of New York, and 95 m. W. S. W. of Boston; lat.  $41^{\circ} 45' 59''$  N., lon.  $72^{\circ} 40' 45''$  W. The town extends  $5\frac{1}{2}$  m. N. and S. and  $3\frac{1}{2}$  m. E. and W., embracing about  $16\frac{1}{2}$  sq. m. The city comprises 10 sq. m., and is about  $3\frac{1}{4}$  m. long from N. to S., with an average breadth of 3 m., the width near the centre, however, being less than 2 m. It is intersected by Park river, which is spanned by 11 bridges, and is bounded W. by the N. and S. forks of that stream. A bridge across the Connecticut, 1,000 ft. long, connects it with East Hartford. The city is laid out with considerable regularity, part of the streets running nearly parallel to the river, and others crossing them E. and W. Main street, which extends from N. to S. through the principal portion of the city, is the great

thoroughfare, and the seat of the principal retail trade. It is broad, and for more than a mile presents an almost unbroken range of brick and stone edifices. On this street are many of the principal public buildings and churches. State and Commerce streets are also the seats of a large and active business. Asylum street, extending W. to the railroad depot, is filled by large brick and freestone edifices, and is the seat of a very extensive and heavy business. In the outskirts are many tasteful and elegant residences; and the city, as a whole, is exceedingly well built. The state house, erected in 1794, is a handsome Doric edifice containing the legislative apartments and several law courts. In the senate chamber is an original painting of Washington

New State House at Hartford, Conn.

by Stuart. On the E. side of the state house square a building is in course of construction for the accommodation of the post office, United States courts, &c., to cost about \$300,000. The city hall, in the Grecian style, the state arsenal, the opera house, and the Union railroad depot, are among the finest of the other public edifices. The city park, embracing 46 acres, is beautifully situated in a bend of Park river, S. of the depot, and contains a fine bronze statue of Bishop Brownell and a statue of Gen. Putnam. Here the new state house, of marble, in the modern Gothic style, is in course of construction (1874). It is to be 300 ft. long by 200 ft. broad in the widest part, and 250 ft. high to the top of the dome, which is 87 ft. above the roof. Besides capacious

chambers for the two houses of the legislature, it will contain rooms for the supreme court and the state library. It is to be completed in May, 1876, and will cost about \$1,500,000. Besides the state house and city parks, there are two other public squares. Of the seven cemeteries, the most noteworthy is Cedar Hill in the S. W. part of the town, comprising 268 acres. The population of the town has been as follows: in 1790, 4,090; in 1800, 5,347; in 1810, 6,003; in 1820, 6,909; in 1830, 9,789; in 1840, 12,793; in 1850, 17,966; in 1860, 29,152; in 1870, 37,743, and of the city 37,180, of whom 10,817 were foreigners. The number of families was 7,427; of dwellings, 6,688.—The Connecticut river is open from about the middle of March to the middle of December,

during which time steamers run daily to New York and different points on the river, and in summer to various watering places on Long Island sound. There are also lines of steamers to Philadelphia and Baltimore, and packet lines to New York, Boston, Albany, Philadelphia, and other points. Railroad communication with New York and the principal places in New England is furnished by the New Haven, Hartford, and Springfield, the Hartford, Providence, and Fishkill, the Connecticut Valley, and the Connecticut Western lines; while local travel is accommodated by street cars, by omnibus to West Hartford, and by stages to the neighboring towns. Hartford has an active trade with the surrounding country, and carries on an extensive wholesale business with the west and south. The tobacco crop of the immediate vicinity is mostly sold here. The manufactures are varied and extensive, embracing iron and brass foundry products, steam engines and boilers, screws, saddlery hardware, carriage hardware, sewing machines, files, water wheels, forgings, wire, steel, machinists' tools, plumbers' materials, lawn mowers, eyelets, stone ware, britannia ware, silver-plated ware, gold pens, spectacles, organs, carriages, sash, doors, and blinds, woolens, rag carpets, envelopes, saddlery and harness, beer, gin, soap for fulling and scouring, cigars, fertilizers, &c. Three companies are engaged in the manufacture of firearms, Sharps's rifles and Colt's pistols being manufactured here. The Colt company has a capital of \$1,000,000, and possesses works and grounds covering 123 acres diked in from the river. Cheney brothers, an incorporated company, with a capital of \$1,000,000, manufacture silk goods and sewing silk; their principal mills are in South Manchester. The aggregate value of the manufactures for 1873 was about \$10,000,000. Including the New York and New England railroad company, with a capital of \$20,000,000, there are 103 incorporated companies in Hartford, having an aggregate capital of \$37,740,300, of which about one half are manufacturing companies, 8 or 10 are mining companies, and the rest are transportation companies, benevolent associations, &c. Book publishing is extensively carried on, 11 firms being engaged in the business. The greater part of the books published here are sold by subscription through agents, who are employed in all parts of the country. The city contains 14 hotels. There are 10 national banks, with an aggregate capital of \$6,562,800; 2 state banks, with \$650,000 capital; 5 savings institutions, with deposits, Jan. 1, 1873, amounting to \$10,041,600 65; and 3 trust companies, with a capital of \$650,000. The deposits of "the society for savings," incorporated in 1819, alone amounted to \$7,020,544 54. The insurance business is proportionally far more extensive than that of any other city of the United States, and has ramifications in all parts of the country. The number of

fire insurance companies is 8, having an aggregate capital of \$7,100,000, besides 2 mutual companies, with cash assets, Jan. 1, 1873, amounting to \$152,341 18. The oldest company is the Hartford, incorporated in 1810, and having a capital of \$1,000,000. The *Ætna*, with a capital of \$3,000,000, was incorporated in 1819, and in 54 years paid losses to the amount of \$39,000,000. There are 8 life insurance companies (3 mutual), a life and accident, and an accident insurance company, having gross assets, Jan. 1, 1873, to the amount of \$78,330,201. The Connecticut mutual company, incorporated in 1846, had nearly \$35,000,000 assets; the *Ætna*, over \$17,500,000; the Connecticut general, about \$10,800,000; and the *Phoenix* mutual, over \$8,000,000. The aggregate assets of the banking and insurance companies at the beginning of 1874 were over \$135,000,000.—The city is divided into 7 wards, and is governed by a mayor holding office for two years, a board of aldermen of 14, and a common council of 28 members. One alderman is elected annually from each ward for two years; the councilmen hold office one year. The recorder holds the city court, and the police judge, with an associate, the police court. The police force consists of 40 men. A paid fire department was organized in 1864; it comprises six steam engines, one hook and ladder, and two hose companies. A fire alarm telegraph is in operation, with 35 alarm boxes, and there are 261 hydrants and 5 reservoirs. Works were erected in 1855 (still maintained to meet any emergency) for pumping water from the Connecticut river, which supplied the city till 1867, when the new works at West Hartford went into operation. These works furnish water from a stream in that town to two reservoirs, one having a capacity of 165,000,000 and the other of 229,000,000 gallons, whence it is distributed through nearly 54 m. of mains. The total cost of apparatus for supplying the city with water to March 1, 1873, was \$1,065,826. The streets are well paved and drained, and lighted with gas. The ordinary receipts into the city treasury for the year ending April 1, 1873, amounted to \$638,691 72; the ordinary expenditures, including \$100,000 for the purchase of the Trinity college grounds, were \$648,196 16; total receipts, \$1,160,115 05; total expenditures, \$1,157,793 89. The floating debt was \$221,404; funded debt, \$1,986,000. The sinking fund amounted to \$161,167. The grand list, or assessed valuation of the town, in 1860, was \$24,813,190; in 1865, \$36,948,305; in 1870, \$44,509,427; in 1872, \$45,676,497. Sessions of the United States circuit and district courts are held here annually.—The benevolent organizations of Hartford are numerous. The American deaf and dumb asylum was chartered in 1816. The main building is 130 ft. by 50, and four stories high. In 1873 the asylum had 18 teachers, 280 pupils, and a library of 2,500 volumes. (See *DEAF AND DUMB*.) The Connecticut retreat for the in-

sane, chartered in 1824, is situated on a commanding eminence just outside the city, surrounded by about 17 acres of ground pleasantly laid out in gardens and walks. The main edifice is of freestone plastered over with cement. The number of officers and attendants, Jan. 1, 1874, was 32; of patients, 139. The Hartford hospital was incorporated in 1854; the buildings with the grounds, 7 acres in extent, cost \$188,495 60; the hospital has accommodations for 100 patients, and possesses a permanent fund of \$153,500. The Hartford orphan asylum was established in 1833. Among other charitable organizations are the Hartford dispensary, the city missionary society, the Connecticut home missionary society, the Connecticut Bible society, and the missionary society of Connecticut, organized in 1798, "to Christianize the heathen in North America, and to promote Christian knowledge in new settlements in the United States." There are 90 unincorporated societies for benevolent, social, and other purposes, including 10 lodges of freemasons, 3 of odd fellows, and 20 temperance societies. The county jail, situated in Pearl street, has 96 cells. A new building is in course of erection further N. Among the educational institutions, the most prominent is Trinity college (Episcopal), founded in 1823, and having in 1873-'4 17 professors and instructors, 94 students, and a library of 15,000 volumes. The buildings, comprising three stone halls, called respectively Seabury, Jarvis, and Brownell, occupy (1874) a site on the W. side of Trinity street, adjacent to the city park. The grounds, however, have been sold to the city, the trustees reserving the right to use them until April, 1877, with the exception of Brownell hall, a portion of which has been demolished to make room for the new state house. A new site for the college, about a mile south of the present one, has been purchased. (See TRINITY COLLEGE.) The theological institute of Connecticut (Congregational) was chartered in 1834, and in 1873-'4 had 3 professors, 18 students, and a library of 7,000 volumes. The Hartford female seminary, founded in 1823, had in 1872 3 instructors and 123 pupils. There are 13 select schools. The town is divided into 10 school districts. The number of public school houses in 1873 was 16, containing 105 rooms and 5 halls; number of teachers, 128; children of school age (4 to 16), 9,138; whole number registered, 6,905; average attendance, about 4,000. The total expenditure for school purposes was \$171,814 46, of which \$91,674 85 was for teachers' wages. The two evening schools had 10 teachers and 501 pupils. The high school was established by vote of the town in March, 1847, and the first building was completed in December of that year. A new building, one of the finest school edifices in the country, was erected in 1869 on a handsome site a short distance S. W. of the union depot. It is 100 by 85 ft. in its external dimensions, and consists of two sto-

ries surmounted by a Mansard roof, with a raised basement. On the N. E. corner is a tower 120 ft. high, containing a clock and an observatory, and on the S. E. corner is another tower 68 ft. high. It was constructed of brick and stone, at a cost of about \$102,000, and will accommodate 409 scholars. The number of teachers in 1873 was 15; of pupils, 404. The number of volumes in the school libraries is about 3,000. The schools are under the supervision of a board of 9 visitors, besides which there is a committee for each district and the high school. The Hartford grammar school, the oldest educational institution in the state, was first endowed with a gift of land by William Gibbins in 1655, and about 10 years afterward received a considerable sum from the estate of Governor Edward Hopkins. It was incorporated in 1798. The scholars must pursue a classical course of study. Tuition is free. Since the organization of the high school, the grammar school has practically formed part of the classical department of that institution, though governed by its own board of trustees. There are 4 daily and 8 weekly newspapers, and 3 monthly periodicals, of which one is published by the students of Trinity college. The Wadsworth athenaeum, in Main street, is a castellated granite building, 100 ft. long by 80 ft. deep in the centre and 70 ft. deep on the wings, with central towers 70 ft. and corner buttresses 56 ft. high. Its cost, over \$60,000, was defrayed by the contributions of citizens. In this building are the reading room and library (containing 23,000 volumes) of the young men's institute; the rooms of the Connecticut historical society, which possesses a library of 16,000 volumes; the Watkinson library (27,000 volumes); and a gallery of valuable paintings and statuary. The state library contains 12,000 volumes. The Connecticut school of design was chartered in 1872. There are 26 churches, of which 11 are in Main street within a distance of a mile, and 7 chapels. The number of religious societies is 40, viz.: 5 Baptist, 1 Catholic Apostolic, 1 Church of Christ, 12 Congregational, 8 Episcopal, 2 Jewish, 4 Methodist, 1 Presbyterian, 2 Roman Catholic, 1 Second Advent, 1 Spiritualist, 1 Unitarian, and 1 Universalist. Besides the Sunday schools connected with the churches, there are 3 mission Sunday schools, with 60 teachers, 470 pupils, and libraries containing 1,000 volumes. The corner stone of a Roman Catholic cathedral to be erected on Farmington avenue was laid in 1873.—Hartford was first settled in 1635 by emigrants from Newtown (now Cambridge), Mass., and from Dorchester and Woburn, many of whom had come originally from Braintree, England. The present locality of Hartford was called by the Indians Suckiaug. The first settlers named it Newtown; but in 1637 it was formally called Hartford, after Hertford, England, the birthplace of the Rev. Samuel Stone, one of the first pastors of the settlement. In 1633 the Dutch had erected a

fort on Dutch point, at the confluence of the Park and Connecticut rivers, within the present limits of Hartford; but in 1654 they were dispossessed by an act of the general court, and the new colony came entirely into the hands of the English. Among the early settlers were a number who had been persons of eminence and affluence in England, and who were held in high honor through all the New England settlements, many of whom were founders of families yet prominent in the city. The first town organization admitted inhabitants, and even temporary residents, only by vote of the town meeting. There was a public market semi-weekly, and a public fair twice every year. The first town meeting was held in 1635, and the first general court of Connecticut in 1636. The first church came ready organized from Cambridge, with its pastors, Hooker and Stone; and its first house of worship was erected in 1638. The first war was the Pequot war in 1637, for which Hartford contributed 43 out of 90 men, including commander and chaplain, besides a large share of provisions, equipments, &c. In 1639 a constitution for the government of the colony was formed. (See CONNECTICUT, vol. v., p. 260.) A school was in operation in 1638, and in 1643 £16 a year was voted to the teacher. A house of correction was in operation in 1640; the first inn was ordered by the general court and established in 1644. In 1650 the first code of laws was drawn up, chiefly by Roger Ludlow, which reduced the number of capital offences from 160, under English law, to 15. In 1687 the independent spirit of the colony was shown by their quiet but determined resistance to Andros, in his attempt to take away the charter of 1662, when, according to current accounts, the lights in the council chamber were all in an instant extinguished, and the charter seized and carried off in the dark, and hid in the famous "charter oak." (See ANDROS, SIR EDMUND.) In 1764 the first printing office was set up by Thomas Green. In 1775 a patriotic and enterprising committee met and made arrangements for raising men and money, which resulted in the taking of Ticonderoga. In 1784 the city was incorporated; in 1792 the first bank and first charitable society were established. From the union of the colonies of Connecticut and New Haven in 1665 till 1701 the legislature met in Hartford; between the latter date and 1818 one stated session was held in Hartford and one in New Haven each year; and from 1819 to 1874 there was an annual session at those places alternately. In 1875, by virtue of a constitutional amendment ratified by a popular vote in 1873, Hartford is again to become the sole capital.

**HARTFORD CONVENTION**, an assemblage of delegates from the New England states which met at Hartford, Dec. 15, 1814. The war between the United States and Great Britain, which began in 1812, was from the first distasteful to the majority of the people of New

England, who regarded it as unnecessary and impolitic, and who had suffered from immense losses by the destruction of their commerce and their fisheries. They regarded the war as a mere party measure of the democrats, and as federalists they had earnestly and persistently opposed it. In February, 1814, a committee of the Massachusetts legislature made a report on public affairs, in which they declared that, in their opinion, the constitution of the United States had been violated by the federal government, and that still worse measures were likely to follow; and they suggested the appointment of delegates to meet such as might be appointed by the legislatures of other states "for the purpose of devising proper measures to procure the united efforts of the commercial states to obtain such amendments or explanations of the constitution as will secure them from future evils." The defence of the New England coast was neglected by the federal government, and the British were beginning to attack it with vigor. Stonington in Connecticut was bombarded, Castine and all Maine east of the Penobscot taken possession of, while a rumor spread that Massachusetts was to be invaded by a formidable force. Another committee of the Massachusetts legislature reported in October, 1814, that, in the position in which that state stood, no choice was left her between submission to the enemy, which was not to be thought of, and the appropriation to her own defence of those revenues derived from her people which the general government had hitherto thought proper to expend elsewhere. The committee also recommended a convention of the New England states; and their report being adopted by the legislature by a vote of three to one, a delegation of 12 men of the highest reputation, with George Cabot, William Prescott, and Harrison Gray Otis at their head, was appointed. A circular letter to the other New England states called upon them to meet in convention "to devise means of security and defence which may be consistent with the preservation of their resources from total ruin, and adapted to their local situation and mutual relations and habits, and not repugnant to their obligations as members of the Union." Connecticut and Rhode Island responded to this invitation, the former by appointing seven, and the latter four delegates. Two delegates appeared from New Hampshire, and one from Vermont, not sent by these states, but by separate counties. When the convention assembled they chose George Cabot president, and Theodore Dwight secretary. For 20 days the convention sat with closed doors, and on their adjournment embodied the result of their deliberations in a report addressed to the legislatures which they represented. This manifesto was moderate in tone and patriotic in sentiment, expressing strong affection for the Union and the greatest aversion to violent or unconstitutional opposition to legal authority. It point-

ed out, however, the dangers impending over New England from the alleged usurpations of the general government and from the foreign enemy. In the power over the militia claimed for the general government; in the filling up of the ranks of the regular army by conscription; in authorizing the enlistment of minors without the consent of their parents or guardians, thus invalidating contracts, the report maintained that the federal constitution had been disregarded in a way that demanded from the individual states firm and decided opposition. The convention recommended to the legislatures of the states for which it spoke the adoption of such measures as might be necessary effectually to protect their citizens from the operation of the acts passed by congress containing provisions subjecting the militia and other persons to forcible drafts, conscriptions, or impressments not authorized by the constitution of the United States. It recommended also an immediate application to the federal government by the New England states for authority to combine their forces for their defence against the British, and to appropriate for the same purpose a reasonable amount of the taxes levied upon them. Finally, it proposed several amendments to the federal constitution, among which were: basing representation on free population; making the president ineligible for a second term; disqualifying persons of foreign birth to hold office; limiting embargoes to 60 days; requiring a two-thirds vote in congress to admit new states, to interdict commercial intercourse, to declare war, or to authorize hostilities, except in cases of invasion. These questions had arisen during the hostilities with Great Britain, and the news of the negotiation of the treaty of peace at Ghent, which arrived soon after the adjournment of the convention, put a practical stop to their discussion. Congress, however, which was then in session, settled some of them by an act regulating the employment of state troops by the federal government in a satisfactory manner.—The holding of the Hartford convention and its supposed treasonable designs caused a great outcry from the democratic party, and excited much alarm and apprehension at Washington. The government stationed Major Jessup, a Kentucky officer of distinction, at Hartford with a regiment of troops to repress any sudden outbreak; but after the most careful investigation, this officer reported to his superiors at Washington that the convention would confine itself to complaints, remonstrances, and an address to the people, and that there was no reason to apprehend any treasonable action. The state department, however, had a correspondent who pretended to be in the confidence of the late British consul at Boston, and to have learned from him or from his papers the existence of a committee of New England royalists, who intended to establish the kingdom of New England with the duke of Kent as its sovereign. The

chief clerk of the state department was sent to Boston to investigate this matter, but could discover no trace of the pretended committee. The imputation of treasonable designs to the Hartford convention continued until a recent period, and resulted in excluding from political power in the nation almost every man implicated in its doings. It was also one of the chief causes which destroyed the federal party. It is now, however, almost universally conceded that the Hartford convention was guiltless of any designs which could justly be considered treasonable.—See "History of the Hartford Convention," by Theodore Dwight (Boston, 1833).

**HARTLEPOOL**, a town, parliamentary borough, and seaport of Durham, England, on a small peninsula N. of the estuary of the Tees, 17 m. S. E. of Durham, with which it is connected by railway; pop. in 1871, 39,969. The peninsula or headland, on which stands the old town, partially encloses a fine harbor which is safe and easy of access. The newer portion of the town, called West Hartlepool, is on the opposite or S. side of the harbor, which is about a mile wide. The old town was rechartered in 1850, and has since been greatly improved. It contains three churches, including the ancient parish church of St. Hilda, and three dissenting chapels, a fine new borough hall, a large market, a mechanics' institute, a theatre, and water works. There are iron mills, puddling furnaces, founderies, ship yards, and breweries; the fisheries are considerable; and there is a large commerce, principally in exporting coal and importing timber. West Hartlepool, which owes its existence to its fine docks, has wholly grown up since the first one was constructed, in 1847. It is well paved, lighted with gas, has large water works, and contains six churches and chapels, a theatre, town hall, mechanics' institute, and market house. There are large ship yards, founderies, locomotive works, saw mills, and brick yards, and 76 acres of dockage and three miles of quays. The harbor is defended by fortifications and has two light-houses. The parliamentary borough, constituted in 1867, is called the Hartlepoons.

**HARTLEY**. **I. David**, an English philosopher, born in Armley, Yorkshire, Aug. 30, 1705, died in Bath, Aug. 25, 1757. He was educated at Jesus college, Cambridge, of which he became a fellow, was destined to the church, but had scruples about subscribing the XXXIX. articles, and therefore studied medicine, which he practised with success at London, Bath, and other places. All records agree in extolling his personal character. His society was sought by the most distinguished literary men of his time. At the age of 25 he began the composition of his great work, "Observations on Man, his Frame, his Duty, and his Expectations," which was published after a labor of 18 years (2 vols., London, 1748-'9). His theory of sensation, grounded on an anatomical inspection of the nervous system, is historically curious as

perhaps the first attempt to explain psychological phenomena on physiological principles. According to him, the white medullary substance of the brain, spinal marrow, and the nerves proceeding from them, is the immediate instrument of sensation and motion. External objects excite vibrations in the medullary cord, which are continued by a certain elastic ether. Connected with this theory are other doctrines, especially that of association, which gave to Dr. Hartley a reputation as one of the most ingenious metaphysicians of the 18th century. When a sensation has been frequently experienced the vibratory movement from which it arises acquires a tendency to repeat itself spontaneously. Ideas are but these repetitions or relics of sensation, and in their turn recall other ideas. By the development of the law of association, and chiefly by the law of transference, he accounts for all the phenomena of the mental constitution. In many cases, the idea which is the link of association between two other ideas comes to be disregarded, though the association itself remains. Thus the idea of money is connected with that of pleasure by the conveniences which wealth may supply; but the miser takes delight in money without thinking of these conveniences. In this way Hartley accounts for almost all the human emotions and passions. An edition of the work, by his son, with notes from the German of H. A. Pistorius, was published in 1791 (3 vols., London). **II. David**, son of the preceding, born in 1729, died in Bath in 1813. As member of parliament for Kingston-upon-Hull, he steadily opposed the war with the American colonies. He was one of the plenipotentiaries appointed to treat at Paris with Dr. Franklin, in whose correspondence, published in 1817, some of his letters appear. He was an early promoter of the abolition of the slave trade, and exhibited his scientific knowledge in several useful inventions.

**HARTMANN, Eduard von**, a German philosopher, born in Berlin, Feb. 23, 1842. He was educated at the gymnasium in Berlin, and subsequently at the school of artillery. He became an officer in 1861; but having hurt his foot accidentally in the following year, and an incurable disease setting in, he has since been almost entirely confined to his room. Devoting himself to literary pursuits, he has published several philosophical works, and among them *Die Philosophie des Unbewussten* (Berlin, 1869; 5th ed., 1873), by which he has gained a place among the foremost thinkers of the age. He contends that philosophy must seek corroboration from results inductively obtained in the physical sciences. He assumes that there is in nature an unconscious will and idea as a pure and spiritual activity, without a substratum of nerve or brain, which is the basis of consciousness. The same unconsciousness he finds in spirit, in the human instinct, sexual love, emotions, morals, æsthetics, and thought, in the development of language, sensual perceptions,

mysticism, and history. His metaphysics teach that unconsciousness is the last principle of philosophy, described by Spinoza as substance, by Fichte as the absolute I, by Schelling as the absolute subject-object, by Plato and Hegel as the absolute idea, and by Schopenhauer as the will. The attributes of the unconscious spirit are will and idea, and the world is the product of both. He affirms that it is neither possible for Hegel's "logical idea" to attain to reality without will, nor for Schopenhauer's "irrational will" to determine itself to prototypal ideas; and he demands, therefore, that both be conceived as coördinate and equally legitimate principles, which after the precedent of Schelling are to be thought of as functions of one and the same functioning essence. The end of development is the turning back of volition into non-volition, which is attained by means of the greatest possible intensification of consciousness, resulting in the emancipation of the idea from the will. Among Hartmann's minor publications are several poetical productions.

**HARTMANN, Moritz**, a German poet of Jewish parentage, born at Duschnik, Bohemia, Oct. 15, 1821, died in Vienna, May 13, 1872. He studied in Prague and Vienna; but umbrage being taken at his liberalism, he left Austria, and published a volume of patriotic poems, *Kelch und Schwert* (Leipsic, 1844), which was followed in 1847 by *Neuere Gedichte*. In 1848 he was a prominent liberal member of the Frankfort parliament, and accompanied Froebel and Blum to Vienna, whence he escaped after the execution of Blum, and travelled extensively, spending a considerable time in the East during the Crimean war, and several years in Paris. In 1860 he delivered lectures on German literature and history in the academy of Geneva. In 1863 he removed to Stuttgart, and in 1868 to Vienna. Among his best known novels are: *Der Gefangene von Chillon* (1863); *Die letzten Tage eines Königs* (1866), which has been translated into English; and *Die Diamanten der Baronin* (2 vols., 1868). Of his political writings the most notable is *Reimchronik des Pfaffen Mauricius* (1849), a satire on the Frankfort parliament, written in the manner of the old rhyming chronicles. A complete edition of his works was published at Stuttgart in 10 vols. in 1874.

**HARTSHORN, Spirits of.** See AMMONIA.

**HARTSOECKER, Nicolaas**, a Dutch philosopher, born in Gouda, March 26, 1656, died Dec. 10, 1725. He was intended for the church, but devoted himself to scientific pursuits. One of his earliest inventions was an improved form of object glasses for microscopes, which enabled him to discover animalcules in the animal fluids, on which a new doctrine of generation was formed. Subsequently in Paris he succeeded in manufacturing object glasses for telescopes superior to any previously made. An account of these discoveries was published in the *Journal des Savants* of Paris by Huygens, and in

1694 Hartsoeker published there an *Essai de dioptrique*, followed in 1696 by *Principes de physique*. He afterward returned to Holland, and while there was introduced to the czar Peter, who endeavored without success to induce him to settle in St. Petersburg. After filling for several years the professorship of mathematics in Düseldorf, he retired to Utrecht. One of his last works was *Recueil de plusieurs pièces de physique*, in which the system of Newton was assailed with more violence than force. Previous to this he published his lectures under the title of *Conjectures physiques* (Amsterdam, 1706-'8), and a number of other works, many of a controversial nature.

**HARTSVILLE**, a town of Bartholomew co., Indiana, about 40 m. S. S. E. of Indianapolis; pop. in 1870, 433. It is the seat of Hartsville university, established in 1851 under the auspices of the United Brethren, which in 1872 had 14 professors and instructors and 117 students, mostly in the preparatory department, of whom 38 were females. The theological school connected with the university had one professor and 11 students.

**HARTWICK**, a town of Otsego co., New York, situated on the Cooperstown and Susquehanna Valley railroad, 4 m. S. of Cooperstown and Otsego lake, and about 60 m. W. of Albany; pop. in 1870, 2,339. The surface is a hilly upland, the highest summits being from 200 to 350 feet above the valleys. The E. part is drained by the Susquehanna, and the W. part by Otego creek. The town contains four post offices, viz.: Hartwick, Hartwick Seminary, South Hartwick, and Toddsville. In the village of Hartwick Seminary is Hartwick theological and classical seminary, incorporated Aug. 13, 1816, and endowed by John C. Hartwick, from whom it received its name. The building has recently been remodelled, and is now one of the finest seminary buildings in the state. Hartwick seminary is connected with the Lutheran church, and in 1873-'4 had 5 instructors and 85 students, of whom 60 were males and 25 females, and 7 were in the theological department. There are 3,000 volumes in the library.

**HARTZ** (Ger. *Harz*, or *Harzgebirge*), the most northwestern mountain range in Germany, between lat.  $51^{\circ} 30'$  and  $52^{\circ}$  N., and lon.  $10^{\circ} 10'$  and  $11^{\circ} 30'$  E. It separates the waters of the Weser from those of the Elbe. This range is divided into two parts, Upper and Lower

The Brocken.

Hartz, lying W. and E. of the Brocken. Their principal axis, which extends in a direction about W. N. W., E. S. E., is not far from 60 m. in length. The width of this main chain, as from Wernigerode to Ilfeld, is about 18 m. The highest summit is the Brocken, a mountain of feldspathic granite, which by its easy decomposition has caused the mountain to assume a rounded graceful form. It rises to the height of 3,737 ft., and overlooks all the surrounding country. The Rosstrappe stands near by in the same group, and is of somewhat inferior elevation to the Brocken, from which it is separated by formations of argillaceous slates and the lower limestones. It is composed of granite in which quartz predominates, giving to the rock a more indestructible character and to the mountain a more rugged aspect than that of the Brocken. The Rammelsberg is a mountain of argillaceous slate and the older sandstones, reaching the height of about 1,200 ft. above the plain near the town of Goslar. The district comprising these mountains is principally made up of granitic rocks, which form the highest summits, and of gneiss, argillaceous slates, and metamorphic

limestones and sandstones, which are grouped around, and penetrated by, the granites. Various rocks of the upper secondary, from the *grès bigarré* or new red sandstone to the chalk, repose unconformably upon the older formations around their marginal outcrop. The more elevated portions of the district are rough and dreary, with a sterile soil and a cold climate. Numerous streams take their rise in the Hartz mountains. Tributary to the Elbe are the Helme, which flows through the deep and beautiful valley called the Goldene Aue, and the Zorge, on the south; the Eine, Selke, and Bode, on the east; and the Holzemme on the north. The Ilse, which forms several fine cataracts in its course, the Ecker, Radau, and Ocker, on the north, and the Innerste, Söse, and Sieber, on the west, flow into the Weser. The valleys, being well watered, are very fertile, and produce abundant pasturage, and large herds of cattle are reared here. This district is also well wooded, and timber forms an important article of export. But the mines, chiefly of lead, silver, copper, zinc, and iron, are the principal source of the wealth of this region. The other minerals found here are sulphur, arsenic, granite, marble, and gypsum; and in the east are a number of important salt springs. For many centuries the mines have been industriously worked, and the business connected with them gives employment to about 30,000 persons. The mines belong chiefly to the province of Hanover (Prussia) and Brunswick; the former possessing those at Clausthal and Andreasberg, in the Upper Hartz, and the latter a portion of those in the Rammelsberg near Goslar. Those of the eastern Hartz are in the territory of Anhalt. The Rammelsberg mines were opened about the year 970, those of the Upper Hartz mostly in the 16th and 17th centuries; and the chief towns upon their sites, as those above named and Altenau, Zellerfeld, Lautenthal, Wildemann, and Grund, were founded in consequence of the discoveries of the mineral resources beneath the surface. These mining towns (*Bergstädte*) are entitled to special privileges, and no business is conducted in them but what is connected with mining and metallurgy. Clausthal is the headquarters of these operations. The council which has general charge of the mines meets here, and here are a mint and a school of mines, the latter furnished with a fine collection of minerals and models of mining and other machinery. The mines of the Upper Hartz belong either to the group at Clausthal or that of Andreasberg. In the former the veins follow several lines of fracture in an E. and W. direction. One passes through the town of Zellerfeld, extending from Wildemann to Clausthal, a distance of 3 m. They produce argentiferous galena, copper pyrites, and blende in a quartzose gangue, intermixed with calcareous spar, brown spar, heavy spar, and spathic iron. They are remarkable for spreading out in thin branches through a great breadth of rock, and at Clausthal these

strings are profitably explored throughout a width of 300 ft. The famous drainage level of these mines is noticed in the article ADIR. The mines and city of Andreasberg are situated upon the steep slope of a mountain of argillaceous and silicious slates. The whole area occupied by the former is hardly a mile square. Rich silver ores are found here in small veins, as the antimonical sulphuret of silver and ruby-red silver of the dark and light varieties. Argentiferous galena is also a product of these mines. At this locality is found the deepest mine in the world. It is upon an argentiferous vein, which has been followed to the depth of more than 2,500 ft. from the surface, the last 800 ft. since about the year 1820. The richest ores are found in courses which extend only about 100 ft. in length on the vein. The best of these was struck at a depth of about 2,160 ft., and has continued highly productive to the greatest depth named. The Rammelsberg mines produce similar ores to those of the Upper Hartz district. On account of the extreme hardness of some of the veinstones of these mines, it has been the practice, instead of attempting to drill the rock for blasting, to build a large fire against the face of the vein, and leave this to act upon the ingredients, like the arsenic and sulphur, which may be volatilized, and thus cause the mass to be easily attacked and broken down to some extent. Various other ores have been obtained in the Hartz besides those named. Iron mines have been extensively worked; ores of antimony have been produced to some extent, as also those of cobalt and manganese. A small quantity of gold has also been found in Anhalt. The rare metal selenium has been extracted from the seleniuret of lead of the same district. The Mansfeld bituminous copper slates are singular ores, of so low a percentage that the copper pyrites disseminated through them is not visible, yet they have been long profitably worked in the Lower Hartz. The annual production of the Hartz mines, not including that of the Rammelsberg, which also yields 5 lbs. of gold, is about 40,000 lbs. of silver, 5,000 to 6,000 tons of lead, 150 tons of copper, and 10,000 tons of iron.—The population of the Upper and Lower Hartz speak different dialects. Besides the Brocken or Blocksberg, which plays an important part in the popular legends and fairy tales of Germany, and which is immortalized in Goethe's "Faust," there are many remarkable localities in the Hartz, as the Stauffenberg, with the ruins of the castle of Henry the Fowler, the castle of Falkenstein, the Alexisbad, &c. The Teufelsmühle, Rosstrappe, and the valley of the Bode are renowned for their fine and peculiar scenery; and two curious caves, Baumannshöhle and Bielhöhle, are interesting on account of their fossil bones.

**HARTZENBUSCH, Juan Eugenio**, a Spanish author, born in Madrid, Sept. 6, 1806. His father was a German carpenter. He was educated by the Jesuits and intended for the church, but,

becoming interested in literature, he translated a number of French and Italian comedies and prepared for the stage several of Calderon's plays. He also composed many short poems. In 1835 he became a stenographer on the staff of the *Gaceta de Madrid*. In 1836 an original drama by him, entitled *Los amantes de Teruel*, was played with success, and he afterward produced many others. He has also published critical editions of the works of Tirso de Molina (12 vols., Madrid, 1839-'42), of Calderon (4 vols., 1849-'51), of Alarcon (1852), and of Lope de Vega (4 vols., 1853). Among his own works are *Cuentos y fábulas* (2 vols., 1861), *Obras de encargo* (1864), and *Obras escogidas* (2 vols., Leipsic, 1865). In 1852 he was named president of the theatrical council, and he has been since 1862 director of the national library.

**HARVARD, John**, the founder of Harvard college, born in England, probably in Middlesex, died in Charlestown, Mass., Sept. 24, 1638. He was educated at the university of Cambridge, and having emigrated to America was made a freeman of the colony of Massachusetts, Nov. 2, 1637. The following year, as appears from the town records, a portion of land was set off for him in Charlestown, where he exercised the ministry. In April, 1638, he was appointed one of a committee "to consider of some things tending toward a body of laws." These are the only particulars known of his life. His property at his death was worth about £1,500, one half of which he gave for the erection of the college which bears his name; but part of this bequest, we are told, was diverted from its original purpose. He also left to the college a library of more than 300 volumes. A monument to his memory was erected in the burial ground of Charlestown by the alumni of the university, and inaugurated with an address by Edward Everett, Sept. 26, 1828.

**HARVARD UNIVERSITY**, the oldest and the most amply endowed institution of learning in the United States, situated in Cambridge, 3 m. W. of Boston, Mass. Six years after the first settlement of this region by the English the following entry appears on their records, under date of Oct. 28, 1636: "The court agreed to give 400*l.* towards a schoole or colledge, whear-of 200*l.* to bee paid the next yeare, and 200*l.* when the worke is finished, and the next court to appoint wheare, and what building." The next year the court ordered that the college should be at "Newetowne," and designated the governor and deputy governor, with ten others, including the principal laymen and ministers of the colony, among whom were John Cotton and John Winthrop, to have charge of the undertaking. Under date of March 13, 1639, it was "ordered, that the colledge agreed upon formerly to bee built at Cambridg shal bee called Harvard Colledge." By the change of the name Newtown to Cambridge it was designed to honor the famous English university, of which some of the early settlers were

graduates, and the name Harvard was given to the institution in recognition of the liberal endowment of about £700 left by the will of the Rev. John Harvard in 1638. It is doubtful whether the original grant of £400 was ever actually paid. It is certain that the project for a college lay in abeyance until the bequest of Harvard at once initiated the necessary measures. In 1638 a class began a course of study in the college under Nathaniel Eaton. The first class graduated, in 1642, consisted of nine members. Efforts were made to educate a few of the aborigines as teachers of their own race, but only one Indian was ever graduated. In 1642 the general government of the college and the management of its funds were vested in a board of overseers, consisting of "the governor and deputy governor for the time being, and all the magistrates of this jurisdiction, together with the teaching elders of the six next adjoining towns—viz., Cambridge, Watertown, Charlestown, Boston, Roxbury, and Dorchester—and the president of the said college." In 1650 the general court granted a charter to the college, under which it became a corporation with the title of the "President and Fellows of Harvard College," consisting of the president, five fellows, and a treasurer or bursar, to have perpetual succession by the election of members to fill vacancies. In October, 1680, by order of the general court, the ferry between Boston and Charlestown was granted to the college. The town of Cambridge gave several parcels of land, as did other public bodies and private individuals. The legislatures of the colony, province, and state of Massachusetts made grants, in early times regular ones annually, to pay the salary of the president, and to aid in the support of some one or two other officers or teachers in the college, as also occasional gifts for special purposes; while lotteries were chartered to obtain money for building some of the older college halls. The last grant made to the college from the public treasury was in 1814. When a constitution was framed for the commonwealth in 1780 the perpetual enjoyment of all their vested rights and powers was secured to the president and fellows of Harvard college, and the council and senate were made the successors of the magistrates in the board of overseers as constituted in 1642. The organization of the board of overseers, under the direction of the legislature, underwent various changes until 1865, when the connection of the college with the commonwealth was dissolved, and the control of the university was vested in its alumni. Besides the president and treasurer of the university, who are *ex officio* members, the board consists of 30 members, divided into six classes, of five each, who after a term of six years go out of office in rotation, five overseers being elected by the alumni each year. The first election of overseers by the alumni was held in Cambridge on commencement day in 1866. Only inhabitants of the state are eligible as

members of the board, and no alumnus is "entitled to vote for overseers before the fifth annual election after the graduation of his class." The first degree of D. D. ever granted by the institution was conferred upon Increase Mather in 1692. A few years later Harvard college received the first of a series of munificent gifts from the Hollis family, including some valuable books. In 1764 the library was destroyed by fire, and about 6,000 volumes were lost, including all of Harvard's books except one, the oriental collection bequeathed by Dr. Lightfoot, and the Greek and Roman classics presented by Bishop Berkeley. Harvard has had 22 presidents, as follows:

—The external administration of the university is vested in two separate boards, viz., the pres-

ident and fellows, known also as the corporation of Harvard college, and the overseers. The latter body has undergone various changes in its organization, but its general powers and duties are the same as those conferred by the act of 1642, giving the board "full power and authority to make and establish all such orders, statutes, and constitutions as they shall see necessary for the instituting, guiding, and furthering of the said college, and the several members thereof, from time to time, in piety, morality, and learning;" and "also to dispose, order, and manage" all the funds and property of the institution. The "corporation," consisting of the president and treasurer of the university and five fellows, is vested with the right to acquire and to hold property and to sue and to be sued. With this board originate all nominations to office in the university, as well for filling vacancies in its own body, as for president, professors, and other officers of instruction. Its action, however, is subject to the approval of the board of overseers. The functions of these two governing bodies extend to all the professional and special schools of the university. The internal government of the institution is administered by the president, deans, and faculties composed of officers of instruction. Besides the dean and faculty of the

Matthews Hall (showing also Massachusetts, Harvard, and Hollis Halls).

college proper, each professional department has a dean and special faculty; but the president of the university is the president of each of the faculties. In 1870 the office of dean of the college faculty was created to relieve the president of a portion of his duties.—The university lands in various parts of Cambridge comprise about 60 acres. The college yard contains about 15 acres, tastefully laid out and

adorned by many stately old elms. Here, forming a large quadrangular enclosure, are clustered 15 extensive buildings, of brick or stone, from two to five stories high. Hollis, Stoughton, Holworthy, Grays, Thayer, Weld, and Matthews halls, the last three erected since 1870, are exclusively dormitories, which, with College house and Holyoke house, on the opposite side of the street from the college grounds,

have accommodations for nearly 700 students. The remaining buildings include Massachusetts hall, erected in 1720, Holden chapel, and Harvard, University, and Boylston halls, all devoted to recitation, lecture, and examination

Appleton Chapel.

rooms, offices, and laboratories; Appleton chapel, with seats for 900; Gore hall, containing the library; and Dane hall for the law school; besides several residences occupied by the

Gore Hall.

president and professors. In the near vicinity of the college yard are the gymnasium, the scientific and mining schools, the divinity school, and the museum of comparative zoölogy. About three fourths of a mile N. W. of the college group is the botanical garden, con-

taining a valuable herbarium, and near it the observatory. On the delta near the college yard stands Memorial hall, erected by the alumni and friends of the college in commemoration of the students and graduates of the university who died in the national service during the civil war. It is constructed from designs by Ware and Van Brunt of Boston, of red and black brick, with copings and window tracery of Nova Scotia stone, and is 310 ft. long by 115 ft. wide. The interior comprises three grand apartments: dining hall, 164 by 60 ft., and 80 ft. high, capable of seating 1,000 persons; memorial vestibule, 112 by 30 ft., and 60 ft. high; and the academic theatre. The dining hall, said to be the grandest college hall in the world, will be used for college festivals, and probably by the Thayer club, an organization supported and managed by students for the purpose of obtaining board at cost. The great west window, 23 ft. wide and 30 ft. high, will be filled with stained glass, as will also in course of time the 36 side windows. Between the dining hall and the academic theatre, which is not yet completed, is the memorial vestibule, surmounted by a tower 200 ft. high. The interior is surrounded by an arcade of black walnut, with marble tablets inscribed with the names of the 120 students commemorated, and the date and place of their death. The walls above are simply decorated in color, with Latin inscriptions, mostly taken from the poets. At either end are large windows filled with stained glass. The estimated cost of the entire structure is \$575,000.—Besides the college proper, the university comprises

the divinity school, law school, medical school, dental school, Lawrence scientific school, school of mining and practical geology, Bussey institution of agriculture and horticulture, observatory, botanic garden and herbarium, and Peabody museum of American archæology and ethnology; and is connected with the museum of comparative zoölogy. All of these are in Cambridge except the medical and dental schools, which are in Boston, and the Bussey institution, which is in Jamaica Plain. A notice of the Episcopal theological school in

Cambridge appears in the catalogue of the university, but there is no connection between the two institutions.—During the past few years many radical changes have been made in the courses of study in the college, with a view of perfecting a system of instruction

which by its elasticity and thoroughness will best accommodate itself to the widely varied tastes and abilities of different students. The preparatory course of study, pursued in schools having no connection with the university, has also undergone a marked revision, in consequence of the changes in the requirements for admission to the college, the aim of the faculty being that the best preparatory training shall be afforded to young men, up to an average age of 18, who intend to pursue non-professional studies for four years or more. Since 1874 candidates have been required to pass an examination in one of two courses of study, the selection being optional with the applicant. Each course embraces 14 subjects (including subdivisions) which are substantially the same in both, viz.: Latin, Greek, mathematics, ancient history and geography, modern and physical geography, and English composition. In one course, however, classical studies predominate, and in the other mathematical and physical. Besides these, there are optional examinations in the classics, mathematics, and physics, for the accommodation of those who desire to be admitted to advanced standing in these, or to pursue elective studies in other departments. In addition to the above, applicants for admission in 1875 and thereafter will be required to translate "easy French prose at sight," with the option of substituting German; and in 1876 requirements in elementary science will be added, the applicant having a choice among the subjects of botany, physics and chemistry, and descriptive astronomy. Two examinations for admission are held, one at the beginning and the other at the close of the academic year. In view of the recently added requirements for admission, and to enable students to enter college at the average age of 18, candidates may divide the admission examination into two, separated by an interval of not less than an academic year. The academic year, which is the same for all departments of the university, extends from the last Thursday of September to the last Wednesday of June, with a vacation of two weeks at the winter holidays. The studies pursued in the academic department are classified into prescribed and elective; the former occupy the whole of the freshman year and about one third of the sophomore and junior years. The studies of the freshman year are Greek, Latin, mathematics, German, ethics, and chem-

istry, 16 hours a week being devoted to recitations. In the sophomore and junior years the required studies are elementary, embracing in the former physics, rhetoric, themes, history, and elementary French for those who

Memorial Hall.

have not passed a satisfactory examination in that language at the beginning of the year; and in the latter logic, psychology, and a portion of the course in rhetoric, as well as of that in themes and forensics. In the senior year only certain written exercises belong to the required course. Numerous courses of elective studies are provided for students in the sophomore, junior, and senior years, who may also choose any of the prescribed studies in the course upon condition of being qualified to pursue them. The elective studies embrace the following courses: 1, the classics, including, besides Latin and classical Greek, ecclesiastical Greek, Hebrew, and Sanskrit; 2, modern languages, including the Anglo-Saxon, and early English, modern Greek, German, French, Romance philology, Italian, and Spanish; 3, philosophy; 4, history; 5, political science; 6, mathematics; 7, physics, including chemistry; 8, natural history; 9, music. In addition to the prescribed studies, every sophomore is required to pursue four courses chosen by himself from the elective studies, with at least two exercises a week each, every junior three courses with three exercises a week each, and every senior four courses with three exercises a week each. Sophomores and juniors may be relieved from pursuing any of the required studies of those years by passing an examination in such studies at the beginning of the year. It will thus be seen that the opportunity is afforded to students of pursuing the ordinary collegiate course, or of concentrating their study upon a limited number of subjects. Examinations in writing are required in every study at the end of the year, besides

similar examinations on nearly every subject in the middle of the year. A large portion of the instruction is given by lectures. A system of special honors, classified as "honors" and "second-year honors," has recently been established for the encouragement of those who wish to attain distinction in special departments of study. The former are awarded at the close of the college course to such students as prove by examination exceptional proficiency in any one of the following courses: classics, modern languages, philosophy, history, mathematics, physics (including chemistry), and natural history. Candidates for honors in the classics or in mathematics must have previously taken second-year honors in the same department. Second-year honors in the classics and in mathematics are awarded to sophomores and juniors upon special examination. The honors awarded are stated in the diploma. The degree of bachelor of arts conferred by Harvard university has been graded as the ordinary degree and the degree with distinction. In the latter case the distinction is indicated in the diploma by the words *cum laude*; to obtain this the candidate must have attained 80 hundredths of the maximum mark for the whole college course, or 87 hundredths of that for the junior and senior years combined. The necessary expenses of an undergraduate during the academic year range from \$400 to \$650, the tuition being \$150. Pecuniary aid afforded to students removes the necessity of any leaving college through indigence. Ninety-two scholarships varying in their annual income from \$40 to \$350 have been established, and the number is rapidly increasing. More than \$20,000 from this source is gratuitously distributed each year among the undergraduates, the preference being given to those ranking highest as scholars. From other beneficiary funds about \$750 is annually distributed in gratuities ranging from \$50 to \$100. There is also a loan fund, the annual interest of which, amounting to more than \$2,000, is lent to students in sums ranging from \$50 to \$150, payable at their option. Besides the above, students may derive an income from acting as monitors; the various monitorships amount to about \$1,200 a year. Twenty-three prizes, yielding annually \$895 in sums from \$15 to \$100, are open to undergraduates.—In the divinity school are two professorships of theology, one of ecclesiastical history, one of New Testament criticism and interpretation, and one of Hebrew, besides a lectureship on Biblical literature. Bachelors of arts are admitted without examination; others are required to pass an examination in Latin and the Greek text of the gospels. The full course occupies three years, on the completion of which the degree of bachelor of divinity is conferred only upon examination. The necessary expenses are about \$300 a year. There are nine scholarships, yielding \$1,695 annually, in sums rang-

ing from \$125 to \$260, and nearly \$3,000 from other funds is annually distributed among the students. The course of study in the law school occupies two years. There are no requirements for admission except that the applicant, if not a college graduate, must be at least 19 years old. But an examination is required for admission to an advanced portion of the course in the case of candidates for a degree. Instruction is given by recitations, lectures, and moot courts, by three full professors, an assistant professor, and several lecturers. The cost of tuition for the first year that a student is a member of the school is \$150, for the second \$100, and for any subsequent year \$50. Eight scholarships, of the annual value of \$100 each, are assigned at the beginning of each academic year to students who have been in the school the whole of the preceding year, and intend to remain throughout the ensuing year. Prior to 1871-'2 the degree of bachelor of laws was conferred upon all who had been enrolled as students a year and a half; it can now be obtained only upon examination. In the Lawrence scientific school courses of instruction are provided for three classes of persons: 1, those desiring the ordinary practical education in engineering and science; 2, those preparing to be teachers; 3, those desiring advanced instruction in science preparatory to the degree of doctor of philosophy or doctor of science. The instruction preparatory to the degrees of civil engineer and bachelor of science comprises a four years' course in civil and topographical engineering, and three years' courses in practical and theoretical chemistry, in natural history, and in mathematics, physics, and astronomy. The teachers' course embraces one year's study in the elements of natural history, chemistry, and physics. Instruction for candidates for the doctor's degree and other advanced students is provided in physics, chemistry, zoology, botany, and mathematics. Candidates for admission to any one of the regular courses leading to the degree of civil engineer or bachelor of science must be examined; but no examination is required for admission to the teachers' course, or that for advanced students. The degree of civil engineer is conferred after examination upon students who have completed the course in civil and topographical engineering. To obtain the degree of bachelor of science the student must have attended the school for at least one year, have completed the course of studies in one or more departments, and pass the examination. The course of study pursued and the grade of merit are specified in the degree, the three grades being indicated by *cum laude*, *magna cum laude*, and *summa cum laude*. The tuition fee for any of the courses in the scientific school is \$150 a year. There are four scholarships yielding annually \$150 each. The full course in the school of mining and practical geology occupies four years, on the completion of which

the degree of mining engineer is conferred after examination. In the case of candidates for this degree an examination for admission to the school is held. Instruction in practical astronomy and the use of astronomical instruments, including the spectroscope, is given at the observatory by the director and three assistants. In 1871 a complete revolution in the system of instruction was made in the Harvard medical school. The new plan went into effect at the beginning of the academic year 1871-'2, and up to this time (1874) this institution has stood alone in its efforts to introduce this radical reform into the system of medical education in the United States. Under the new system instruction is given by lectures, recitations, clinical teaching, and practical exercises distributed throughout the academic year. This extends from the last of September to the last of June, and is divided into two equal terms. The course of instruction occupies three years, beginning with the fundamental subjects of anatomy, physiology, and chemistry in the first year, and proceeding systematically through all the recognized branches of a good medical education. In the important subjects of anatomy, physiology, chemistry, and pathological anatomy, obligatory laboratory work is substituted for or added to the usual didactic lectures. Instead of the customary oral examination for the degree of doctor of medicine held at the end of the course, a series of written examinations on all the main subjects of medical instruction is distributed for regular students through the entire course. Other students may pass all of those examinations together at the end of the course. Besides being obliged to pass the required examinations and present a thesis, every candidate for a degree must be 21 years of age, and must have studied medicine three years and attended this school for one year. The cost of tuition is \$200 a year. A special course is provided for graduates in medicine desiring advanced instruction. The marked diminution in the number of students which has been followed by a rapid annual increase in the number of applicants for admission. The dental school affords, by lectures, recitations, and practical demonstrations, a complete course of instruction in the theory and practice of dentistry. Courses of study are provided in anatomy, physiology, chemistry, surgery, operative and mechanical dentistry, and dental pathology and therapeutics. The academic year is divided into two equal terms. Attendance during the winter term only is required for graduation. The degree of doctor of dental medicine is conferred upon those candidates of adult age who have pursued their professional studies three years under competent instructors, and attended two courses in this institution, and who pass the required examination. Attendance upon one course of lectures in another dental or medical school

may be substituted for the first course in this school. The tuition fee is \$110 for the winter term, or \$150 for the year. The school of agriculture and horticulture, established in execution of the trusts created by the will of Benjamin Bussey, affords thorough instruction in agriculture, useful and ornamental gardening, and stock raising. The regular course of study to be pursued by candidates for a degree occupies three years, and embraces instruction in physical geography, meteorology, geology, chemistry and physics, botany, zoölogy, and entomology, in levelling and road building, and in French and German. The studies of the first year are pursued at the Lawrence scientific school in Cambridge; those of the remaining two years at the Bussey institution near Jamaica Plain. The museum of comparative zoölogy was founded in 1859, with Agassiz as director, in which position he continued until his death in 1873. It is under the direction of the faculty, while the property is held by the trustees, who also appoint the director; the assistants are appointed by the faculty. The extensive collections are open to visitors every day except Sunday. Instruction in natural history is given by the director and 11 assistants. The building of the museum contains 10 distinct working laboratories. Connected with the museum of comparative zoölogy is the Anderson school of natural history on Penikese island, one of the Elizabeth group, about 16 m. S. W. of Cape Cod. This institution was founded by John Anderson of New York as a summer school of natural history, and was opened in 1873 under the personal supervision of Prof. Agassiz. (See ELIZABETH ISLANDS.) The Peabody museum of American archaeology and ethnology was founded by the late George Peabody, who gave \$150,000 for that purpose. The object of the founder was the formation and preservation of collections in archaeology and ethnology, and to afford instruction in those departments. No building has yet been erected for a museum, and no organization except the board of trustees has been effected; but large collections pertaining to archaeology and ethnology have been made.—Besides those already mentioned, the degrees of master of arts, doctor of science, and doctor of philosophy (Ph. D.) are conferred in accordance with the regulations adopted at the beginning of the year 1872-'3. Prior to that time the latter two degrees had not been conferred by this university, while that of master of arts could be obtained by any Harvard graduate after a period of three years from graduation, by paying a fee of \$5. These degrees are now conferred only upon written examinations, and in conformity with specified regulations as to residence, graduation, &c.; the aim being to encourage young men to devote one or more years to liberal study after obtaining the bachelor's degree. The degrees of master of arts and doctor of philosophy are open only to bachelors of arts; those who have not gradu-

ated at Harvard must prove that the course pursued by them is equivalent to the requirements for the bachelor's degree in this university, or must pass such additional examinations as the faculty may prescribe. To become a master of arts, the candidate, after taking the bachelor's degree, is required to pursue for at least one year at the university an approved course of study, and to pass an examination on that course. This degree is also conferred upon graduates of the law or divinity school of Harvard university who are at the same time bachelors of arts, and who pass an examination in a course of study in law or theology after pursuing that course one year at the university. A university residence of at least two years is required of the candidate for the degree of doctor of science, who, besides being a bachelor of science, must also have pursued during three years an approved course of scientific study embracing at least two subjects, and must sustain an examination in those studies. Only a two years' course, however, is required of students who are both bachelors of arts and bachelors of science of Harvard university. The degree of doctor of philosophy is conferred upon those who, after taking the degree of A. B., pursue at the university for two years an approved course of liberal study in any of the following departments: philology, philosophy, history, political science, mathematics, physics, and natural history. Candidates are further required to pass a thorough examination on that course and present a satisfactory thesis. The fee for the examination for the degree of master of arts is \$30, and for that of doctor of philosophy or doctor of science, \$60. All the elective courses of study in Harvard college are open to graduates of other colleges on payment of the fees. For male students, and for candidates for the advanced degrees, the fees range from \$50 a year for three hours of instruction a week, to \$120 for six hours. For the encouragement of a more thorough scholarship than is acquired by undergraduates, six fellowships for graduates have been established, each of which has an income large enough to support a student. Four of them are so far free from restrictions that students while holding them may pursue their studies either in this country or in Europe. No distinction is made as to color or age in the admissions to Harvard college, but women are excluded. A system of examinations for women has however been adopted, the first of which was held in June, 1874. A general or preliminary examination in English, French, physical geography, botany or physics, mathematics, history, and German, Latin, or Greek, is held for those not less than 17 years old. The advanced examination is for women not less than 18 years old who have passed the preliminary examination. It comprises five departments, languages, natural science, mathematics, history, and philosophy, in one or more of which the candidate may

present herself. The function of the university is limited to preparing the examination papers, examining the work of the candidates, recording its results, and giving certificates to those who pass. The examinations may be held in any city or town. The preliminary examination continues during seven days. A fee of \$15 for the preliminary and \$10 for the advanced examination is required.—The various libraries of the university contain 200,000 volumes, distributed as follows: college, 136,000; botanical garden, 4,000; divinity school, 16,000; law school, 15,000; Lawrence scientific school, 3,000; medical college, 2,000; museum of comparative zoölogy, 5,000; observatory, 3,000; society libraries of students, 16,000. The university has no funded property from the public treasury, but has always depended upon the revenues from students and the gifts of individuals, which have far surpassed in number and magnitude those made to any other American institution of learning. No value is reported for the lands and buildings used for college purposes, and the various collections, libraries, apparatus, works of art, &c. The total investments of the college in 1873 were stated by the treasurer at \$2,765,110, of which \$1,854,372 was productive and yielded an annual income of \$133,676. The total number of officers of instruction in the university in 1873-'4, exclusive of librarians, proctors, &c., was 110, including 50 professors, 25 assistant professors, 12 lecturers, 5 tutors, 11 instructors, and 12 assistants. In the college proper there were 18 professors, 15 assistant professors, 5 tutors, 4 instructors, and 8 assistants. The whole number of students was 1,174, including 35 candidates for higher degrees and 10 resident graduates. Of the 706 undergraduates, 217 were in the freshman, 170 in the sophomore, 155 in the junior, and 164 in the senior class. The following statement indicates the number of instructors and pupils in the different departments of the university, the same instructors in some instances being counted in two departments:

DEPARTMENTS.	Professors.	Assistant professors.	Other instructors.	Total of instructors.	Students.
Academic department.....	18	15	17	50	706
Bussey institution.....	3	2	7	12	3
Dental school.....	5	4	4	13	31
Divinity school.....	5	..	1	6	22
Lawrence scientific school.....	10	4	8	22	42
Law school.....	3	1	2	6	138
Medical school.....	10	5	13	28	175
Museum of comparative zoölogy.....	..	..	..	12	..
School of mining.....	9	1	..	10	..

The total number of instructors in all departments has increased from 45 in 1865-'6 to 110 in 1873-'4, the number of students from 936 to 1,174, and the number of volumes in the libraries from 165,000 to 200,000. In the college proper during that period the number of instructors has increased from 22 to 50, the

number of students from 413 to 706, the library from 110,000 to 136,000 volumes, and the number of scholarships from 41 to 92. According to the triennial catalogue of 1872, the university had conferred 12,175 degrees, including 596 honorary. The number of graduates from the college was 8,330, of whom 3,088 were living; 2,036 students had graduated from the medical, 1,720 from the law, 428 from the theological, 183 from the scientific, 39 from the dental, and 4 from the mining school.—See “A History of Harvard University,” from 1636 to 1776, by Benjamin Peirce (1833); “The History of Harvard University,” by Josiah Quincy (1840); “A Sketch of the History of Harvard College,” by Samuel Atkins Eliot (1848); and “Biographical Sketches of Graduates of Harvard University” (1642–’58), by John Langdon Sibley (vol. i., 1873).

**HARVEST FLY**, a hemipterous insect, of the division *homoptera* (from having the wing covers of the same texture throughout), of the family *cicadadae*, and chiefly of the genus *cicada* (Oliv.), improperly called locusts in America. It has been known from remote antiquity, and is the *τρίγλις* of the Greeks, *cicada* of the Latins, *cigale* of the French, and *cicala* of the Italians. The harvest flies or cicadians have short antennæ, conical, six-jointed, and tipped with a little bristle; wings and wing covers in both sexes, inclined at the sides of the body; three joints in the tarsi; a hard skin; and in the female a piercer lodged in a groove under the end of the body. Those of the genus *cicada*, which has been improperly translated grasshopper, are easily known by their broad heads; their large, convex, and brilliant eye on each side, and three simple eyes on the crown; their wings and the covers veined and transparent; and an elevation on the back part of the thorax in the form of an X. The males make a loud rattling sound by means of a kind of kettle-drum apparatus on each side of the base of the abdomen; this is covered by two large oval plates, and consists of a cavity containing plated folds of a parchment-like membrane, transparent as glass; these are moved by muscular cords, whose alternate and very rapid contractions and relaxations produce a corresponding tension and looseness of the membranes and a consequent harsh rattling noise, heard to a considerable distance; the action is assisted by the rapid movements of the wings, and the sound is rendered more intense by the resonance of cavities within the body protected by valves. The piercer has two lateral plates toothed like a saw in the lower portion, and between them a spear-pointed borer. They have not the power of leaping like locusts and grasshoppers; the legs are short, and the anterior thighs are armed with two stout spines. In the perfect state they live only a few weeks, performing the work of reproduction and then dying; in the larva state they are wingless and subterranean, living on the juices of roots, and passing a series of years in the ground.

The *C. septendecim* (Linn.) is called the 17 years locust from the prevalent belief that its life is prolonged to that extent in the imperfect state; undoubted testimony, both from popular and scientific sources, proves that these insects usually appear at intervals of 17 years, but acci-

Seventeen Years Locust (*Cicada septendecim*).

dental circumstances may accelerate or retard their progress to maturity; though they appear in some parts of the country probably every year, and indeed in all districts except northern New England and to the north of that, the lineal descendants of each swarm appear only every 17 years; the popular name of locust was doubtless derived from this fact of their appearance in large swarms after long intervals of time, like the locusts of the East. In the perfect state this harvest fly is of a black color, the anterior edge and principal veins of its transparent wings and covers being orange red; near the tips of the covers there is a dusky zigzag line in the form of the letter W, which by the superstitious is supposed to indicate approaching war; as the mark on the other wing would be inverted like the letter M, the two were supposed to announce a war with Mexico during their appearance in Louisiana in 1835, which however did not arise until some years after; the eyes are red, with metallic reflections; the rings of the body are edged with dull orange, and the legs are of the same color; the expanse of wings is from  $2\frac{1}{2}$  to  $3\frac{1}{2}$  in. Though found upon almost all kinds of trees, except most evergreens, they prefer forests of oaks. The perfect insects emerge from the ground from February to the middle of June, according to latitude and the warmth of the season; their numbers are often so great that the limbs are bent and broken by their weight, from six to eight being sometimes seen on every leaf; the drumming sound is heard from morning to night, but most loudly between the hours of 12 and 2. They are not found in low alluvial lands, and a dry air is necessary for the perfection of the drumming. The males perform the act of reproduction and soon die; they present scarcely a trace of digestive apparatus, and probably take no nourishment; the sexual system is fully developed on emergence from the ground, each of their 500 sperm cells containing about 1,000 spermatozoa. The females have each about 500 eggs, of about  $\frac{3}{16}$  of an inch in diameter, which when deposited are twice that size; their digestive sys-

tem is complete, and the demand for food to develop the eggs must be satisfied during their longer life; the females are one third smaller than the males. In order to deposit her eggs, the female clasps the smallest twig of a tree with her legs, and introduces the piercer to the pith obliquely and in the direction of the fibres, detaching little splinters by the lateral saws at one end to serve as a cover to the perforation; after boring a hole long enough for about 16 eggs, she introduces them in pairs side by side, but separated slightly by woody fibre, and standing obliquely upward; after making a nest and filling it in a space of 15 minutes, she makes others on suitable twigs until her stock is deposited; by this time incessant labor has so weakened her that she drops exhausted from the tree, and soon dies. The eggs are pearl white, very delicate, and are hatched in from three to six weeks, according to favoring circumstances. The twigs pierced by the insect wither and fall to the ground, either on account of the wound or because such are selected as would soon fall from natural causes; in this way many of the larvæ reach the earth, but most are developed on the trees; the emerging larva is about  $\frac{1}{16}$  of an inch long, hairy and grub-like, of a yellowish white color, with six legs, the first of which are strong like lobster claws, and spiny beneath; there are rudiments of wings, or little prominences, on the shoulders, and under the breast is a long sucking ciliated tube with a central tongue. Active on leaving the egg, they in a few moments drop to the ground, and at once bury themselves beneath the surface by means of their fore feet; they follow the roots of plants, perforating them with their beaks and sucking their juices; they do not descend very deeply into the soil, and change but little during their long subterranean abode except in size and in development of the rudimentary wings. As the time of transformation approaches, they gradually advance toward the surface in cylindrical and circuitous passages, about half an inch in diameter and from a depth of one or two feet; now become pupæ, they gradually acquire strength for their final change; they leave the earth in a warm night and ascend trees, on which in a short time the pupa skin bursts on the back, and the perfect cicada comes forth. The ground is sometimes riddled like a honeycomb by their numbers, which in about six weeks are all dead. Did these insects appear every year or two in the same locality, fruit and forest trees would suffer much from their attacks, even though they only rob roots of juices; but fortunately they appear only at long intervals, and their eggs are eaten from the beginning by ants and other insects; the larvæ are also devoured by the same insects, by birds (especially woodpeckers), by toads and frogs, and other reptiles; when turned up by the plough, blackbirds and hogs eat great numbers of them; many perish in their wooden prison, and others are killed by the

fall from the trees; as they generally occur in swarms containing about the same number at each period, of course only a small proportion of the eggs laid can ever produce the perfect insect, probably not more than two of the deposit of each female arriving at maturity.—Another American species is the dog-day cicada (*C. canicularis*, Harris), so called from the time of its first appearance on July 25; it is about  $1\frac{1}{2}$  in. long, with a spread of 3 in.; it is black above, with a powdery white substance on the under parts, and with green markings on the head, thorax, wing covers, and legs. These and several other species have the drumming apparatus, which is always integumental, having no relation to the respiratory system; the sound in some of the large southern individuals continues for nearly a minute. Other harvest flies of the same family, but principally of the genus *membracis* (Fabr.), have only two eyelets; they are not furnished with a musical apparatus, but have the faculty of leaping a distance of 5 or 6 ft.;

European Harvest Flies.—1. *Cicada plebeia*. 2. *Cicada orni*.

they are more properly called tree-hoppers. For full details and references in regard to the American *cicadada*, the reader may consult Dr. Harris's work on "Insects Injurious to Vegetation."—The European species do not pass more than a year in their subterranean abode. The *C. plebeia* (Linn.) is the largest, and is probably the one sung by poets of antiquity, especially by Anacreon and Virgil. These insects were so highly esteemed by the Athenians that they wore golden images of them in their hair; they, however, were also esteemed as food, just before the conclusion of the nymph state; they are said to be sold in South American markets, and, freed from the head, wings, and legs, to be roasted and ground into flour. More than 60 species have been described, spread over almost all the warm regions of the earth. The *C. plebeia* is black, with reddish spots on the thorax and wing covers. The *C. orni*, common in central and southern Europe, is about an inch long, yellowish mixed with black; by their wounding certain species

of ash tree (*ornus*), a saccharine fluid escapes, which, dried and hardened, is used in medicine as manna; this hint from the insect has been taken advantage of by man, who, by making incisions in the trees, is able to obtain a large supply of this purgative substance.

**HARVEY**, a S. central county of Kansas, recently formed, and not included in the census of 1870, intersected by the Little Arkansas river, and watered by affluents of Whitewater creek; area, about 450 sq. m. The Arkansas touches the S. W. corner. The Atchison, Topeka, and Santa Fé railroad and Wichita branch traverse it. Capital, Newton.

**HARVEY**, Sir George, a Scottish painter, born at St. Ninian's, near Stirling, in 1805, died Jan. 23, 1876. He was one of the founders of the royal Scottish academy. His pictures represent scenes from Scottish history and domestic life, and particularly those relating to the trials and persecutions of the Covenanters. In some, however, the serious character is relieved by a vein of quaint humor characteristic of his nationality. He also painted landscapes with effect. Among his works are "Covenanters Preaching" (1830), "The Curlers" (1835), "The Past and Present" (1840), "A Highland Funeral" (1844), "John Bunyan and his Daughter selling Laces at the Door of Bedford Jail" (1857), and "The Penny Bank" (1864). He was elected president of the Scottish royal academy in 1864, and was knighted in 1867. He published "Notes of the Early History of the Royal Scottish Academy" (1870).

**HARVEY**, William, an English physician, discoverer of the circulation of the blood, born in Folkestone, Kent, April 1, 1578, died in London, June 3, 1657. He was the eldest of a family of nine children, and at 10 years of age was sent by his father to the grammar school in Canterbury, whence in 1593 he went to Caius college, Cambridge. Having taken his degree of B. A., he repaired about 1598 to the university of Padua, where he attended the lectures of Fabricius ab Aquapendente and other eminent professors of medical science, and in 1602 graduated as doctor of medicine. Returning to England, he settled in London, and in 1607 was admitted a fellow of the royal college of physicians. Two years later he was appointed physician to St. Bartholomew's hospital, a post which he filled uninterruptedly till 1644, and in 1615 became lecturer on anatomy and surgery in the college of physicians. It was in 1619, while he was discharging the duties of this latter office, that the discovery with which his name has since been associated is supposed to have been made, although, from his desire to thoroughly confirm and mature his opinions, the published treatise on the subject, entitled *Exercitatio Anatomica de Motu Cordis et Sanguinis in Animalibus*, and dedicated to Charles I., did not appear till 1628 (4to, Frankfurt). Harvey, it is said, expressed himself indebted to his former master, Fabricius, for his discovery; but beyond the inductive method of

research which led to it, and which he acquired from the teachings of the Paduan professor, and the discovery by the latter of the valves in the veins, the merit is undoubtedly his own. It appears certain, however, that Cæsalpinus, who died at Rome about the time that Harvey left Italy, distinctly stated in one of his works the system of the circulation of the blood. (See CÆSALPINUS.) For two years previous to the death of James I. Harvey was the royal physician extraordinary, and in 1632 Charles I. appointed him his physician in ordinary. He was thenceforth intimately connected with the court, and frequently prosecuted his anatomical experiments in the presence of the king, whose fortunes he followed after the commencement of the revolution, and with whom he was present at the battle of Edgehill. He subsequently retired with the king to Oxford, where he was made warden of Merton college and received the degree of M. D., and where he remained until the surrender of the city to the parliamentary forces. Ever more interested in the advancement of science than in the mutations of political strife, he devoted himself while there to researches on generation, a subject which had engaged his attention for some years previous, and upon which he published in 1651, five years after his return to London, his second important work, *Exercitationes de Generatione Animalium*. His adherence to the royal cause had meanwhile lost him his position as physician to St. Bartholomew's hospital; but he continued to discharge his functions as lecturer at the college of physicians until near the close of his life. In 1652 he received the rare honor of having his statue placed in the college hall, with an inscription testifying to the value of his discoveries. He subsequently built an addition to the college and endowed it with his paternal estate, one of the conditions of the grant being that an oration should be delivered annually in commemoration of the benefactors of the college, and an "exhortation to the members to study and search out the secrets of nature by way of experiment, and for the honor of the profession to continue mutually in love." Three years before his death he was elected president, but declined the office on account of his advanced age.—For many years Harvey experienced the treatment with which all innovators or discoverers are familiar, and complained that his practice declined considerably after the publication of his treatise on the circulation of the blood, a result which he had indeed predicted. He was far, however, from being looked upon as an empiric; and notwithstanding the hostility of some eminent continental professors and of the older members of the profession generally, he enjoyed the intimacy of the king, and of Bacon, Hobbes, Cowley, and other persons of note in England, several of whom were his devoted partisans. He, moreover, lived to be considered as the first anatomist and physician of his time,

and to see his discoveries universally acknowledged. He was a man of even temper, and in his controversy on the doctrine of circulation with Riolanus, professor of anatomy in Paris, the only one in which he personally engaged, exhibited a forbearance, modesty, and discretion eminently worthy of imitation. Harvey's works, which are written in Latin, display elegant scholarship, and occasionally a considerable degree of eloquence. The best edition, published by the college of physicians in 1766, and preceded by a life of the author in Latin by Dr. Lawrence, contains, in addition to his works above enumerated, his reply to Riolanus, an anatomical account of Thomas Parr, who died at the age of 152, and nine letters on anatomical subjects. During the civil war his house in London was pillaged, and a number of valuable manuscripts were destroyed, the loss of which he never ceased to deplore. The library of the British museum possesses two manuscript works by him, *De Musculis et Motu Animalium* and *De Anatomia Universalis*; the latter, dated April, 1616, contains the germ of the doctrine of circulation. The most recent publication of Harvey's works is the translation by R. Willis, M.D., brought out under the auspices of the Sydenham society (8vo, London, 1847).—For authorities concerning his life, see Lawrence's memoir, Sprengel's "History of Medicine," Aikin's "Biographical Memoirs of Physicians in Great Britain," "Lives of British Physicians" in Murray's "Family Library," &c.; and for a notice of his discoveries, see CIRCULATION, and EMBRYOLOGY.

**HARVEY, William**, an English engraver and designer, born in Newcastle-on-Tyne about 1800, died Jan. 13, 1866. At the age of 14 he was apprenticed to Thomas Bewick, and in 1816 went to London and put himself under the instruction of Haydon, whose "Dentatus" he engraved on wood. From 1840 he almost exclusively devoted himself to designing for wood engraving, and produced an immense number of works. Many important publications were illustrated by him, including Lane's translation of the "Arabian Nights," the "Pilgrim's Progress," Northcote's "Fables," and Knight's "Pictorial Shakespeare." His style is original, but has occasional mannerisms.

**HARWICH**, a seaport of Essex, England, situated on a point of land opposite the confluence of the Orwell and Stour, 66 m. N. E. of London; pop. in 1871, 6,107. The harbor is one of the best on the E. coast of England, being completely sheltered, and having water sufficient to float the largest ships of war. Hundreds of colliers and other vessels anchor here during the prevalence of N. E. winds. It is defended by three forts and a redoubt, with a moat and drawbridge. Two fixed lights indicate the entrance, which is encumbered with rocks, and dangerous without a pilot. Steam packets sail regularly between Harwich and Antwerp, in connection with the Great Eastern railway. Ship building, and other employ-

ments connected with maritime affairs, occupy a great portion of the population. Harwich has become a place of fashionable summer resort, as it is surrounded by beautiful scenery and affords sea bathing. The town is of Saxon origin. In 1318 it was incorporated by Edward II., and in the campaign of 1346-'7 it supplied 14 ships to the fleet of Edward III.

**HARWOOD, Edward**, an English author, born in Lancashire in 1729, died in London, Jan. 14, 1794. He was educated for the ministry, and in 1765 took charge of a small Unitarian society in Bristol. At the end of five years, in consequence of charges affecting his religious opinions and private character, he was induced to go to London, where he passed the remainder of his life. He published "A Liberal Translation of the New Testament" (2 vols., 1767); "Introduction to the Study of the New Testament" (2 vols., 1767-'71); "View of the various Editions of the Greek and Roman Classics" (1775); and "The New Testament collated with the most approved MSS., with Select Notes in English, Critical and Explanatory" (2 vols., 1776).

**HASDRUBAL**, or *Asdrubal* (in Punic, probably, "he whom Baal aids"), the name of a number of Carthaginian naval and military commanders, celebrated in the history of the three Punic wars, of whom the following are the most distinguished: **I.** Son-in-law, and successor in the command in Spain, to the great Hamilcar Barca, after whose death in 229 B. C. he continued his operations with the assistance of the young Hannibal, founded New Carthage (now Cartagena, in Murcia), and concluded a treaty with the Romans, which made the Ebro the boundary of the Roman and Carthaginian possessions in the peninsula. He was killed by a Gallic slave in revenge for the death of his master, and was succeeded in command by Hannibal (221). **II.** Son of Hamilcar, was left in Spain when his brother Hannibal started on his expedition across the Pyrenees and Alps to Italy (218). Being afterward prevented from following him by a defeat on the Ebro which he suffered from an army under Publius and Cneius Cornelius Scipio, he fought in Africa against Syphax, king of a Numidian tribe, and again in Spain, where he was successful against his former adversaries, both of whom fell (211). Two years later he was defeated by the son of Publius, the afterward renowned Scipio Africanus, though he could not be prevented from crossing the Pyrenees while hastening to the assistance of his brother in Italy. Arrived in Umbria, he lost his army and life on the banks of the Metaurus, between the modern Pesaro and Sinigaglia, being defeated by the Romans under C. Claudius Nero and M. Livius (207). His head is said to have been cut off and thrown into Hannibal's camp. **III.** Son of Gisco, commander in the second Punic war, fought in Spain, 214-206 B. C., was defeated together with Mago by P. C. Scipio toward

the end of this period, and retired to Africa, where by giving to Syphax his daughter Sophonisba, already promised to Masinissa, he caused the enmity of Masinissa to the Carthaginians. Together with Syphax he was twice defeated by Scipio, who had landed in Africa in 204. The condemnation to death pronounced against him by the irritated people, which did not deter him from continuing in arms against the enemies of his country, was reversed after the arrival of Hannibal. Finally, however, being driven to despair by the public hatred, he terminated his life by poison.

**IV.** Commander against Masinissa and in the third Punic war, when he twice defeated the Roman consul Manilius, bravely opposed Scipio Africanus the younger, and after the taking of Carthage by the latter retired into the citadel, and finally, with a small number of his own troops and a host of deserters, to the temple of Æsculapius. Further resistance being impossible, he secretly went over to the camp of Scipio to implore his mercy. The conqueror spared his life, but showed him to the deserted defenders of the temple, and he saw his wife throw her children and then herself into the flames of the burning edifice. Having adorned the triumph of Scipio, he spent the remainder of his life as a captive in Italy.

**HASE, Karl August**, a German theologian, born at Steinbach, Saxony, Aug. 25, 1800. He studied theology at the universities of Leipsic, Erlangen, and Tübingen, was imprisoned for five months in 1819 on account of his participation in the movement of the *Burschenschaft*, became *Privatdocent* of theology at Tübingen in 1823, professor of philosophy at Leipsic in 1829, and professor of theology at Jena in 1830. For many years he took a prominent part in the theological disputes of the day, and in 1844 became one of the editors of the *Protestantische Kirchenzeitung* of Berlin, the organ of the German rationalists. His works are very numerous, and several of them have passed through many editions. Among them are: *Lehrbuch der evangelischen Dogmatik* (1825; 6th ed., 1870); *Gnosis* (3 vols., 1827-'9; 2d ed., 1870); *Hutterus Redivivus, oder Dogmatik der evangelischen Kirche* (1829; 10th ed., 1862); *Das Leben Jesu* (1829; 5th ed., 1865; translated by James Freeman Clarke, Boston, 1859); *Kirchengeschichte* (1834; 9th ed., 1867; translated by C. E. Blumenthal and C. P. Wing, New York, 1856); *Neue Propheten* (1851); *Franz von Assisi* (1856); *Das geistliche Schauspiel* (1858); *Der Papst und Italien* (1861); *Polemik gegen die römisch-katholische Kirche* (1862; 2d ed., 1871); and *Ideale und Irrthümer* (1872).

**HASENCLEVER. I. Peter**, a German manufacturer, born at Remscheid, Rhenish Prussia, Nov. 24, 1716, died in Landshut, Prussian Silesia, June 13, 1792. Frederick the Great had a high opinion of his business capacity, and was in the habit of consulting him. In 1765 he established a house in New York for the sale of

hemp, potash, and iron. Having become bankrupt by the mismanagement of a partner, he returned to Europe, and carried on a large linen trade in Landshut until his death. He was the author of "Letters from Philadelphia" in the correspondence of Schlözer, part 35 (1780), and of a "Description of the City of New York," in the commercial notices of Sinapius, part 4 (1781).

**II. Johann Peter**, a German painter, of the same family with the preceding, born at Remscheid, May 18, 1810, died in Düsseldorf, Dec. 16, 1853. He was educated at Düsseldorf under Schadow, and subsequently at Munich. Among his works, a series entitled the "Jobiad" are well known.

**HASENPFLUG, Karl Georg Adolf**, a German painter, born in Berlin, Sept. 23, 1802, died April 13, 1858. He was the son of a shoemaker, and learned his father's trade, but obtained admission to the studio of the decorative painter Gropius, where he attracted the notice of King Frederick William III. He executed paintings of the cathedrals of Halberstadt, Magdeburg, Erfurt, Bamberg, and several others; and in 1830 he was placed in charge of the restoration of the Magdeburg cathedral. In 1835 he took up his residence in Cologne, to make a special study of the cathedral, which he represented from without and within in two large paintings. In his many representations of German mediæval architecture he brought into view the picturesque side of that art. His paintings have been carried to Belgium, England, and America.

**HASHISH.** See **HEMP**.

**HASKELL**, a N. W. county of Texas, watered by the head streams of the Brazos river; area, 1,275 sq. m.; still unsettled. It consists mostly of high prairie land, of little value except for grass. Antelopes and prairie dogs abound.

**HASLAM, John**, a British physician, born in Edinburgh in 1763, died in London in July, 1844. He was educated at Cambridge, and studied medicine in London, where he became intimate with John and William Hunter. He was for many years apothecary to Bethlehem insane hospital, afterward resided several years in Edinburgh, and returning to London, soon attained a large practice there. In 1827 and 1828 he delivered courses of lectures on the intellectual composition of man. His works are: "Observations on Insanity" (1798); "Illustrations of Madness" (1810); "Considerations on the Moral Management of Insane Persons" (1817); "Medical Jurisprudence as it relates to Insanity, according to the Law of England" (1818); "A Letter to the Governors of Bethlehem Hospital" (1818); "Essay on Sound Mind" (1819); and "Lectures on the Intellectual Composition of Man" (1827-'8).

**HASLINGDEN**, a market town of Lancashire, England, 16 m. N. N. W. of Manchester; pop. in 1871, 12,201. It has a handsome parish church of modern date with the exception of the tower, which belonged to a building erected in the time of Henry VIII. The woollen manu-

facture, formerly the staple of the town, is now supplanted by that of cotton. Excellent building stone, slate, and flags abound in the neighborhood, and there are several coal mines.

**HASSE, I. Friedrich Christian August**, a German historian, born at Rehfeld, near Herzberg, Jan. 4, 1773, died in Leipsic, Feb. 6, 1848. He was a professor at the military academy of Dresden and at the university of Leipsic, and edited the *Leipziger Zeitung* from 1830 till his death. He succeeded Friedrich Arnold Brockhaus in 1823 as editor of the *Neue Folge des Conversations-Lexikon*, editing also the 6th and 7th editions of that cyclopædia. Besides many other works, he published *Geschichte der Lombarden* (4 vols., Dresden, 1826-'8). **II. Friedrich Rudolf**, son of the preceding, born in Dresden, June 29, 1808, died in Bonn, Oct. 14, 1862. He studied theology in Berlin, became professor in 1836 at Greifswald, and in 1842 at Bonn, where he was made consistorial councillor in 1853. His principal works are *Anselm von Canterbury* (2 vols., Leipsic, 1843-'52), and the posthumous *Geschichte des alten Bundes* (1863) and *Kirchengeschichte* (3 vols., 1864). **III. Karl Ewald**, a German physiologist, brother of the preceding, born in Dresden, June 23, 1810. He graduated at Leipsic, and has been professor there and at Göttingen. His *Anatomische Beschreibung der Krankheiten der Circulations- und Respirationsorgane* (Leipsic, 1841) has been translated into English and Dutch, and his *Krankheiten des Nervenapparats* (Erlangen, 1855) constitutes vol. iv. of Virchow's *Handbuch der Pathologie und Therapie*.

**HASSE, Johann Adolf** (called in Italy *Il Sassone*, the Saxon), a German composer, born at Bergedorf, near Hamburg, March 25, 1699, died in Venice, Dec. 23, 1783. He was a pupil of Porpora and Scarlatti. His opera *Sesostrate*, produced at Naples in 1726, established his reputation; and after giving several other works to the Italian stage, the success of which was insured by the coöperation of his wife, the celebrated singer Faustina, he accepted the office of chapelmaster and composer to the elector of Saxony. In 1733 he was invited to London to compete with Handel, and brought out his *Artaserse*, in which Farinelli made his début before an English audience. Although the opera was performed 40 nights, Hasse, disgusted with the virulence of the musical cabals, left London, and about 1740 established himself in Dresden. Upon the bombardment of that city in 1760 he lost all his musical manuscripts. He then went to Vienna, and the last years of his life were spent in Venice. Dr. Burney considered Hasse the most learned, natural, and elegant composer of his age. His works, including all the libretti of Metastasio, were so numerous that it is said he often failed to recognize his own music.

**HASSELQUIST, Fredrik**, a Swedish naturalist, born at Törnvala, East Gothland, Jan. 14, 1722, died in Smyrna, Feb. 9, 1752. He studied under Linnæus at the university of Upsal. Having obtained a royal stipend to travel and

study abroad, he proceeded in 1749 to the East, although warned by Linnæus that his constitution was too feeble. After visiting parts of Asia Minor, Egypt, and Palestine, he died on his way home. Linnæus in 1757 published the results of his pupil's investigations in a work entitled *Iter Palæstinum*, of which an English translation was published in 1766 (8vo, London).

**HASELT**, a town of Belgium, capital of the province of Limburg, on the Demer, 42 m. E. N. E. of Brussels, and 20 m. W. N. W. of Maestricht, with which it is connected by railway; pop. in 1866, 10,448. It is fortified and well built. The chief manufactures are tobacco, madder, soap, oil, linen, and leather.

**HASTING**, or *Hastings*, a Scandinavian viking, or sea rover, born about 812, some say in Scandinavia, others in Normandy, others at Tranquilla (modern Trancost) on the Seine. He attached himself to a band of Northmen who had established themselves on the island of Bièse, over whom he soon gained the chief command on sea and land. His first achievement was the devastation of the banks of the Loire as far as Tours (about 845). He next undertook an expedition against Spain; but meeting a repulse at Corunna, he retraced his course toward France, sacked Bordeaux, and carried fire and sword as far as Toulouse and Tarbes. The people of the latter city celebrate to this day the anniversary of a victory gained by their forefathers over Hasting on May 21. Refitting at the mouth of the Adour, he sailed again for the coast of the peninsula, took Lisbon, pillaged the city for 13 days, burned Seville, and marched upon Cordova, but was arrested by the allied forces of the Moors and Christians. Returning with reinforcements, he destroyed the great mosque of Algeciras and compelled Alfonso the Great, king of Leon, to seek refuge at Oviedo. Majorca, Minorca, and Provence, in their turn, became also the scenes of Hasting's incursions. He next made a descent upon Tuscany, and planned a voyage to Rome. Steering along the coast into the bay now known as the gulf of Spezia, he desecrated a city (Luna, now Luni). Not doubting that he was approaching Rome, he disembarked his troops, and sent ambassadors to say to the emperor, as he supposed, that, fresh from the conquest of France, he desired only to obtain supplies and means to refit his fleet. For himself, weary of a roving life, he sought to lay down his command and thenceforth to repose in the bosom of the church. The count of Luna and the bishop came out to meet him, and administered baptism, but declined to admit him or any of his followers within the city walls. Hasting then feigned death; and a vast funeral train, passing into the city, deposited the bier before the cathedral altar. The chief then sprang up and struck the bishop to the earth; and the mourners, throwing off their long robes, cut their way back to the city gates, and let in their comrades. The city was won, but Hasting soon learned to his surprise that he

was not master of Rome. After other exploits he once more appeared upon the coast of Normandy. Count Robert of Anjou and the duke of Aquitaine surprised him at Brisarthe, near Angers, from which place, after a furious battle, in which both the Frankish leaders were slain, Hasting ascended the Loire, plundered every town on its banks, and sailed for England to join a Danish invasion. Repulsed by Alfred the Great, he reappeared upon the Loire, and wrung from Charles the Fat possession in perpetuity of the county of Chartres. He now sought a home in Denmark, where at a great age his identity is lost in the confusion of the chronicles, which attribute to him the subsequent exploits of a number of vikings who assumed his name.

**HASTINGS**, a municipal and parliamentary borough of Sussex, England, 54 m. S. S. E. of London, with which it is connected by railway;

Battle Abbey, Hastings.

pop. of the town in 1871, 29,289; of the borough, 33,335. Hastings is one of the cinque ports, and is pleasantly situated on the coast, being sheltered on three sides by hills and cliffs. It consists of an old and a new town. The trade is inconsiderable. Crowds of visitors flock to it during the bathing season.—The battle of Hastings, between William of Normandy and Harold, king of the Anglo-Saxons, was fought on Oct. 14, 1066, at Senlac, six miles from Hastings. The Normans, formidable by their cavalry and bowmen, advanced to the attack, and were met by the Anglo-Saxons with their battle axes, the Kentish men in front. The battle continued from 9 o'clock in the morning till sunset, and the Anglo-Saxons suffered severely by advancing to pursue the Normans, who feigned retreat; yet they maintained their position till Harold fell pierced by an arrow. Then their efforts immediately relaxed, and they dispersed at dusk. "The subjugation

of a nation by a nation," says Macaulay, speaking of the consequences of the battle, "has seldom, even in Asia, been more complete." Upon the battle field the conqueror within two years founded the "abbey of bataille," and the name of Senlac was changed to that of Battle, which the place still bears. The victorious army numbered 60,000 men, more than one fourth of whom were left on the field; the number of the vanquished and their loss are unknown.

**HASTINGS**, a central county of Ontario, Canada, bordering on the bay of Quinté, an inlet of Lake Ontario; area, 2,337 sq. m.; pop. in 1871, 48,364, of whom 20,408 were of Irish, 11,543 of English, 5,968 of German, 5,120 of Scotch, 2,785 of French, and 1,547 of Dutch origin or descent. The surface is interspersed with small lakes and rivulets. Gold is found in the interior. The county is traversed by the Grand Trunk railway. Capital, Belleville.

**HASTINGS**, a city and the capital of Dakota co., Minnesota, on the right bank of the Mississippi river, at the mouth of the Vermilion, and about 5 m. above the mouth of the St. Croix, 20 m. E. S. E. of St. Paul; pop. in 1860, 1,653; in 1870, 3,458. Railroad communication is furnished by the Chicago, Milwaukee, and St. Paul, and the Hastings and Dakota lines. The Vermilion here falls 110 ft. in half a mile, and furnishes abundant water power. The principal manufactories are four flour mills, a saw mill, and a shingle mill. The city has a three-story

brick hotel, a large central school house, containing the high school, and having eight teachers, three school houses with one teacher each, a Catholic school and a second in course of erection, a national bank, two weekly newspapers, and eight churches.

**HASTINGS**, Francis Rawdon Hastings, marquis of, an English soldier, born Dec. 9, 1754, died in the bay of Baja, near Naples, Nov. 28, 1826. He was educated at Oxford, and at the age of 17 entered the army as ensign in a foot regiment. In 1773 he was sent with his regiment to America, and two years later, as captain in the 63d foot, participated in the battle of Bunker hill. In 1778 he was appointed adjutant general of the British forces in North America, with the rank of lieutenant colonel. His good conduct at the battle of Monmouth in the same year procured him the command of a British corps in South Carolina, which he led at the battle of Camden (Aug. 16, 1780), and with which he

subsequently defeated Greene at Hobkirk's hill. Returning to England before the close of the war, on account of ill health, he was captured by a French cruiser. Soon after his release he was created Baron Rawdon and honored with several marks of distinction by the king; and in 1793 he succeeded his father as earl of Moira. In the succeeding year he commanded a body of 10,000 men sent to relieve the duke of York in Flanders, which service he successfully performed. After various other services, he was in 1806 appointed master general of the ordnance in the Grenville and Fox ministry, and after the assassination of Mr. Perceval in 1812 made an unsuccessful attempt to form a cabinet. Shortly after he was appointed governor general of India, where he remained till 1823. The most important event of his administration was the successful termination of the Nepaul war. He was subsequently governor of Malta. In December, 1816, he was created Viscount Loudon, earl of Rawdon, and marquis of Hastings.

**HASTINGS, Warren**, governor general of British India, born Dec. 6, 1732, died Aug. 22, 1818. He was descended from the Hastingses of Daylesford, Worcestershire, but the estate had been sold, and of all their ancient possessions the grandfather of Warren held only the rectory of Daylesford, to which he had been presented by his father. He had two sons, Howard, who held an office in the customs, and Pynaston, the father of Warren. Pynaston, at the age of 15, imprudently married Hester Warren, the daughter of a small farmer, and being in great poverty abandoned his native country, leaving two children to the care of his father. The rector, impoverished by a lawsuit, left Daylesford, and became curate at Churchill, where Warren was sent to the charity school of the village. In 1740, his uncle Howard having taken charge of his education, he went to a school at Newington, where he was well taught but badly fed; to the latter circumstance he was accustomed to attribute his diminutive stature and feeble health. At the age of 10 he was removed to Westminster. Here his mental powers became conspicuous, and at 14 he stood first among his competitors, and was already distinguished for ambition, resolution, and industry. His uncle dying, he was now left dependent upon a distant relative, who procured for him a writership in the East India company. In January, 1750, he went to India. Here he at once began to study the native languages, and was one of the first to make himself familiar with the history and literature of the people among whom he now lived. He was soon noticed by Lord Clive, and was employed in various commercial and diplomatic measures. In 1756 he married the widow of Capt. Campbell, who, together with the two children she had borne him, died before his return to England. He remained in India 14 years, not distinguished in any remarkable manner, but acquiring knowledge and highly esteemed. In 1764 he arrived in Eng-

land with a moderate fortune, which was soon exhausted by his liberality to his needy relatives and his profuse generosity. His talents and his knowledge of East Indian affairs soon brought him again into the service of the company. In 1769 he returned to India, and was made second in the council of Madras, and in 1772 he became the highest official of the company, the president of the supreme council of Bengal. His power was next enlarged by a change made in the Indian constitution by an act of parliament, which consolidated the separate governments into one, and Hastings became (Jan. 1, 1774) governor general of British India. The vast territory over which he ruled was composed of new conquests; the English were few in number, and their supremacy was constantly endangered by Hyder Ali, rajah of Mysore, by the Mahrattas, and by other native powers. In these dangers the administrative talent and unwearying constancy of Warren Hastings established the British empire in India. He was unscrupulous, resolute, and apparently cruel; he perhaps depopulated whole districts by his exactions, and committed acts of signal injustice. But success followed him; he defeated opposition in his council, and destroyed his Indian foes. He was not however sustained by the home administration, nor by the board of directors. Rumors of his tyranny in India were assiduously spread over England by his enemies, but the court of proprietors sustained him by large majorities whenever the attempt was made to remove him from his office. Encouraged by their support, he now neglected or refused to obey the orders of the board of directors whenever he thought them impolitic, overawed the minority of his council, and ruled with a power almost unchecked, until February, 1785, when he resigned his office, and set out for England, not unconscious of the danger that threatened him there. He left India, it is said, highly popular with the natives as well as the English residents, and followed by general regret. Upon his arrival in England, the opposition in parliament, led by Edmund Burke, introduced a resolution for an inquiry into his conduct, but the proceedings did not commence until the session of 1786, when Burke brought forward his articles of impeachment. Mr. Pitt, intimidated by the unpopularity of the accused, consented to the measure, and gave up Hastings to the opposition. In the impeachment Burke charged him with numerous acts of oppression, with desolating whole regions of British domain, with peculation and corruption, with exciting useless wars, and with various acts dishonoring the British name. He divided his charges into four heads, namely, the oppression and final expulsion of the rajah of Benares, the cruel treatment of the begums or princesses of Oude, unfair contracts, and wasteful expenditure. The sessions of 1786-'7 having been consumed in preliminary measures, the house of lords met

in Westminster hall, Feb. 13, 1788, to hear the impeachment. The hall was richly adorned, and a distinguished assembly of royalty and nobility, of men of genius, of influence, and of fame, gathered to hear the trial. Hastings, frail, small, sickly, but still resolute, knelt at the bar, and then heard without exhibiting any emotion the terrible denunciations of his accusers. On the 15th Burke, in the name of the commons of England, opened the charge in a speech which lasted three days. He was assisted by Fox, Sheridan, Grey, and others, and also in private by Sir Philip Francis. During the sessions of 1788-'90 the prosecution presented its charges. In 1791 the commons, to shorten the trial, were willing to withdraw some of the articles, and on June 2, the 73d day of the proceedings, Hastings began his defence. This continued until April 23, 1795, on which day, the 148th, he was acquitted by large majorities on each separate charge. Public opinion had turned in his favor, and his acquittal was approved by a majority of his countrymen. He convinced the nation that his measures had secured its prosperity, and showed by his poverty that he had not amassed wealth in his government. The expenses of the trial, £76,000, had consumed all his fortune. In March, 1796, the East India company granted him an annuity of £4,000 for 28½ years, and lent him £50,000 for 18 years without interest. He now purchased the Hastings estate at Daylesford, and retired from political life, occupying himself in rebuilding the family mansion, and in agricultural pursuits, seeking to naturalize in England the plants and animals of India. During his second voyage to India he had become acquainted with the baron and baroness Imhoff, who were his fellow passengers. The baroness attended him during a severe illness on shipboard, and about a year after his arrival in India, the baron having by agreement procured a divorce, his wife became Mrs. Hastings. This lady, who was accomplished and attractive, always preserved his regard, and now presided over the hospitalities of Daylesford. Hastings had long aspired to a peerage, but never received any higher public honor than an appointment as privy councillor, a short time before his death. He was however treated with the most distinguished respect by both houses of parliament when in 1813 he appeared at the bar of the commons as a witness on Indian affairs. In private life Warren Hastings displayed many virtues. He was generous, unselfish, hospitable, and a steady friend. He was a good scholar, and wrote with readiness and force. He encouraged among his countrymen the study of the Indian languages and history. He was for a time president of the Asiatic society, promoted geographical research, invited learned Hindoos to settle in Calcutta, founded colleges for the instruction of the native youth, and urged upon them the necessity of becoming familiar with the language, literature, and science of

England. In his political conduct he is generally allowed to have shown remarkable ability. Macaulay says that he administered government and war with more than the capacity of Richelieu; and Mill, the historian of British India, thinks him the most eminent of the chief rulers of the East India company.

**HAT**, a covering for the head. From the most remote times man has made use of a head covering of some kind. The most ancient form probably is the cap, such as is seen in figures representing the goddess of liberty. The ancient Greeks had several other kinds of head dress, the names and appearance of which have been preserved in their writings and on engraved gems. According to Strutt, the *pileus* was a woollen cap, which was sometimes worn as a lining to the helmet; and he quotes several Latin authorities to show that it was adopted by the Romans at the public games and festivals, by those who had been slaves, and by the aged and infirm for the sake of its warmth. It is supposed to have been made of felt, in some of its forms not unlike hats of the same material at the present day. When conical it was the *apex* of the Roman priests, worn probably from the time of Numa; with an elevated crest pointed forward like the liberty cap, it was the Phrygian or Mysian bonnet; with a brim, it became the *petasus*, a hat much like the round felt hats now worn. Among the Romans the cap was a symbol of liberty, and slaves were presented with one on receiving their freedom. After the assassination of Cæsar coins were issued by Brutus and Cassius on which was represented a cap between two daggers; and after Nero's death many Romans put on caps in order to proclaim the restoration of their liberties. Even at a later period the cap or hat was identified with liberty, as in the republic of the Netherlands after the emancipation from Spain, when a hat became the national emblem. The first hatters in the middle ages appeared in Nuremberg in 1360, under the name of *Filzkappenmacher* (manufacturers of felt caps); in France, under the reign of Charles VI., 1380-1422; and in 1401 in Würzburg, Bavaria. Charles VII., in a picture of his entrance into the city of Rouen in 1449, is represented as wearing a felt hat. The early Anglo-Saxons were generally no other covering for the head than the long flowing hair they sedulously cultivated. The few examples of caps are simple in form and scanty in dimensions. About the 8th century they wore caps resembling the Phrygian bonnet. "Those of the lower class of people," says Strutt, "appear rough behind, and probably were composed of the skin of some animal dressed with the hair upon the hide, and the shaggy part turned outward. When the men of quality wore this kind of covering, it was usually enriched with some species of ornament. Another cap, in the form of a perfect cone, was worn occasionally by the nobility." Speaking of the head dress in use in the 9th century, the

same author observes: "The hat was, I doubt not, made of various materials, and by no means seems to be a part of dress universally adopted; from its general appearance I have supposed it to have been made of skins with the shaggy part turned downward, and probably it might often be so; but they had also felt or woollen hats at this period (*fellen hat*), which their own records testify." About the middle of the 12th century one of the "nobels of the lande mett at Clarendon" is described by Froissart as wearing "a hatte of biever." The hat being the most conspicuous article of dress, and surmounting all the rest, it was natural to give to it special care and attention, to place in it showy plumes and jewels, and surround it with bands of gold and silver. To it were attached ornamental rosettes, sometimes designed as badges of honor or of office. Its form and sometimes color were also made to designate the rank and character of the wearer, as the monarch by his crown, the cardinal by his red hat, betokening a readiness to spill his blood for the sake of Jesus Christ, and the court fool by the cap with a bell. In one form it served to distinguish the military officer, and in another the peaceful Quaker. Among the great variety of hats used by the English, the forms of which are preserved in old pictures, none combine the grace, elegance, and comfort of the soft hat of the Spaniards, which the latter have retained while the fashion of the English hat has been continually changing. The manufacture of hats has been carried to perfection in the United States, where it was introduced at an early date. The representations made by the London board of trade to the house of commons in 1732 refer to the complaints of the hatters in London at the extent to which the manufacture was carried on in New England and New York.—Without including caps and straw hats, the kinds in general use may be classed as those which are felted throughout, and those which are made with a covering, usually of silk plush upon a prepared stiff body. In the former class are included the coarse qualities made entirely of wool mixed with hair and stiffened with glue; those called plated, which are furnished with an external pile or nap of finer material than the body, and sometimes water-proof stiffened before the nap is put on; and those called short naps, in which some of the better class of fur is worked in the plating or nap, and all are water-proof stiffened. Beaver hats, formerly esteemed the best of all hats, had merely a nap of the fur of the beaver, which was felted into the body; the best hats being finished with the finest fur taken from the belly and cheeks of the animal, and the inferior qualities with that from the back. The soft genuine beaver hats, now rarely seen, were made upon a body of rabbits' fur. As beavers' fur became scarce, nutria was substituted for it, also the fur of the musquash, hare, and rabbit; and for the body lambs' wool and that of the llama were used

instead of rabbits' fur. Furs intended for felting are prepared in different ways. Hare skins are split open, then rubbed with a jagged knife blade called a rake to remove bits of fleshy matter adhering to the pelt. They are next damped on the pelt side with water, and being placed together in pairs, pelt to pelt, are pressed. They are thus made smooth and ready for shearing, by which the long coarse hairs are clipped close down to the fur. The angular projections and edges of the pelt are then trimmed off, a process called rounding. The fur was formerly cut from the skins by hand, and this method is still practised among some of the smaller European manufacturers; but by the principal manufacturers, and in America by all, it is now cut by machines of American invention. The skin is held horizontally with the fur side down, a narrow edge of the pelt being pushed over a horizontal bed knife, which presses back the fur. Behind this bed knife a cylinder, provided with knives set obliquely, revolves with great rapidity. The edge of the pelt is caught between the descending knife and the bed knife, and cut off as by a pair of scissors; the line of fur attached to the strip is thus severed at the roots and falls on a surface placed to receive it. As strip after strip of pelt is thus cut off, the fur continues falling till the whole fleece lies compactly together. Rabbit skins are treated in a similar way, except that the long hairs, instead of being clipped, are pulled by catching each one between a knife blade and the thumb, which is protected by a leather covering. Beaver and nutria skins require more care to remove the fatty and fleshy matters, and to cleanse them from grease, all which must be done before the long hairs are pulled. Nutria skins especially are loaded with fat upon the pelt, and the fur is filled with grease. Scrubbing with a brush and free use of soap and boiling water are necessary to remove the latter. Attempts have been made to remove the fur by chemical ingredients, but the effect of these has usually been to impair the felting property. But the application of dilute nitric acid to the fur before it is removed from the pelt is found to improve this property, probably by destroying the last traces of the grease. Skins that have been wetted with it are said to be "carroted," from the color it imparts; they should be immediately dried by exposure to the heat of a fire, or by smoothing with a hot iron and drying in the sun. Rabbit and hare skins by long keeping are very liable to suffer injury from moths and other insects, and the former, especially if kept in large heaps, from the running of the greasy matter among them, and becoming rancid, corroding the pelt itself. In England it is found that the strongest rabbit fur for felting is obtained from animals bred near the sea. The skins taken in the winter are far superior in quality to those obtained at other times, and are distinguished in the trade as seasoned, all others being called unseasoned.

The annual production of hatters' fur in the United States is about 500,000 lbs.; but the principal supplies come from towns on the North sea, from Frankfort, Brussels, and a few other places. The furs are obtained there in large quantities, and have the excellent quality of thickness due to a cold climate.—After the fur has been separated from the pelt it is first mixed, the different qualities together, and the finest carded cotton is added in the proportion of  $\frac{1}{4}$  to  $\frac{1}{2}$  oz. of cotton to 4 or 5 oz. of fur, the usual quantity required for a felt hat. The mixing is effected in a picking machine, into which it is drawn as fed, and, immediately seized by a toothed picker, which revolves with great velocity, creating a powerful current of air, it is tossed about in the capacious box forming the top of the machine, and carried as it falls upon an endless apron, which delivers it to a second pair of feed rollers and another picker, by which the operation is repeated. The fur discharged from this contains the long hairs and bits of pelt and other impurities, from which it is to be separated in the next process, which is called blowing. The machines for this are contained in a box sometimes 20 ft. long and about 7 high, in which case there are eight successive sets of the same apparatus of pickers and screens. As the fur is fed in at one end, it is taken by the feed rollers against the points of a cylindrical picker, which revolves several thousand times in a minute. This strikes out a large portion of the heavy hairs and coarse particles, and tosses the light fur into the upper portion of the box, where it is blown forward to the next set, in which it is subjected to a repetition of the same process. The coarser portions fall upon an inclined screen, which is kept in agitation. The loose hairs and refuse stuff fall through this, and the portion that is shaken off the screen is delivered back on the floor under the point of starting. As it collects it is taken up and sent through again. Much of the dust separates through the perforated sheet copper with which the machine is covered. The next process is to form the hat body; an operation that has been accomplished by various methods, as by bowing and working the fur together by hand, and thus felting it; also by what is called the pneumatic process, by which a mat is obtained that is afterward worked upon a block into the required shape. Thomas Blanchard of Boston several years ago, by exhausting the air under a fine wire gauze, caused the fur to be drawn together upon this and partially felted, in the form of a thin narrow ribbon. This was then wound upon a double cone of the size and form for two hat bodies. The next improvement was that of Henry A. Wells of New York in 1846, who invented the machine now in use. He made a cone of sheet copper punched full of round holes, and, setting it upright, caused it to revolve slowly upon its axis. Under this an exhausting fan is put in action, causing by its rotation of about 4,000 times in a minute a

current of air to draw through the holes from the outside. A trunk or box with a vertical opening directed against the cone discharges the fur, which is fed into it at the other end. Here it is received from the feeding apron in quantity just sufficient for one hat body. It is drawn in between two horizontal feeding rollers covered with felt, and immediately seized by a cylinder revolving about 3,600 times in a minute, and furnished with several longitudinal lines of stiff brushes. This generates a current of air, which scatters the fur, and blows it toward the mouth of the trunk, where it is rapidly drawn upon the perforated cone and evenly spread over the top and down the sides of the same, in quantity enough for one body in 16 revolutions. H. A. Burr improved the discharging trunk, so that it could be adjusted to deposit more or less fur on any desired portions of the cone. As the fur collects, the workman picks off any coarse particles that gather on the surface, and when the supply for one hat body is deposited he wraps a wet cloth over the cone, and slips a metallic cover over the whole, which he removes into a tank of hot water. A new cone is immediately set in its place to receive another coating of fur. The hot water makes the mat more tenacious. It is soon slipped off the cone, taken to a table, gently worked by hand-rolling in a piece of blanket, squeezed and pressed, and then folded into convenient shape. It is now ready to be pressed with others, to be made up into the bundles in which the bodies are sent to the hatters. The material has not yet assumed the form or size of a hat. It is a large open-mouthed bag, smaller and rounded at the closed end. In making the bodies by the old hand process, a man used to be occupied a whole day upon four or five. By the machine just described, and known as the "former," tended by two men and a boy, and employing another in rolling the bodies, 400 are completed each day, all of which are alike in shape, weight, and thickness. The cost of the labor on each is estimated at from 6 to 10 cts. The inferior bodies made by the old method cost for labor about 56 cents; their manufacture is now generally abandoned.—After the mats come into the hands of the hatters, they are reduced in size by sizing. This, which is entirely a hand process, consists in rubbing a pile of several bodies, first dipped into hot water and rolled in a piece of blanket, upon a sloping table, technically called a battery, which is arranged around a central caldron affording accommodation for from 8 to 12 workmen. By rubbing the bodies together for a short time they are reduced to about one third their original size, and the felt is rendered more compact. A skilful workman knows just how far to carry this process, which leaves the shells, as they are now called, uniform in thickness and size. They are then dyed of any desired color, after which they are blocked, which consists in stretching the cone-shaped shell over a wooden block of the shape

and size of the hat to be made. This was formerly done by hand, but is now effected by a patented machine called the Eickemeyer hat-blocking machine, invented by Rudolf Eickemeyer of Yonkers, N. Y., for the use of which a royalty of from 2 to 8 cts. per dozen is paid by all manufacturers. The next operation is pouncing, by which the rough surface of the hat is smoothed and all inequalities are removed. This also was formerly done by hand by two workmen, one shaving down the inequalities with a sharp knife, and the other smoothing the surface with sand-paper and pumice stone; but it is now performed by a patented machine in which the hat while revolving is brought into contact with a cylinder covered with emery paper. A royalty of 6 cts. per dozen for fur hats and 3 cts. per dozen for wool hats is paid by each manufacturer for the use of this machine, which was invented by Sidney S. Wheeler and Daniel D. Manley of Danbury, Conn. After pouncing the hat is again stretched on a block and pressed into shape with a hot iron. This is technically called finishing. If the hat is to be stiff, the next operation is curling, which consists in pressing the brim into shape with a hot iron. The trimming is done by girls, who put in the lining, the round top piece, technically called the tip, and the leather, and sew on the band and the binding. The binding is usually done with the sewing machine, but in some hats it has to be put on by hand. The last operation, called ironing off, is merely the running of a hot iron over the hat to press it into perfect shape, after which it is ready for the packing box. A cheaper quality of hat is made from felted wool, the manufacture of which is conducted in nearly the same manner. Wool hats, however, are sized or felted in a fulling mill. They are made entirely of wool in the United States, but in England a little fur is sometimes mixed with the wool.—Silk hats were formerly made of felt shells formed by the Wells machine, but the felt bodies are now almost entirely superseded by those made of muslin. The muslin is prepared by being stretched on frames and saturated with a solution of shell-lac in ammonia and water. For the brims of hats from two to six thicknesses are required; for the tops one or two thicknesses. After the several sheets are thoroughly rubbed together so that they adhere to each other, they are dried by the fire, after which another coat of shell-lac varnish is put on. When this is dry the muslin is removed from the frames and cut into the proper shapes for sides, tops, and brims. The several pieces are then fitted together over a block. The side is put on first, and then the top, the projecting edges of the latter being ironed down until they adhere firmly to the side. A strip of thin muslin, technically called robbin, is then saturated with shell-lac and ironed down around the edge to strengthen it and to keep the parts together. Lastly, the brim is put over the block and fastened in a

similar way, the inner edge being turned up and ironed against the side and finally strengthened with a piece of robbin. After the brim has been trimmed the body is again varnished with a solution of shell-lac and alcohol, and when this is dry the hat is ready for the cover of silk plush. The brim is covered by one piece on the under side, which is put on first, and one on the upper. These are secured by ironing with a hot iron, which softens the varnish and causes it to stick the plush to the body. The cover for the side, to which the circular piece for the top has been sewed with a scarcely discernible seam, is next slipped on and ironed until it adheres thoroughly, the seams being carefully concealed. Fashionable hats require the finest quality of French plush; that made by Martin at Lyons and Metz is held in the highest estimation on account of the excellence of the black dye with which it is colored. The hat is now lined and trimmed, and afterward shaped and smoothed with the iron. Great care is given to finishing the brim, which is curled by hand, the workman judging by his eye of the perfection of the outline. The lining of the best quality of hats is of silk, that of the cheaper kinds usually of paper. In what are called French gossamer bodies, the body is composed of but one thickness of muslin, and the silk lining is ironed on to this so as to stick fast to it, after which another thickness of muslin is ironed on to the outside. In those called English bodies, the body is generally of two thicknesses, and has another thickness of muslin ironed on to it after the hat is formed. This is the common style of hat, and weighs about four ounces. Hat bodies are sometimes made also of cork, willow, and felt. Cork bodies are cut very thin, and are of course very light. Willow bodies are of thin slips of willow, woven by a process patented by a firm in Philadelphia. White hats for summer wear, called cassimere hats, are made of felt. The superiority of American silk hats is owing to the scrupulous care in the selection as well as in the manipulation of the materials. The best are not surpassed in Europe. The French make hats of similar quality; but in England the humidity of the climate will not admit the use of hats so light as those worn in America.—According to the census of 1870, the total value of the hat and cap manufactures of the United States in that year was \$24,848,167; of which New York produced \$8,708,723, New Jersey \$5,007,270, Connecticut \$3,740,871, Massachusetts \$3,416,191, and Pennsylvania \$2,813,766.—For straw hats, see STRAW.

**HATRAS**, a town and fort of India, in the province and 90 m. S. E. of the city of Delhi; pop. about 25,000. It is the chief mart for the cotton produced in the neighborhood, which is forwarded to Furruckabad, on the Ganges, and conveyed by that river to the lower provinces. The present fort is a square of about 500 yards, and is surrounded by a mud wall and a deep

dry ditch. The old fort is situated half a mile E. of the town, and though now a heap of ruins was once regarded as formidable. Hatras was taken by the British in 1803. At the outbreak of the Mahratta war in 1817 the chief of the place assumed a hostile attitude. He was summoned to surrender the fort, but refused, whereupon the town was breached and evacuated, Feb. 23, 1817. On March 1 fire was opened upon the fort, which was abandoned during the night, and immediately dismantled, as well as the neighboring fortress of Mursan.

**HATTERAS.** See CAPE HATTERAS.

**HATTI-SHERIF** (Turkish, noble writing), any ordinance written by the sultan's hand, or which contains his *paraf*, or flourish, and the words, "Let this my order be obeyed." Sometimes it is called *hatti-humayun*, "august writing." A hatti-sherif is irrevocable. The most celebrated in modern times was the hatti-sherif of Gulhane, promulgated by the sultan Abdul-Medjid, Nov. 3, 1839, guaranteeing life and property to all subjects of the empire without distinction of creeds. This ordinance was confirmed by the hatti-humayun of Feb. 18, 1856, which granted religious liberty to the non-Mohammedan population, abolished the civil and judicial authority of the Mussulman ecclesiastics, proclaimed the equality of all creeds and nationalities, abolished persecution and the punishment of religious converts, made non-Mohammedans admissible to public office and ordained their representation in the council of state, permitted foreigners to hold landed property, decreed the establishment of public schools, the codification of the laws, the reform of the monetary system and of the police, and proposed to introduce other public improvements.

**HAUCH, Johannes Carsten von**, a Danish poet, born in Frederikshald, Norway, May 12, 1791, died in Rome, March 4, 1872. He graduated at the university of Christiania in 1821, travelled in France and Italy, composed several of his dramas while in the latter country, and returned to Denmark in 1827. For several years he was professor of natural sciences in the university of Sorö, and in 1846 he became professor of northern literature at Kiel. Expelled from that office at the insurrection of 1848, Queen Maria Sophia Frederica offered him an asylum at the castle of Frederiksborg, where he resided several years. In 1851 he succeeded Oehlenschläger as professor of æsthetics and belles-lettres at the university of Copenhagen. His works comprise many tragedies, as *Bajazet*, *Tiberius*, *Don Juan*, &c.; a dramatic epic, *Hamadryaden*; lyrical poems and romantic tales, among which are *Wilhelm Zabern* (2d ed., 1848) and *Robert Fulton* (2 vols., 1853). He also wrote upon zoölogy and other natural sciences. His *Nordische Mythenlehre*, in German, appeared in Leipsic in 1848. In concert with Forchhammer he prepared the "Life of Oersted" (Copenhagen, 1853). His latest works were: *Charles de la Bessière* (1860), *Waldeman Seier* (1862), *Nye*

*Digtninger* (1869), *Afhandlinger og æsthetiske Betragtninger* (1869), and *Minder fra min første Udenlandsreise* (Copenhagen, 1871).

**HAUG, Martin**, a German orientalist, born at Ostdorf, Württemberg, Jan. 30, 1827, died June 3, 1876. After having privately learned Greek, Latin, and Hebrew, in 1848 he went to the university of Tübingen, where he studied Sanskrit; and he afterward studied at Göttingen and Bonn. In 1856 he was invited to Heidelberg by Bunsen, to aid him in preparing his *Bibelwerk*. In 1859 he went to India, and became professor of Sanskrit in the college at Poona, where he was brought into intercourse with the most learned native priests, and acquired a minute knowledge of their various forms of doctrine and worship. In 1863, under appointment from the British government, he made a journey through the province of Guzerat, and collected many valuable manuscripts in Zend and Sanskrit. He returned to Europe in 1866. His principal works are: *Ueber die Pehlevisprache und den Bundehesch* (Göttingen, 1854); *Ueber die Schrift und Sprache der zweiten Keilschriftgattung* (1855); *Die fünf Gathas*, &c. (2 vols., Leipsic, 1858-'60); "Essays on the Sacred Language of the Parsees" (Bombay, 1862); and an edition, with a translation, of "The Aitareya Brahmana of the Rigveda" (2 vols., Bombay, 1863).

**HAUGHTON, William**, an English dramatist, born in the latter half of the 16th century, died probably in the early part of the 17th. He is supposed to have written a number of dramas in connection with Decker and others, and a few unassisted. The only plays attributed with certainty to him are the comedy, "Englishmen for my Money, or a Woman will have her Will," which is reprinted in "The Old English Drama" (4 vols. 12mo, 1830), and "The Pleasant Comedie of Patient Grissill," in which he was assisted by Chettle and Decker, and which was reprinted by the Shakespeare society in 1841.

**HAUKSBEE, or Hawksbee, Francis**, an English natural philosopher, born in the latter part of the 17th century, died after 1731. He held the office of curator of experiments to the royal society, and was the first to mark the circumstances of electrical attraction and repulsion, and to observe the production of light by friction both in air and in a vacuum. His observations were given chiefly in "Physico-Mechanical Experiments on various Subjects" (4to, 1709; translated into French and enlarged, Paris, 1754).

**HAUPT, Moritz**, a German philologist, born in Zittau, July 27, 1808, died in Berlin, Feb. 5, 1874. He was a son of ERNST FRIEDRICH HAUPT (1774-1834), who was noted for his Latin metrical versions of Goethe's poems and of German church hymns. Moritz graduated at Leipsic in 1837, and was professor of German language and literature and of classical philosophy from 1838 to 1850, when he was removed on account of his sympathy with the

liberal movement of 1848-'9. He next succeeded his former teacher Hermann as secretary of the historico-philosophical class till 1853, when he became Lachmann's successor in the chair of classical literature at the university of Berlin, where he delivered remarkable lectures until the day before his sudden death. For the last 13 years of his life he was perpetual secretary of the academy of sciences. His works include many critical editions of classics, and he was one of the highest authorities on old German philology.

**HAUPTMANN, Moritz**, a German composer, born in Dresden, Oct. 13, 1792, died in Leipsic, Jan. 3, 1868. The son of an architect, he was intended for the same profession and became proficient in mathematics and other sciences; but he afterward devoted himself to music. Completing his education under Spohr, he became in 1812 a violinist in the royal orchestra of Dresden, and in 1822 at Cassel under the direction of Spohr. He remained here till 1842, when he became cantor to the Thomas school at Leipsic, and at the same time director of music in the churches of St. Thomas and St. Nicholas, and professor of counterpoint and fugue at the newly established conservatory. His *Die Natur der Harmonik und Metrik* (Leipsic, 1853; 2d ed., 1873) procured him in 1857 from the university of Göttingen an honorary diploma as doctor of philosophy. His sacred compositions are esteemed his best; but his Italian sonnets composed for the contralto voice of his wife, and his duets for violin and piano, were greatly admired. His productions include *Salve Regina* for four voices, a full mass for chorus and orchestra, and the operas *Mathilde* and *Klein Karin*.

**HAURÉAU, Jean Barthélemy**, a French author, born in Paris, Nov. 9, 1812. He received a college education, and became a journalist at Le Mans. After the revolution of 1848 he was appointed keeper of manuscripts at the national library in Paris, and was returned to the constituent assembly for the department of Sarthe, but retired from politics after the *coup d'état* of 1851. In 1861 he was appointed librarian for the order of advocates of Paris, and became a member of the academy of inscriptions and belles-lettres, over which he presided in 1873. His principal works are: *Critique des hypothèses métaphysique de Manès, de Pélage et de l'idéalisme transcendantale de Saint Augustin* (Le Mans, 1840); *Histoire littéraire du Maine* (6 vols., Paris, 1842-'73); *Histoire de la Pologne depuis son origine jusqu'en 1846*; *De la philosophie scolastique* (2 vols., 1851); *François I. et sa cour* (1853); *Charlemagne et sa cour* (1854); *Gallia Christiana*, &c. (3 vols., 1856-'65). The last work is a continuation of the 13 volumes issued by the Benedictines between 1715 and 1785.

**HAUSER, Kaspar**, a German youth, remarkable for his mysterious history, born about 1812, died at Anspach, Dec. 17, 1833. He was found in the streets of Nuremberg, May 26, 1828,

dressed in the garb of a peasant, and by his apparent helplessness attracted the attention of one of the citizens. On his person was found a letter from which it appeared that since he was six months old his mother had left him in charge of a poor laborer, the writer of the letter, who kept him in close confinement, but brought him up in the Christian religion and taught him to write. The time having arrived for relinquishing the custody of the boy, the laborer removed him from his house during the night and escorted him as far as the vicinity of Nuremberg, leaving him to reach that town alone. Enclosed in the letter was a note purporting to come from Kaspar's mother, and stating that she was a poor girl when she gave birth to him (April 30, 1812), and that his father was a cavalry officer at Nuremberg. The only information which the person to whom the letter was addressed could elicit from the boy was that he came from Ratisbon, and wanted to become a cavalry officer as his father had been. He was removed to the station house, but was unable or unwilling to give any account of himself except that his name was Kaspar Hauser. He would not take anything but bread and water. He could write his name and a few other words, but was otherwise entirely ignorant. Besides the letter, there were found in his possession a pocket handkerchief with his initials marked in red and several Roman Catholic prayer books. He was of a delicate constitution, but well formed, and his general appearance was that of a high-born youth. He was detained in prison as a vagrant, but the mayor of Nuremberg frequently took him to his house, and gradually learned from him that from his earliest childhood he had been kept in a kind of cellar, from which the light was shut out. No human being ever came to see him, excepting a man during the night, who washed and dressed him and brought him bread and water. His only amusement was two wooden horses. Shortly before he was taken away, this man, whose face he was never permitted to see, came more frequently to teach him to write and to walk, and eventually he carried him on his back to Nuremberg. After about two months he was handed over to Professor Daumer, who undertook his education. But the natural ability of which he had given evidence in his conversation decreased as he was subjected to a regular system of instruction. He mastered, however, writing and drawing. He was fond of riding on horseback, and rode well. One of his many peculiarities was that he could not bear the presence of priests and physicians, and that he was restless and uneasy in church. He entered Daumer's family July 18, 1828. On Oct. 17 the professor's mother found him lying prostrate in the cellar with a wound on his forehead. He said that a man whose face was blackened had assaulted him with a knife, upon which he ran away and hid himself in the cellar. The most search-

ing investigations were unavailing to detect the man. By order of the authorities the boy was now removed to the residence of a magistrate and attended by two policemen, but had only been there a few months when one day they heard the report of a firearm, and on entering the room whence it came they found Kaspar weltering in his blood. His explanation was that the wound had been inflicted by the accidental discharge of a pistol. Among the many strangers who became interested in Hauser's fate was Lord Stanhope, who went to Nuremberg in 1831. He removed him to Anspach with a view of completing his education, and placed him in a law office there, where he displayed little ability. He also provided Feuerbach, the jurist, and president of the court of appeal, with the means of pushing legal proceedings. After the death of Feuerbach, who had gained more insight into the case than any other person, and had published *Kaspar Hauser, Beispiel eines Verbrechens am Seelenleben* (Anspach, 1832), Stanhope was about taking his protégé to England, when Kaspar was stabbed in the side, Dec. 14, 1833. He was able to reach his home, and to tell that his murderer was a stranger, who professed to be the bearer of some important revelations, and whom he met by appointment in the palace garden when the wound was inflicted, from which he died three days afterward. Persons then were not wanting who regarded Kaspar Hauser as an impostor, and Merker published a work entitled *Kaspar Hauser nicht unwahrscheinlich ein Betrüger* (Berlin, 1830); but Daumer defended him upon psychological and moral grounds. Strenuous efforts were vainly made to discover the murderer. In 1859 Daumer published at Frankfort *Enthüllungen über Kaspar Hauser*; and several other works on the subject appeared at about the same time. In 1872 the interest in Hauser was revived by the publication of official documents (*Authentische Mittheilungen über Kaspar Hauser*), by means of which Julius Meyer, a Bavarian jurist, endeavored to prove that he was an impostor. Prof. Daumer published in reply an exhaustive work, *Kaspar Hauser, sein Wesen, seine Unschuld, seine Erduldungen und sein Ursprung* (Ratisbon, 1873), which makes it highly probable that he was the son of the grand duke Charles of Baden and his wife Stephanie, and that the countess of Hochberg and Major Hennehofer were the authors of the crime, which was designed to secure the succession in Baden to the children of the countess and the grand duke Charles Frederick.

**HÄUSSER, Ludwig**, a German historian, born at Cleeburg, Alsace, Oct. 26, 1818, died in Heidelberg, March 17, 1867. He went in 1835 to Heidelberg to study philology; but through the influence of Schlosser he made also extensive historical researches, and in 1839 published *Die deutschen Geschichtschreiber vom Anfange des Frankenreichs bis auf die Hohenstaufen*. In 1848 he edited in conjunction with Gervin-

nus, the *Deutsche Zeitung*, and was chosen a member of the chamber of Baden. In 1850 he accepted a professorship in Heidelberg, but continued to take an active share in politics, and in 1860 returned to the chamber, where he was a warm supporter of the liberal ministry. Among his most important historical works are *Deutsche Geschichte vom Tode Friedrichs des Grossen bis zur Gründung des Deutschen Bundes* (4 vols., Berlin, 1854-'7), *Geschichte der Französischen Revolution* (1867), and *Geschichte des Zeitalters der Reformation* (1868; English translation by Mrs. R. Sterge, 1874). A complete edition of his works was commenced in Berlin in 1869.

**HAUSSMANN, Georges Eugène**, baron, a French politician, born in Paris, March 27, 1809. He is a grandson of the revolutionist Nicolas Haussmann of Colmar (1761-1846). He studied law, became an advocate at Paris, and was successively sub-prefect of Nérac (1833), St. Giron (1840), and Blaye (1842), and prefect of the departments of Var, Yonne, and Gironde (1850-'52). In 1853 Napoleon III. appointed him prefect of the department of the Seine, in which office he became celebrated by his extensive operations for the improvement and embellishment of Paris, one of the many new boulevards constructed under his administration bearing his name. The demolition of some old quarters of the metropolis drove many of the indigent working classes to the suburbs, where they subsequently became the most turbulent promoters of the commune; while thousands, on the other hand, were saved from starvation by being employed on Haussmann's public works. The transformation of the Bois de Boulogne into an English park, the prefecture, the new and massive barracks, admirable water works, the restoration of the Hôtel-Dieu, the completion of the Louvre, and many other memorable works were due to Haussmann's enterprise; but they involved an enormous expenditure, requiring repeated loans, and giving rise to much opposition in the press and in the corps législatif, and to charges of mismanagement, which were exposed in 1868 with great success in Jules Ferry's *Comptes fantastiques d'Haussmann*. The prefect succeeded nevertheless in contracting a new loan in 1869 for 260,000,000 francs; but he was obliged to retire after the accession of the Ollivier administration (January, 1870).—See *Histoire générale de Paris*, published under Haussmann's auspices (2 vols., 1866), and *Parallèle entre le marquis de Pombal et le baron Haussmann*, by Lon (1869).

**HAUTBOY** (Fr. *haut bois*, high wood), or **Oboe**, a musical wind instrument of the reed species, slender at the upper end, but spreading out conically at the lower. Its compass extends from C below the treble clef to G, the fourth line above the staff. It was formerly used chiefly in military music, but is now an indispensable appendage to the orchestra. It derives its name from its high, piercing sound.

**HAUTE-GARONNE** (Upper Garonne), a S. department of France, formed from the ancient provinces of Languedoc and Gascony, bordering on Spain and the departments of Tarn-et-Garonne, Tarn, Aude, Ariège, Hautes-Pyrénées, and Gers; area, 2,429 sq. m.; pop. in 1872, 479,362. The N. portion is nearly level, but the S. is covered with lofty mountains, mostly spurs from the Pyrenees, one of which, Mont Maladetta, rises to the height of 11,162 ft. The principal rivers are the Garonne, Neste, Salat, Ariège, Save, and Tarn. The climate of the lowlands is in general mild, but that of the mountainous districts is severe in winter. The soil of the valleys and plains is very fertile. The chief vegetable productions are wheat, maize, millet, rye, flax, hemp, potatoes, garlic, fruit, and timber, with which the declivities of the mountains are thickly covered. A large quantity of wine is made, generally of inferior quality. The department is rich in minerals; iron, copper, lead, antimony, bismuth, zinc, coal, rock crystals, slate, gypsum, marble, and granite are found in abundance. The staple manufactures are coarse woollens, canvas, calico, leather, tinware, earthenware, copperware, scythes, files, mathematical instruments, glass, gunpowder, cannon, tobacco, wine, and brandy. It is divided into the arrondissements of Toulouse, Muret, Villefranche, and St. Gaudens. Capital, Toulouse.

**HAUTE-LOIRE** (Upper Loire), a S. E. department of France, in Languedoc, bordering on the departments of Puy-de-Dôme, Loire, Ardèche, Lozère, and Cantal; area, 1,916 sq. m.; pop. in 1872, 308,732. The surface is volcanic, and in general mountainous, being almost everywhere traversed by offshoots of the Cantal or Cévennes chains, the summits of which are covered with snow during a considerable portion of the year, and their declivities with dense forests, extensive pastures, or chestnut woods and vineyards. The loftiest of its peaks is Mont Mezin, 5,790 ft. high. The principal rivers are the Loire, Allier, and Lignon. The climate varies with the aspect and elevation of every district. The soil of the valleys and plains is fertile. The chief productions are wheat, rye, oats, barley, peas, beans, potatoes, fruit, timber, and wine of poor quality. The minerals are iron, copper, coal, lead, antimony, chalcedony, sapphires, amethysts, marble, gypsum, &c. The only important manufactures are silk, thread lace, and ribbons. It is divided into the arrondissements of Le Puy, Brioude, and Yssingeaux. Capital, Le Puy.

**HAUTE-MARNE** (Upper Marne), a N. E. department of France, formed chiefly from the ancient province of Champagne, bordering on the departments of Marne, Meuse, Vosges, Haute-Saône, Côte d'Or, and Aube; area, 2,401 sq. m.; pop. in 1872, 251,196. The surface is generally hilly, and occasionally mountainous. Some of the Langres summits attain an elevation of 2,500 ft. The principal rivers are the Marne, Meuse, and Aube. The climate is mild

and healthful in summer, but in winter often very severe in the highlands. The valleys and plains are fertile. The chief productions are wheat, oats, barley, peas, beans, potatoes, mustard, hemp, fruit, garden plants, and timber, with which more than one third of the department is covered. A large amount of wine is made. There are more than 100 furnaces for the smelting and manufacture of iron, and cotton and woollen yarn, woollen stockings, leather, gloves, paper, beer, and brandy are manufactured. It is divided into the arrondissements of Chaumont, Langres, and Vassy. Capital, Chaumont-en-Bassigny.

**HAUTES-ALPES** (Upper Alps), a S. E. department of France, in Dauphiny, bordering on Italy and the departments of Savoie, Isère, Drôme, and Basses-Alpes; area, 2,158 sq. m.; pop. in 1872, 118,898. The loftiest mountains of France (not including Mont Blanc) lie within its limits, Mont Olan, the Pic d'Arzine, and Mont Pelvoux rising upward of 13,400 ft. above the sea. The entire surface is rugged and uneven, with vast forests. There is rich pasture, and the department produces the cereals, wine, hemp, chestnuts, wool, &c. It is divided into the arrondissements of Gap, Embrun, and Briançon. Capital, Gap.

**HAUTE-SAÔNE** (Upper Saône), an E. department of France, in Franche-Comté, bordering on the territory of Belfort and the departments of Vosges, Doubs, Jura, Côte d'Or, and Haute-Marne; area, 2,062 sq. m.; pop. in 1872, 303,088. The surface is in general mountainous, offshoots from the Vosges and Faucilles ranges covering it to a considerable extent. The highest summits are the Ballon de Servance and the Ballon de Lure, which attain an elevation of nearly 4,000 ft. Its rivers are the Saône and its tributaries, the Coney, Lanterne, Oignon, and Amance. The climate is more equable than that of the surrounding departments, and the soil is on the whole fertile. The principal productions are wheat, rye, maslin (wheat and rye mixed), maize, barley, oats, potatoes, millet, beets, peas, beans, rape, fruit, and timber. The rivers abound with a variety of fish, including trout, carp, pike, barbel, eels, and crawfish. The minerals are iron, coal, porphyry, granite, and gypsum. The staple manufactures are hardware, glass, earthenware, leather, cotton stuffs, paper, brandy, and oil. It is divided into the arrondissements of Vesoul, Gray, and Lure. Capital, Vesoul.

**HAUTE-SAVOIE** (Upper Savoy), an E. department of France, bordering on the lake of Geneva, Switzerland, and the departments of Savoie and Ain; area, 1,667 sq. m.; pop. in 1872, 273,027. With the department of Savoie and a part of Alpes-Maritimes it forms the territory ceded to France by Sardinia in 1860. The country is mountainous, and Mont Blanc is on the S. E. border. The area of arable land is limited, but the grain raised, with chestnuts, which are an important article of food for the laboring classes, is nearly suf-

ficient for home consumption. In the northern part the vine is cultivated; but a large proportion of the surface is devoted to pasturage, and the mountains furnish timber in abundance. The minerals include iron, copper, and lead, but they are not extensively worked. The manufactures, principally of hardware, coarse woollens, and leather, are not important; and the chief trade is in wool, cattle, and dairy products. It is divided into the arrondissements of Annecy, Bonneville, St. Julien, and Thonon. Capital, Annecy.

**HAUTES-PYRÉNÉES** (Upper Pyrenees), a S.W. department of France, in Gascony, bordering on Spain and the departments of Gers, Haute-Garonne, and Basses-Pyrénées, and deriving its name from the mountains which bound it on the south; area, 1,749 sq. m.; pop. in 1872, 235,156. Its surface is broken by numerous offsets of the Pyrenees, between which lie picturesque and fertile valleys, watered by the Arros, the Gave-de-Pau, and other streams. The department has mines of copper, iron, argentiferous lead, manganese, antimony, and zinc, and contains fine marble, granite, freestone, kaolin, gypsum, and several mineral springs. It produces abundance of fruits, wine, good pasturage, cattle, sheep, and horses, but not enough grain for domestic consumption. The manufactures are not important, and consist chiefly of the woollen stuffs called *barèges*. It is divided into the arrondissements of Tarbes, Argeles, and Bagnères-de-Bigorre. Capital, Tarbes.

**HAUTE-VIENNE** (Upper Vienne), a W. department of France, formed of parts of the ancient provinces of Marche and Limousin, bordering on the departments of Indre, Creuse, Corrèze, Dordogne, Charente, and Vienne; area, 2,130 sq. m.; pop. in 1872, 322,447. The surface is diversified with mountains, valleys, and extensive plains. The mountains are connected with those of Auvergne, and form a dividing ridge between the basins of the Loire and the Garonne. Their highest point, the Puy-Vieux, is 3,200 ft. The Vienne, Thorion, and Gartempe are the principal rivers. The soil is not fertile, but good pasturage is abundant, and horses, cattle, sheep, &c., are reared. Iron, copper, lead, antimony, tin, coal, granite, amethysts, emeralds, &c., are found, and an active manufacturing industry is devoted to iron, steel, copper, porcelain, paper, &c. It is divided into the arrondissements of Limoges, Bellac, Rochechouart, and St. Yrieix. Capital, Limoges.

**HAUT-RHIN** (Upper Rhine), formerly a N. E. department of France, in Alsace, bordering on Switzerland and the grand duchy of Baden; area, 1,586 sq. m.; pop. in 1866, 530,285. By the treaty of May 10, 1871, between France and Germany, most of the department was ceded to Germany and now forms a portion of Alsace-Lorraine. (See ALSACE.) The portion retained by France contains 235 sq. m., and in 1872 had a population of 56,781. It is called the territory of Belfort, from its capital.

**HAÛY. I. René Just**, a French mineralogist, born at St. Just, near Beauvais, Feb. 28, 1743, died in Paris, June 3, 1822. He was born of humble parents, but his love for religious music attracted the attention of a priest, who, after giving him some instruction, procured him a situation in the choir of a church in Paris, whence he went to the college of Navarre and to that of Cardinal Lemoine. In the latter institution, where he became a teacher, he first acquired a love for botany; and accidentally entering the lecture room of Daubenton, he conceived a passion for mineralogy, which shaped his course in life. The accidental dropping of a specimen of calcareous spar revealed to him the geometrical law of crystallization. Communicating his discovery to Daubenton, at the suggestion of Laplace, who saw its great importance, he laid it before the academy in 1781. His discovery met with bitter opposition; but the only answer he made to his detractors was new researches and more careful study. From the date of his memoir on the schorls in 1784 commenced a new era in mineralogy; chemistry confirmed the teachings of crystallography, and an entirely new arrangement of minerals was the consequence. During the revolution Haüy, who had received holy orders, was thrown into prison; but the exertions of Geoffroy Saint-Hilaire obtained his release a few days before the massacre of September, 1792. In 1793 he was appointed one of the committee on weights and measures, and in 1794 keeper of the cabinet of mines. In the latter capacity he prepared his principal work, *Traité de minéralogie* (4 vols. 8vo, Paris, 1801), of which a portion had been published in a single volume in 1797. It is a complete exposition of the idea that the crystalline form should be the principal guide in the determination of mineralogical species, elevating his favorite study at once into the class of exact sciences. In December, 1802, he was appointed professor of mineralogy in the museum of natural history. In answer to an application from government to prepare a treatise on physics for colleges, he published in 1803 his *Traité élémentaire de physique*, which passed through three editions. The little emolument accorded to him under the empire he lost under the restoration, and in the latter part of his life he was cramped by poverty; but he endured it with cheerfulness, and was greatly respected by all who knew him. He died from the effects of a fall, leaving as sole inheritance to his family his magnificent collection of crystals, the fruit of 20 years' labor; it is now preserved, in a room by itself, in the museum of natural history in Paris. Among his works, besides those above referred to, are: *Essai d'une théorie sur la structure des cristaux* (1784); *Exposition de la théorie de l'électricité et du magnétisme* (1787); *De la structure considérée comme caractère distinctif des minéraux* (1793); *Caractères physiques des pierres précieuses* (1817); and *Traité*

*de cristallographie* (1822). He also contributed numerous papers to many of the scientific journals of the day. He was a member of the French academy, and of the principal scientific and learned associations of Europe and America. **II. Valentin**, a brother of the preceding, celebrated as an instructor of the blind, and as the inventor of apparatus for their education, born at St. Just, Nov. 13, 1745, died in Paris, March 19, 1822. He was called in France the "apostle of the blind," and commenced his labors in their behalf in 1784. For an account of his career, see **BLIND**.

**HAVANA** (Span. *La Habana*, or *San Cristóbal de la Habana*), a fortified maritime city, capital of the Spanish colony of Cuba, and of a district of the same name, ranking among the foremost seaports and commercial marts of the world. It is situated on the W. side of a beauti-

ful bay of the gulf of Mexico, on the N. W. coast of the island; lat. 23° 8' N., lon. 82° 22' W. The population is represented in the official returns of 1871 as being only 169,184, comprising 108,754 whites, 37,623 free negroes, &c., and 22,807 slaves; but it is really at least 200,000. The Spanish government has always in its official census returns underrated the population of its colonies. The city stands on a sort of peninsula, formed on one side by the bay and on the other by the waters of the gulf; and it is commonly distinguished into two portions, the intramural or old town, between the bay and the site of the ancient walls, and the extramural or new town, beyond the walls. In the former the streets, though for the most part regular and well paved, are extremely narrow, and, being lowest in the middle, favor the accumulation of great pools of

Havana.

water in the rainy season; and the sidewalks are barely wide enough for one pedestrian. The macadamized thoroughfares of the other portion, rather resembling roads than streets, are ample, well ventilated, and fringed on either side with rows of graceful palm trees. Some of them are among the principal promenades or drives of the city. The prevailing style of architecture is identical with that of the south of Spain. The houses are solidly built of stone, with very thick walls, often painted within and without in showy colors, especially blue, green, or yellow, and sometimes a mingling of all three; they are either of one story and roofed with tiles, or of two stories with a flat roof of substantial masonry, at times surmounted by a *mirador* (lookout), affording at once a magnificent view and a cool and agreeable retreat after sunset. The

windows, which are extremely high, are never glazed, but defended on the outside by strong iron bars, and within by wooden shutters secured, like the doors, with massive bars or bolts. The doors, almost always double, are very ponderous, and open either directly into the *sala* or parlor, or into a large gateway (*zaguan*), guarded by a *portero* or janitor, and leading into an open *patio* (courtyard) whence a spacious staircase leads to the apartments above. All the rooms open upon a covered veranda which surrounds the patio. In the dwellings of the rich the floors and stairs are usually of marble, the decorations and furniture luxurious and tasteful, and the patio is generally embellished with a parterre of exotic flowers and an elegant fountain in the centre. Many of the residences in the extramural portion of the city are constructed in a more

modern style, particularly in El Cerro (the Hill), a handsome street 3 m. long, leading to a village of the same name, and chiefly inhabited by the wealthy and fashionable, especially in summer. There is, however, no quarter of the town exclusively occupied by the higher classes, and in any street a miserable hovel may be seen side by side with a stately mansion. Foremost among the public edifices of Havana is the cathedral, erected in 1724, and used as a college by the Jesuits till 1789; but it is less remarkable for the beauty of its architecture than as being the resting place of the ashes of Christopher Columbus, transferred thither from Santo Domingo, Jan. 15, 1796. On one of the walls is a stone slab with the bust of Columbus in relief, and an inscription beneath. There are fifteen other churches, nine of which are attached to certain monastic orders; two, Santa Catalina and San Juan de Dios, date from the 16th century; one, San Agustin, from the beginning of the 17th; and all are noteworthy for the richness and splendor of their decorations. *El Templete*, the Little Temple, is curious as having been erected in 1828 on the spot where mass was first celebrated, in 1519. There are numerous monasteries and nunneries. The governor's palace, on the W. side of the Plaza de Armas, is a yellow two-story edifice, with a handsome colonnade in front; it is occupied by the captain general, his staff, and the offices of the several government departments. The custom house, fronting on the bay, is a spacious building, devoid of architectural interest; but the customs warehouse, formerly the church of San Francisco, consecrated in 1737, has the loftiest tower in the city. Other buildings or public establishments worthy of mention are the admiralty, the exchange, the university, the prison, a vast quadrangular structure erected in 1771, near the mouth of the bay, and the *real casa de beneficencia*, a large building with beautiful grounds and comprising an orphan asylum and an asylum for vagrants, established about 1790. Havana has three theatres, one of which, built under the auspices of Captain General Tacon, whose name it bears, is said to be equal in size to La Scala of Milan; an arena for bull fights, this amusement being still popular in Havana; a gymnasium, a circus, and a number of well arranged and comfortable public baths. The university has faculties of philosophy and letters, sciences, pharmacy, medicine and surgery, and law. There is also a large number of public and private schools, the former dependent upon the superior board of public instruction, the president of which is the captain general, and which is composed of three sections, each under a vice president. There is a hospital for those afflicted with a species of leprosy peculiar to the Antilles and reputed incurable; a lying-in, a charity, and a military hospital, and an insane asylum. The cemeteries, seven in number, under the charge of the church, are situated

in the extramural district. Interments are made, as in Spain, in niches of tombs built in several stories above ground, each closed with an inscribed slab. Few cities in the world have a larger number of *paseos* or public promenades and public parks than Havana. The Plaza de Armas, at a short distance from the quays, and facing which is the governor's palace, as already observed, comprises four gardens, with a statue of Ferdinand VII. in the centre; magnificent palms and other trees border the walks, along which are stone seats with iron rests; and a regimental band plays there every evening. The Alameda de Paula, bordering the bay, has an elegant fountain surmounted by a marble column, with military trophies and national symbols. A favorite evening resort is the Parque de Isabel, tastefully laid out, and having in the centre a statue of Isabella II. The Campo de Marte, used as a drill ground for the military, is a large enclosure resembling a trapezium in shape, the longest side of which is 375 ft.; it has four handsome gates, distinguished respectively by the names Colon, Cortes, Pizarro, and Tacon. The Paseo de Tacon is a magnificent wide drive, with double rows of trees, a promenade for pedestrians, and profusely embellished with columns and statues, some of the latter, especially one of Charles III., ranking among the finest specimens of art in America. Adjoining this promenade is a beautiful gate opening into the botanic garden, in which are specimens of countless tropical plants; and besides these gardens are the magnificent grounds attached to the *quinta* or country residence of the captain general. Other paseos, such as those of La Reina, El Prado, La Cortina de Valdés, and El Salon de O'Donnel, vie in beauty and scenery with those enumerated. In the vicinity of the city are numerous places of fashionable resort, such as Marianao, Puentes Grandes, and Guanabacoa. Not least among the interesting features of Havana were formerly the walls which girded the old town, commenced in 1633, under Flores, but not completed till 1702. With their forts, ten bastions, and seven gates, they were quite useless; and a new town having grown up beyond them, they were almost totally demolished in 1864, and handsome dwellings erected in their place, materially improving the appearance and sanitary condition of the city. Good water is brought from the river Chorrera by an aqueduct about 7 m. long, furnishing a sufficient supply for use and for about 50 public fountains. The city is well lighted with gas. There are eight good hotels, and a great number of restaurants, cafés, &c.—The climate of Havana is essentially tropical; but the excessive heat is tempered by the sea breeze, which blows regularly every morning, and the agreeable *terral* (land breeze) every evening. There are but two seasons: the dry or so-called winter season, from November to May, when very little rain falls; and the wet or summer season, which usually begins early in June and lasts till

about the middle of October, and during which scarcely a day passes without heavy rain, sometimes accompanied by violent thunder and lightning. The mean temperature during the day is 80° F. in winter, and 86° to 90° in summer. Havana has several times been visited by terrific hurricanes, especially in 1768, 1810, 1844, and 1846, when numbers of ships anchored in the bay were entirely destroyed, and much damage was done in the city and surrounding country. Yellow fever prevails each year, commencing generally toward the end of June, and disappearing in September; foreigners only are attacked by this disease, which is particularly fatal among the shipping and soldiers. The average mortality is 27 per day throughout the year.—The harbor, one of the finest in the world, is entered from the northwest by a channel which is narrow for about three eighths of a mile, and then opens into a magnificent triple-headed bay, with a mean depth of five fathoms, and capable of accommodating 1,000 vessels of any size. The wharves, which, save the portion occupied by the paseos above mentioned, extend along the whole water front of the town, are provided with covered sheds, and are almost continually lined with ships of all nations, closely ranged with their bowsprits inward. The harbor is defended by six forts. One of these, the *bateria de la Punta*, stands on a projecting tongue of land called the Punta, to the right of the entrance; another, the Morro castle, is placed directly opposite the first; both were built at the close of the 16th century. On the same side as the Morro are the fortifications of La Cabaña, situated upon abrupt hills overlooking the narrow entrance; still further inward is the Casa Blanca, commanding the city; and beyond, in regular succession around the bay, are seen the forts Número Cuatro, Principe, San Lázaro, and Pastora, the tower of Chorre-ra, and the fortress of Santo Domingo. Between the forts Número Cuatro and Casa Blanca stands the little town of Regla, with its vast warehouses of stone and corrugated iron, as handsome and substantial as any in the world, and in which is stored each year the greater portion of the sugar of the island previous to its exportation. In the arsenal, erected in 1734, ship building was formerly carried on; it has a dry dock of sufficient capacity for a vessel of 1,000 tons; and cannon were cast here of bronze, the copper being furnished by the Cobre mines on the island.—There are in Havana some iron foundries, machine shops, and carriage and other factories; but the chief manufacturing industry is that of tobacco. No less than 100 first-class and innumerable minor establishments are devoted to the manufacture of cigars, of ever changing brands, usually numbering about 1,000; and the average daily production of paper cigarettes is computed at 2,600,000.—After New York, Havana is the principal commercial port of the new world. About two thirds of the foreign

commerce of the island is carried on through it, the chief articles of export being sugar, rum, molasses, and tobacco, with oranges, pineapples, plantains or bananas, and fruit jellies. The quantities of sugar exported in the two years 1872-'3 were as follows:

YEARS.	Boxes.	Hhds.	Total in lbs.
1872.....	1,161,178	51,089	108,308,370
1873.....	1,163,387	58,003	119,039,230

The total value of that exported in 1872 was \$26,666,672 50; in 1873, \$26,892,927 50, approximately. In 1872 there were exported some 1,500 tierces (12,000 gallons) of molasses, 20,841 pipes (2,605,125 gallons) of rum, 248,775 lbs. of wax, 18,210,800 lbs. of tobacco in leaf, 229,087,545 cigars, and 19,344,707 packages (containing each 25) of cigarettes. In 1873 the quantity of leaf tobacco exported was 18,184,350 lbs., the number of cigars 239,168,758, and of packages of cigarettes 24,065,084. The imports consist chiefly of linen, cotton, woollen, and silk fabrics, breadstuffs, machinery for sugar mills, railway materials (the last four from the United States), wines, oil, &c. The following table exhibits the number, nationalities, and tonnage of the vessels entered in 1872:

COUNTRIES.	Number.	Tonnage.
United States .....	882	417,725
Spain .....	785	228,416
Great Britain.....	300	106,261
Prussia.....	44	69,721
France .....	52	38,538
Norway .....	57	20,752
Other nations.....	49	18,091
Total.....	2,169	899,504

There are two lines of steamers, averaging three vessels per week, from New York; weekly lines from Philadelphia, Baltimore, and New Orleans, and a line twice weekly from Key West; weekly lines from Spain, France, and England, some of the steamers of the two last *in transitu* for Vera Cruz and other gulf ports of Mexico; steamers weekly to Matanzas; and an extensive coasting trade with Santiago de Cuba and the intermediate ports. An extra steamer from New York every 20 days for Vera Cruz carries passengers and freight to and from Havana. Four railways, with numerous branches, place the city in communication with the principal towns in the Western Department; telegraphs extend to all important points in the island; there is a submarine cable to Key West, and another from Batabanó to Santiago de Cuba, and thence to Kingston, Jamaica, connecting with that from the latter island to Aspinwall. Horse cars run every five minutes between the old and new towns; besides which there are several lines of omnibuses, and a large number of public vehicles running very cheaply. Havana has three public and a large number of private banks; es-

tablishments of commercial, industrial, and agricultural credit; a savings bank; a *monte de piedad* (pawn office) under the direction of the government; and 21 daily and other newspapers and periodicals. Besides the library of the university, there are several others attached to the various literary and scientific institutions. The royal Havana lottery is under the immediate supervision of the government, to which it yields annually about \$40,000,000; and another lottery, under the auspices of the municipal government, was organized in 1873. —Diego de Velazquez, the conqueror of the island, founded, on July 25, 1515, a town at the mouth of the river Güines or Mayabeque, and called it San Cristóbal in honor of Christopher Columbus. Shortly afterward it was transferred to the embouchure of the Rio Almendares, and finally, in 1519, to its present site and under its present name. As early as 1508 Sebastian de Ocampo visited the bay for the purpose of repairing his ship, and from that circumstance named it *bahía de las Carenas* (Caren bay). To its convenient geographical position and the excellence of its harbor is due the rapid growth and early prosperity of Havana; but that prosperity aroused before long the cupidity of freebooters and pirates, who sacked and burned it in 1538. In order to prevent the repetition of similar incursions, a fort called La Fuerza, still standing and occupied as a barrack, was built by Hernando de Soto, and the town declared to be a stronghold, orders being issued at the same time that it should be saluted by vessels of war entering the port. Havana was probably raised to a bishopric soon after its foundation, for its second bishop died in 1528. In 1539 De Soto set out from here on his expedition for the conquest of Florida, taking with him 900 foot and 300 horse, but leaving the garrison well defended; for Havana had already been constituted the chief naval station and port of outfit for the Spanish forces in the new world, then called India, and the indispensable haven and outpost for the newly established viceroyalty of New Spain, whose shores were without any adequate harbors. In 1550 the residence of the captain general and the seat of government were transferred from Santiago de Cuba to Havana. In 1551 pirates, under the notorious Jacob Sores, sacked the church and the houses of the wealthy, and forced the commandant of the fort to surrender. After committing numerous outrages and murdering many of the influential citizens, Sores departed; but the place was afterward repeatedly seized by buccaneers. It was unsuccessfully attacked by Drake in 1585; but from that time until the middle of the 18th century it was the scene of no remarkable event. The yellow fever first made its appearance among the shipping in the summer of 1761. The following year an English squadron commanded by Admiral Pocock bombarded the city, and compelled it to capitulate, Aug. 14, after a brave defence during two months. It was re-

stored to the Spaniards in 1763, by the treaty of Paris. In 1782 was published *La Gaceta de la Habana*, the earliest newspaper in the island. In 1789, after the expulsion of the Jesuits, their church became the cathedral of Havana, in which seven years later was deposited the urn containing the ashes of Columbus. In 1818 the port of Havana, in common with the others of the island, was by law opened to foreign commerce. The work on the first railway of the island, that from Havana to Güines, was begun in 1835; and in 1837 the first ferry boats were established between the city and Regla on the opposite shore of the bay. In 1850 the first line of mail steamships from Cadiz to Havana was established. On the revolution in Hayti in 1795 upward of 12,000 families from that island settled in Havana, as did also a large portion of the French army driven from Hayti in 1802; and a few years later, during the struggle of the Spanish continental colonies for their independence, vast numbers took refuge in Havana, especially from Mexico. Many useful institutions and material improvements and embellishments of the city are mainly due to Captain General Don Miguel Tacón, such as the fire company, established in 1835, the theatre which bears his name, and several of the finest public promenades.

**HAVEL**, a river of Germany, and the principal right branch of the Elbe. It rises in a small lake near Neu Strelitz in Mecklenburg, flows S., passing within a few miles of Berlin, to Potsdam, and thence W. and N. W. to its junction with the Elbe. Its entire length is 218 m., and it is navigable to Fürstenberg, 30 m. from its source. It is the connecting link of a chain of 18 lakes, of which the lake of Tegel, the most northerly, the great lake between Spandau and Potsdam, the Fahrlandsee, the Jungfernsee near Potsdam, and the Schwillowsee are the most important. Near Deetz it expands to a breadth of 1,000 ft., and again contracts suddenly to 300 ft. Near Brandenburg it enlarges into the Beetzsee. Its principal affluents are the Rhin, Dosse, Spree, and Plaue. The Finow canal connects it with the Oder, and the Plaue canal with the Elbe; and the Rappin canal, connecting the upper and lower course by means of the Rhin, saves a long stretch of winding navigation. The river, with these canals, is of great importance to the internal commerce of Prussia.

**HAVELOCK**, Sir Henry, a British soldier, born at Bishop Wearmouth, Durham, April 5, 1795, died near Lucknow, India, Nov. 25, 1857. He was educated at the Charterhouse school. In 1813 he began the study of the law, but in 1815 obtained a commission in the army, and in 1823 was sent to India. He distinguished himself in the Burmese war of 1824, and at its conclusion was sent on a mission to the court of Ava, and in 1827 published "The History of the Ava Campaigns." In 1828 he was promoted to a captaincy, and accompanied

the army for the invasion of Afghanistan as staff officer of Sir Willoughby Cotton. He was at the storming of Ghuznee and the occupation of Cabool, and wrote a "Narrative of the War in Afghanistan in 1838-'9" (2 vols. 8vo, London, 1840). He afterward distinguished himself in Afghanistan, in the Mahratta campaign, and in that against the Sikhs. In 1843 he was appointed Persian interpreter to the commander-in-chief, and brevetted as lieutenant colonel, and at the conclusion of the Sutlej campaign was appointed deputy adjutant general at Bombay. In 1849 he went to Europe for his health, and returned to Bombay in 1851, and became in succession brevet colonel, quartermaster general, and adjutant general. In the expedition sent to Persia in 1856, he commanded the troops at the taking of Mohammerah. He returned to Bombay when peace was concluded, and sailed for Calcutta, but was wrecked on the voyage (April, 1857) off the coast of Ceylon. Reaching Calcutta while the sepoy mutiny was at its height, he was at once despatched to Allahabad to take command of a column destined for the relief of Cawnpore, which was then besieged by the Nana Sahib. He left Allahabad in the beginning of July with about 1,200 men, and, having been joined by a reinforcement which raised his strength to nearly 2,000, encountered and routed 3,500 mutineers at Futtehpore, and on the 16th defeated the Nana before Cawnpore. The Nana having fled on the following day, Havelock entered the city, to find that the surviving Europeans had been massacred on the 15th. From Cawnpore Havelock followed the Nana to Bithoor, defeated him, and burned the place. He then pushed on toward Lucknow, where the garrison, under Inglis, was closely beset. Having crossed the Ganges on the 25th, he was opposed at Onao by the enemy, over whom he gained a brilliant victory (July 29). On the same day he defeated the mutineers again at Busserut-Gunge; but a few days afterward, finding his force reduced to about 1,300 men, and being encumbered with the sick and wounded, he had to retreat and wait for reinforcements. The enemy immediately reoccupied Busserut-Gunge, and Havelock returned twice and drove them out. After the third attack (Aug. 12) he recrossed the Ganges to Cawnpore, having now only 1,000 men. Joining Gen. Neill at that place, he marched against the Nana, who had reentered Bithoor, and routed him, Aug. 16. On Sept. 15 Gen. Outram reached Cawnpore with 1,700 men. His rank was higher than Havelock's, but he relinquished to the latter the chief command; and on the 19th Havelock, now major general, again set out for Lucknow, Outram accompanying the force as a volunteer. After a series of battles he reached that city on the 25th, and fought his way with a loss of over 500 men into the residency, where Inglis was shut up. Outram now took the command. Under him, seconded by Have-

lock, the garrison and their relievers had to withstand a siege until the arrival of Sir Colin Campbell enabled them to retire to Cawnpore. The residency was evacuated Nov. 22, but Havelock, whose strength had been broken by sickness and exposure, died of dysentery three days afterward. Previous to his death the commander-in-chief had conferred on Havelock the "good service pension" of £100 a year. A baronetcy having been conferred on him the day after his death, the title, together with an annuity of £1,000, was given to his eldest son, Henry Marshman Havelock (born Aug. 6, 1830), who had been with his father in Persia, and during the campaign against the sepoys, in which he was twice wounded. An annuity of £1,000 was also granted to his widow, who was a daughter of the missionary Dr. Marshman.—See J. C. Marshman's "Memoirs of Havelock" (2d ed., London, 1870).

**HAVEN, Alice Bradley**, an American authoress, born in Hudson, N. Y., Sept. 13, 1828, died at Mamaronock, N. Y., Aug. 23, 1863. Her maiden name was Emily Bradley, and while a school girl she sent, under the pseudonym of Alice G. Lee, many attractive sketches to the Philadelphia "Saturday Gazette," edited by Joseph C. Neal. Their correspondence resulted in her marriage with Mr. Neal in 1846, and at his request she assumed the name of Alice, and thereafter wrote under the pseudonym of Cousin Alice. On his death in 1848 she took the editorial charge of the "Gazette," and conducted it for several years, contributing at the same time poems, sketches, and tales to other periodicals. She published a volume in 1850 entitled "The Gossips of Rivertown, with Sketches in Prose and Verse," but is more generally known by her series of juvenile stories, as "Helen Morton," "Pictures from the Bible," "No such Word as Fail," "Patient Waiting no Loss," "Contentment Better than Wealth," "All's not Gold that Glitters," "Out of Debt out of Danger," "The Coopers," and many others. In 1853 she was married to Mr. Samuel L. Haven. Her biography has been published under the title "Cousin Alice, a Memoir of Alice B. Haven" (New York, 1865).

**HAVEN, Erastus Otis**, an American clergyman, born in Boston, Mass., Nov. 1, 1820. He graduated at Wesleyan university, Middletown, Conn., in 1842. After teaching some years in Armenia seminary, New York, he entered the itinerant ministry of the Methodist Episcopal church, and was pastor about six years in New York and vicinity. In 1853 he accepted the professorship of Greek and Latin in the university of Michigan, but left it in 1856 to become editor of "Zion's Herald" in Boston, where he resided till 1863. During this time he was a member of the Massachusetts board of education, and served two terms in the state senate, being specially prominent in the advocacy of educational interests. In 1863 he became president of the university of Michigan; which during the next six years nearly doubled

in numbers and in resources, and became one of the largest universities of the country. In 1869 he became president of the Northwestern university at Evanston, Ill.; in 1872 he was elected first corresponding secretary of the Methodist Episcopal board of education; and in June, 1874, he was appointed chancellor of the Syracuse university, N. Y. He is the author of "The Young Man Advised" (12mo, New York, 1855), "Pillars of Truth" (1860), and "Rhetoric, a Text Book for Schools" (1869).

**HAVEN, Gilbert**, an American clergyman, born near Boston, Sept. 19, 1821. He graduated at Wesleyan university in 1846, and for two years taught Greek and Latin in Amenia seminary, of which in 1848 he became principal. In 1851 he joined the New England conference of the Methodist Episcopal church, and was stationed successively at Northampton, Wilbraham, Westfield, Roxbury, and Cambridge, Mass. In 1861 he was appointed chaplain of the 8th Massachusetts regiment, the first commissioned chaplaincy after the breaking out of the civil war. In 1862 he made a tour in Europe and the East, and on his return was stationed as pastor for two years in Boston. His earnest advocacy of the cause of the colored population, both before and during the civil war, led to his appointment in 1865 to the supervision of the interests of the destitute freedmen and whites in the state of Mississippi. In 1867 he was appointed editor of "Zion's Herald," Boston, and continued in this office till 1872, when he was elected bishop of the Methodist Episcopal church. The general conference assigned his residence at Atlanta, Ga., and placed under his special superintendence the interests of the Methodist Episcopal church in the extreme southern states. He has been a persistent advocate of Protestant missions in Italy and among the Spanish-speaking peoples, and in 1872 and 1873 visited Mexico in the interest of this cause. He has published "The Pilgrim's Wallet," a book of travels (1864), and "National Sermons: Sermons, Speeches, and Letters on Slavery and its War" (1869).

**HAVEN, Joseph**, an American clergyman, born in Dennis, Mass., in 1816, died in Chicago, May 23, 1874. He graduated at Amherst college in 1835, studied in the Union theological seminary in New York, and graduated at the theological seminary at Andover in 1839. He was pastor of Congregational churches in Ashland and Brookline, Mass., in 1850 became professor of mental and moral philosophy in Amherst college, and in 1858 of systematic theology in the Chicago theological seminary. In 1870 he resigned his professorship on account of enfeebled health, and visited Germany, Palestine, and Egypt. In 1874 he was appointed professor of mental and moral philosophy in the university of Chicago. Dr. Haven has published "Mental Philosophy" (Boston, 1857), "Moral Philosophy" (1859), both extensively used as school text books, and "Studies in Philosophy and Theology" (Andover, 1869).

**HAVERFORD COLLEGE**, an institution of learning under the care of the society of Friends, founded by members of that body in Philadelphia, New York, and New England, and opened in the autumn of 1833. It is situated in the township of Haverford, Delaware co., Pa., on the line of the Pennsylvania railroad, 8 m. N. W. of Philadelphia. The buildings stand on a lawn of 60 acres, laid out with great taste, and adorned with a fine collection of trees and shrubbery. The institution is richly endowed, and furnished with libraries, a chemical laboratory, philosophical apparatus, mineralogical and geological cabinets, and an astronomical observatory. In 1873-'4 there were 5 professors, 50 students, and 8,932 volumes in the libraries. The total number of graduates was 232.

**HAVERFORDWEST** (Welsh, *Hwlford*), a parliamentary borough, town, and county in itself, of S. Wales, locally in Pembrokeshire, of which it is the capital, on the Cleddy, about 200 m. W. by N. of London; pop. in 1871, 11,390. The parish church of St. Thomas dates from 1225. Among the schools is one founded in 1684 for clothing and educating 24 boys and 12 girls. The river is navigable to this point at spring tides for vessels of 100 tons, but the port is dependent on that of Milford. It was once strongly fortified, but all traces of the walls and towers have disappeared. On a rock overhanging the river was a strong castle built in the 12th century by Gilbert de Clare, first earl of Pembroke. In the insurrection of Owen Glendower it was successfully defended against the French troops in the Welsh service. In the civil wars of the 17th century it was held by the royalists. The only remaining vestige of the castle is the keep, which has received large additions and been converted into the county jail.

**HAVERHILL**, a city of Essex co., Massachusetts, on the N. bank of the Merrimack river, at the head of navigation, 18 m. from the sea, and 27 m. N. of Boston; pop. in 1850, 5,877; in 1860, 9,995; in 1870, 13,092, of whom 2,003 were foreigners. It is connected by two handsome bridges with Bradford on the opposite bank of the river. The Boston and Maine railroad crosses the Merrimack at this point, and connects at Bradford with the Newburyport railroad. A street railroad company has recently been organized. The city is divided into six wards, and is about 12 m. in length on the river and 3 m. in breadth, bordering on New Hampshire. Within its limits are several hills, commanding extensive and beautiful views, and four lakes, from two of which it draws its supply of water. At the E. extremity is Rocks village, connected with West Newbury on the opposite bank of the Merrimack by a wooden bridge, and at the W. extremity Ayers village, containing several manufactories. The thickly settled portion is pleasantly built on a gentle acclivity, presenting with its neat shaded dwellings and background of hills a remarkably attractive appearance. There are a soldiers' monument of white marble, a fine city hall,

an odd fellows' and a masonic building, two other public halls, five hotels, and six wharves. Haverhill is noted for the manufacture of boots and shoes, which is the principal industry, and in which it is surpassed only by Lynn. In 1832 the number of firms engaged in the business was 28; in 1837, 42; in 1860, 100; in 1874, 150. The shipments have been as follows; in 1850, 46,272 cases; 1855, 66,984; 1860, 83,856; 1872, 200,000, worth about \$8,000,000. The number of hands employed is from 6,000 to 8,000, many of whom are Canadian French. The goods manufactured here are principally for women's, misses', and children's wear, and are sold chiefly in the west and south. There are also 26 manufactories of heels, &c., 3 of lasts, 1 of shoe nails and tacks, 8 or 10 of other articles used in the manufacture of boots and shoes, 3 of carriages, 4 of bricks, 3 of wool hats, 5 of paper boxes, 1 of woollens, a bonnet bleachery, 4 machine shops, 4 national banks with an aggregate capital of \$840,000, and 2 savings banks with deposits in 1874 amounting to \$3,128,000. Four or five small streams furnish water power. The valuation of property in 1873 was \$10,861,470; taxation, \$217,229 40; debt, Jan. 1, 1874, \$352,875 64. The number of public schools in 1873 was 47, viz.: 1 high, 25 grammar, and 21 primary, having 52 teachers and 2,111 pupils. There are a daily, a tri-weekly, a semi-weekly, and two weekly newspapers, a public library, a children's aid society and

home, a young men's Christian association, and 20 churches.—Haverhill was settled in 1640, and incorporated in 1645. A city charter was granted in 1870. For a long period it was a frontier town, and suffered severely during the Indian wars. In 1697 Mrs. Hannah Dustin was taken captive during an Indian attack, but shortly after escaped by killing 10 of her captors, with the aid of a boy and her nurse. The city is the birthplace of the poet Whittier.

**HAVERSTRAW**, a town of Rockland co., New York, on the W. bank of the Hudson river, opposite Peekskill, and 32 m. N. of New York city hall; pop. in 1870, 6,412. The principal village is situated on the margin of the river, and is overhung by a line of limestone cliffs, which produce large quantities of lime. About 2 m. above is the village of Grassy Point. The principal business is the manufacture of bricks. The village contains a bank, a select school, two hotels, a weekly newspaper, print works, a foundery, a ship-building establishment, and three cigar factories. The town also contains the incorporated village of Warren, situated in the S. part. Stony Point, famous in the revolutionary war, is just above Haverstraw, from which it was separated in 1865.

**HAVRE** (Fr. *Le Havre*), a fortified seaport of Normandy, France, in the department of Seine-Inférieure, situated on the S. shore of the English channel and on the right bank of the Seine, 108 m. direct, or 143 m. by rail, N. W. of Paris, and 44 m. W. of Rouen; lat. 49° 29' 14" N.,

Havre.

lon. 0° 6' 38" E.; pop. in 1872, 86,825. Next to Marseilles it is the principal emporium of France, and has direct communication by steam vessels with London, Rotterdam, Hamburg, Copenhagen, St. Petersburg, Cadiz, Malaga,

New York, &c. With the United States the commerce is of great magnitude, and Havre is an important point of departure of emigrants. It receives the bulk of the American cotton, and ships most of the exports of French goods

to the United States. The number of vessels entered in 1870 was 8,458, tonnage 2,516,898, of which 116, tonnage 114,000, were American; cleared, 5,707, tonnage 1,386,152. The number of vessels belonging to the port is about 500. The imports of cotton in 1870 were 464,985 bales, of which 294,032 bales were from the United States. The imports of petroleum were 116,247 bbls.; of coals, 116,100 tons. The total value of the imports and exports is about \$250,000,000 annually; and about one fifth of the whole foreign commerce of France is carried on through this port. The imports consist chiefly of cotton, spices, coffee, tea, sugar, timber, &c., and the exports of French manufactured goods, wine, brandy, oil, jewelry, salted meat, butter, cheese, fish, &c. There are manufactories of paper, sugar refineries, a government manufactory of tobacco, a large cotton factory, several manufactories of machinery, a large establishment for the manufacture of salt, &c. The ship yards of Havre produce the best vessels in France. Its docks are among the finest in the world and capable of accommodating over 600 vessels. The largest, called l'Eure, has an area of 700,000 sq. ft., and one of its dry docks is 515 ft. long by 112 ft. broad. A basin recently constructed has an area of 53 acres. Havre is much frequented during the season for sea bathing. It has a commercial court, a school of navigation with an observatory, three theatres, a public library, an exchange, a chamber of commerce, a merchants' club house, and a Lloyd's with the principal European journals. Among the churches are an English chapel and an American church. The old fortifications have been removed, and new forts constructed on the heights, which command both the city and the sea. The military quarter of Havre contains an extensive arsenal. The city hall, which is centrally situated, is a magnificent edifice, resembling the late Tuileries in the style of its architecture. The adjoining picturesque village of St. Adresse is studded with pretty villas and gardens.—Havre was founded by Louis XII. at the beginning of the 16th century, and consisted then only of a few huts. Francis I. caused it to be fortified, and the construction of a port was begun under his auspices. It was called after him *Ville Française* or *Franciscopoli*, and afterward, from a chapel of that name, *Havre de Grâce*. The English took it in 1562, and bombarded it on several occasions in the 17th and 18th centuries. The extension of the fortifications and of the town generally was ordained by Louis XVI. in 1786, and has since been carried out far beyond the original plans. Among the eminent persons born in Havre are Mlle. Soudéry, Mme. de Lafayette, Bernardin de St. Pierre, and Casimir Delavigne.

**HAVRE DE GRACE**, a town of Harford co., Maryland, on the W. bank of the Susquehanna river, near its mouth in Chesapeake bay, 35 m. N. E. of Baltimore; pop. in 1870, 2,281, of whom 441 were colored. It is the S. terminus

of the Tidewater canal, and the Philadelphia, Wilmington, and Baltimore railroad here crosses the river on a bridge 3,271 ft. long, completed in 1867 at a cost of more than \$1,250,000. The town is noted for its scenery, and has considerable trade in coal, and a weekly newspaper. It was laid out in 1776, and was burned by the British in the war of 1812.

**HAWAIIAN ISLANDS**, or *Sandwich Islands*, the most northerly cluster of the Polynesian archipelago, constituting a kingdom, and consisting of 12 islands, in the North Pacific, between Mexico and China, extending about 360 m. in a curve from N. W. to S. E., between lat. 18° 55' and 22° 20' N., and lon. 154° 55' and 160° 15' W. Their names and areas, in order from S. E., are: Hawaii, 4,040 sq. m.; Maui, 603 sq. m.; Molokini, islet; Kahoolawe, 60 sq. m.; Lanai, 150 sq. m.; Molokai, 169 sq. m.; Oahu, 522 sq. m.; Kauai, 527 sq. m.; Lehua, islet; Niihau, 70 sq. m.; Kaula and Bird island, islets; total, about 6,100 sq. m., of which two thirds are included in the principal island, which gives its name to the group. The islands are of volcanic formation and mountainous, the fertile lands being mostly confined to the valleys and to a belt of alluvial soil at the shore. The uplands are better adapted to grazing than to tillage. The mountains, covered with dense forests, are not cultivable. The windward coasts, which receive the N. E. trade winds, intercept the rain, and are fertile, while the leeward parts of the same island may be almost rainless. On the windward side the mountains are densely wooded. The upper limit of vegetation is determined by the aspect. On the windward side of Mauna Kea the writer has observed mosses at a height of more than 12,000 ft.; on the leeward side of Mauna Loa vegetation ceases at 8,000 ft. Only seven of the islands are inhabited. Hawaii, the easternmost (formerly miscalled *Owhyhee*), is of a triangular shape, and is of the most recent formation; it consists of a sloping belt of coast land, a high central plateau, and three principal mountains: Mauna Kea, 13,953 ft.; Mauna Loa, an active volcano, 13,760 ft.; and Mauna Hualalai, 7,822 ft. In no part of the islands can one journey far without seeing extinct craters, generally overgrown with luxuriant vegetation. Many hundred square miles of Hawaii are covered with recent and barren lavas. Near the shore the natives cultivate sweet potatoes upon lavas that are hardly cooled, pulverizing the scoria and mixing with it a little vegetable mould. Earthquakes, generally slight, occur frequently upon Hawaii, but not so often upon the other islands. From June, 1833, to May 31, 1867, 173 shocks were recorded at Hilo. On April 2, 1868, five days before a great eruption from Mauna Loa, violent shocks occurred in the district of Kau, and a volcanic wave which followed the earthquake swept away the hamlets on the coast. Hawaii has two great active craters, Kilauea and Mauna Loa; the former is continually, the lat-

ter intermittently active. From the latter great eruptions took place in 1832, 1840, 1843, 1852, 1855, 1859, 1868, and 1873. The lava generally forces its way through the side of the mountain at a distance of several miles from the terminal crater, which is active at the same time. The eruptions of 1840, 1859, and 1868 made their way to the sea, adding somewhat to the area of the island. Those of 1843 and 1855 poured out respectively about 17,000,000,000 and 38,000,000,000 cubic feet of lava. That of 1859 ran 50 m. to the sea in eight days. Kilauea is the largest continually active crater in the world. It is situated upon the eastern part of Mauna Loa, at an elevation of 3,970 ft., and is a pit 8 m. in circumference and 1,000 ft. in depth. Its eruptions are commonly independent of those from the summit crater. The crater is easily descended, and the melted lava may be often dipped out upon the end of the traveller's staff. The principal town upon this island is Hilo, on the N. E. coast, which is rainy, fertile, and highly tropical in appearance. The leeward coasts of Hawaii are sterile and volcanic, overhung in many parts by a steep bleak mountain. Herds of wild cattle, descended from a stock introduced by Vancouver in 1793, roam in the mountain forests, where they are hunted for the sake of their horns and hides. Maui, the second island in size, is composed of two mountainous peninsulas connected by a low isthmus. Mauna Haleakala, on the eastern peninsula, is 10,200 ft. high, and has an extinct summit crater, the largest known, being 2,000 ft. deep and 27 m. in circumference. The principal town is Lahaina. Kauai, the third island in size, is the most uniformly tropical in character; it is fertile and abundantly watered. Oahu, the fourth, has fertile plains upon the N. and S. sides; the latter are the best cultivated, and are the most populous region in the whole group. The capital, Honolulu, is here situated. The highest peak on Oahu is 3,310 ft. high. Molokai, the fifth island in size, is mountainous, presenting a magnificent wall of precipices to the north; it is thinly inhabited, as are the yet smaller and lower islands, Lanai and Niihau. Kahoolawe, Molokini, Lehua, Kaula, and Bird island are uninhabited.—The Hawaiian islands have one excellent harbor, that of Honolulu, on the island of Oahu. It is protected by a barrier of coral reef, has 21 ft. of water on the bar at low tide, and from 4 to 6½ fathoms inside. It affords safe anchorage and great facilities for the discharging of cargoes, and is easy of access from all quarters and with all winds. Hilo, on the N. E. side of Hawaii, has a good natural harbor, protected seaward by a reef of coral and lava, and with from 3 to 8 fathoms of water. With proper wharves, this would be an excellent harbor. Lahaina, on the island of Maui, has an open roadstead with good anchorage. Kawaihai and Kealakeakua, on the W. side of Hawaii, and Waimea, Koloa, Nawiliwili, and Hanalei, on Kauai, have tolerable harbors.—The climate of the islands

is healthful and remarkably equable, so much so that the Hawaiian language has no word to express the general idea of weather. Extreme heat is never known; the mean temperature of the year at Honolulu is 75° F., and the daily range seldom exceeds 15°. During 12 years the extremes of temperature in the shade were 53° and 90°. At Lahaina the range in 10 years was from 54° to 86°. June is the warmest month, and January the coldest and most rainy. A more bracing climate may be obtained by ascending the mountains; an hour's ride from Honolulu up the Nuuanu valley will give a lower temperature. Above Lahaina, at an elevation of 3,000 ft., the thermometer ranges from 40° to 75°; and at Waimea, on Hawaii, the average temperature is 64°. On the windward side of the islands the climate is rougher and the rainfall more abundant. Honolulu and Lahaina, from their genial climate, are particularly adapted for the residence of invalids. Much of the island scenery is extremely beautiful.—The indigenous fauna of the islands is small. It consists of swine, dogs, rats, a bat which flies by day, and domestic fowls, which appear to be native. Snipes, plovers, and wild ducks are found on all the islands. There are only a few species of singing birds; many species, however, have beautiful plumage. One of the birds, *melithreptes Pacifica*, has under each wing a small tuft of feathers of a golden yellow color and about an inch in length. The war cloak of Kamehameha I. was made of these rare feathers; it was 4 ft. long and 11½ wide at the bottom, and its formation is said to have occupied nine successive reigns. Many varieties of fish frequent the shores, and form a staple of diet with the natives. The indigenous flora numbers about 373 species, and many more have been introduced. The coconut, banana, breadfruit, pandanus, cordyline (*ki*), and taro or kalo (*arum esculentum*) are probably indigenous. The last forms the principal food of the natives. The productions of the islands are sugar, rice, coffee, cotton, sandal wood, tobacco, arrowroot, wheat, maize, tapioca, oranges, lemons, bananas, tamarinds, breadfruit, guavas, potatoes, yams, kalo, fungus, wool, hides, tallow, pulu (a fibre collected from the trunks of the tree fern), and ornamental woods. Neat cattle, sheep, goats, and hogs are raised.—The islands lie several hundred miles south of the commercial routes between San Francisco and Japan and China. They are a station for the English line of steamers from California to the Feejee islands and Australia, to which latter market the increasing trade of the South Pacific islands mainly goes. That of the Hawaiian islands is tending in the same direction. A considerable part of the sugar crop of 1873 went to Melbourne and Sydney, where the duty is low. The planters and foreign residents desire a reciprocity treaty with the United States, and in 1856, 1867, and 1869 unsuccessful attempts were made to negotiate one; and still more recently the Hawaiian government of-

ferred to cede the harbor of Pearl river, 6 m. from Honolulu, to the United States, as an inducement to grant such a treaty. As a naval station, the islands offer many advantages to any power that should eventually seek the control of the North Pacific. The commerce is at present chiefly with California; the value of that trade from 1853 to 1873, including freights, passage money, and cargo values inward and outward, exceeded \$19,750,000. The American duties on Hawaiian sugar exported amount to \$225,000, and on rice and other products \$75,000, or \$300,000 annually. The imports from the United States in 1873 exceeded \$1,000,000; they consist chiefly of manufactured goods, lumber, shooks, cured meats, breadstuffs, and groceries. Sugar is the chief export; the amount sent to San Francisco increased from 282,000 lbs. in 1853 to 15,500,000 lbs. in 1872. The total export for 1873 was 23,129,101 lbs. Coffee and cotton are subject to destructive blights. The leading exports in 1873 were:

Sugar, lbs. ....	23,129,101	Fungus, lbs. ....	57,533
Molasses, galls. ....	146,459	Hides, pcs. ....	20,577
Rice, lbs. ....	941,438	Pulu, lbs. ....	412,823
Paddy, lbs. ....	507,945	Goatskins, packs. ....	66,702
Coffee, lbs. ....	262,025	Tallow, lbs. ....	495,000
Wool, lbs. ....	329,507	Salt, tons. ....	445½

The total value of the exports in 1873 was \$2,128,055; of the imports for the same year, \$1,349,448. The number of merchant vessels arriving was 106, with a tonnage of 62,089. The number of cargoes invoiced at above \$10,000 was 34, of which 28 arrived in American, 3 in British, and 3 in Hawaiian vessels. The whaling fleet has fallen off from 549 visits of ships in 1859 to 63 in 1873, it having sought other ports.—Up to the year 1839 the islands were governed as an absolute monarchy and upon feudal principles. In that year Kamehameha III. was induced to sign a bill of rights, and in 1840 and 1842 to grant constitutions by which he surrendered the absolute rule in favor of a government by the three estates of king, nobles, and people, with universal suffrage, a biennial parliament, and paid representatives. The constitution of 1842 and the civil and penal codes were mainly prepared by Chief Justice William L. Lee, an American. Judge Lee rendered great services to the nation, especially in confirming to the common natives a third of the lands of the kingdom, which were formerly owned entirely by the king and chiefs. The new constitution remained in force until the accession of Kamehameha V., who abrogated it Aug. 13, 1864, and promulgated in its place a constitution imposing qualifications on suffrage and on eligibility to the legislature, and centralizing the government in the hands of the king. A voter must read and write, pay his taxes, and have an income of \$75 a year. The executive power is the king, a privy council, of which the four governors of the larger islands are members, and four responsible ministers. The legislative power is the king and the parliament, composed of 14 nobles (of whom 6

are whites) and 28 representatives (of whom 7 are whites). Both classes discuss and vote together. The judiciary power is a supreme court, composed of a chief justice, who is also chancellor, and at least two judges, four district courts, and police and other tribunals. For 1870 and 1871 the entire income of the government was \$912,000, or \$456,000 per year. The salaries called for amount to half of the income; the king is paid \$22,500 a year. Persons of foreign birth or parentage, chiefly Americans, occupy various positions under the government; and the constitution is modelled largely after that of the United States. It guarantees liberty of worship and of the press, free instruction, the right of assembly and of petition, trial by jury, and *habeas corpus*. There is no army or navy; the king has a body guard. In 1843 the Hawaiian kingdom was recognized as an independent sovereignty by France and England, and in 1844 by the United States.—The Hawaiians form one of the families of the brown Polynesian race (radically distinct from the Malay, and more akin to the Papuan, according to Wallace), a race which inhabits also the Marquesas, Tonga, Society, Friendly, and Samoan groups, as well as New Zealand. Their similarity of language is so great that the Hawaiian and the New Zealander, though separated by a distance of 5,000 m., can readily understand each other. The Hawaiian language is very pictorial and expressive, with a full vocabulary for all natural objects. Its primitive character is shown by the deficiency of abstract words and general terms; even generic terms, like insect, color, are wanting; at the same time it abounds in nice distinctions, and is exact in grammatical structure. The American missionaries employed but 12 letters in reducing it to writing, A, E, I, O, U, H, K, L, M, N, P, W; and the number of different sounds is not greatly larger than this. As in all Polynesian languages, every word and syllable must end in a vowel. The ratio of vowel to consonantal sounds is nearly twice as great as in Italian. The Polynesian ear marks the slightest distinctions of vowel sound, but is dull in distinguishing consonants; *b* and *p*, *d* and *t*, are confounded; and in Hawaiian *l* is interchangeable with *d*, and *t* with *k*. The language contains no verb whatever to express either being, existence, possession, or duty.—The Hawaiians are of a tawny complexion, inclining to olive, without any shade of red; the hair is black or dark brown, glossy and wavy; they have large eyes, a somewhat flattened nose, and full lips. They are well made and active, and of good stature; the chiefs are often larger, and considerably exceed the average height of Europeans. Like other Polynesians, they are expert in swimming and in the use of canoes, by which their war expeditions were often carried on. They are good fishermen and horsemen, and make serviceable sailors in the whaling fleets. Their disposition is facile, yielding, and imitative;

they are demonstrative and laughter-loving, and are capable of a fair degree of intellectual and moral elevation. Their songs or *meles* manifest genuine poetic feeling. In arithmetic, geometry, and music they show special aptitude. They are not naturally an industrious race, but they now cultivate the soil with considerable skill; they manufacture sugar, molasses, salt, and arrowroot, and work in iron and other metals. At the time of Cook's visits they had abandoned cannibalism, but were characterized by licentiousness and brutality, and living under the reign of terror imposed by the cruel tyranny of the *tabu*. Their character is not yet essentially civilized, although it has been much modified by education. The population of the islands is steadily decreasing. In 1779 it was roughly estimated by Cook at 400,000, which was doubtless a great exaggeration. An estimate in 1822 gave 142,000. Official censuses have since been made at different periods, which gave: in 1832, 130,313; in 1836, 108,579; in 1850, 84,165; in 1853, 73,138; in 1860, 69,800; in 1866, 62,959; in 1872, 56,899. In the 21 years from 1832 to 1853 the decrease was 44 per cent.; in the 19 years from 1853 to 1872 it was 22 per cent. This lessening rate of decrease, however, must be in part attributed to the increasing number of half-breeds and of foreigners. The number of foreigners upon the islands in 1850 was 1,962; in 1853, 2,119; in 1860, 2,716; in 1866, 4,194; in 1872, 5,366 (1,938 Chinese, 889 Americans, 619 English, 395 Portuguese, 234 Germans, and 88 French). There were 51,531 natives (2,487 half-breeds). The decrease of the aborigines is due to many causes, of which those now principally active may be traced to their contact with the whites. The main cause is that foreign diseases are extremely fatal to them. In 1853 the smallpox carried off 1,200 out of a population of 2,800 in Ewa, near Honolulu. Measles, influenza, and venereal diseases have been prevalent and fatal; licentiousness prevails in spite of missionary effort, and is a considerable check upon population. Diseases of the heart and lungs, dysentery, fevers, and leprosy are frequent. A hospital has been established of late years upon the W. part of Molokai for the seclusion of lepers. The discontinuance of ancient sports, the introduction of foreign dress, and the rapid change in the habits of the people, formerly in natural relation with their circumstances, have tended strongly in the same way. The introduction of clothes appears to have been especially fatal, the Hawaiian being utterly careless about precautions respecting dampness and ventilation. The pure native race seems destined to disappear, and the half-caste population is increasing rapidly. The marriages of the Chinese and Americans with the native women are usually fruitful of healthy children; but marriages between the natives are not prolific. Education has been diffused among the Hawaiians to an extent perhaps unexampled elsewhere. Of

8,931 children between the ages of 6 and 15, 8,287 were attending 245 schools of various grades in 1872. There is one teacher for every 27 children in the group, and scarcely a Hawaiian of proper age cannot read and write his own language. Comparatively little effort has been made to teach the natives English. The schools receive subsidies from the government, and are under its supervision. A number of newspapers, in Hawaiian and English, are sustained. The people maintain churches by voluntary effort, and are extremely liberal in their contributions for various religious objects. A large proportion of the inhabitants are communicants. There is however a tendency to subside into the habits and practices of barbarism, and the native superstitions are with difficulty kept in check. But life and property are as secure as anywhere in the world, and capital offences are extremely rare.—In 1820 the first missionaries from America arrived at the islands. There was no written language; the land was owned by the king and the chiefs, to whom the people were absolutely subject. But Kamehameha II. had just abolished idolatry, and he, and still more his successor, were friendly to the mission, which soon gained great success. The islands rapidly assumed the appearance of a civilized country. In 1822 the language was reduced to writing; and since that time more than 200 works, mostly educational and religious, have been published in Hawaiian. The total number of Protestant missionaries sent to the islands, clerical and lay, including their wives, is 156. The cost of the mission up to 1869 was \$1,220,000. It has been formally discontinued, but a considerable number of the missionaries still remain, supported by their churches or engaged in business. The whole number of persons admitted to the Hawaiian Protestant churches up to 1873 inclusive was 67,792; and the total membership of the same churches in 1873 was 12,283. Several of the Protestant missionaries and their children have filled places in the government. In 1827 a French Catholic mission was established at Honolulu. In 1829 the Hawaiian government directed the priests to close their chapels; some of the proselytes were confined in irons, and Roman Catholic missionaries arriving afterward were not allowed to land. In 1839 the French government sent a frigate to Honolulu, and compelled Kamehameha III. to declare the Catholic religion free to all. The whole number of the Catholic population of the islands in 1872 was stated to be 23,000. An English Reformed Catholic mission was sent out in 1862, and met with favor from Kamehameha V., who was less in sympathy with the Protestant missionaries than his predecessor had been. An Anglican bishop of Hawaii was appointed, who remained till 1870. Since his return in that year to England the mission has attracted less interest, and its success has been small.—These islands were known to the Spaniards more than a cen-

tury before their rediscovery by Capt. Cook in 1778, Hawaii being called Mesa. They first became generally known by the fate of Cook, who was killed by the natives, Feb. 14, 1779. He named the group the Sandwich islands, after Lord Sandwich, then first lord of the admiralty; but the name placed at the head of this article is that which is used at the islands. In 1795-'6 Kamehameha subjugated all of the islands except Kauai, which gave in its allegiance a few years later, and founded the line of kings which ruled the islands until the close of 1872. His successors assumed Kamehameha as a title, prefixing a special name. The dates of their death and succession are as follows: Kamehameha I., May 8, 1819; II. (Liholiho), July 14, 1824; III. (Kauikeaouli), Dec. 15, 1854; IV. (Alexander), Nov. 30, 1863; V. (Lot), Dec. 11, 1872. King Lot dying without leaving an heir or appointing a successor, and the line of Kamehameha I. being extinct, William Lunalilo, descendant of an old family of Hawaiian chiefs, was elected king Jan. 8, 1873. He died Feb. 3, 1874, without issue, and David Kalakaua, a high chief, was elected king in his place, by a parliament assembled Feb. 12, 1874, for that purpose.—A full list of works relating to the islands will be found in the "Hawaiian Club Papers" (Boston, 1868). Besides the works of the explorers Cook, Vancouver, Freycinet, Kotzebue, Byron, and Wilkes, and those of the missionary Ellis, the following are among the more important: Dibble, "History" (Lahaina, 1843); Jarves, "History" (Boston, 1843; enlarged, Honolulu, 1873); H. T. Cheever, "The Island World in the Pacific" (New York, 1851); Dana, "Coral Reefs and Islands" (New York, 1853), and "Geology of the U. S. Exploring Expedition" (Philadelphia, 1849); G. W. Bates, "Island Notes, by a Haole" (New York, 1854); Andrews, "Grammar of the Hawaiian Language" (Honolulu, 1854), and "Dictionary" (1865); Hopkins, "Hawaii" (London, 1866); Mann, "Flora of the Hawaiian Islands" (Boston, 1868); Brigham, "Notes on Hawaiian Volcanoes" (Boston, 1868-'9); Bliss, "Paradise of the Pacific" (New York, 1873); Nordhoff, "Northern California, Oregon, and the Sandwich Islands" (1874). See also Coan on volcanoes in the "American Journal of Sciences" (1851-'73), and the "Missionary Herald" (1819-'74).

**HAWES, Joel**, an American clergyman, born in Medway, Mass., Dec. 22, 1789, died at Gilead, Conn., June 5, 1867. He graduated at Brown university in 1813, and, after studying theology at Andover, was settled in the first Congregational church in Hartford, Conn., in 1818, where he became known as an able preacher and writer. He published "Lectures to Young Men" (Hartford, 1828), which has had a very large circulation in the United States and Great Britain; "Tribute to the Memory of the Pilgrims" (1830); "Memoir of Normand Smith" (1839); "Character Everything to the Young" (1843); "The Religion of the

East" (1845); "Looking-Glass for the Ladies, or the Formation and Excellence of Female Character" (1845); "Washington and Jay" (1850); "An Offering to Home Missionaries" (1865); and numerous occasional sermons.

**HAWFINCH**, a conirostral bird, of the family *fringillidae* and genus *coccothraustes* (Briss.). The common European hawfinch (*C. vulgaris*, Briss.) has a very large bill and head, like other grosbeaks; the neck is short and thick, and the body and limbs are proportionally small. In the male the head is yellowish brown, with the throat and space before the eyes black; fore part of back dark chestnut, the rest brownish gray, shading on the upper tail coverts into yellowish brown; wings with purple gloss and white spots; tail black, the outer feathers with a terminal white spot on the inner web, the inner gray toward the end and tipped with white; below pale yellowish brown; under tail coverts white; the bill flesh-colored, tipped with dusky; the fifth to the eighth primaries have their tips emarginate and the external margins falcate; the ninth, tenth, and five of the secondaries are truncated, the inner edge

Hawfinch (*Coccothraustes vulgaris*).

of the tips rounded, and the outer sharp; the tail is short and straight. The female resembles the male, but the colors are paler. The length is about 7 in., and the extent of wings 11 in. Specimens are often seen more varied with white. It is found in the mountainous and elevated regions of Europe, and is an irregular visitant of Great Britain. It feeds on the seeds of various trees, especially the hornbeam, plane, pines, and cherry, on the kernels of the haws, plum, &c., on laurel berries, and in the summer on various garden vegetables, particularly green peas. The song is pleasant, but plaintive. The nest is very elaborately constructed, of the usual materials, on the highest branches of trees, and the eggs, three to five, are of a pale olive green, with black spots, and irregular streaks of dusky; the young are hatched toward the end of May, and resemble the young green finch; the bill becomes deep blue in the breeding season.

**HAWICK**, a town and borough of Roxburghshire, Scotland, on the Teviot, 40 m. S. E. of Edinburgh, with which it is connected by rail-

way; pop. in 1871, 11,356. It is divided into nearly equal parts by the river Slitrig. Several of the newer streets contain handsome houses; but old structures may be seen in various parts, having more the look of fortresses than dwellings. There is an elegant new parish church, and an old church, which was the scene of the capture of Sir Alexander Ramsay by Sir William Douglas in the reign of Robert Bruce. There are several other churches, public libraries, and reading rooms, an academy, benevolent institutions, and an exchange, built in 1864. At the upper end of the town is the Moat, an artificial mound, 312 ft. in circumference at the base and 117 at the top, and 30 ft. high, supposed to have been used at first for a burial place, and afterward as a court of justice. The Tower inn was formerly a fortress of the barons of Drumlanrig. Hose, blankets, and flannels are largely manufactured, and gloves, leather, and candles are also made. Branksome tower, famous from Scott's "Lay of the Last Minstrel," is 3 m. from the town.

**HAWK**, a name indiscriminately applied to many birds of the falcon family, of the sub-families *accipitrinæ*, *buteoninæ*, *falconinæ*, and *milvinae*; indeed, to almost any bird of prey which is not a vulture, an eagle, or an owl. The duck hawk has been described under **FALCON**, the hen hawk under **HARRIER**, and the fish hawk and goshawk under their respective titles; the white-tailed and swallow-tailed hawks are noticed under **KITE**, and the pigeon and sparrow hawks in their alphabetical order; and many are described under **BUZZARD**. The well known American birds of this name which may be most appropriately noticed here are the

*Accipiter Cooperi.*

following. Cooper's hawk (*accipiter Cooperi*, Bonap.) is about 20 in. long, with an extent of wings of 38 in.; the form is more long and slender than in the falcons and goshawk, the wings are short, and the tarsi and tail long; the general color above is dark ashy brown, darker on the head; the under parts are transversely barred with light rufous and white; throat and under tail coverts white. It is found generally in

the eastern parts of temperate North America, less commonly in the west. The flight is very rapid, and near the ground; it is one of the boldest hawks, attacking birds larger than itself; the ruffed grouse, quails, pigeons, and hares are its favorite food. The sharp-shinned

hawk (*A. fuscus*, Gmel.) is a small species, from 11 to 14 in. long, with an extent of wings of 2 ft.; the upper plumage is brownish black, tinged with ashy; under parts light rufous, with transverse white bands; the throat and under tail coverts white, the former streaked

Sharp-shinned Hawk (*Accipiter fuscus*).

with black; tail ashy brown, white-tipped, with about four brownish black bands. It is found throughout North America from Mexico to the arctic regions; it is one of the swiftest and boldest of the hawks, seizing upon birds and animals which it cannot fly away with; its flight is low and irregular, and its direction changed with great quickness; it preys also on reptiles.—The young of all the hawks differ greatly from the adults, having generally a much lighter and white-mixed plumage. The keenness of vision of these birds, sweeping with great rapidity, and often at a considerable height above their prey, is remarkable; to have a "sight like a hawk" has become a proverb. They usually fly low, irregularly, and with sudden change of course, for which their short wings and long tails are well adapted; the falcons, on the contrary, have longer wings and shorter tails, and fly with greater regularity and at considerable elevation, from which they descend with exceeding swiftness; the kites have both the wings and tail elongated, with a corresponding power of rapid and high flight, and the ability of very sudden descent and change of direction. Hawks, and indeed birds of prey generally, are almost always shot at when they come within range of a gun, without any particular reason, except that they are hawks, and of a ferocious disposition; they do no great mischief beyond the occasional stealing of a chicken, hare, grouse, or pigeon, which otherwise would fall a victim to man's appetite; and they are of positive advantage to the agriculturist by destroying animals and birds injurious to vegetation, and noxious reptiles.

**HAWKE**, Edward, baron, an English admiral, born in 1715, died at Shepperton, Middlesex,

Oct. 14, 1781. He entered the navy at a very early age, and in 1734 had risen to the command of a vessel. Ten years later he was present at the naval battle of Toulon between the English fleet and the combined French and Spanish fleets, on which occasion his ship, the *Berwick*, broke from the line of battle, and captured the Spanish ship *Padre*, of superior force. But as this act of heroism involved a disobedience of orders, Capt. Hawke was tried and dismissed from the service, to which he was immediately restored by George II., who thenceforth called him his own admiral. In 1747 he was made rear admiral of the white, and on Oct. 14 of the same year gained a complete victory over a French squadron off Belleisle on the coast of France. In 1756 he superseded Admiral Byng in the Mediterranean, and subsequently was employed in blockading the French ports in the bay of Biscay. In April, 1758, he drove a French armament destined for America on shore in the Basque roads. In November, 1759, he attacked the French fleet under Conflans in Quiberon bay in the midst of a storm, and, after a memorable and extremely perilous action, the ships being closely engaged among the breakers on the coast, destroyed or captured several of the enemy's vessels, thus preventing the projected invasion of England. For these services he received the thanks of parliament and a pension of £2,000. In 1765 he was appointed vice admiral of England and first lord of the admiralty, and in 1776 was created Baron Hawke of Towton in Yorkshire.

**HAWKESWORTH, John**, an English author, born in London in 1715 or 1719, died Nov. 17, 1773. He was apprenticed to a clockmaker, and afterward seems to have passed some time in an attorney's office. In 1744 he succeeded Dr. Johnson as compiler of parliamentary debates for the "Gentleman's Magazine." In 1752 he began, in concert with Johnson and Thornton, a series of papers called the "Adventurer," on the plan of the "Rambler." This periodical was published twice a week, and ran through 140 numbers, of which 70 were by Hawkesworth. They were very successful, and procured him from the archbishop of Canterbury the Lambeth degree of LL. D. In 1765 he published an edition of the works of Swift, with a memoir. He was critic in the "Gentleman's Magazine" from 1765 to 1772, when he was selected to prepare for publication, at the cost of the government, an account of Cook's voyage to the South sea, for which he received £6,000. The work appeared in 1773, in 3 vols. 4to, illustrated with maps and cuts, and comprised, besides a digest of Cook's papers, a narrative of the previous voyages of Byron, Wallis, and Carteret. He wrote "Zimri," an oratorio (1760); "Edgar and Emmeline," a fairy drama (1761); "Almorán and Hamet," an eastern tale (1761); and a translation of Fénelon's *Télémaque* (1768).

**HAWKING.** See FALCONRY.

**HAWKINS**, a N. E. county of Tennessee, bordering on Virginia, drained by Holston river, here navigable by steamboats; area, 710 sq. m.; pop. in 1870, 15,837, of whom 1,889 were colored. It is traversed by Clinch mountain and other high ridges. Limestone is abundant, and the valleys are fertile. The East Tennessee, Virginia, and Georgia railroad skirts the S. W. border, and a branch terminates at the county seat. The chief productions in 1870 were 138,968 bushels of wheat, 466,470 of Indian corn, 112,306 of oats, 26,124 lbs. of wool, 117,468 of butter, and 3,354 tons of hay. There were 3,192 horses, 3,705 milch cows, 1,298 working oxen, 4,793 other cattle, 16,567 sheep, and 21,700 swine; 2 flour mills, and 2 saw mills. Capital, Rogersville.

**HAWKINS, Benjamin Waterhouse**, an English artist, born in London, Feb. 8, 1807. He graduated at St. Aloysius college, and afterward studied sculpture under W. Behnes. From 1842 to 1847 he lived at Knowsley, the seat of Lord Derby, engaged in making studies from living animals. He was assistant superintendent of the world's fair in London in 1851. From 1852 to 1855 he was occupied in constructing 33 life-size models of extinct animals for the crystal palace park, many of them colossal. He has lectured in the principal cities of England, Scotland, and America, on geology and zoology, illustrating his lectures by his drawings, and since 1868 has resided in the United States. He has published "Popular Comparative Anatomy" (London, 1840); "Elements of Form" (1842); "A Comparative View of the Human and Animal Frame" (1860); and, in conjunction with Prof. Huxley, "An Elementary Atlas of Comparative Osteology" (1864), and "Artistic Anatomy of the Horse, Cattle, and Sheep, for Art Students."

**HAWKINS, Sir John**, an English navigator, born in Plymouth about 1520, died in the West Indies, Nov. 21, 1595. In his youth he made several voyages to Spain, Portugal, and the Canary islands, and was engaged for some years in the slave trade. The first adventure from England in this traffic was made by Hawkins in 1562, when he sailed with a small squadron for the coast of Guinea. There he obtained 300 blacks, whom he sold advantageously in Hispaniola (Hayti), and with the profits of this sale was enabled to fit out a second and larger enterprise for the same purpose in 1564. In the following year Queen Elizabeth granted him permission to wear as his crest "a demi Moor in his proper color, bound and captive." He made a third voyage in 1567, for which he received assistance from the queen, and with 500 negroes sailed from Guinea to Spanish America. All trade between the Spanish settlements and foreigners having been prohibited, he found himself unable to dispose of his cargo, and, indignant at the refusal of the governor of Río de la Hacha to trade with him, he took possession of the town. He then sailed to Cartagena and sold his slaves, but soon after leav-

ing that place he was attacked by the Spanish fleet in the bay of San Juan de Ulua, Mexico, and escaped with but two vessels, with which he made his way to England, arriving in January, 1568. This loss seems to have disheartened him, and he made no more commercial voyages. In 1573 Elizabeth appointed him treasurer of the navy. He served in 1588 as rear admiral against the Spanish armada, and was knighted for his services. In 1590 he was sent with Sir Martin Frobisher to intercept the Plate fleet, and to harass the trade of Spain, but was successful only in the latter object. In 1595 he commanded, in conjunction with Drake, an expedition against the Spanish possessions in the West Indies. The two commanders quarrelled and separated, the attacks upon Dominica and Porto Rico were repulsed, and Hawkins died at sea. He was an able seaman, but rude, cunning, and avaricious. He was twice returned as member of parliament for Plymouth, and once also for another place. He founded at Chatham a hospital for seamen.

**HAWKINS, Sir John**, an English author, born in London in March, 1719, died May 21, 1789. He was articled to an attorney, but devoted his leisure to literature and the cultivation of music. He subsequently acquired a large fortune in the practice of his profession, and by legacies and marriage. In 1741 he joined the madrigal society, and soon after gained considerable reputation by the publication of several sets of madrigals, for which he furnished the words. In 1749 he was admitted a member of Dr. Johnson's club. About 1760 he began to collect materials for a history of music, which after 16 years of labor was published in 5 vols. 4to, under the title of "General History of the Science and Practice of Music." It suffered somewhat in competition with Dr. Burney's history, published about the same time; but the value of the information which it contains is beyond all question, and it fairly supplies in learning what it lacks in elegance of style. A new edition, with an index, was published in 1853 (2 vols. 4to, London). The library which he had accumulated in the preparation of this work he presented to the British museum. He also published an edition of Walton's "Complete Angler," and a memoir of Dr. Johnson, whose works he edited in 11 volumes.

**HAWK MOTH**, the proper name of the second or crepuscular division of the order *lepidoptera*, corresponding to the old genus *sphinx* (Linn.), most conveniently divided into the sections of sphinxes, ægerians, and glaucopidians. For the characters of the order both in the perfect and immature state, see BUTTERFLY, and CATERPILLAR. The hawk moths have the antennæ fusiform or thickest in the middle, and generally hooked at the tip; the comparatively narrow wings are retained in a horizontal or slightly inclined position by a bristle or bunch of stiff hairs on the shoulder of each hind wing, which is received by a hook on the under side of each fore wing, the upper ones covering the

lower; there are two pairs of spurs on the hind legs. Most of these insects fly in the morning and evening twilight, though a few appear by day. Linnæus gave the name of *sphinx* to this group from a fancied resemblance of some of their caterpillars, when at rest, to the Egyptian figure; supporting themselves on the posterior pairs of legs, they raise the fore part of the body, and remain fixed in this position for hours at a time. The adult sphinxes are generally called humming-bird moths from the noise they make when flying, and hawk moths from their hovering and powerful flight; the body is thick and robust, and the strong wings long, narrow, and pointed; with their very long tongues they obtain honey from flowers while on the wing; many are of such size, and have such brilliant colors, that they might readily be taken for humming birds. Some of the ægerians also fly by day; though their flight is swift, it is not prolonged, and they generally alight while feeding; they much resemble bees and wasps; they have a

Hawk Moth (*Sphinx quinquemaculatus*).

tuft at the end of the body which can be extended like a fan. The glaucopidians, so named from the bluish color of the eyes in some of the species, have the antennæ feathered on each side; they fly mostly by day, and alight to take their food. The large green caterpillar, with a horn on the top of the last segment, commonly called potato worm, is a good example of the larva of the sphinx moth. In this division all have 16 legs, in pairs beneath the first to third and sixth to tenth or last segments of the body; and all, except the ægerians and glaucopidians, have a horn or tubercle on the top of the last segment. The sphinx caterpillars devour the leaves of plants on which they are found. The caterpillars of the ægerians are called borers, in common with the larvae of other orders of insects, from their living concealed within the stems or roots of plants, and feeding upon their interior substance; they are soft, whitish, and slightly downy; they make a cocoon with bits of wood

cemented by gummy matter, within which they are transformed into chrysalids; these are of a shining bay color, having the edges of the abdominal segments armed with rows of short teeth, by means of which they work out of the cocoon and out of the hole in the wood.

Larva and Chrysalis of *Sphinx quinquemaculatus*.

The caterpillars of the glaucopidians are slender, with a few scattered hairs or tufts; they eat the leaves of plants, and undergo transformation in cocoons of coarse silk; the chrysalids are round at one end, tapering at the other, without teeth on the surface; they much resemble the nocturnal moths.—The potato worm, or larva of the *sphinx quinquemaculatus*, with oblique whitish stripes on the sides, grows to a length of 3 or 4 in. and the thickness of the finger; it attains its full size toward the end of August, and often injures the plant by devouring the leaves; crawling into the ground, it remains a chrysalis during the winter, and in the following summer comes out a large moth, measuring 5 in. across the wings; the color is gray, with blackish lines and bands, and five round orange spots encircled with black on each side of the body; the tongue, which when not in use is coiled like a watch spring, may be unrolled to a length of 5 or 6 in. The elm is infested with a pale green caterpillar, about  $3\frac{1}{2}$  in. long, with seven oblique white lines on each side, a row of little notches on the back, and four short notched horns on the shoulders; this is the larva of a sphinx (*ceratomia quadricornis*, Harris), and sometimes commits considerable mischief during July and August; these larvæ pass the winter in the earth, and come out in the following June large moths, with an expanse of wings of nearly 5 in.; the color is light brown, varied with darker and with white, with five longitudinal dark brown lines on the hind part of the body. This caterpillar is easily caught in the morning during the season of maturity. Grape and other vines are attacked by the larvæ of the *satellitæ* and *uchemon* hawk moths, the moth of the former being of a light olive color and expanding 4 or

5 in., and of the latter reddish ash, with brown patches on the thorax and anterior wings, and expanding 3 or 4 in. For details on other sphinxes injurious to vegetation, see the work of Dr. T. W. Harris, "On Insects Injurious to Vegetation." The sphinx caterpillars, being of large size and full of juices, are commonly chosen by the ichneumon flies as the nidus in which to deposit their eggs, the larvæ from which, feeding on the substance of the caterpillar, and frequently spinning their cocoons in great numbers on the outside, so reduce it that the metamorphoses do not take place; multitudes are destroyed in this way.—Ash trees and cucurbitaceous vines suffer much from the boring larvæ of egerians; the former from the *trochilium dentatum* (Harris), of a brown color, with yellow markings, expanding about  $1\frac{1}{2}$  in.; the latter from the *egeria cucurbitæ* (Harris), with an orange-colored body spotted with black, and with its fore wings expanding about  $1\frac{1}{2}$  in. Peach and cherry trees throughout the United States have of late years been infested with a naked whitish borer, the *egeria* [*T.*] *exitiosa* (Say); the perfect insect is a slender dark blue moth, the males being much the smaller, and differing considerably in marking from the females. For an account of these insects, and the best ways of preventing their ravages, see Dr. Harris's papers in vols. v. and ix. of the "New England Farmer."—The glaucopidian moth (*procris Americana*) is in some years very injurious to vines, stripping off the leaves in mid-summer. Its wings are very narrow, expanding about an inch; the color is blue black, with a saffron collar; the caterpillars are yellowish, with black velvety tufts on each ring, and a few hairs on the end of the body. They are about half an inch long, gregarious, and rather sluggish in their motions; in the southern states several broods are hatched in a season. For a full account see "Hovey's Magazine" for June, 1844.—Many species of all these sections are found in Europe, where their habits have been carefully observed.

*Egeria exitiosa*.

**HAWKS, Francis Lister**, an American clergyman, born in New Berne, N. C., June 10, 1798, died in New York, Sept. 26, 1866. He graduated at the university of North Carolina in 1815, studied law and practised with great success for several years, and was elected to the legislature. He resolved however to enter the ministry of the Protestant Episcopal church, and was ordained in 1827. He officiated for a time as assistant minister in New Haven, and in St. James's church, Philadelphia, and in 1830 was chosen professor of divinity in Washington (now

Trinity) college, Hartford. In 1831 he became rector of St. Stephen's church, New York, and at the close of the year of St. Thomas's church in the same city, where he officiated till 1843. Having been appointed by the general convention of 1835 historiographer of the American Episcopal church, he went to England, and obtained numerous important papers relating to the early history of Episcopacy in America. In 1837 he founded, with Dr. C. S. Henry, the "New York Review," of which he was for some time editor and a principal contributor. In 1839 he founded St. Thomas's hall, at Flushing, L. I., a school specially for the sons of the clergy, but through its failure became heavily involved in debt. In 1843 he removed to Mississippi, of which diocese he was elected bishop the same year. His consecration was opposed in the general convention of 1844, on account of charges connected with his financial embarrassments. His character was fully vindicated, and a vote of acquittal was passed, but he refused to accept the bishopric. At the end of 1844 he became rector of Christ church, New Orleans, where he remained five years, being meanwhile elected first president of the university of Louisiana. In 1849 he became rector of Calvary church, New York, his pecuniary embarrassments and those of the church having been relieved by a large subscription. In 1852 he was elected bishop of Rhode Island, but declined. At the outbreak of the civil war Dr. Hawks, whose sympathies were strongly with the south, resigned his charge, and in 1862 became rector of Christ church, Baltimore. In 1865, however, he returned to New York, where the chapel of the Holy Saviour was begun for him; and his last public act was the laying of the corner stone in September, 1866. He was the author of "Reports of Cases adjudged in the Supreme Court of North Carolina, 1820-'26" (4 vols. 8vo, Raleigh, 1823-'8); "Digest of all the Cases decided and reported in North Carolina;" "Contributions to the Ecclesiastical History of the United States" (2 vols. 8vo, embracing Virginia and Maryland, New York, 1836-'41); "Commentary on the Constitution and Canons of the Protestant Episcopal Church in the United States" (8vo, 1841); "Egypt and its Monuments" (8vo, 1849); and "Auricular Confession in the Protestant Episcopal Church" (12mo, 1850). Dr. Hawks translated Rivero and Tschudi's "Antiquities of Peru" (1854), and edited "The Official and other State Papers of the late Maj. Gen. Alexander Hamilton" (8vo, 1842); "Narrative of Commodore Perry's Expedition to the China Seas and Japan in 1852-'4" (8vo and 4to, 1856), compiled from Perry's original notes and journal; the "Romance of Biography" (12 vols.); Appleton's "Cyclopædia of Biography" (1856); and "History of North Carolina" (1857).

**HAWK'S BILL.** See **TURTLE**.

**HAWKSMOOR, Nicholas**, an English architect, born in 1666, died in 1736. He was a pupil of

Sir Christopher Wren, after whose death he was surveyor of Westminster abbey, and designed many of the edifices erected in pursuance of the statute of Queen Anne for building 50 new churches. He is also said to have been associated with Sir John Vanbrugh in building Castle Howard and Blenheim.

**HAWKWOOD, Sir John** (called by the Italians **GIOVANNI ACUTO**), an English military adventurer in the 14th century. He fought for the Viscontis and for Gregory XI., and so daring were his ravages of the Florentine territory, that he was paid 130,000 golden florins as a ransom. In Naples he sided with Charles III. against Louis of Anjou. In the course of a campaign in the contest between Florence and the Viscontis, shortly before his death, Hawkwood pitched his camp on a hill. Jacopo del Verme, another leader of condottieri, opened the dikes of the Adige, and surrounded the hill with water, sending at the same time a fox in a cage as a present to Acuto. His reply was: "Good; but the fox does not look at all sad; he will find his way out." He found a crossing place, and cut his way through his opponents.

**HAWLEY, Gideon**, an American missionary, born in Stratford (now Bridgeport), Conn., Nov. 5, 1727, died in Marshpee, Mass., Oct. 3, 1807. He graduated at Yale college in 1749, and commenced his labors at Stockbridge in 1752, opening a school at that place, in which he instructed a number of Mohawk, Oneida, and Tuscarora families. In 1754, under the patronage of Sir William Johnson, he began a mission among the Iroquois, or Six Nations, on the Susquehanna river; but in 1756 he was obliged by the disturbances of the French war to leave that region, when he became a chaplain in the army marching against Crown Point. The campaign being over, he reëngaged in his missionary work at Marshpee, where he was installed as pastor in 1758, and there passed the remainder of his life.

**HAWLEY, Joseph**, an American revolutionist, born in Northampton, Mass., in 1724, died March 10, 1788. He graduated at Yale college, and practised law at Northampton. At the time of the disputes between Great Britain and America, he took a prominent part in advocating the cause of the colonies. "We must fight," he wrote to the delegates of Massachusetts, "if we cannot otherwise rid ourselves of British taxation. The form of government enacted for us by the British parliament is evil against right, utterly intolerable to every man who has any idea or feeling of right or liberty." He was several times elected a member of the council, but declined, preferring to occupy a seat in the state legislature, of which from 1764 to 1776 he was an influential member. From a violent opposer of the ecclesiastical measures of Jonathan Edwards, whose removal from Northampton he had been active in effecting, he became his warm advocate, and in 1760 wrote a letter deploring his part in the affair.

**HAWTHORN.** See **THORN**.

**HAWTHORNE. I. Nathaniel**, an American author, born in Salem, Mass., July 4, 1804, died at Plymouth, N. H., May 19, 1864. His ancestors, who came from England, had settled at Salem in the early part of the 17th century. The Hawthornes in that century took part in the persecution of the Quakers and the witches. For a long period the men of the family followed the sea; "a gray-headed shipmaster in each generation retiring from the quarter-deck to the homestead, while a boy of 14 took the hereditary place before the mast, confronting the salt spray and the gale, which had blustered against his sire and grandsire." The father of Nathaniel Hawthorne was a shipmaster who died of yellow fever in Surinam in 1808. His mother, whose maiden name was Manning, was a woman of great beauty and extreme sensibility. Her grief at her husband's death was hardly mitigated by time, and for the rest of her life she lived a mourner in absolute seclusion. For more than 30 years she took her meals alone in her chamber. At the age of 14, on account of feeble health, Nathaniel Hawthorne was sent to live on a farm belonging to his family in Raymond, on the borders of Sebago lake in Maine. He returned to Salem for a year to complete his studies preparatory to entering Bowdoin college, where he graduated in 1825, in the same class with George B. Cheever and Henry W. Longfellow. Franklin Pierce, who was in the preceding class, was his intimate friend. After quitting college he resided many years in Salem, leading a solitary life of meditation and study, a recluse even from his own household, walking out by night and passing the day alone in his room, and writing wild tales, most of which he burned, and some of which appeared in newspapers, magazines, and annals. In 1828 he published in Boston an anonymous romance, called "Fanshawe," which he never acknowledged, and which has not been reprinted. In 1836 he went to Boston to edit the "American Magazine of Useful Knowledge," of which he wrote the whole, and for which, owing to the insolvency of the publishers, he received no pay. In 1837 he collected from the annual called "The Token" and from other periodicals a number of his tales and sketches, and published them at Boston under the title of "Twice-told Tales." The book was noticed with high praise in the "North American Review" by Mr. Longfellow, who pronounced it the work of a man of genius

and of a true poet, but it attracted little attention from the general public. Gradually, however, it found its way into the hands of the more cultivated and appreciative class of readers; and in 1842 a new edition was issued, together with a second series of tales collected from the "Democratic Review" and other magazines. These volumes, says Mr. George W. Curtis, are "full of glancing wit, of tender satire, of exquisite natural description, of subtle and strange analysis of human life, darkly passionate and weird." In 1838 Mr. Bancroft the historian, then collector of the port of Boston, appointed Mr. Hawthorne a weigher and gauger in the custom house. He fulfilled his novel duties well, was a favorite with the sailors, it is said, and held his office till after the inauguration of President Harrison in 1841, when, being a democrat, he was displaced to make room for a whig. After leaving the custom house he went to live with the

The Old Manse at Concord, Mass.

association for agriculture and education at Brook Farm in West Roxbury, Mass., of which he was one of the founders. He remained here a few months, "belaboring the rugged furrows;" but before the year expired he returned to Boston, where he resided till 1843, when he married Miss Sophia Peabody and took up his abode in the old manse at Concord, which adjoins the first battle field of the revolution, a parsonage which had never before been profaned by a lay occupant. In the introduction to the volume of tales and sketches entitled "Mosses from an old Manse" (New York, 1846), he has given a charming account of his life here, of "wild, free days on the Assabet, indulging fantastic speculations beside our fire of fallen boughs with Ellery Channing, or talking with Thoreau about pine trees and Indian relics in his hermitage at Walden." These "Mosses" were mostly written in the old manse, in a delightful little nook of a study

in the rear of the house, from whose windows the clergyman of Concord watched the fight between his parishioners and the British troops on April 19, 1775. In the same room Emerson, who once inhabited the manse, wrote "Nature." Mr. Hawthorne resided in Concord for three years, mingling little with the society of the village, and seeking solitude in the woodland walks around it, or in his boat on the beautiful Assabet, of which in his "Mosses" he says: "A more lovely stream than this, for a mile above its junction with the Concord, has never flowed on earth,—nowhere, indeed, except to lave the interior regions of a poet's imagination." In 1846 Mr. Hawthorne was appointed surveyor of the port of Salem. He carried his family thither, and for the next three years he was the chief executive officer in the decayed old custom house, of which and its venerable inmates he gave a graphic and satirical sketch in the introduction to "The Scarlet Letter" (Boston, 1850), a powerful romance of early New England life, which became at once exceedingly popular, and established for its author a high and wide-spread reputation. In 1849, the whigs having regained control of the national government, Mr. Hawthorne was again removed from office. Retiring to the hills of Berkshire, he settled in the town of Lenox, in a little red cottage on the shore of the lake called the Stockbridge Bowl. Here he wrote "The House of the Seven Gables" (Boston, 1851), a story the scene of which is laid in Salem in the earlier part of the present century. It was not less successful than "The Scarlet Letter," though its striking and sombre effect is wrought out of homely and apparently commonplace materials, and its strain of horror is prolonged almost to tediousness. This was followed by "The Blithedale Romance" (Boston, 1852), in which, as he says in the preface to the book, he "has ventured to make free with his old and affectionately remembered home at Brook Farm, as being certainly the most romantic episode of his own life." The characters of the romance, he says, are entirely fictitious, though the scene of Brook Farm was in good keeping with the personages whom he desired to introduce. "The self-conceited philanthropist; the high-spirited woman bruising herself against the narrow limitations of her sex; the weakly maiden, whose tremulous nerves endow her with sibylline attributes; the minor poet, beginning life with strenuous aspirations, which die out with his youthful fervor; all these might have been looked for at Brook Farm, but, by some accident, never made their appearance there." In 1852 Mr. Hawthorne returned to Concord, where he purchased a house and a few acres of land, intending to make it his permanent home. During the presidential canvass of 1852 he published a life of his college friend Franklin Pierce, the democratic candidate. President Pierce in 1853 appointed his biographer to one of the most lucrative

posts in his gift, the consulate at Liverpool. Mr. Hawthorne held this office till 1857, when he resigned it, and for two years travelled with his family in France and Italy, residing for a good while in Rome and in Florence. He returned to Concord in the latter part of 1860, and lived here quietly until his health failed, and in the spring of 1864 he set out on a journey through New Hampshire with ex-President Pierce. He reached a hotel in the town of Plymouth, where he stopped for the night, and was found dead in his bed in the morning. Among his works not already mentioned are: "True Stories from History and Biography" (Boston, 1851); "The Wonder Book for Girls and Boys" (1851); "The Snow Image and other Twice-told Tales" (1852); and "Tanglewood Tales," a continuation of "The Wonder Book" (1853). Each of these is in 1 vol. 12mo. In 1845 he edited "The Journal of an African Cruiser" (New York), from the MSS. of a naval officer, Lieut. Horatio Bridge. His longest and perhaps his best work, "The Marble Faun," a romance of Italy, was published in Boston in 1860, and in the same year reprinted in London with the title "Transformation." His next work, "Our Old Home," a series of English sketches contributed to the "Atlantic Monthly," was published in a volume in 1863. This was the last of his books that appeared during his life. After his death his wife edited from his diaries, which he kept with remarkable regularity, his "American Note Books" (1868), "English Note Books" (1870), and "French and Italian Note Books" (1872). In 1872 "Septimius Felton, or the Elixir of Life," a psychological romance, the scene of which is laid in Concord in 1775, was found among his manuscripts and edited by his daughter Una. Some chapters of "The Dolliver Romance," an unfinished work, were published in the "Atlantic Monthly" in 1864. A complete edition of his writings was issued in Boston in 1873, in 21 vols. 16mo. Mr. Hillard of Boston, one of Hawthorne's most intimate friends, says of him in an article in the "Atlantic Monthly" for 1870: "He was a man as peculiar in character as he was unique in genius. In him opposite qualities met, and were happily and harmoniously blended; and this was true of him physically as well as intellectually. He was tall and strongly built, with broad shoulders, deep chest, a massive head, black hair, and large, dark eyes. Wherever he was, he attracted attention by his imposing presence. He looked like a man who might have held the stroke oar in a university boat. And his genius, as all the world knows, was of masculine force and sweep. But, on the other hand, no man had more of the feminine element than he. He was feminine in his quick perceptions, his fine insight, his sensibility to beauty, his delicate reserve, his purity of feeling. No man comprehended woman more perfectly; none has painted woman with a more exquisite and

ethereal pencil. And his face was as mobile and rapid in its changes of expression as is the face of a young girl. His lip and cheek heralded the word before it was spoken. His eyes would darken visibly under the touch of a passing emotion, like the waters of a fountain ruffled by the breeze of summer. So, too, he was the shyest of men. The claims and courtesies of social life were terrible to him. The thought of making a call would keep him awake in his bed. At breakfast, he could not lay a piece of butter upon a lady's plate without a little trembling of the hand—this is a fact, and not a phrase. He was so shy that in the presence of two intimate friends he would be less easy and free-spoken than in that of only one." **II. Sophia Peabody**, an American authoress, wife of the preceding, born in Salem, Mass., in 1810, died in London, England, Feb. 26, 1871. She was married to Hawthorne in 1843, having made his acquaintance by illustrating one of his "Twice-told Tales," "The Gentle Boy." She had considerable artistic talent, and after the death of her husband devoted herself to editing his "Note Books." In 1868 she published a volume of her own observations entitled "Notes in England and Italy." She was residing in England with her two daughters when she died. **III. Julian**, an American author, son of the preceding, born in Boston, June 22, 1846. He went to Europe with the rest of the family in 1853, and remained there till 1860, when he came home to Concord. There he went to school for three years, his previous education having been entirely domestic. In 1863 he entered Harvard college, in the class which graduated in 1867; but his attendance was very irregular, and he did not graduate. In 1868 he entered the scientific school of the university, but gave more attention to rowing and other muscular exercises than to his studies. He rowed in the college regatta in the summer of that year, and in the autumn went to Dresden in Germany, where he resided nearly two years, studying engineering. He came to New York in 1870, and was employed till 1872 as an engineer in the department of docks. In November, 1870, he married an American lady of German descent, whose acquaintance he had made in Dresden. In 1871 he began to write stories and sketches for the magazines, and in 1873 published in London and New York a novel entitled "Bres-sant." In 1872 he went with his family to Dresden, where he now (1874) resides.

**HAXTHAUSEN, Franz Ludwig Marie August**, baron, a German author, born near Paderborn, Feb. 3, 1792, died in Hanover, Dec. 31, 1866. He was a wealthy land owner, served in the army, studied at Göttingen, and travelled extensively, especially in Russia. His works include *Die Agrarverfassung und ihre Conflicte* (Berlin, 1829); *Die ländliche Verfassung der Provinz Preussen* (Königsberg, 1838); *Studien über die innern Zustände, das Volksleben und insbesondere die ländlichen Einrichtungen*

*Russlands* (3 vols., Hanover, 1847-'52), a book which attracted great attention in Russia; *Transkaukasien* (2 vols., Leipsic, 1856); *Das constitutionelle Princip* (French and German, 2 vols., 1865); and *Die ländliche Verfassung Russlands* (1866).

**HAY, John**, an American author, born in Salem, Ill., Oct. 8, 1839. He was educated at Brown university, studied law at Springfield, Ill., and had just been admitted to the bar when he received the appointment of private secretary to President Lincoln (1861). He remained with the president almost constantly until his assassination in 1865, but served as a staff officer for several months in the field during the civil war. In 1865 he was appointed secretary of legation at Paris, where he remained till 1867, when he was transferred to Vienna. Here he was for some time chargé d'affaires; and in 1868 he was again transferred to Madrid as secretary. In 1870 he returned to America, and became attached to the staff of the "New York Tribune." He has written "Pike County Ballads" and "Castilian Days," both published at Boston in 1871.

**HAY COLD, Hay Asthma, or Hay Fever**, an affection first described by Dr. John Bostock in 1819, under the name *catarrhus æstivus*. The local symptoms denote subacute inflammation of the nostrils (coryza), and of the bronchial mucous membrane (bronchitis), together with irritability of the eyes, and, in a certain proportion of cases, bronchial spasm or asthma. More or less fever and other evidences of constitutional disturbance accompany the affection. The foregoing names imply that the cause is contained in emanations from hay. Observations show that fresh or newly mown hay causes the affection in some persons; but this expression of the causation is not sufficiently comprehensive, as other emanations from the vegetable kingdom give rise to it. The special cause or causes contained therein have not as yet been ascertained. It is probable that different persons are affected by the products of different kinds of vegetation, diffused in the atmosphere. The peculiar susceptibility to their influence is inherent in the system; that is, it is an idiosyncrasy; and this idiosyncrasy is manifested only during the summer or autumnal months. In some cases the affection occurs in successive years precisely at the same period, and has a uniform duration. It rarely if ever persists or is developed after the occurrence of black frosts. It appears to be unknown in the southern states and in the northern regions of Canada. It is never developed on the sea; and persons suffering from it find instant and complete relief after the first 12 or 24 hours of a sea voyage. Relief is also obtained in situations where there is little or no vegetation. These facts render it certain that the cause is contained in the atmosphere, and that it is of vegetable origin. The affection has been elaborately studied by Dr. Morrill Wyman, author of a work entitled

"Autumnal Catarrh (Hay Fever)" (1872). According to this author, there are two forms of annually recurring bronchial inflammation (catarrh) in the northern part of this country, affecting persons with a peculiar idiosyncrasy. The first is often called the rose cold or June cold, commencing in the latter part of May or early in June, and continuing into July. This corresponds to the affection known in England as hay asthma or hay fever. The other form is called by Dr. Wyman *catarrhus autumnalis* or autumnal catarrh. In this form the affection begins generally in the third or fourth week of August, and ends in the latter part of September or in October. Dr. Wyman has collected facts which show that relief may be obtained by going to certain portions of the White Mountain region, to Mount Mansfield in Vermont, to the Adirondack mountains, or generally to any point lying 800 ft. above the sea. Persons who suffer from the affection in the places in which they reside, may secure relief and exemption by various changes of residence, to be determined in each case by individual experience, inasmuch as the particular agencies are unknown. The treatment of the affection, when removal without the region in which the cause exists is not practicable, must consist of palliative measures. Iodide of potassium, and the salts of bromine, arsenic, and strychnine, have been found useful. Prof. Helmholtz has discovered vibrio-like organisms in the nasal secretions in this complaint, whose action is arrested by the local employment of quinine.

**HAYDEN, Ferdinand Vandever,** an American geologist, born in Westfield, Mass., Sept. 7, 1829. He emigrated to Ohio at an early age, and graduated at Oberlin college in 1850. He afterward studied medicine at the Albany medical college, taking his degree in 1853. In the spring of that year he visited the "Bad Lands" of Dakota on White river in the interest of Prof. James Hall, explored one of the remarkable ancient deposits of extinct animals, and returned with a large and valuable collection of fossil vertebrates. He again ascended the Missouri river for the American fur company in the spring of 1854, and spent two years in exploring the upper Missouri, entirely at his own expense, returning in 1856 with another large collection of fossils, a part of which was deposited in the academy of sciences of St. Louis, and a part in that at Philadelphia. These collections attracted the attention of the officers of the Smithsonian institution, and he was appointed geologist on the staff of Lieut. G. K. Warren of the topographical engineers, who was then making a reconnaissance of the northwest, and continued on this duty till 1861, when he entered the army as a medical officer. In 1864 he was assistant medical inspector of the department of Washington, and in the autumn of the same year chief medical officer of the army in the Shenandoah valley. In 1865 he was elected professor of geology and mineralogy in the university of Pennsyl-

vania, and held that post till 1872, when he resigned on account of the increased labor in managing the survey. In the summer of 1866 he made another expedition to the upper Missouri in behalf of the academy of sciences of Philadelphia, bringing back another valuable collection of vertebrate fossils. The United States geological survey of the territories, under charge of Prof. Hayden, was commenced in the spring of 1867 with an appropriation of \$5,000; continued in 1868 with \$5,000, in 1869 with \$10,000, in 1870 with \$25,000, in 1871 with \$40,000, in 1872 with \$75,000 and \$10,000 for engraving, and in 1873 with \$75,000 and \$20,000 for engraving. Seven annual reports of the survey have been published, and a final report on Nebraska, in octavo, besides 3 vols. 4to, with illustrations. Besides his reports, Dr. Hayden has written about 40 scientific papers, published in the "American Journal of Science," in the proceedings of the academy of sciences of Philadelphia, and in the reports of the Smithsonian institution. He is a member of the national academy of sciences, and of many other American and European societies. Dr. Hayden has occupied about 20 years in exploring the west, and has extended his investigations over much of Kansas, Nebraska, Colorado, Dakota, Montana, Idaho, Utah, and New Mexico.

**HAYDN, Joseph,** a German composer, born at Rohrau, Lower Austria, March 31, 1732, died in Vienna, May 31, 1809. He was the eldest of the 20 children (by two mothers) of Matthias Haydn, a wheelwright. In his fifth year his musical talents attracted the notice of Frank, a school teacher of Haimburg, who advised the parents to give their son a musical education. When six years old he was sent to the school at Haimburg, where he learned reading, writing, singing by note, and all the instruments then usual in orchestras which his strength would admit of his playing. He had come to Haimburg at a season of numerous religious processions, and the drummer had just died. Frank gave the child a lesson or two, and a few days after the people of the town laughed to see their processions led by a boy of six years beating a drum, which was mounted upon a humpbacked dwarf. His voice proved to be one of remarkable power, sweetness, and compass, and attracted the notice of the parish priest, who afterward recommended him to Reuter, chapelmaster of the cathedral of St. Stephen's in Vienna, as a choir boy. Reuter examined him, gave him a single lesson in the execution of the shake or trill, ordered him to practise singing the scale daily, and at eight years of age received him into the choir. The number of boys in the choir was six, for the support and instruction of each of whom Reuter received 700 florins (about \$300), a sum amply sufficient in those days for their handsome support, and to furnish them with the best teachers. In the case of Haydn, and doubtless of the others, a large proportion of the 700 florins

went into Reuter's pocket; for, with the exception of a little Latin and much practical music, Joseph seems to have been taught nothing. In the theory and science of the art he received in eight years but two lessons from his master. His physical wants were as ill supplied as those of his mind. Hunger during these years was a spur to him in the study of singing, he having early learned that his beautiful voice could be made to procure him food. Constant practice in singing the music of the best Italian and German ecclesiastical composers made up in some measure for the want of adequate instruction in musical theory; his natural instinct for correct harmony and counterpoint being developed in spite of his ignorance of rules. With little bread, little instruction, and many a beating from Reuter, Joseph reached his 16th year, when his voice began to break, and his master, seeing that he could no longer make him a source of profit, sought a fit occasion to dismiss him. Joseph was often in difficulty from his practical jests. One of these gave Reuter the wished-for occasion. One of the boys wore his hair long and tied in a queue. Joseph, to bring him into uniformity with the others, took opportunity to cut it off, and being complained of was sentenced to a severe castigation upon the open hand. He begged hard to be let off, offering to resign if his punishment were remitted. "No help for you," said Reuter; "you shall first receive your *Schilling* and then march." The boy of 16 was turned into the streets of Vienna with a threadbare coat and three bad shirts. His parents, to whom he went, could not aid him, and besought him to carry out the old plan and enter the church. What he had seen of the lower clergy during his eight years in St. Stephen's had not increased his liking for such a life, and he returned to Vienna to see what could be done in music. He took up his abode in a garret room of a five-story house, where he had neither stove nor fireplace, and where rain and snow penetrated through the holes in the roof. Among the first friends whom the boy found was a widow, who with her daughter lived by knitting; she gave him permission to sleep on the floor in her own room when the winter came. She afterward fell into extreme want. Haydn was then in prosperity; in his good fortune he remembered her, and for 30 years gave her a small monthly pension. It was at this period that his genius received its permanent direction. The first six sonatas of C. P. E. Bach fell into his hands. "I could not leave my instrument," said he in his old age, "until I had played them through; and whoever thoroughly understands me, must see that I owe very much to Emanuel Bach; that I comprehended and industriously studied him. Emanuel Bach himself sent me a compliment for this." After a time he attracted the notice of Metastasio, who lived in the same house. The poet had charge of the education of a Signora Martinez, then a child, and Haydn was

employed to give her rudimentary instructions in music, thus having opportunity to make himself a thorough master of the Italian language. Through Metastasio he became acquainted with Porpora, who was then in Germany giving singing lessons to the mistress of Correr, the Venetian ambassador. Thus far Haydn had had no opportunity of studying the theory of music with a master, nor been able to purchase books for this purpose. It was therefore of the greatest importance to him to have the benefit of the profound knowledge and experience of Porpora. Porpora, too, wished for some one to play the accompaniments when he gave his lessons. That he received lessons from Porpora directly, save such as were necessary to render him adequate to the old master's demands upon him, is very doubtful; but he derived the highest advantage from being present at the lessons, and willingly bore the old man's ill humor. During a visit of three months to the baths of Mannersdorf, Correr took his mistress and her teacher, and Haydn chose to act during that time as Porpora's servant rather than miss the opportunity of improving himself. He wore no livery, and dined at the table of Correr's officials, not at that of the servants. He was known as Porpora's accompanist, and in this capacity attracted the notice of Gluck, Wagensell, and other musical notabilities of Vienna. His salary was then six ducats a month. From this time his prospects were continually brighter. A Baron Fürnberg often invited him to his house both in the city and in the country, to small musical parties; and for him, during the autumn of 1750 or the winter following, Haydn composed his first quartet for stringed instruments. Returning one day to his lodgings, he found that his clothes and a few other possessions had been stolen; but he had already made friends, and one of them gave him a good suit of black, another linen, &c., and Fürnberg took him for two months to his country seat. From 1751 to 1759 his life was that of a successful young music teacher. His fees for instruction gradually rose from two to five florins per month. Sundays and church festivals were busy days with him; at 8 in the morning he played the organ in the chapel of the Carmelites, at 10 in the chapel of Count Haugnitz, and at 11 he sang (tenor) in his old choir at St. Stephen's, receiving for each service 17 kreutzers. He was often employed in serenading, his own music generally forming part of the programme. One evening the handsome wife of Kurz, a famous harlequin, was the recipient of the serenaders' homage, and the husband was so struck by the music as to go down to the street and ask who was its author. Haydn, then about 20, acknowledged it. Kurz had the text for a short comic opera, *Der hinkende Teufel* ("The Limping Devil"), a satire on the lame theatre director, Affligio, and this he persuaded Haydn to compose. The piece was given three times with applause, and then forbidden by the police. Haydn received

for his work 24 ducats. Having now the means, he determined to make himself master of the science of music, and to reduce to order what he had previously acquired by observation and practice. His first purchase was the theoretical work of Emanuel Bach, which appeared in 1753. Then came Mattheson's *Vollkommener Kapellmeister*, and finally Fux's *Gradus ad Parnassum*. To these works he devoted a most thorough study, giving the preference on the whole to Bach, although he afterward used Fux as his text book in teaching on account of the excellence of his method. His own pen was never idle. Besides his exercises in harmony and counterpoint for his own improvement, he wrote pieces in infinite variety for his pupils, which fell into the hands of publishers and made him known, though they gave him no pecuniary profit. In 1759, at the age of 27, he at length obtained an appointment. A Bohemian, Count Morzin, engaged him as music director and composer, with a salary of 200 florins, free lodgings, and table with his secretaries and other officials. Haydn now resolved to marry. A hair dresser, Keller, in the Landstrasse, Vienna, had often aided him in his days of want, and in return Haydn had instructed the eldest daughter in music, and to her lost his heart. But she had chosen to enter a convent, and, urged by gratitude and the persuasions of Keller, he transferred his proposal to her sister, and married her. She proved but a sorry match for the chapelmaster. She had few truly feminine qualities, and was disposed to squander Haydn's earnings. Morzin would have no married men in his orchestra, and Haydn was obliged to keep his marriage secret. It was during this year that Haydn wrote his first grand symphony for full orchestra. Before the winter of 1759-'60 was over, which Morzin spent in Vienna, he found it necessary to reduce his expenses, and one step was to dismiss his orchestra. This was no loss to Haydn, for Prince Nicholas Esterházy had heard his symphony, and in 1760 appointed him chapelmaster. This position Haydn held without interruption until Esterházy's death, full 30 years, spending eight or nine months of the year at Eisenstadt or at Eszterház in Hungary, and the winter in Vienna. His salary, at first 400 florins, was gradually increased to 1,000. The prince was ever ready with his purse, and thrice when Haydn's house in Eisenstadt was burned, Esterházy rebuilt it at his own expense. In his will he gave Haydn a pension equal to his salary for life, and his successor, though he dismissed his orchestra, continued to Haydn his title of chapelmaster, and added 400 florins to his pension. The composer had free range of the fields and forests of the prince, and could gratify his passion for shooting and fishing to his heart's desire. It cost him little to live in the country, with no family but a wife and a servant or two; and but for Frau Haydn's propensity to squander her husband's earnings, he might

have saved a handsome share of his emoluments. A French traveller who visited Eszterház about 1782 says: "The château stands quite solitary, and the prince sees nobody but his officials and servants, and strangers who are drawn hither from curiosity. He has a puppet theatre, which is certainly unique in character. Here the grandest operas are produced. One knows not whether to be amazed or to laugh at seeing *Alceste*, *Alcides*, *Al bivio*, &c., put upon the stage with all due grandeur and played by puppets. His orchestra is one of the best I ever heard, and the great Haydn is his court and theatre composer. He employs a poet for his singular theatre, whose humor and skill in suiting the grandest subjects to his stage, and in parodying the gravest pieces, are often exceedingly happy. He often engages a troop of wandering players for months at a time, and he himself with a few officials and servants forms the entire audience. They are allowed to come upon the stage uncombed, drunk, their parts not half learned, and half dressed. The prince is not for the serious and the tragic, and he enjoys it when the players, like Sancho Panza, give loose reins to their humor." For this prince Haydn, ever ready with new and excellent music in which no tragic tones resounded, was just the man. Haydn said of him toward the close of his life: "My prince was satisfied with all my works; I received applause; as chief of the orchestra, I could try experiments, observe what produced the right effect and what weakened it; could therefore improve, add, cut out, venture. I was separated from the world, nobody to meddle with and plague me, and so I was perforce original." The demand upon him for church and instrumental music was constant; for theatrical music frequent; and the best of the year's productions in the country came in the winter to a hearing in Vienna before the highest musical circle in Europe. Thus ten years had not passed since entering the service of Esterházy before the name of Haydn had a European reputation, and the publishers of Leipsic, Berlin, Hamburg, and even of more distant cities, vied with those of Vienna in giving his works to the world. Anything like a complete catalogue of his compositions during these 30 years is impossible; much was lost when his houses were burned, much was scattered; but we know of 163 pieces for the baryton, from the solo with pianoforte to the octet and grand concerto; of symphonies for full orchestra, at least four per annum; of a score or two of masses and other works for divine service in the prince's chapel; of more than 100 works of chamber music of the higher forms, with an immense number of simpler construction. At least 12 Italian operas by him were performed in the private theatre, and four German operettas by the marionettes. The oratorio *Il ritorno di Tobia* was composed in 1774 for the "Musicians' Widows and Orphans Society" in Vienna, he being a candidate for admission. On learning that he must bind

himself to compose for the society whenever called upon, he withdrew his score; and the society 18 years later was proud to elect him an honorary member. The fame of his Italian operas procured him an order to compose one for the imperial opera house in Vienna. *La vera costanza* was written and accepted. Haydn had studied the capacities of the singers carefully, and adapted his parts with great skill to their various powers. The theatre was in the hands of the same Italians who had before succeeded in preventing the performance of Mozart's *La finta semplice*, and it was enough to array them against Haydn that he was a German. The one means in their power to kill the opera was to make an entire change in the distribution of the parts, and this they did. Saying, "I know what and for whom I wrote," Haydn took his score and returned to Eisenstadt. During the building of the new château at Eszterházy, the accommodations were so limited that the prince took with him of his orchestra but a few virtuosos, who were obliged to leave their families at Eisenstadt. Six months passed, and the musicians, full of impatience to return, were astonished and despairing to learn that Esterházy intended to prolong his stay two months. They came to Haydn praying him to find some means of changing the prince's determination. To have sent in a petition would only have brought upon him and them the laughter of their employer. Haydn composed a sextet, giving the first violin to the virtuoso Tomasini, whose playing would be sure to hold the prince until the close. At the performance one player after another ceased, blew out his candle, took his music and instrument, and silently left the room, until at length Tomasini alone remained, and he only to finish his part, when like the rest he put out his light and withdrew. "If they all go away, we must leave too," said Esterházy. The performers had waited in an anteroom, and as the prince came through he said laughing: "Haydn, I understand it; the gentlemen may all leave tomorrow." The sextet was afterward developed into a symphony. In 1780 the philharmonic society of Modena sent Haydn a diploma as honorary member. In 1785 he received an order from Cadiz in Spain to compose a series of seven adagios for orchestra, to be played in the principal church at the annual festival in commemoration of the crucifixion. To these seven were afterward adapted words founded upon the seven phrases spoken by Christ upon the cross. As adagios, performed in a church lighted by a single lamp, the priests prostrate before the altar, and the multitude kneeling in silence, this music is, as Haydn himself declared, among the most successful of his compositions. Prince Nicholas Esterházy died Sept. 28, 1790. His son and successor Paul Anthony, not having the taste of his father, dismissed the orchestra, retaining Haydn nominally as his chapelmaster. The composer was now free from all labor but that of composition, had a

handsome income secured to him, and, having made Vienna his residence, occupied himself in laying plans for future works on a grander scale than any hitherto attempted. Thus only could he compete with the young Mozart, whom he loved as a son, but whose genius was a spur to the veteran. A few weeks after the death of Esterházy a stranger entered the room of Haydn. "I am Salomon, of London," said he, "and come to take you thither; tomorrow we will strike a bargain." Salomon was a native of Bonn, but left that city early in life to enter the service of Prince Henry of Prussia, and in 1783 emigrated to London. He had repeatedly urged Haydn by letter in previous years to visit that city, and Prince Esterházy was ready to give the necessary leave of absence; but Haydn was unable to make up his mind to accept the invitation. Gallini, the undertaker of the great professional concerts in Hanover square, was with Salomon upon the continent at this time engaging singers and virtuosos for the succeeding season. Salomon was already at Bonn on his way back to London when he learned the death of Esterházy, and immediately started for Vienna to engage Haydn. The composer hesitated long, but an offer of 3,000 florins for an Italian opera, and 100 florins for every new work which he should compose and direct in a series of 20 concerts, at length overcame his scruples, and on Dec. 15, 1790, he left Vienna. The musical world of London received him with the highest degree of enthusiasm, which increased with each new work that he produced. Soon after the concerts began, a quarrel broke out between Gallini and Salomon on the one part, and the other directors of the concerts on the other, which resulted in driving the two from Hanover square to the Haymarket theatre. Haydn, having made his contract with Gallini, remained faithful to him notwithstanding the offer of a large sum from the other party. The public followed Haydn to the Haymarket, and the enterprise of Gallini and Salomon was successful. Haydn's first stay in London lasted 18 months. The principal works produced were: *Orfeo* (opera seria), 9 symphonies, a symphony concertante, "The Storm," a grand chorus with orchestra, 6 quartets, 11 sonatas, several beautiful songs and canzonets, and the arrangements to more than 100 Scotch songs. The *Orfeo* was not given, because Gallini's license did not include operatic performances. In the summer of 1792 Haydn returned to Vienna, with a handsome sum saved from his earnings, and the fame of being (for Mozart was now dead) the greatest of living composers. On Jan. 19, 1794, he left Vienna for a second visit to London, where he remained a year and a half. His principal works were three symphonies, a large number of songs and airs, both with pianoforte and orchestral accompaniment, the ten commandments composed as canons, 24 minuets and German dances, 6 contra dances, 3 sonatas, an overture, ballads,

&c. George III. and his queen endeavored to persuade him to remain in England; the university of Oxford created him doctor of music. All classes vied in testifying their admiration of his genius. His fame preceded him to Vienna, and soon after his return in 1795 he gave a concert, which was crowded to excess, wherein he produced his three new symphonies, and in which the young Beethoven appeared both as composer and virtuoso, and played his own first pianoforte concerto. Haydn was now in Vienna what he had been in London, the unrivalled master. He had brought with him from London an English text for an oratorio, prepared by Linley, from Milton's "Paradise Lost," entitled "The Creation." Not venturing to compose so grand a work to an English text, he placed it in the hands of Baron van Swieten, who translated and arranged it in its present form. Twelve persons of the highest nobility subscribed to the amount of 500 ducats, which they offered him for a composition of the new text. Haydn accepted the proposition, and in the 68th year of his age he completed this magnificent work. It was first produced March 19, 1799. Its great success led Van Swieten to prepare another text from Thomson's "Seasons," which was composed within the next two years, and first produced at Vienna, under the title of *Die Jahreszeiten* ("The Seasons"), April 24, 1801. This labor had been too great for him, and the barren, unpoetical text had been a source of great trouble and annoyance. Soon after finishing it he felt a feverish attack in his head, and from that time his strength, both mental and physical, sensibly failed. From this period to his death he spent most of his time in his house and garden, which had become one of the principal attractions to strangers in Vienna. On March 27, 1808, he was once more induced to appear in public. It was at a performance of the "Creation," in the great hall of the university. At the famous passage, "and there was light!" in the first chorus, the audience as usual burst into tumultuous applause. Haydn, waving his hand toward heaven, exclaimed, "It comes from there!" At the end of the first part he felt it necessary from his great weakness to leave the room; and as he was borne out in the great chair in which he had sat, he once more, with tearful eyes, turned to the orchestra, and spread out his hands as if to bless them. It was his farewell to the whole world. On May 10, 1809, early in the morning, a corps of the French army advanced toward the suburb Mariahilf of Vienna, not far from Haydn's house. His servants were engaged in getting him out of bed and dressing him when four cannon reports shook the house and frightened the domestics. "Children," said Haydn, "fear not; where Haydn is, no misfortune can befall you." But he had hardly spoken these brave words when he himself began to tremble violently. He now declined rapidly, and died May 31, in his 78th year.—

Gerber's attempt to catalogue Haydn's works fills over 13 octavo pages of his *Neues Lexikon*, and is far from being complete. Haydn himself in 1805 was unable to give a complete list of his compositions; he could remember but 118 symphonies, yet Gerber had at that time the themes of 140. His compositions in England alone filled 768 leaves (1,536 pages) music folio. The following is an abstract of the list which he made out in 1805 for Prof. Bertuch, "of such as he could remember:" 118 symphonies, 83 quartets, 24 trios, 19 operas, 5 oratorios, 163 compositions for the baryton, 24 concertos for different instruments, 15 masses, 10 pieces of church music, 44 sonatas for pianoforte, with and without accompaniment, 42 German and Italian songs, 39 canons, 13 vocal pieces for three and four voices, 365 Scotch and English songs arranged with accompaniments, 40 *divertimenti* for from three to nine instruments, four fantasias, capriccios, &c. Haydn will for ever fill a large space in musical history, not only for the magnitude, number, originality, and beauty of his compositions, but as being one of the small number who have made eras in the development of the art. He is the great mentor in the department of orchestral and chamber music, the father of the modern quartet and its kindred forms, and of the grand symphony. By this it is not meant that orchestras and small companies of performers on stringed instruments were unknown before his time, but that he, adopting the sonata form as perfected by Emanuel Bach and introducing it into compositions for the orchestra and chamber, laid the foundation for that wonderful development of instrumental music exhibited in his own later compositions and in the works of Mozart, and which reached its climax in the musical "poems" of Beethoven. There are but two names in musical history for which this honor is claimed at the expense of Haydn's fame. The one, San Martini (Sammartini), belonged to the old Italian school, and if any of his instrumental works belong to the new era, they are those of his later days, when Haydn's influence was already everywhere felt. But the fame of Haydn has hardly been seriously claimed for San Martini. Of the other, Boccherini, for whom more serious claims have been urged, it is sufficient to say that when Haydn's quartets were already becoming known and gaining him a reputation, Boccherini was a child of 13 or 14 years; that Haydn was already in the service of Prince Esterházy as chapelmaster when Boccherini's opus I., *Sei sinfonie*, for two violins, alto and 'cello obbligato (that is, mere quartets) was written; that Boccherini's first work for more than four instruments—a concerto (op. 8) for six instruments obbligati, and six *ad lib.*—was not composed till 1769, before which date at least 18 of Haydn's symphonies and several of his quartets had been printed in Paris. Haydn thought it unfortunate that circumstances had led him so preponderantly

into the field of instrumental composition, rather than into that of operatic writing. But in this no one who is acquainted with his works at all extensively can doubt he was in error. He was of too happy a temperament to have touched the deep-toned harps of Handel, Gluck, Mozart, and Beethoven. For more than half a century music flowed from his pen in a continuous stream, always new, always attractive, always cheerful, always beautiful, often grand, sometimes reaching the sublime, but never betraying any touches of really tragic sorrow or grief. He was the musical apostle of the beautiful and the happy.—Haydn's biography has been written by Griesinger (1810), "Bombet" (Beyle, 1817), Grosser (1826), and Ludwig (1867). **II. Michael**, a German composer, brother of the preceding, born at Rohrau, Sept. 16, 1737, died in Salzburg, Aug. 18, 1808. He was educated in music by Reuter, and rose to eminence as an organist and composer, chiefly in consequence of his close study of the works of Fux, Bach, Handel, and Graun. He was chapelmaster at Grosswardein in Hungary, and occupied the same position in the cathedral of Salzburg, where he also established an excellent school of counterpoint. His works are numerous, and embrace operas, oratorios, masses, symphonies, and many other popular forms of vocal and instrumental composition; but they are little known in consequence of the author's reluctance to have them published during his life. His brother Joseph considered him the best composer of sacred music of the day.

**HAYDON, Benjamin Robert**, an English painter, born in Plymouth, Jan. 25, 1786, died by his own hand in London, June 22, 1846. Disregarding the wishes of his father that he should adopt his own business, that of a bookseller, he went to London at the age of 18, and became a student in the school of the royal academy. He was an enthusiast in the pursuit of what is called "high art," and prosecuted his studies in drawing and anatomy with singular earnestness. His first picture, "Joseph and Mary resting with our Saviour after a Day's Journey on the Road to Egypt," was exhibited in 1807, and immediately purchased by Thomas Hope, the author of "Anastasis." This was followed by "Dentatus," a work which established his reputation, but involved him in a quarrel with the academy, whose hanging committee had placed the picture in a small side room. A fondness for controversy led him to publish several attacks upon the academy, which had only the effect of estranging some of his most valuable friends, of exasperating his own temper, and of cutting him off from what was the chief ambition of his life, the honor of being an academician. From this time forward, notwithstanding the frequent production of eminent works, he had constantly to struggle with pecuniary difficulties. In 1815 he established a school, in opposition to that of the academy, in which the Landseers

and Eastlake were instructed, and about the same time became associated in the conduct of a periodical entitled "Annals of the Fine Arts." Having no tact for either pursuit, he failed in both; and in 1823, two years after his marriage, he was so involved in debt that he became an inmate of the king's bench prison, where he remained two months. Subsequently he painted here one of his most characteristic works, "The Mock Election," representing a scene which took place within the prison walls in July, 1827, and which was purchased by George IV. for 500 guineas. For his "Pharaoh and Moses," painted soon after his release, he obtained an equal sum. Notwithstanding these and similar emoluments, in 1836 he again became a prisoner for debt, but was soon after enabled to compound with his creditors. About this time he lectured on painting with considerable success. Upon the publication by government, in great part through Haydon's own exertions, of proposals for decorating the new houses of parliament with frescoes representing scenes in the history of the nation, he sent to the exhibition in Westminster hall two cartoons, "The Curse" and "Edward the Black Prince." No notice was taken of his performances, and his hope of executing some great public work of art was crushed for ever. To show the world how erroneous had been the decision of the judges, he commenced a series of gigantic pictures, including "Uriel and Satan," "Curtius Leaping into the Gulf," the "Burning of Rome," and the "Banishment of Aristides," the two latter of which, while on exhibition in London, attracted but 133 visitors during the time that Tom Thumb in an adjoining room received 120,000. Under the weight of this neglect and of pecuniary embarrassments his reason gave way, and while engaged on his last great picture, "Alfred and the Trial by Jury," he put an end to his life, having first written in his journal: "Stretch me no longer on this rough world." A post-mortem examination discovered a long-seated disease of the brain, which may account for much of his eccentricity. His family were provided for by a public subscription. Haydon's autobiography, edited by Tom Taylor in 1853 (2d ed., 3 vols. 8vo), lays bare the character of the man, and explains his unhappy career. His love of art was a passion rather than a principle. An impetuosity of temper, impatience of criticism, and an exaggerated estimate of his own powers and of his mission as the apostle of high art, were continually involving him in disputes. His "Judgment of Solomon," "Christ's Entry into Jerusalem," "Christ Rejected," "Christ's Agony in the Garden," and "Raising of Lazarus," all painted previous to his first imprisonment for debt, and in the maturity of his artistic powers, are among the most favorable specimens of his style. Several of these pictures contain portraits of eminent personages, and the "Christ's Entry into Jerusalem" is now the property of the Catholic

cathedral in Cincinnati. His literary efforts are confined chiefly to his "Lectures on Painting and Design" (2 vols. 8vo, 1844-'6), which are bold and clear expositions of the principles of art as he understood them. He also wrote the article on painting in the "Encyclopædia Britannica," and induced the government to purchase the Elgin marbles.

**HAYDUKS**, a class of Hungarians who were originally shepherds (Hung. *hajdu*), and from whom patriotic militia organizations subsequently received the name. The gallantry of the Hayduks was signally rewarded by Bocskay, prince of Transylvania and the protector of the rights of the Protestants, who endowed them, Dec. 12, 1605, with privileges of nobility, and assigned to them a district known as the Hayduk towns (*Hajdu-városok*); and they have retained most of those privileges, excepting immunity from taxation, which was withdrawn by the emperor Charles VI. at the beginning of the 18th century. The district is enclosed within the county of Szabolcs, E. of the Theiss, and comprised in 1870 an aggregate population of 59,715, almost all Magyars and Protestants. Besides the capital, Bőszörmény (pop. 19,208), it contains the towns of Dorog (8,216), Hadház (7,024), Nánás (13,198), and Szoboszló (12,269).—Menials of Hungarian officials and magnates having been called hayduks, the name was adopted at German courts for ponderous lacqueys, though these are generally Germans or Swiss, and not Hungarians.

**HAYEL**, or **Hail**, a city of Arabia, in Nedjed, capital of the sultanate of Shomer, situated in a plain between the mountain ranges Jebel Adja and Jebel Solma, lat. 27° 44' N., lon. 42° 42' E., 240 m. N. E. of Medina; pop. in 1862, about 22,000. The walls, which are 20 ft. high, with bastioned towers and folding gates, surround an area capable of containing a population of 300,000, if its houses were closely packed as in European cities; but there are many large gardens, open spaces, and plantations within their circuit. The palace of the sultan with its pleasure grounds occupies nearly a tenth of the city. It is surrounded by a wall 30 ft. high, with semicircular bastions along its front, and a gateway flanked by high square towers. From the palace itself rises a massive oval tower 70 ft. high. The streets of the city are irregular, and most of the houses, which are generally of brick with flat roofs, are built about central courtyards. The surrounding plain is studded with houses and gardens, the country seats of wealthy citizens or of members of the ruling family. Hayel is the centre of a thriving commerce.

**HAYES, Augustus Allen**, an American chemist, born in Windsor, Vt., Feb. 28, 1806. He graduated at the military academy in Norwich, Vt., in 1823, and then began the study of chemistry as a profession. In 1825 a laborious research undertaken by him, for the purpose of more accurately determining the proximate composition of various American medicinal

plants, was rewarded, among other results, by the discovery of the organic alkaloid sanguinaria, a compound remarkable for the brilliant colors of its salts, although itself colorless, or nearly so. In 1827, while assistant professor of chemistry in the New Hampshire medical college, he investigated the compounds of chromium; and his paper on this subject was highly praised by Berzelius. Dartmouth college about the same time conferred upon him an honorary degree of M. D. Since 1828 he has resided in Boston or its vicinity, and has devoted his time to chemical investigations, filling also successively the posts of director of an extensive manufactory of colors and chemical products at Roxbury, of consulting chemist or director of some of the most important dyeing, bleaching, gas, iron, and copper-smelting establishments in New England, and of state assayer of Massachusetts. His contributions to science have been numerous and valuable, and may be found chiefly in the "Proceedings" of the American academy and of the Boston society of natural history, in the "American Journal of Science," and in the "Annual of Scientific Discovery." In 1837 he conducted an elaborate investigation upon the economical generation of steam and the relative value of fuels, which in 1838 led to a novel arrangement of steam boilers. To Dr. Hayes belongs also the credit of the application of the oxides of iron in refining pig iron in the puddling furnace, so as to produce without loss a pure malleable iron; and still earlier, the refining of copper was, under his direction, rendered a much shorter and more certain operation, by the introduction of the scales of oxide of copper produced in refining. Among his other important original researches are those in relation to the chemical decomposition of alcohol by chlorine and the formation of chloroform; upon the action of alcohol on the human system, and the demonstration of its invariable oxidation in the system into aldehyde and acetic acid; on the formation, composition, and specific differences of the varieties of guano; on the existence of a deposit of native iron on the west coast of Africa; and a memoir on the difference in the chemical constitution and action of sea waters, on and below the surface, on soundings, and at the entrances of rivers. This last research forms part of an investigation undertaken under a commission from the United States navy department to examine and report on the subject of copper and copper sheathing as applied in the construction of national vessels, and his report embodies a vast amount of scientific and commercial information. In 1859-'60, while considering the question of supply of water to the city of Charlestown, he found, as his earlier analysis indicated, that the deep water of Mystic pond was far less pure than the surface water. The question of diffusion under a flowing surface came up for study, with the responsibility of accepting or

rejecting the source of supply. He had proved that a copper strip or wire, passing vertically through two masses of water of slightly unlike composition, would become polarized, and exhibit electrolytic action. This mode of testing the exact limits of the impure water was applied under his direction, and it was shown that a compound affording sulphur when decomposed could be detected by its action on the strip to form a black sulphide, and the limits of the existence of this compound were read on the surface of the strip of copper, or silvered copper. A large number of observations on this and other masses of water have proved the high practical value of the application, and demonstrated the presence of a stream of naturally pure water, nearly 20 ft. deep, flowing over impure water without contamination. After the outbreak of the civil war, Dr. Hayes called public attention to the uncertainty of the foreign supply of saltpetre, and the necessity of domestic production. His efforts resulted in the manufacture of the supply for the navy from caustic potash and nitrate of soda, by a novel process, the product being of great purity. After spending two years in Europe, to restore his impaired health, studying various phenomena of chemical geology, he returned to the United States, and for the last few years has withdrawn from active life.

**HAYES, Isaac Israel**, an American explorer, born in Chester co., Pa., March 5, 1832. He was educated in Philadelphia, graduated M. D. at the university of Pennsylvania in April, 1853, and in May was appointed surgeon of the second Grinnell expedition to the Arctic ocean, under command of Dr. Kane, which he accompanied, returning with it in 1855. Some reminiscences of this expedition are given in his "Arctic Boat Journey" (Boston, 1860). He was convinced that there was an open sea around the north pole, and presented his views to the American geographical and statistical society in December, 1857, and during the ensuing winter in lectures on arctic explorations delivered in different parts of the country, especially at the Smithsonian institution in Washington. Subscriptions in aid of an exploring expedition were collected by scientific and other societies in America and Europe, and with this aid he was enabled to fit out the schooner *United States*, of 133 tons, in which he sailed from Boston, July 9, 1860, with a company of 14 persons besides himself. He reached Upernavik, Greenland, Aug. 12, entered Melville bay on the 23d, and, after being twice driven back by the violence of the wind and floating floes of ice, anchored in Port Foulke on the W. coast of Greenland, in lat. 78° 17', Sept. 9. He explored the glacier system of Greenland, and after wintering in Port Foulke set out April 4, 1861, upon a boat and sledge journey across and up the sound. The party of 12 men and 14 dogs found it impracticable to drag the boat over the hummocks of ice, and sending it back, Dr. Hayes

pressed onward with three companions and two dog sledges. They reached the W. coast of the sound May 10, and travelled north until the 18th. Their provisions being exhausted, they were obliged to return, having reached land in lat. 81° 37' N., beyond which they saw open water. The schooner was broken out of the ice July 10, and returned to Boston Oct. 23. In this expedition Dr. Hayes discovered a new sound or channel opening westward from the centre of Smith sound. He found the portion of Kennedy channel which Morton had reported to be open in June, 1854, frozen over May 23, 1861, and the W. coast of the channel heaped with great masses of ice. Before his return home civil war had begun, during which he served as a surgeon in the U. S. army. He published an account of the expedition under the title of "The Open Polar Sea" (Boston, 1867), and received for his discoveries a gold medal from the royal geographical society of London, and another in 1868 from the geographical society of Paris. In 1869, with the artist William Bradford, he explored the southern coasts of Greenland, and published "The Land of Desolation" (New York, 1872). He has also published "Cast away in the Cold," a story (Boston, 1868). He is now (1874) preparing a history of maritime discovery, and still entertains the project of reaching the north pole by way of Smith sound.

**HAYES, Rutherford B.** See supplement.

**HAYLEY, William**, an English author, born in Chichester in 1745, died in Felpham, Nov. 20, 1820. He was educated at Eton and Cambridge, and studied law, but being rich devoted himself to literature. In 1792 he made the acquaintance of Cowper, whose life he afterward wrote (1802). His "Triumphs of Temper," a poem in six cantos (1781), was perhaps the most popular of his poetical works. Among his other writings are an "Essay on Painting" (1778), "Essay on History" (1781), "Essay on Old Maids" (1785), and the "Life and Poetical Works of Milton" (1794).

**HAYM, Rudolf**, a German author, born at Grünberg, Silesia, Oct. 5, 1821. After having studied in Halle and Berlin, he became a teacher; but the Prussian government refusing to license him as a professor, he turned his attention to journalism and politics, was in 1848 elected to the Frankfurt parliament, and published *Die deutsche Nationalversammlung* (3 vols., Berlin, 1848-'50). In 1850 he edited the *Constitutionelle Zeitung* in Berlin; but being expelled from that city for having given umbrage to the authorities, he went to Halle, where he obtained a diploma, and in 1851 began to lecture on philosophy and modern German literature, and eventually obtained a professorship. He edited the *Preussische Jahrbücher* from 1858 to 1864, wrote for Ersch and Gruber's cyclopædia, and has published *Wilhelm von Humboldt* (Berlin, 1856), *Hegel und seine Zeit* (1857), *Arthur Schopenhauer* (1864), and *Die Romantische Schule* (1870).

**HAYNAU, Julius Jakob von**, an Austrian soldier, born in Cassel, Oct. 14, 1786, died in Vienna, March 14, 1853. He was an illegitimate son of the elector William I. of Hesse-Cassel, who while stationed with his regiment in the town of Haynau, Prussian Silesia, formed an illicit connection with an apothecary's daughter named Rebekka Ritter, who after a morganatic marriage with him assumed the name of Frau von Lindenheim. Two daughters and four sons resulted from this marriage, who adopted the name of their mother's birthplace. The eldest son, Wilhelm (1779-1856), became known by the unpopular part which he took in the affairs of Hesse-Cassel in 1850; the second, Friedrich, was minister of war of the elector from 1853 to 1855; the third, Ludwig, died in Heidelberg in 1843; and the fourth, the subject of this notice, entered the Austrian service in 1801 as lieutenant, was wounded and captured in the campaign of 1805 near Nördlingen, was in 1813 and 1814 with the army in Italy, and in 1815 on the upper Rhine. Having been promoted to the rank of major general in 1835, he became military commander of Gratz in 1844, and of Temesvár in 1847. Radetzky appointed him commander of Verona in 1848. In the night of July 24-25 he despatched, upon his own responsibility, a number of soldiers to Somma Campagna, and secured by this measure the victory of Custoza. Afterward he displayed his skill at the siege of Peschiera. He became notorious for his rigorous measures at Ferrara, Bergamo, and other places; and his ruthless energy in quelling the insurrection of Brescia (March and April, 1849) spread terror among the Italian population. He subsequently took part in the siege of Venice, and on May 30 he was invited to assume the supreme command of the Austrian army in Hungary. He defeated the Hungarians near Raab and elsewhere, and, protected in the flank and rear by the Russian forces, he rapidly advanced toward Szegedin, crossed the Theiss, and routed the Hungarians at Szöreg (Aug. 5) and near Temesvár (Aug. 9), by which victory he rescued that fortress and virtually terminated the war. The emperor of Austria rewarded him with the governorship of Hungary, and gave him extensive estates. The execution of the thirteen Hungarian commanders at Arad, as well as of Louis Batthyányi and other patriots at Pesh, took place under his command. His intractable and haughty temper, which on many occasions had brought him into collision with his superiors, at length caused him to be dismissed from the public service, July 6, 1850. He travelled in England, where, for his cruelty toward the Italians and Hungarians, and especially the ill treatment to which female political prisoners were said to have been subjected under his orders, he was assaulted by the draymen of Barclay's brewery in London, on his visit to that establishment in September, 1850, in such a violent manner that he barely escaped with his life. Hostile demonstrations were also

made against him in Brussels and Hanover. His name was more identified with Austrian oppression in Hungary and Italy than that of any other servant of the house of Hapsburg; but Baron Schönhals in his biography of his comrade, which appeared in Gratz in 1853, tried to exonerate him from the charge of intentional cruelty, asserting that he acted only in obedience to the orders of his masters.

**HAYNE, Isaac**, an American revolutionary officer, born in South Carolina, Sept. 23, 1745, executed in Charleston, S. C., Aug. 4, 1781. In 1780 he was a senator in the state legislature. On the invasion of the state by the British, he served in a cavalry regiment which kept the field during the final siege of Charleston. Being included in the capitulation of that place, he was paroled on condition that he should not again serve against the British while they held possession. When in 1781 the fortunes of the British began rapidly to decline, he and all others in his situation were required to join the British standard as subjects. His wife and several of his children lay at the point of death from smallpox, but his expostulations were unheard, and he went to the city, after obtaining a written pledge from the military commandant of his district that he should be allowed to return. This pledge was ignored in Charleston, and he was told that he must either become a British subject or go to prison. He subscribed a declaration of allegiance to the royal government, but only under protest against the advantage taken of him at such a moment. Thus enabled to return to his family, he maintained his pledge of neutrality. But when, by the continued success of the Americans, the British were driven from all quarters, and nothing remained to them but Charleston, they resolved to require military service of all who had given their parole. Hayne then went to the American camp, and was commissioned by the governor as colonel of a militia regiment. In July, 1781, he made an incursion to the Quarter House, a precinct within five miles of Charleston, and captured Gen. Williamson, who had gone over to the British. It was feared that Williamson would be hanged as a traitor, and the British commandant at Charleston ordered out his entire force in pursuit. Hayne's party was surprised and scattered, and he himself captured. He was taken to Charleston, and after a brief examination by a board of officers, without any trial, and no witnesses being examined, he was condemned to be hanged by the joint orders of Lord Rawdon and Lieut. Col. Balfour. He protested against this summary process, which was illegal, whether he was regarded as a British subject or as a captive who had broken his parole. The citizens and ladies of Charleston united in petitioning for his pardon; but Rawdon and Balfour were inexorable. A respite of 48 hours only was allowed him in which to take leave of his children, at the end of which period he was hanged. This vindictive measure was

discussed with great ability in the British parliament, and while both Rawdon and Balfour justified it, each was solicitous to attribute it to the agency of the other. Lord Rawdon (earl of Moira) published a justification of his conduct, which was analyzed and criticised by Robert Y. Hayne in the "Southern Review" for February, 1828.

**HAYNE, Paul Hamilton**, an American poet, born in Charleston, S. C., Jan. 1, 1831. He was educated in Charleston, and became a frequent contributor to the "Southern Literary Messenger" and other periodicals. He was for a time editor of the Charleston "Literary Gazette," was connected with the Charleston "Evening News," and was from its beginning (1857) a principal editor of "Russell's Magazine," published in Charleston. He published a volume of poems in Boston in 1854, and another in New York in 1857. These collections consist chiefly of brief poems, sonnets, and lyrics, "The Temptation of Venus, a Monkish Legend," being the longest. A third volume, entitled "Avolio, and other Poems," was published in 1859. Since then he has been a frequent contributor to periodicals, mainly of short poems. In 1873 he edited the poems of Henry Timrod, and in the same year published in Philadelphia a fourth volume of his poems under the title of "Legends and Lyrics." Since the close of the civil war he has resided in Georgia, near Augusta.

**HAYNE, Robert Young**, an American statesman, born in St. Paul's parish, Colleton district, S. C., Nov. 10, 1791, died in Asheville, N. C., in September, 1840. He was educated in Charleston, and was admitted to the bar before he was 21 years old. At the beginning of the war of 1812 he served in the 3d regiment of South Carolina troops, and then resumed practice in Charleston. In 1814 he was chosen a member of the state legislature, and after serving two terms he was elected speaker of the house, and then attorney general of the state. In 1823 he was chosen a senator of the United States. In the debates on the question of protection to American manufactures Mr. Hayne took a leading part, and in every stage of the discussion he was an uncompromising opponent of the protective system. When the tariff bill of 1824 came before the senate, he made in opposition to it an elaborate and powerful speech, in which for the first time the ground was taken that congress had not the constitutional right to impose duties on imports for the purpose of protecting domestic manufactures. He was equally strenuous in his opposition to the tariff of 1828, which roused in South Carolina the spirit of resistance that came to a crisis in 1832. In that year Mr. Clay proposed a resolution in the senate declaring the expediency of repealing forthwith the duties on all imported articles which did not come into competition with domestic manufactures. Mr. Hayne denounced this proposition, and submitted an

amendment to the effect that all the existing duties should be so reduced as simply to afford the revenues necessary to defray the actual expenses of the government. He supported this amendment in one of his ablest speeches, but it was rejected, and the principles of Mr. Clay's resolution were embodied in a bill which passed both houses and received the sanction of the president. Mr. Hayne on this occasion was the first to declare and defend in congress the right of a state, under the federal compact, to arrest the operation of a law which she considered unconstitutional. This doctrine led to the celebrated debate between Mr. Webster and himself. In consequence of the passing of the tariff bill the legislature of South Carolina called a state convention, which met at Columbia, Nov. 24, 1832, and adopted an ordinance of nullification. In the following December Mr. Hayne was elected governor of the state, while Mr. Calhoun, resigning the vice presidency of the United States, succeeded to his place in the senate. On Dec. 10 President Jackson issued his proclamation denouncing the nullification acts of South Carolina. The governor replied with a proclamation of defiance, and South Carolina prepared for armed resistance. But congress receded from its position on the protective question, the tariff was for the time satisfactorily modified, and South Carolina in another convention, of which Gov. Hayne was president, repealed her ordinance of nullification. In December, 1834, he retired from the office of governor, and was soon after elected mayor of Charleston. He was attending a railroad convention at Asheville when he contracted a fever and died.

**HAYNES, John**, governor of Massachusetts, and afterward of Connecticut, born in Essex, England, died in 1654. He came with Hooker's company to Boston in 1633, and soon after was chosen assistant, and in 1635 governor of Massachusetts. In 1636 he removed to Connecticut, and in 1639 was chosen its first governor, and every alternate year afterward, which was as often as the constitution permitted, till his death. He was one of the five who in 1638-'9 drew up a written constitution for the colony, which was the first ever formed in America, and which embodies the main points of all our subsequent state constitutions, and of the federal constitution.

**HAYNES, Lemuel**, an American clergyman, born in West Hartford, Conn., July 18, 1753, died in Granville, N. Y., Sept. 28, 1834. His father was black and his mother white. The latter abandoned her offspring, who at the age of five was bound out as a servant in a family at Granville, Mass., where he was educated as one of the children. In 1775 he joined the revolutionary army at Roxbury; in 1776 was a volunteer in the expedition to Ticonderoga; after which he returned to Granville and became a farmer. Between this time and 1780 he studied Latin and Greek, and devoted much attention to theology. In 1780 he received

license as a preacher, and was invited to supply the pulpit of a new church in Granville. Here he remained for five years. In 1785 he was ordained, and, after preaching two years in Torrington, Conn., was called to a parish in Rutland, Vt., where he was settled for 30 years. He afterward preached at Manchester, Vt., about three years; and then at Granville, N. Y., from 1822 till his death. He had great shrewdness, wit, and common sense. One of his sermons, delivered impromptu in reply to Hosea Ballou, on the subject of Universalism, passed through many editions on both sides of the Atlantic. A memoir of him was published by the Rev. Dr. Cooley.

**HAYS**, a central county of Texas, intersected by San Marcos river and watered by branches of the Colorado; area, 690 sq. m.; pop. in 1870, 4,088, of whom 1,217 were colored. A chain of thickly wooded hills crosses it from N. E. to S. W., and the rest of the surface is generally undulating. Building stone is abundant. The chief productions in 1870 were 92,420 bushels of Indian corn, 7,838 of sweet potatoes, and 1,468 bales of cotton. There were 2,448 horses, 1,863 milch cows, 6,044 other cattle, 1,481 sheep, 3,770 swine, and 2 saw mills. Capital, San Marcos.

**HAYS, William Jacob**, an American artist, born in New York, Aug. 8, 1830. He studied drawing with John R. Smith in New York, and devoting himself to animal painting, went to the head waters of the Missouri in 1860 to paint the fauna of that region. He has since visited Nova Scotia and travelled extensively through the northern part of the United States, sketching and studying the habits of the native animals. Among his principal works are: "The Herd (bisons) on the Moor" (1861); "The Stampede" (1862); "The Prairie-Dog Village" (1862); "Bison Bull at Bay" (1865); "Bull Moose of Nova Scotia" (1867); "Prairie on Fire" (1869); "Bouquet of Orchids," 86 varieties (1871); "Herd of Caribou in Nova Scotia" (1871); and "Mule Deer" (1872). Mr. Hays has in preparation a work on the "Ruminants of America," to be fully illustrated by himself.

**HAYTI, or Haïti**. **I.** An island of the West Indies, formerly called Hispaniola (Span. *Es-pañola*), and afterward Santo Domingo. It is one of the Greater Antilles, and after Cuba the largest and most beautiful of the West India islands, lying between lat. 17° 36' and 19° 59' N., and lon. 68° 20' and 74° 38' W. Its greatest length E. and W., from Cape Engaño to Cape Tiburon, is 405 m., and its greatest width N. and S., from Cape Isabella to Cape Beata, 165 m.; area, including the islands off the coast, 28,030 sq. m.; pop. about 708,500, three fourths of whom are negroes or mulattoes, and the remainder whites or mestizos. Hayti is 48 m. E. S. E. of Cuba, from which it is separated by the Windward passage, 118 m. E. N. E. of Jamaica, and 76 m. W. N. W. of Porto Rico, from which it is separated by the Mona passage. In the Windward passage, about 40 m.

W. of Cape Tiburon, is the guano island of Navaza. The island of Tortuga or Tortue lies a short distance from the N. W. coast, and that of Gonaïve in the southern division of the great gulf, 85 m. wide, formed by the vast peninsulas which stretch W., the one toward Cuba and the other toward Jamaica. Hayti is now occupied by two independent states, the republic of Hayti to the west and the Dominican Republic to the east. The island is of very irregular form, being so deeply indented by bays and inlets as to constitute a coast line of about 1,500 m., presenting numerous excellent harbors. Of the great peninsulas, the southwestern is the most conspicuous, being 150 m. long by 18 to 40 m. wide; the northwestern is about 50 m. long by 30 to 45 m. wide; and that of Samana, to the northeast, is about 40 m. long by 6 to 8 m. wide. The island is intersected W. and E. by three chains of mountains, connected by transverse ridges, and intervening are extensive plains and savannas. The central chain, the principal part of which is the Sierra del Cibao, runs E. S. E. from Cape San Nicolas to Cape Engaño; its culminating point, near the centre of the island, attains an elevation variously estimated from 7,200 to 9,000 ft. Nearly parallel with this chain is the Sierra de Monte Cristo, stretching from near the town of Monte Cristo to Escocesa bay, where it terminates abruptly. Between these two ranges extends the Vega Real or Royal valley, 130 m. long, watered by the Yuna and Gran Yaque rivers, and comprising extensive pasture lands. The third or southern mountain range commences at Cape Tiburon, extends E. through the S. W. peninsula, and terminates at the Rio Neiva, about midway between the cities of Port-au-Prince and Santo Domingo. The secondary chains, running from the main ones toward the sea, divide the country into plains of various figures and extent, which are intersected by still other ridges reaching sometimes to the beach. Besides the Vega Real, there are other extensive plains and valleys, as the *Ulanos* or flats of the southeast, also a rich pasture district 80 m. in length, and the plain of Les Cayes at the W. end of the island. The latter has been greatly extended by the formation of a kind of rock consisting of comminuted shells and coral, incrusting with calcareous cement, resembling travertine, a species of rock in process of formation throughout the whole of the West India islands; fragments of pottery and other human works have been found in it at a depth of 20 ft. The proximity of the mountains to the N. coast prevents the formation of any considerable rivers, and hence the principal streams have their courses either in a W., S., or E. direction. The Artibonite flows S. E. and N. W., and the Gran Yaque N. W.; the Yuna flows S. E.; and the Neiva, Nisao, and Ozama flow S. They are all obstructed by sand bars, and few of them are navigable even for short distances. The Ozama, however, admits vessels of any size into the harbor, and for 3 m. up is about four

fathoms deep. Lakes are numerous; those of Enriquillo and Azua are salt; the former, in the valley of the Neiva, is 20 m. long by 8 m. broad, and the latter half that size. S. of these lies the fresh-water lake of Icotea or Limon, about the size of Azua. Near the mouth of the Yuna are extensive salt marshes known by the name of Gran Estero. Mineral springs exist in various parts; in the east are the hot springs of Banica (temperature 112° to 125° F.), Biahama, Jayua, and Pargatal, and in the west the chalybeate spring of Sainte-Rose, the saline of Jean Rabel, and the sulphur of Dalmarie. The minerals found in the island are various, including gold, silver, platinum, mercury, copper, iron, tin, sulphur, manganese, antimony, rock salt, bitumen, jasper, marble, and several kinds of precious stones. The gold mines have been abandoned, and gold washing is only carried on by the poorer classes in the northern streams. Indeed, all the minerals are neglected for want of machinery and capital. On the shores of the bay of Pearls are the remarkable caves of San Lorenzo, similar in character and formation to those of Matanzas in Cuba.—The climate is hot and moist, but generally salubrious; in the north, and especially in the more elevated localities, there is a perpetual spring. The seasons are divided into wet and dry; in some localities years have passed over without a single heavy shower. The rainy season is from April to November in the W., S., and central portions, and embracing the other half of the year in the N. districts. It is only on the southern coasts that hurricanes are common. At Santo Domingo the extremes of temperature are 60° and 95°, with an annual mean of 78·5°; and at Port-au-Prince the extremes are 63° and 104°, with a mean of 81°. The maximum occurs in August and September, but the summer heats are much tempered by the sea breezes by day, and the *terral* or land breeze during the night. Hayti has on several occasions suffered from earthquakes; the most disastrous on record are those of 1564, 1684, 1691, 1751, 1770, and 1842. By that of 1751 Port-au-Prince was destroyed, and the coast for 60 m. submerged; and by that of 1842 many towns were overturned and thousands of lives lost. Vegetation is of a tropical character, except where elevation has a controlling influence, and for beauty and luxuriance is unsurpassed by any in the world. The mountains are clothed with majestic forests of pine, mahogany, ebony, fustic, satinwood, and lignum vitæ; also the *roble* or oak, the wax palm, divi-divi, and numerous other cabinet woods; while the graceful *palma real* or royal palm flourishes everywhere in the lowlands. The richest of flowering plants abound; and the usual tropical esculents, grains, and fruits, including plantains, bananas, yams, batatas, maize, millet, oranges, pineapples, cherimoyas, sapodillas, with melons, grapes, and tamarinds, grow in all parts of the islands. There is a species of agave, *Fourcroya Cubense*, extremely abun-

dant, from the fibres of which is made almost all the rope used in the country. The western or French section has always been the best cultivated and most valuable part of the island, as it is the most populous. The articles chiefly raised for export are coffee, cotton, cacao, sugar cane, indigo, and tobacco. Some of these are now less and others more extensively produced than in colonial times. In 1789, 76,000,000 lbs. of coffee were exported from the whole island; in 1854-'5 only 50,749,876 lbs. were exported; in 1855-'6 the quantity was 35,497,724 lbs.; and in 1857-'8, 46,699,270 lbs. The sugar cane was first planted here by Pedro de Atienza in 1520; and no country produces it in greater perfection. The other most important exports are guano and other manures, logwood and other dyes, and mahogany and other woods.—The native quadrupeds are small, the largest being the agouti; but the animals introduced from Europe, and now in a wild state, have thriven prodigiously, large numbers of cattle, swine, and dogs roaming freely in the savannas; the cattle of hundreds of owners graze in herds, and are annually collected and counted, and the young branded. Birds are not numerous; still large numbers of pigeons are annually taken and used as food, and ducks and other water fowl frequent the marshy places. Insects abound, many of them venomous, such as scorpions, tarantulas, and centipedes. There are many species of snakes and lizards; the iguana sometimes attains a length of 5 ft., and is then much feared; its flesh is by the natives considered a delicacy. The lakes and rivers contain caymans and alligators; in the surrounding sea whales are frequently taken; manatees or sea cows are numerous; and turtles, lobsters of enormous size, oysters, and crabs abound on the coasts. II. A republic, occupying the W. portion of the island, and divided from the Dominican Republic on the east by an irregular line drawn from the mouth of the river Anses-à-Pitre or Pedernales on the S. coast to that of the river Massacre, which flows into the bay of Manzanillo, on the N. coast. Its territory extends between lat. 17° 55' and 19° 55' N., and lon. 71° 52' and 74° 38' W., and, including the islands of Tortuga, Gonaive, &c., contains 10,204 sq. m. It is divided into six departments, and subdivided into arrondissements and communes; the population is about 570,000. The capital and chief port, Port-au-Prince, situated at the head of the great bay, has a population of about 21,000; and the other ports open to foreign commerce are Cape Haytien, Port de la Paix, Gonaives, Saint-Marc, Miragoane, Jérémie, Aux Cayes, Acquin, and Jacmel. In this portion of the island the mountains, although relatively more numerous, are of less elevation than in the E. portion; and between them are beautiful and fertile plains and valleys, well watered, and yielding spontaneously valuable timber, precious woods, and dyes. Agriculture is imperfectly carried on,

with inadequate implements. In earlier times, when the soil was cultivated by slaves, some of the staples were more abundantly produced. The articles most largely exported are coffee, cotton, cacao, wax, logwood, fustic, and other dyes, mahogany, and tortoise shell. Cotton, though always cultivated extensively here, has been subject to numerous fluctuations; before the revolution 7,200,000 lbs. were annually sent to France alone; in 1858 the total quantity exported was only 463,608 lbs. On the outbreak of the American civil war cultivators were stimulated by the rise in price from 4*d.* to 2*s.* 6*d.* per pound, and the exports increased to 5,000,000 lbs.; and notwithstanding a heavy fall in prices in 1865, the crop in 1866 reached 7,000,000 lbs. The civil war of 1868 again checked the trade, reducing the exports to 2,000,000 lbs.; but an interval of peace brought the exports for 1871-'2 to 4,130,315 lbs. The yield of the most favorable year above recorded is, however, greatly inferior to the capabilities of the country; and this restricted production is due to the disorganized state of society, the system of peasant culture, and the lack of field hands. The coffee yield has been less intermittent than that of cotton; during the last 15 years of the 18th century it averaged 70,000,000 lbs.; from 1850 to 1860 the annual average was 45,000,000 lbs., and in the following decade 60,000,000. All the Haytian coffee is in common designated Santo Domingo; it is of excellent quality, and comparatively cheap; but there is a general prejudice against it, as it is often sent away imperfectly hulled, and even with an addition of sand and gravel to increase the weight. It is mostly sent to France, where large quantities are bought for the army. The coffee exports to Hamburg were 19,303,858 lbs. in 1872, and 9,401,666 lbs. in 1873. The home consumption is estimated at 1,644,000 lbs. annually. Of cacao, which of late years has been much neglected, the produce might with care be augmented indefinitely. The quantities of the principal articles exported in the year ending Sept. 30, 1872, were as follows: coffee, 64,774,861 lbs.; cacao, 3,003,488; cotton, 4,140,315; logwood, 183,600,000; wax, 139,740; mahogany, 608,941; honey, 88,060 gallons; hides, fustic, and other articles unenumerated. Their total value was \$7,504,633. The largest share of the exports in 1871 went to England, \$1,400,000; but it is probable that much of this was for merchandise *in transitu*, the Liverpool packets taking through freight for Havre and other continental ports. The imports from England embrace small quantities of almost every article manufactured in that country, which owes this advantage to its direct steam communication with Hayti. Large quantities of English hardware are taken, and galvanized iron has of late been extensively imported for roofing houses, a precaution rendered necessary by the frequency of disastrous fires. Only the high class of provisions are brought from England, this branch

being monopolized by the United States. Certain kinds of American cotton fabrics now find a good market in Hayti; for, though somewhat dearer than the British, they are found to be more durable. The total value of the imports for the year ending Sept. 30, 1872, was \$6,860,408. The imports from England in 1870, \$3,900,000, were more than one half the total imports into the country; and although they fell to \$2,500,000 in the following year, the same proportion was preserved. The United States sent 40,399 gallons of petroleum to Hayti in 1871, 69,377 in 1872, and 87,421 in 1873. The port movements in 1871-'2 were: 904 vessels entered, tonnage 165,903, and 850 cleared, tonnage 186,985. There being little cargo in Hayti for the United States, it is advantageous to ship coffee and cotton for England *via* New York, there to be transhipped. Vessels under 50 tons burden, not being subject to tonnage dues, do not appear on official returns. Two steamers from New York make about 18 trips annually to the island. The internal carrying trade is almost exclusively carried on by horses and mules.—Owing to protracted civil wars, the finances are in extreme disorder, and it is impossible to obtain accurate statements thereof. The revenue in 1870 was estimated at 40,000,000 of *gourdes*, or \$2,500,000, and the expenditure at double that amount. There is a large floating debt, arising from the accumulation of the paper money successively emitted by several governments, especially from 1853 to 1855, when the annual emission was about 4,500,000; and this currency, amounting in 1872 to some 800,000,000, has at times been subject to great depreciation; in the year just mentioned it fluctuated from 165 to 350 per cent., while during the late civil war it was almost valueless. A measure initiated by the government in 1873 to redeem the paper money proved abortive, the rate of exchange having been fixed at 300 per cent., while the commercial value was 250 paper dollars to one of silver. Another scheme for the same purpose, namely, increasing temporarily, first by 10 and afterward by 25 per cent., the import and export duties, already very high, had an evil effect upon commerce. Smuggling became an organized system; only one half of the duties was paid to the government, and the other divided between the merchants and the custom-house officials. Heavy payments lately made to France on account of the public debt, and of the indemnity for losses sustained by French subjects during the revolution, have considerably embarrassed the finances. In 1873 a like compensation of £9,073 was paid to England. The remaining debt to France in 1872 was \$3,863,242, to be paid in 11 annual instalments.—The government is based on the constitution proclaimed on June 14, 1867, by the terms of which the legislative power rests in a national assembly composed of two chambers, the senate and the chamber of deputies, the

latter being elected by direct vote of all male citizens for a term of three years, while the senators are appointed by the deputies for two years. The executive power is vested in a president elected by the people for four years, and who must have completed 35 years of age. A president can be reelected only after a lapse of four years from the expiration of his term of office. Four ministers, of finance and foreign affairs, justice and public instruction, interior, and war, aid him in the administration of the republic. The judicial power rests in a high court of cassation, being the highest tribunal of appeals, with superior courts in the capitals of departments, and subsidiary and primary courts in the *arrondissements* and *communes*. The laws are founded on the civil code of France. The Roman Catholic is the religion of the people, under the jurisdiction of an archbishop. There are four colleges in Hayti, and each commune has a number of common and grammar schools.—Hayti was discovered by Columbus in December, 1492, and here, at Isabella on the N. shore, was founded the first Spanish colony in the new world. Santo Domingo was founded Aug. 4, 1496. For nearly half a century these settlements received much attention and rose to great prosperity; but as other parts of America were discovered, the population was drawn off, and the natives having been extirpated, the island became almost a waste. In 1585 Admiral Drake seized Santo Domingo city, for which he received a ransom of 25,000 ducats. About 1632 the French took possession of the W. shore, and their numbers (increased in a certain measure by the buccaneers who had established themselves on the island of Tortuga and on the N. W. coast of Hayti) multiplied so rapidly that the Spaniards were unable to cope with or banish them; and by the treaty of Ryswick, Sept. 20, 1697, the western portion of the island was guaranteed to France. Cultivation in Hayti (as the French now called their part of the island) rapidly extended under the new rule; a large proportion of the cotton and sugar consumed not only in France, but in all Europe, came toward the end of the 18th century from Hayti, which by that time had become one of the most valuable possessions in the new world. The boundaries between the two colonies were not fixed till 1777. In the mean time the eastern or Spanish portion made little or no progress. In 1790 the population of the western colony numbered about 500,000, of which number 38,360 were of European origin and 28,370 free people of color, the remainder being negro slaves. The free people of color were mostly mulattoes, and some of them had received a liberal education in France and possessed large estates; still they were excluded from all political privileges, and were not eligible to positions of authority or trust. The great revolution in France was heartily responded to by the whites of the colony, who sent deputies to the national as-

sembly at Paris, and proclaimed the adhesion of the colony to the principles of liberty, equality, and fraternity. The application of these principles, however, it was intended should be confined exclusively to the whites. But the mulattoes demanded their extension to themselves; and this appeal being treated with contempt and indignation, they resolved to resort to arms. Accordingly some 800 of them rose in insurrection in October, 1790, under one Vincent Ogé, who had been educated in France; but he was defeated, captured, and with his brother broken on the wheel, and 21 of his followers were hanged. Much indignation was expressed in Paris against the colonists, and by the influence of the society of *les amis des noirs*, the national assembly, May 15, 1791, passed a decree declaring that the people of color born of free parents were entitled to all the privileges of French citizens. This decree did not touch slavery or meddle with the slaves, but it excited to the highest pitch the jealousies and apprehensions of the planters, who forced the governor of the colony to suspend its operation until they could appeal to the home government. The refusal of their rights caused much commotion among the mulattoes, and civil war again appeared inevitable, when a third party, little considered by either of the others, unexpectedly interfered. The slaves on the plantations rose in insurrection, Aug. 23, 1791. The whites in alarm consented (Sept. 11) to admit the mulattoes to the civil rights granted them by law, and for a time there seemed some prospect of the restoration of peace. But on Sept. 24 the national assembly at Paris, moved by the remonstrances which had been received from the white colonists, repealed the decree of May 15. The mulattoes now flew to arms, and the civil war continued with increased ferocity on all sides for several years. Commissioners were repeatedly sent from France, but could effect nothing. The whites themselves were divided into hostile factions, royalist and republican, the French part of the island was invaded by the Spaniards and by the English, and the insurgent blacks and mulattoes under able chiefs held strong positions in the mountains and defied all efforts to subdue them. The French commissioners, involved in difficulties on every hand, at length decided to conciliate the blacks, and in August, 1793, proclaimed universal freedom, in apprehension of an English invasion, which took place in the following month. In February, 1794, the national convention at Paris confirmed this act of the commissioners, and formally guaranteed the freedom of all the inhabitants of the French colony. Meantime the English conquered the whole western coast of the island, took the capital, Port-au-Prince, and besieged the governor, Gen. Laveaux, in Port de la Paix, the last stronghold of the French, who were reduced to extremities by famine and disease. At this juncture the blacks, led by Toussaint l'Ouverture, relying on the procla-

mation of emancipation, came to the aid of the French governor. The siege of Port de la Paix was raised, the Spaniards were driven back, and after a long contest, during which Toussaint was appointed by the French authorities commander-in-chief of the army, the English in 1797 were expelled from the island, the whole of which, by the treaty with Spain concluded at Basel, July 22, 1795, now belonged to France. Under the energetic administration of Toussaint l'Ouverture, peace was restored, commerce and agriculture revived, the whites were protected and their estates restored to them, and a constitution for the colony was adopted, acknowledging the authority of France, but making no distinction between the citizens on account of race or color. In 1801, however, Napoleon Bonaparte, then first consul, resolved to restore slavery in Santo Domingo; the French legislature at Paris decreed its restoration; and an expedition under Gen. Leclerc was sent to enforce the decree. The army landed at Samana at the end of January, 1802, the campaign was commenced, and fought with various success until May 1, when a treaty of peace was concluded. Notwithstanding this treaty, Toussaint was treacherously seized at midnight, and conveyed to France, where he died April 27, 1803. Indignant at the capture of their leader, the negroes immediately renewed hostilities under Dessalines, who prosecuted the war with vigor and success; and the yellow fever, having broken out in the French army, became a more fearful and fatal antagonist than the marshalled negroes. In the midst of this calamity Leclerc died, and was succeeded in command by Gen. Rochambeau. The first act of this general was the renewal of the armistice, but it proved of no advantage to him; the blacks continued to receive reinforcements, the fever raged violently, and to add to his embarrassment, an English fleet appeared off the coast. When the period for which the armistice had been proclaimed expired, his army was reduced to a mere handful of men, powerless for either offence or defence, and was soon after driven into Cape Haytien, where on Nov. 30, 1803, the French general capitulated to the commander of the English squadron. On Jan. 1, 1804, the Haytians formally asserted their independence; and Dessalines, who had conducted the war to its close, was appointed governor for life. Not content, however, with the simple title allotted to his station, and in imitation of Bonaparte, who had six months before grasped the imperial sceptre of France, Dessalines assumed (Oct. 8, 1804) the title of Jean Jacques I., emperor of Hayti; but his reign was troublous and brief, and terminated in a military conspiracy on Oct. 17, 1806, he himself being assassinated on the same day. Hayti was now divided among several chieftains, the principal of whom were Henri Christophe in the northwest and Pétion in the southwest. The eastern part of the island was repossessed by Spain. Chris-

tophe was appointed chief magistrate for life; but in 1811, having become dissatisfied with his present honors, he changed his title to that of king, calling himself Henri I., and had the kingly office made hereditary in his family. Pétion continued to act as president of the southwest till March, 1818, when he died, universally lamented by his people. On the other hand, the despotic Christophe by his arbitrary acts provoked the vengeance of his subjects, and shot himself during a revolt against his authority in October, 1820. Boyer, who succeeded Pétion in power, now united all the governments of the west, and ruled over the whole Haytian territory. The retrocession of the eastern colony had been made at the instigation of the English government; but it was never fully acquiesced in by the inhabitants, and its possession by Spain had since been rather nominal than real. The proximity of a free republic, separated only by a conventional line, was also fraught with danger, and encouragement to revolt was not otherwise wanting. At length the people determined to be as free and independent as their neighbors, and on Nov. 30, 1821, threw off the Spanish yoke and declared their country a republic. Profiting by the dissensions that followed, Boyer, the Haytian president, now invaded the disturbed country, and in 1822 united the whole island under his government. France acknowledged the independence of its former colony in 1825, on the condition that Hayti should pay 150,000,000 (subsequently reduced to 90,000,000) francs, as an indemnity for the losses of the French colonists during the revolution. Boyer retained the presidency till 1842, when a revolution broke out against his power and compelled him to flee; and soon after the inhabitants of the east, under the leadership of Juan Pablo Duarte, rose against the Haytians, overpowered them, and in February, 1844, formed themselves into an independent state under the style of the Dominican Republic. In the following years the supreme power in Hayti was successively held by Hérard, Guerrier, Pierrot, and Riché till 1847, when Gen. Faustin Soulouque was elected president. He renewed the attempt to subjugate the eastern republic; but he, at the head of an army 5,000 strong, was opposed by Santana with only 400 men, and signally defeated at Las Carreras on the river Ocoa in April, 1849. Soulouque was a member of the secret order of Vaudoux; he was superstitious and illiterate, but possessed of great ambition. On Aug. 26, 1849, aided by the blacks, he assumed the title of emperor as Faustin I., and caused the constitution to be altered to meet the changed circumstances of affairs; and to consolidate his power, he surrounded himself by a court composed of princes of the blood, dukes, counts, barons, &c., and established two orders of knighthood, that of St. Faustin and the legion of honor. He was crowned with great pomp in 1850. His policy, which had become des-

potic; his habits, too expensive for the condition of the country; and above all his impudent robberies of the public funds, gave rise to a sullen discontent, which soon pervaded the whole country. On Dec. 22, 1858, he was deposed; and on the following day a republic was proclaimed under Fabre Geffrard. On Jan. 10, 1859, Soulouque made an attempt to regain the crown, but was compelled to surrender to Geffrard, and on the 15th he set sail for Jamaica. In September a band of conspirators attempted to assassinate Geffrard, but succeeded only in murdering his daughter. The assassins were apprehended and executed. A series of impolitic acts soon rendered the new administration as unpopular and odious as had been that of Soulouque. On the night of Feb. 22, 1867, the citizens of Port-au-Prince rose in insurrection; and Geffrard, foreseeing that a change was contemplated and imminent, tendered his abdication and fled to Jamaica, having previously secured a large amount of public money. A triumvirate was now appointed, composed of Nissage-Saget, Chevalier, and Salnave; but in June the last named was elevated to the presidency, and the present constitution at once promulgated. A new insurrection broke out against Salnave in 1868. After having been several times defeated by the revolutionists, he fortified himself in Port-au-Prince; but his fleet having been captured, the town bombarded, and the grand palace completely destroyed, he was compelled to seek safety in flight, and yielding to the persuasions of the British consul, he endeavored to escape to Dominican territory. He was, however, captured by Cabral, and on Jan. 11, 1870, surrendered to Nissage-Saget, who had meantime been called to the capital by the victorious Gen. Brice, by whom the city had been bombarded. Salnave was tried by court martial, on charges of bloodshed and treason, sentenced to death, and shot on the steps of his ruined palace. On May 29 Nissage-Saget was named president of the republic of Hayti; and he has now (April, 1874), in spite of numerous attempts to overthrow his government, almost completed his term of office, a good fortune which few of his predecessors enjoyed.

**HAYWARD, Abraham**, an English writer and translator, born about 1800. He is a lawyer, holding the rank of queen's counsel. His works are: "Statutes founded on the Common Law Reports" (London, 1832); a prose translation of Goethe's "Faust" (1833-'47); translation of Savigny's "Vocation of our Age for Legislation and Jurisprudence" (1839); "Law regarding Marriage with the Sister of a Deceased Wife" (1846); "Juridical Tracts" (1856); "Biographical and Critical Essays" (2 vols., 1858-'73); "Autobiography, Letters, and Remains of Mrs. Piozzi" (2 vols., 1861); "Diaries of a Lady of Quality from 1797 to 1844" (1864); and "More about Junius" (1868).

**HAYWOOD. I.** A W. county of North Carolina, bordering on Tennessee, and watered by

Big Pigeon river; area, about 550 sq. m.; pop. in 1870, 7,921, of whom 515 were colored. It lies between the Blue Ridge and Iron mountain, and has a rough surface with fertile river bottoms. The chief productions in 1870 were 40,734 bushels of wheat, 206,998 of Indian corn, 26,879 of oats, 11,126 of potatoes, 18,692 lbs. of tobacco, 15,299 of wool, and 76,463 of butter. There were 1,357 horses, 2,539 milch cows, 4,106 other cattle, 7,844 sheep, and 11,234 swine. Capital, Waynesville. **II.** A S. W. county of Tennessee, drained by the Hatchee and the S. fork of Forked Deer river; area, 600 sq. m.; pop. in 1870, 25,094, of whom 13,832 were colored. It has an even surface, and a fertile, well cultivated soil. The Louisville and Nashville and Great Southern railroad passes through it. The chief productions in 1870 were 38,507 bushels of wheat, 522,921 of Indian corn, 31,037 of sweet potatoes, 89,739 lbs. of butter, and 10,510 bales of cotton. There were 2,172 horses, 1,889 mules and asses, 7,706 cattle, 5,206 sheep, and 20,514 swine; 4 manufactories of carriages, 2 of tin, copper, and sheet-iron ware, and 6 saw mills. Capital, Brownsville.

**HAZARD, Rowland Gibson**, an American manufacturer and author, born in South Kingston, R. I., Oct. 9, 1801. He has been engaged from his youth in mercantile and manufacturing pursuits, in which he has accumulated a large fortune. While in New Orleans in 1841-'2, with great effort, and under repeated threats of being lynched, he obtained the release of large numbers of free negroes who belonged to ships from the north, and who had been placed in the chain gang. He was a member of the Rhode Island house of representatives in 1851-'2 and 1854-'5, and was a state senator in 1866-'7. He has published an "Essay on Language" (1834); "Lectures on the Adaptation of the Universe to the Cultivation of the Mind" (1840); "Lecture on the Causes of the Decline of Political and National Morality" (1841); "Essay on the Philosophical Character of Channing" (1844); "Essays on the Relations of Railroad Corporations to the Public" (1849); "Essay on the Duty of Individuals to Support Science and Literature" (1855); "Essays on the Resources of the United States" (1864); "Freedom of the Mind in Willing" (1864); "Essays on Finance and Hours of Labor" (1868); and "Causation and Freedom in Willing," two letters addressed to John Stuart Mill (1869).

**HAZARDVILLE, Conn.** See ENFIELD.

**HAZEBROUCK**, a town of France, in the department of Le Nord, 24 m. W. N. W. of Lille, at the junction of the Calais and Dunkirk railways; pop. in 1866, 9,017. It has several handsome public buildings, among which are the spacious and richly ornamented parish church, built from 1493 to 1520, surmounted by a beautiful spire of open work, 240 ft. high; a fine town house, an old Augustinian convent now occupied by the large linen market, a

communal college, and a normal school. There are manufactures of linen, thread, starch, soap, leather, and salt; breweries, tanneries, dye works, oil mills, and lime kilns.

**HAZEL**, the common name for shrubs or small trees of the genus *corylus*, which is by some botanists placed with the oak, chestnut, &c., in the order *cupuliferae*, while others make it the type of a small order *corylaceae*, comprising the hazel and the hornbeams. The name of the genus is an ancient one, and is supposed to be from the Greek *κέρυς*, a helmet, while the word hazel is referred by some to the Anglo-Saxon *hæsel*, bonnet. There are seven recognized species of the genus *corylus*, two of which are natives of North America. These are small, much branched shrubs, rarely over 6 ft. high, and very common along the edges of woods and by roadsides and in thickets. They are among the first plants to open their flowers in spring; the staminate and pistillate flowers are in aments very dissimilar in appearance, and both upon the same plant; the male or staminate flowers are in cylindrical pendulous aments 2 or 3 in. long, and consist of a wedge-shaped scale, beneath which are about eight anthers; being perfectly formed the autumn before, these aments

Hazel Flowers.

Hazel Leaves and Fruit.

are ready to open with the first warm days, and when quite in flower they are tremulous with every breeze and scatter their pollen profusely. The pistillate aments are small, and might be overlooked by a careless observer, as they appear so much like buds. A close inspection will

show a cluster of delicate crimson stigmas projecting from the apex of the bud-like ament; the fertile flowers are very simple, consisting of an ovary with two elongated styles, placed in the axil of a scale and accompanied by two small bracts, which as the fruit matures increase rapidly in size, and ultimately form an envelope or husk which encloses it; the fruit is a one-seeded nut with a bony shell and a large sweet kernel. The most abundant American species is the common or American hazel, *C. Americana*, which has a nut about three fourths of an inch broad, somewhat less in length, and surrounded by a husk longer than itself, but which is open down to the nut; this involucre consists of two leafy bracts, which are thick below, with their margins cut and fringed. This species extends from Canada to Florida and west of the Mississippi. The nuts vary in size and quality, but at the best are inferior to the imported. The beaked hazel, *C. rostrata*, is a smaller bush than the other, and mainly differs from it in the form of the husk, which closely surrounds the nut and is prolonged beyond it into a long bristly beak; its form has been compared to that of a long-necked bottle; the nuts are less pleasant to the taste. This is more common northward and upon mountains southward, and extends to the Pacific coast; a variety of it has even been found near the Amoor river in Asia.—The most important *corylus* is *C. Avellana*, which produces the well known imported filbert. The specific name is said to be from *Abellina* in Asia, which Pliny supposed to be its native country, but it is found wild in various parts of Europe and Asia, and to a limited extent in northern Africa. In its natural state the filbert forms a large bush, but by keeping down the suckers which it so abundantly produces it may be made to form a tree 20 or 30 ft. high. The filbert is largely cultivated in England and on the continent. This species has nearly the same general appearance as the American hazel bush, but the fruit is much larger, while the involucre or husk is not usually longer than the nut. It is but little cultivated in this country, and is only now and then seen in gardens, chiefly as a curiosity. With proper care in pruning there seems to be no obstacle to its cultivation here; those who have tried it say that it yields abundantly. In England, where much attention is given to their cultivation, the bushes are kept to the height of about 6 ft., and in their early growth are pruned with a view to produce a great number of lateral branches, as it is upon these that the fruit is borne. There are 30 or 40 named varieties recorded, but not more than half a dozen are in general cultivation. The name filbert, or "full-beard," is given to those with a long husk; those with a short husk are called hazel-nuts, or simply nuts; while those with a short nut and a thick shell are known as cobs. Among the most valued varieties is the Cosford, which has a very long nut with a thin shell. In two of the esteemed

cultivated rarities, the red and the white filbert, the husk is so much prolonged beyond the nut that some botanists have regarded it as a species, *C. tubulosa*; another marked variety is the frizzled nut. It is said that 30 cwt. of nuts have been produced upon a single acre. In England the nuts are preserved and sold in the husk; after being thoroughly dried they are sometimes subjected to the fumes of burning sulphur to prevent moulding; some for the same purpose pack them with salt. Besides the large quantities raised in England, the importation, chiefly of Barcelona nuts, is very large, over 140,000 bushels having been imported in a single year. Those brought to the United States come almost wholly from the south of Europe; a very small quantity of English nuts in the husk are sold by city fruit dealers. The wood of the filbert is very close-grained, and furnishes tough and flexible shoots for making crates, hoops, whip handles, withes, and the like. A variety with dark purple foliage is cultivated as an ornamental shrub. An Asiatic species, *C. colurna*, forms a large tree; its nuts are imported into England under the name of Smyrna or Constantinople nuts; they yield an oil valued by painters.

**HAZLETON**, a borough of Luzerne co., Pennsylvania, on the dividing ridge between the Delaware and Susquehanna rivers, about 2,000 ft. above the sea, and 80 m. N. N. W. of Philadelphia; pop. in 1860, 1,707; in 1870, 4,317; in 1874, about 7,000. It is connected with the seaboard by the Lehigh Valley railroad, and with the west by the Danville, Hazleton, and Wilkesbarre line. It has a very healthful summer climate, and is resorted to during that season by many wealthy families from the seaboard and inland cities. It is the centre of the Hazleton coal field, commanding the trade of that district, and contains the shops of the Hazleton division of the Lehigh Valley railroad, two planing mills, two grist mills, a furniture factory, a foundry, a large hotel, two banks, a daily and two weekly newspapers, three public school buildings, and eight churches.

**HAZLITT**. **I.** William, an English author, born in Maidstone, April 10, 1778, died in London, Sept. 18, 1830. His father, a Unitarian clergyman, sent him to the Unitarian college at Hackney to be educated for the ministry. But he devoted himself to philosophy and art, and on leaving college determined to become a painter. He painted portraits with tolerable success, but finding he was not likely to reach a high standard, he renounced the art. In 1805 appeared his essay on "The Principles of Human Action," after which he became a regular contributor to newspapers of political articles and theatrical art criticisms, which, with his criticisms on literature and literary men, constitute his chief claim to remembrance. Among his best known works are: "Characters of Shakespeare's Plays" (8vo, London, 1817); "A View of the English Stage" (1818); "Lectures on the English

Poets" (1818); "Lectures on the English Comic Writers" (1819); "Lectures on the Literature of the Elizabethan Age" (1821); "Table Talk" (2 vols. 8vo, 1824); "The Spirit of the Age" (1825), containing sketches of the leading public characters of the day; an essay on the fine arts in the "Encyclopædia Britannica;" and the "Life of Napoleon Bonaparte" (4 vols. 8vo, 1828), dictated by enthusiastic admiration of his subject. In 1836 appeared his "Literary Remains," with a notice of his life by his son, and thoughts on his genius and writings by Sir E. L. Bulwer and Sergeant Talfourd (2 vols. 8vo). Hazlitt's free comments upon living authors made him many enemies. He was married in 1808, and divorced in 1823, and in the succeeding year married a wealthy widow. **II.** William, an English author, son of the preceding, born in Wiltshire, Sept. 26, 1811. He was called to the bar in London in 1844, and appointed registrar of the court of bankruptcy in 1854. He is chiefly known in the world of letters by editions of some of his father's works; an edition of the writings of De Foe (3 vols. 8vo, 1840); translations of Michelet's "Roman Republic," Guizot's "History of the English Revolution" (12mo, 1846) and "History of Civilization" (3 vols. 12mo, 1846), Thierry's "History of the Conquest of England by the Normans" (2 vols. 12mo, 1847), and Huc's "Travels in Tartary, Thibet, and China" (1852); and an edition of Johnson's "Lives of the Poets," with additions, from the earliest period to the close of the last generation (4 vols. 12mo, 1854). In connection with Mr. Roche he has compiled a "Manual of Maritime Warfare" and editions of the bankruptcy acts of 1861 and 1869. **III.** William Carew, an English author, son of the preceding, born Aug. 22, 1834. He entered the Inner Temple in 1859, and was called to the bar in 1861. He has written "The History of the Venetian Republic" (4 vols., 1858-'60); "British Columbia and Vancouver Island" (1858); and "Sophy Laurie," a novel (1865). He has also edited "Old English Jest Books" (3 vols., 1864), "Remains of the Early Popular Poetry of England" (4 vols., 1864-'6), the works of Charles Lamb (4 vols., 1866-'71), "Memoirs of William Hazlitt" (2 vols., 1867), "Bibliography of Old English Literature" (1867), "English Proverbs and Proverbial Phrases" (1869), "Popular Antiquities of Great Britain" (3 vols., 1870), and a new edition of Warton's "History of English Poetry" (4 vols., 1871). In the last named work he was assisted by several eminent antiquaries.

**HEAD**. **I.** Sir George, an English author, born near Rochester in 1782, died in London, May 2, 1855. He served as commissary in the British army during the war in the Peninsula, and also in Nova Scotia and the Canadas. He published "Forest Scenes and Incidents in the Wilds of North America," "Home Tour," and "Rome, a Tour of Many Days." **II.** Sir Francis Bond, an English author, brother of the pre-

ceding, born near Rochester, Jan. 1, 1793, died July 20, 1875. While an officer in the engineers a company engaged him to explore the gold and silver mines of South America, between Buenos Ayres and the Andes. He arrived in Buenos Ayres in 1825, and in a short time had completed the work, having crossed the pampas four times and the Andes twice, and ridden more than 6,000 miles, most of the time alone. His "Rough Notes of a Journey across the Pampas" (1826) gives a graphic description of his expedition. In November, 1835, he was appointed lieutenant governor of Upper Canada, and held office during the insurrection of 1837; after which he returned home and published a narrative in which he justified the severe measures he had taken against the insurgents. For his services in suppressing the rebellion he was created a baronet in 1838, and received the thanks of the legislatures of Upper Canada, Nova Scotia, and New Brunswick. In 1867 he was made a privy councillor. His remaining works are: "Bubbles from the Brunnen of Nassau" (1833); "Life of Bruce" (1844); "The Emigrant" (1847); "Stokers and Pokers" and "The Defenceless State of Great Britain" (1850); "A Fagot of French Sticks" (1851); "A Fortnight in Ireland" (1852); "Descriptive Essays" (1856); "The Horse and his Rider" (1860); and "The Royal Engineer" (1870).

**HEADLEY, Joel Tyler**, an American author, born in Walton, Delaware co., N. Y., Dec. 30, 1814. He graduated at Union college in 1839, studied at Auburn theological seminary, and was pastor for two years at Stockbridge, Mass. Obligated by the failure of his health to abandon his profession, he travelled in Europe in 1842-'3, and after his return published two volumes entitled "Letters from Italy" and "The Alps and the Rhine" (New York, 1845), which were received with favor. In 1846 he published "Napoleon and his Marshals" (2 vols. 12mo) and "Sacred Mountains," and in 1847 "Washington and his Generals" (2 vols.). Among his later publications are lives of Oliver Cromwell, Winfield Scott, Andrew Jackson, and Washington; "Adirondacks, or Life in the Woods" (1849); "The Imperial Guard of Napoleon from Marengo to Waterloo" (1852), founded on a popular French history by E. M. de Saint-Hilaire; a "History of the Second War between England and the United States" (2 vols., 1853); "Sacred Scenes and Characters;" "Life of General Havelock" (1859); "The Great Rebellion, a History of the Civil War in the United States" (2 vols., 1863-'6); "Chaplains and Clergy of the Revolution" (1864); and "Sacred Heroes and Martyrs" (1870). Mr. Headley resides near Newburgh, on the Hudson river. In 1856-'7 he was secretary of state of New York.

**HEALY, George Peter Alexander**, an American painter, born in Boston, July 15, 1813. He went to Paris in 1836, where he remained several years, alternating his residence there with oc-

casional visits to the United States. He is known for his portraits of Louis Philippe, Marshal Soult, Gen. Cass, Calhoun, Webster, Pierce, Gen. Sherman, O. A. Brownson, W. H. Prescott, H. W. Longfellow, and other prominent persons. His large historical picture of "Webster's Reply to Hayne," which contains 130 portraits, was completed in 1851, and now hangs in Faneuil hall, Boston. At the great Paris exhibition in 1855 he exhibited a series of 13 portraits and a large picture representing Franklin urging the claims of the American colonies before Louis XVI., for which he received a medal of the second class. He resided in Chicago from 1855 to 1867, when he went to Europe, and now (1874) lives in Rome.—His daughter MARY is the author of "Lakeville" (1871), and other successful novels.

**HEARD**, a W. county of Georgia, bordering on Alabama, and intersected by the Chattahoochee river; area, 286 sq. m.; pop. in 1870, 7,866, of whom 2,648 were colored. The surface is hilly and well wooded with oak, hickory, and pine. Gold, lead, and iron have been found, and the soil is generally rich. The chief productions in 1870 were 22,771 bushels of wheat, 151,435 of Indian corn, 13,406 of sweet potatoes, and 3,508 bales of cotton. There were 637 horses, 744 mules and asses, 1,231 milch cows, 2,282 other cattle, 3,012 sheep, and 6,425 swine. Capital, Franklin.

**HEARING**. See ACOUSTICS, and EAR.

**HEARNE, Samuel**, an English explorer, born in London in 1745, died in 1792. In early life he served as a midshipman under Hood, but upon the conclusion of the seven years' war he entered the employment of the Hudson Bay company, and made several journeys into the northern regions of British America in quest of a northwest passage and of mines of the precious metals. In 1770-'71 he descended the Coppermine river about 80 m. to the Arctic ocean. He was promoted for these services, and in 1787 returned finally to England. In 1795 appeared his "Journey from the Prince of Wales's Fort, in Hudson's Bay, to the Northern Ocean; undertaken by order of the Hudson's Bay Company for the Discovery of Copper Mines, a Northwest Passage, &c., in the Years 1769, 1770, 1771, and 1772" (4to, London).

**HEARNE, Thomas**, an English antiquary and author, born at White Waltham, Berkshire, in 1678, died June 10, 1735. He graduated at Oxford in 1699, and became janitor of the Bodleian library in 1701, and in 1712 second librarian. Three years later he was appointed archtypographus of the university and esquire beadle of civil law; but being a strong Jacobite, he was soon compelled to resign his offices. His plodding industry and irritable temper brought upon him the ridicule of many satirists, and Pope described him in the "Dunciad" under the name of "Wormius." Among Hearne's most valuable publications, which number more than 40, and the greater

part of which were printed by subscription at Oxford, are the "Life of Ælfred the Great," from Sir John Spelman's manuscript in the Bodleian library (8vo, 1709); Leland's "Itinerary" (9 vols. 8vo, 1710-12); and Leland's "Collectanea" (6 vols. 8vo, 1715).

**HEART**, a hollow muscular organ, the centre of the circulatory apparatus, situated within the cavity of the chest, giving origin to the arteries and receiving the termination of the veins. In the human species it is conical, with its base upward and backward, on the median line, from the fourth to the eighth dorsal vertebra, and its point directed downward, forward, and to the left, reaching nearly to the level of the sixth costal cartilage. In the human subject its length is about 5 in., its breadth about  $3\frac{1}{2}$  in., and its average weight a little less than 10 oz. Its size in any particular individual corresponds very nearly with that of the closed fist. In man and all the warm-blooded vertebrate animals the heart is double, that is, it consists of two lateral halves, right and left, separated by an impervious partition; the right half being destined to receive the venous blood returning from the general circulation and send it to the lungs; the left half receiving the arterialized blood from the lungs and sending it into the arterial system, to be distributed throughout the body. The left half is considerably the thicker, more muscular, and more powerful; the impulse required to propel the blood through the general circulation being greater than that needed to carry it through the vessels of the lungs. Each half consists of two cavities communicating with each other, called respectively the "auricle" and the "ventricle." The auricle is the smaller and thinner, receiving the blood directly from the veins, while the ventricle is the larger and stronger, receiving the blood from the auricle and discharging it into the corresponding artery. Between the auricle and ventricle, on each side, is an opening, the "auriculo-ventricular orifice," through which the blood passes from the former to the latter. From the right ventricle originates the pulmonary artery, going to the lungs, and from the left ventricle the aorta, the main trunk of the arterial system. The heart is so placed within the chest that the right auricle and ventricle are situated rather upon its anterior, and the left auricle and ventricle rather upon its posterior portion; so that in a front view the right side of the organ comes most prominently into notice. The great arteries also arise from the base of the heart in such a way that the commencement of the pulmonary artery is in front and a little to the left, that of the aorta rather behind and to the right. Thus the two streams of blood, arterial and venous, in passing through the heart, cross each other in an obliquely spiral direction; the venous blood, which enters the right auricle, passing out by the pulmonary artery on the left, and the arterial blood, which enters by the left auricle, passing out

by the aorta on the right. The structure of the heart, as already intimated, is essentially muscular. Its muscular fibres, which form by far the greater part of its mass, belong to the striped variety, resembling in this respect the fibres of the voluntary muscles. They are dis-

FIG. 1.—The Heart, Great Vessels, and Lungs—Front View. *R.V.*, right ventricle; *L.V.*, left ventricle; *R.A.*, right auricle; *L.A.*, left auricle; *Ao.*, aorta; *P.A.*, pulmonary artery; *P.V.*, pulmonary veins; *R.L.*, right lung; *L.L.*, left lung; *V.S.*, vena cava superior; *V.I.*, vena cava inferior.

tinguished from the latter by two peculiarities: their smaller size, and the fact that, although generally arranged in a parallel direction, they frequently anastomose with each other, thus forming a kind of muscular network, and no doubt affording mutual points of support at the time of their contraction. The general arrangement of the muscular fibres of the heart is spiral and circular. They originate principally from a strong fibrous ring surrounding the auriculo-ventricular orifices. Thence the fibres destined to form the walls of the auricles pass upward and encircle these cavities with a variety of interlacing bands, some of which pass across the intervening septum and thus connect the two auricles by muscular fibres common to both. The fibres of the anterior portion of the right ventricle also pass obliquely downward across the interventricular septum, and wind spirally round the apex of the left ventricle. The deep-seated fibres of each ventricle are still more strongly spiral and even nearly circular in direction, like the transverse fibres of the intestine, so that when they contract like the fingers of a closed hand, they nearly obliterate the cavity of the ventricles. At their termination they again run upward, and are attached to the auriculo-ventricular

FIG. 2.—Muscular Fibres of the Heart.

ring from which they originated, or, by fleshy columns, to the tendinous chords of the ventricular valves. Besides its muscular tissue, the heart is covered externally by a serous and fibrous membrane, the pericardium, and is lined internally by another serous membrane, the endocardium; the latter of which is continuous with the lining membrane of the blood vessels. At each of the great orifices of the heart are membranous valves, composed of a thin and flexible but strong fibrous tissue, so arranged as to allow the blood to pass freely onward in its course, but to prevent its flowing back in the opposite direction. Those situated at the auriculo-ventricular orifices are the ventricular valves; those at the orifices of the great arteries are the arterial valves. Each set, on the right and left side, has also received a special name corresponding to certain peculiarities of form or position. The right ventricular valve is composed of a broad fibrous

having the form of semilunar bags, with their concavities toward the wall of the artery to which they are attached, and their convexities toward the cavity of the ventricle. Thus when the stream of blood passes from the ventricle into the artery, the valves are flattened against the wall of the vessel, and offer no resistance to its current; but when distended by a backward impulse they fill with blood, and, their edges coming in contact, they close the orifice of the ventricle in this direction. Both sets of arterial valves, from the similarity of their figure, are called semilunar valves; but they are also known as the pulmonary or the aortic valves, according to the particular vessel in which they are situated. They are usually described in connection with the heart; but it is evident from what has been said above that they belong in reality rather to the arterial system.—The action of the heart consists in an alternate contraction and relaxation, by which at one instant it receives the blood from the veins and at another propels it into the arterial system. In this process the two auricles, right and left, contract simultaneously; and the two ventricles subsequently contract, also at the same instant with each other. Still the auricular and ventricular contractions are not distinctly and separately alternate with each other, to the same extent as the strokes of the two pistons of a force pump. The action of the heart appears rather to consist in a single continuous contraction, which begins at the auricle and thence runs forward to terminate at the ventricle. The ventricular action is much more powerful than that of the auricle; and of the two ventricles the left is so much the more important in size and strength, that mainly to the action of this part are due the changes in form and position of the heart at the instant of contraction. The contraction of the ventricles is almost instantly followed by their relaxation; and while in this condition they are gradually filled by the blood flowing steadily into them from the veins and through the quiescent auricles. Then comes the contraction of the auricles, which completes the distention of the ventricular cavities; and this distention is at once followed by the vigorous contraction of the ventricles, discharging their blood in great abundance, to be followed again by a period of relaxation. This is the succession of the phenomena which present themselves when the heart is seen in activity during life.—At every ventricular contraction the substance of the heart becomes harder; it twists slightly upon itself from left to right; and its point strikes the walls of the chest, in the human subject, in the fifth intercostal space, a little to the left of the edge of the sternum. The induration of the organ at the moment of its activity is due to its muscular nature, since the same tension and momentary induration can be felt in any of the voluntary muscles in contraction. Such a muscle, when in activity, becomes swollen and at the same time harder

sheet with three main points or divisions, whence it is called the tricuspid valve. Its floating edges are easily displaced from the auricle toward the ventricle, thus allowing the blood a free passage in this direction; but on being forced backward, from the ventricle toward the auricle, its free edges come in contact with each other and are firmly held in this position by a number of tendinous chords running from its edge and under surface to the inner wall of the ventricle below, which are now put upon the stretch. Thus the passage from the ventricle to the auricle is completely closed, and it can be opened only in a forward direction. The left ventricular valve is similar to the right, except that it consists of only two main pointed sheets, like the two halves of a bishop's mitre; it is therefore called the mitral valve. It is supported in position by tendinous chords, as in the former instance (fig. 3). At each of the arterial orifices are three valves,

to the touch; and the induration disappears when the muscle becomes relaxed. That the induration of the heart really coincides in time with the contraction of the ventricle and the compression of the blood, may be easily shown by an experiment first performed by Harvey, namely, by thrusting a small metallic canula through the substance of the left ventricle into its cavity, upon which the blood is driven out from the external orifice of the canula in interrupted jets, each jet corresponding in time with the induration and tension of the substance of the heart. The movement by which the point of the heart strikes the walls of the chest produces a visible and tangible undulation of the integument at the fifth intercostal space. This is called the "impulse." The impulse is a valuable guide for the physician in many cases, as it is increased to an abnormal degree in cases of hypertrophy of the heart, and also displaced from its natural location when the organ is enlarged or from any cause altered in position. The heart is loosely attached, at its base, by means of the great vessels to the anterior surface of the spinal column; but its body and apex are nearly unconfined, being covered only by the pericardium, whose exterior is itself a serous membrane, being invested by the free surface of the pleura. Consequently, while the base of the heart is generally fixed, the point of the organ may move in various directions when compressed or encroached upon by neighboring growths. When the heart is simply enlarged, its point is turned further toward the left side. When the pericardium is distended with an accumulation of serum, the point of the organ fails to reach the walls of the chest, and the impulse disappears altogether. When there is an accumulation of fluid in the left pleural cavity, the point of the heart may be turned completely over to the right of the sternum, so that the impulse may be felt on that side. There are also cases, though rare, in which, from a congenital malformation, the relative position of all the internal organs is reversed, the heart being placed on the right side, the liver on the left, the spleen and great pouch of the stomach on the right, &c. The abnormal position of the heart may be more easily distinguished during life than that of any other internal organ, owing to its very perceptible impulse against the walls of the chest.—The action of the heart is accompanied by two peculiar sounds, very audible when the ear is applied to the front part of the chest. These sounds follow each other, in the healthy condition, with perfect regularity, and are both produced at each cardiac contraction. They are known as the first and second sounds of the heart. The first sound occurs at the instant of the ventricular contraction. It is distinct, but slightly prolonged, and is heard most plainly over the anterior and lateral surface and toward the apex of the organ. It is produced by the shutting back and sudden tension of the ventricular valves, combined, ac-

cording to some authorities, with the muscular action of the heart's walls and the passage of the blood through its cavities. The second sound, which immediately follows the first, is shorter, but sharper and clearer. It is heard most distinctly over the sternum at the level of the third costal cartilage. Doubtless it is due exclusively to the shutting back of the arterial valves (aortic and pulmonary); since, in the first place, it is heard with remarkable clearness directly over the situation of these valves, and becomes fainter and less marked as the ear is moved further away; and secondly, it has been found by experiment upon the larger animals that if these arterial valves be hooked back by a curved needle introduced into the base of the great vessels, the second sound immediately disappears, but returns again as soon as the valve is liberated. The character, regularity, position, and relative intensity of these sounds often become valuable signs to the medical man in determining the nature and progress of affections of the heart.—The pulsations of the heart follow each other, in every species of animal, with a certain degree of rapidity. Generally speaking, this rapidity is greater in the warm-blooded, less in the cold-blooded animals. In species of the same class, the pulsations are more rapid in the smaller, less so in the larger. In the human subject the average rapidity of the cardiac pulsations, for an adult male, is about 70 a minute. They are more frequent, as a rule, in young children and in the female sex; and there are variations in this respect, within certain limits, in particular persons, owing to individual peculiarities of organization. Thus it would not necessarily be an abnormal sign to find in any particular person the habitual frequency of the heart's action from 60 to 65, or from 75 to 80 a minute. As a general rule, the heart's action is slower and more powerful in fully developed and muscular persons, more rapid and feebler in those of slighter organization. In all cases the heart is temporarily excited to increased frequency of action by unusual exertion or by nervous excitement; and its pulsations also become more rapid in many diseased conditions, particularly those of a febrile character. The heart's action is always purely involuntary, being entirely independent of the will. Its persistency is very remarkable. In the warm-blooded animals the heart's action ceases in a very few minutes after the destruction of the nervous centres, or after the circulation of the blood in its own vessels is arrested by hæmorrhage, by ligature, by the stoppage of respiration, or by excision of the heart itself; since, like the other organs in these animals, it requires a constant supply of freshly arterialized blood to preserve its vitality. But in the cold-blooded animals it will continue to beat for many hours after it has been emptied of blood, and even after it has been cut out of the chest and separated from all its nervous and vascular connections. The pulsations of the separated heart have been seen

to go on in the eel for six hours, in the torpedo for nine hours, and in the salmon for twenty-four hours. In the turtle, the brain and medulla oblongata having been destroyed, the heart, left *in situ* but drained of blood, continued to pulsate for more than eight hours; and the heart of the same animal, cut out of the body, drained of blood, divested of pericardium, and exposed upon an earthen plate, continued its action for four hours. This shows that the heart, as a muscular organ, is endowed with an unusual degree of irritability. Other muscles contract only occasionally, on the application of a special stimulus; but with the heart the contractions are incessantly repeated, with only momentary intervals of relaxation, from the first periods of embryonic existence to the latest moment of life. This irritability is so great that the contact of any foreign substance, even that of the atmospheric air or the plate upon which the separated organ rests, is sufficient to produce a contraction, which is repeated at intervals as soon as the muscular irritability has again accumulated by a short interval of relaxation. During life, it is believed, the immediate stimulus to each cardiac contraction is the filling of its cavities by the blood which flows into them. When this distention is complete, the ventricles respond by a contraction, empty themselves, and then remain quiescent until again filled to their full capacity, when the motion is repeated. But for this to go on, as it does, indefinitely, the inherent irritability of the heart must be very great, as compared with other muscles; and in fact, as mentioned above, its motions may continue to be excited for a considerable period by the contact of the external atmosphere or other foreign bodies.—In the inferior animals the heart varies in size, form, and construction, according to the general external configuration of the body, and particularly according to the arrangement of the organs of respiration, and the activity with which this function is performed. In the warm-blooded animals, namely, mammalia and birds, whose respiration is very active and performed by lungs, the heart is a double organ with four cavities, as in man; consisting of a right auricle and right ventricle destined for the pulmonary circulation, and a left auricle and left ventricle for the general circulation. Since in these animals, in order to provide for the necessary activity of respiration, all the venous blood must constantly pass through the lungs before reaching the arterial system, the two sets of cavities in the heart are completely distinct from each other, the venous blood being carried exclusively to the lungs for aëration, and the pure arterialized blood alone being disseminated through the arterial system. But in the reptiles which are air-breathing animals but of sluggish respiration, the two ventricles are imperfectly separated from each other, the septum between them being more or less perforated, or, as in the crocodiles, the two ventricles communicating with the same artery.

In the batrachia, the heart consists of but three cavities, two auricles, and one ventricle. Thus the venous blood from the right auricle and the aërated blood from the left auricle are mingled in the cavity of the single ventricle, and this mixed blood is sent partly to the lungs and partly to the general circulation. Thus the blood sent to the organs of the general circulation is never so highly aërated as in the mammals, and the blood sent to the lungs is never completely venous. This is no doubt one reason why respiration can be so long suspended in these animals without producing death. In fishes there is but a single auricle and a single ventricle, destined to receive the venous blood coming from the body, and to propel it into an arterial trunk, by which it is conveyed to the gills. After passing through these organs the arterialized blood is again collected in a single trunk corresponding to the aorta, and thence distributed throughout the body. In the fishes, accordingly, the entire heart represents the right side of that organ, as it exists in the mammalia; its contractions being sufficient to insure the passage of the blood through the organs of respiration, and afterward also through the whole arterial system.

**HEART, Diseases of the.** The diseases of the heart are: 1, inflammatory affections; 2, organic diseases, or structural lesions; and 3, functional disorder. The inflammatory affections are distinguished from each other and named according to the particular structure inflamed. Inflammation of the serous membrane which covers the organ and lines the heart sac (pericardium) is called pericarditis. Inflammation of the membrane lining the cavities of the organ (endocardium) is called endocarditis. Inflammation of the substance of the organ (muscular and connective tissue) is called myocarditis or carditis. **I. INFLAMMATORY AFFECTIONS.—Pericarditis.** The inflammation in pericarditis may be either acute or subacute and chronic. Acute pericarditis is characterized by the same local morbid effects essentially as acute inflammation affecting other analogous serous membranes, as for example acute pleurisy. The inflammatory product called coagulable lymph or fibrinous exudation is found after death in more or less abundance, covering the inflamed membrane, together with the effused liquid or serum, the quantity of this varying in different cases, and holding in suspension flakes of lymph. If recovery take place, the lymph and the serum disappear, and in place thereof new tissue is formed causing permanent adhesion of the heart to the pericardial sac, either wholly or in part. An entire obliteration of the space between the heart and this sac, by means of this newly formed tissue, is not incompatible with the continuance of life and health. Acute pericarditis may be produced by penetrating wounds or contusions of the chest. Exclusive of these so-called traumatic causes, the affection occurs in connection with acute articular

rheumatism, or rheumatic fever. The affection is generally secondary to some other disease, most frequently rheumatism. It sometimes occurs in connection with either acute or chronic disease of the kidneys; also in some cases of pleurisy and pneumonia. It is a rare complication in cases of pyæmia, scurvy, erysipelas, and the eruptive and continued fevers. As a primary affection it is exceedingly rare. An attack of pericarditis is generally indicated by acute, lancinating pain, referred to the region of the heart, increased by a deep inspiration. Its intensity varies considerably in different cases, being sometimes excruciating, and sometimes slight or even wanting. There is also more or less tenderness on pressure over the region of the heart, and its action is notably increased. With these local symptoms are associated those pertaining to the system at large which accompany symptomatic fever. As the affection is almost always developed in connection with other diseases, the symptoms of the latter are of course combined with those of the former. After a time, which in some cases consists of only a few hours, the local symptoms are liable to be modified by the effects of the accumulation of liquid within the pericardial sac. The movements of the heart are restrained in proportion as the liquid is abundant and rapidly effused. The pulse may now become feeble and irregular, and the patient suffer from a distressing sense of oppression, which is increased by any muscular exertion or by emotional excitement. The compression of the heart may be the cause of death, which sometimes occurs suddenly after some exertion or excitement.—The diagnosis or recognition of pericarditis has been rendered prompt and positive by means of auscultation and percussion. Soon after the attack, the exudation of fibrine occasions a friction sound with the heart's movements, and this is proof of the existence of the disease. Afterward, when considerable liquid has been effused into the sac, the friction sound may cease, but it is practicable to determine the presence and the quantity of liquid within the sac by physical signs, which are obtained by auscultation and percussion. The danger in cases of pericarditis depends, other things being equal, on the intensity of the inflammation, the quantity of exuded fibrine, and the amount of effused liquid. Aside from these conditions, much depends on the diseases with which it is associated. When developed in connection with rheumatism, it ends in recovery in the majority of cases; but occurring in connection with disease of the kidneys, with pleurisy or pneumonia, and in cases of pyæmia, it ends in death much oftener than in recovery. When death is not sudden, the disease destroys life by slow asthenia or exhaustion.—As regards treatment, acute pericarditis claims in general the measures indicated in other inflammatory affections. These measures, however, are in many cases to be modified by the circum-

stances pertaining to the diseases with which this is associated. A very important fact proper to the affection, however, is that the source of danger is the weakness of the heart as a direct effect of the inflammation, and as caused by the pressure of liquid within the sac. This modifying fact contra-indicates active measures of treatment which in themselves tend to impair the power of the heart's action. Whenever the effusion of liquid is such as to compress the heart, measures having for their object the absorption of the liquid are indicated. In the treatment of rheumatism an important object is to prevent the development of this complication; and clinical experience has shown that this object is promoted by the use of alkaline remedies.—Chronic pericarditis may be a sequel of the acute affection, or the inflammation may be subacute from the first. In some cases the inflammation continues with an abundant exudation of lymph, agglutinating the inner surfaces of the sac, and proving fatal by slow exhaustion. In other cases a large accumulation of liquid takes place, amounting to several pounds in weight; and to the exhaustion incident to the persistence of the inflammation is added the compression of the heart thus occasioned. In both varieties the disease, as a rule, proves fatal sooner or later. A few cases have been reported in which the liquid has been removed by puncture of the chest, and relief of distressing symptoms has been thereby obtained. The removal of liquid from the pericardial sac through a very small canula by means of suction, or, as it is called, aspiration, can be effected without danger from the operation, and it remains to be ascertained whether in some instances recovery may not follow.—*Endocarditis.* In this affection the inflamed membrane is in contact with the blood contained within the cavities of the heart; hence, although fibrinous exudation takes place as in pericarditis, the exuded lymph is in a great measure washed away from the membrane and carried into the circulation. A portion, however, adheres to the membrane, roughening the surface in contact with the blood, and giving rise to an abnormal sound (an endocardial or bellows murmur), which is an important physical sign of the disease. Moreover, upon the little masses of lymph which adhere to the membrane coagulated fibrine from the blood contained in the cavities of the heart is apt to be deposited; and in this way are produced the so-called vegetations or warty growths which, being sometimes detached and carried into the arteries with the current of the blood, are arrested in vessels too small to allow of their further progress, become fixed, and occasion an obstruction which may lead to hæmorrhage (hæmorrhagic infarctions), and to the impairment of nutrition within a circumscribed area beyond the point at which the obstruction is seated. These movable plugs or emboli, as they are termed, play an important part

in affections proceeding from disturbance of the circulation and nutrition in different organs of the body, more especially the brain. (See BRAIN, DISEASES OF THE.) The phenomena thus produced are treated of by medical writers under the head of embolism, and the study of these phenomena within the last quarter of a century has enlarged in no small degree the boundaries of pathological knowledge. The local effects of endocarditis are also of much importance as laying the foundation for progressive changes, especially in the valves of the heart, constituting what are called valvular lesions. The inflammation in endocarditis is generally limited to the left side of the heart, that is, to the endocardial membrane lining the left ventricle and the left auricle.—Like pericarditis, this is very rarely a primary disease; and in the great majority of cases it occurs in connection with acute articular rheumatism. It is evidently due to the same internal agency which in rheumatism causes the inflammation within the joints, this agent being a morbid principle in the blood, supposed to be lactic acid. Endocarditis occurs in a much larger proportion of cases of acute articular rheumatism than pericarditis. These two diseases are associated whenever rheumatic pericarditis occurs; in other words, the latter affection rarely if ever occurs in rheumatism without the co-existence of endocarditis. The development of endocarditis is attended with little or no pain or other subjective symptoms referable to the heart; and hence the knowledge of its existence followed the application of auscultation to the study of diseases of the chest. The diagnosis rests wholly upon physical evidence obtained by auscultation. The roughening of the endocardial membrane within the left ventricle causes, as already stated, an adventitious sound or murmur, and the production of this murmur while a patient is under observation constitutes the proof of the presence of the affection. The diagnostic murmur accompanies the first sound of the heart, and is referable to the mitral valve. The immediate danger from endocarditis is slight; indeed, there is no immediate danger to life except from the formation within the heart of a clot (thrombosis) of sufficient size to arrest the circulation either within the heart or the large vessels. The liability to embolism has been already referred to, but this is seldom if ever directly fatal. The affection, however, is by no means one of small importance, the danger being that valvular lesions may be the result. These lesions, progressively increasing, may at a period more or less remote, often after the lapse of many years, occasion death.—As regards treatment, endocarditis calls for no active measures. It is important that undue action of the heart be prevented as far as possible by enjoining mental and physical quietude, and relieved, if it exist, by soothing remedies. The alkaline treatment in cases of rheumatism is preventive to a certain extent of this affection, as it is of peri-

carditis. It is probable also that the judicious use of alkaline remedies moderates the intensity of the endocardial inflammation, and thereby diminishes its local effects.—*Carditis, or Myocarditis.* Inflammation of the substance of the heart, irrespective of the pericardium and the endocardium, is extremely rare. Suppurative inflammation, however, sometimes occurs, giving rise to an abscess in the walls of the organ or in the septum between the ventricles. The pus contained in the abscess may be discharged into the pericardial sac, causing pericarditis, or into the ventricular cavity, causing purulent infection of the blood (pyæmia). Induration produced by a morbid increase of the tissue which unites together the muscular fibres, is another effect of inflammation seated in the walls of the organ. There are no means of determining during life the existence of carditis or myocarditis. II. ORGANIC DISEASES. The organic diseases or structural lesions to which the heart is liable relate, first, to the valves and orifices, and second, to the walls of the organ.—*Valvular Lesions.* In the great majority of cases these are seated in the left side of the heart, being either mitral or aortic, or in both the situations indicated by these terms. The changes embraced under the name valvular lesions are various, arising from morbid thickening or attenuation, calcification (formerly called ossification), rupture of valves, &c. The various changes, however, produce their evil results chiefly in two ways, namely, by affecting the valves so as to render them more or less incompetent to perform their functions, and diminishing the size of the mitral or aortic orifice so as to produce more or less obstruction to the passage of blood. The lesions which render the valves incompetent permit the blood to flow backward or regurgitate, and hence they are sometimes distinguished as regurgitant lesions. On the other hand, those which diminish the size of the orifices prevent the free passage of the blood in its direct or onward course, and hence they are termed obstructive lesions. Not infrequently the lesions are such as to involve both regurgitation and obstruction at the same orifice. The lesions may be situated at either the mitral or the aortic orifice, or at both orifices; and in some instances one or both of the corresponding orifices in the right side of the heart, the tricuspid and the pulmonic, are the seat of analogous lesions.—Obstruction of the flow of blood through the orifices within the heart, and regurgitation, lead to enlargement of the organ and to various morbid effects in other organs. The effects of mitral lesions relate especially to the lungs. Owing to the congestion of the lungs induced by obstruction and regurgitation at the mitral orifice, the changes in the blood effected by respiration are impeded, whence the sense of want of breath which in certain cases of disease of the heart is the source of great distress. Hæmorrhage into the air tubes and into the air cells sometimes results from the

congestion due to mitral obstruction. An effect of the persistent pulmonary congestion caused by mitral lesions is an over accumulation of blood in the cavities of the right side of the heart, and from this effect follows general dropsy. Aortic lesions interfere especially with the circulation throughout the arteries of the system; the immediate effect is to keep the left ventricle over-distended with blood. The regurgitant lesions in this situation render the supply of arterial blood to the heart itself insufficient, and more than any other involve the liability to sudden death. It is a popular impression that all organic affections of the heart involve this liability. This is far from being true; sudden death occurs in only a small proportion of cases.—Valvular lesions generally occur as a sequel of acute articular rheumatism. They often take place slowly, and for a long time they are latent as regards any symptoms of which the person affected is conscious. Their progress, as a rule, is unattended by pain, and in general it is not until they have induced a certain amount of enlargement of the heart that the evils just referred to begin to be apparent. Not infrequently many years elapse before they give rise to any marked effects. When not a sequel of rheumatism, they may arise from changes in nutrition incident to old age, and they are sometimes due to syphilis. The valves of the heart may be imperfectly developed, or lesions may result from disease occurring in fetal life. These congenital lesions are oftener seated in the right than in the left side of the heart. In a considerable proportion of the cases of young children affected with organic disease of the heart, the primary lesions are congenital.—The diagnosis of valvular lesions has been rendered very complete by means of auscultation. With very rare exceptions, they give rise to adventitious sounds, or murmurs, the characters of which, as regards their situation, their transmission in different directions, and their relations to the heart sounds, enable the physician not only to determine the existence of lesions, but to localize them, and to distinguish between those which involve obstruction and regurgitation. Moreover, the normal heart sounds are modified in such a way as to afford information of the extent to which the valves are injured by the lesions. Auscultation, indeed, enables the physician to determine the existence, the seat, and the character of valvular lesions, long before they have occasioned any apparent morbid effects of which the patient is conscious.—When valvular lesions have advanced sufficiently to produce obvious symptoms referable to either obstruction or regurgitation, or to both, they will destroy life sooner or later. The duration of life varies within wide limits; often a great amount of injury is tolerated for a long period. The lesions are irremediable, and therefore the treatment does not embrace recovery as an object; but much may be done by judicious manage-

ment to relieve symptoms, to postpone serious evils, and to prolong life. The more important of the measures of management relate to a proper regulation of the habits of life as regards diet, exercise, &c. While excessive muscular exercise is to be avoided, such an amount as is taken without discomfort may be highly useful by improving the general condition of the system. While excesses in eating and drinking are hurtful, a deficient alimentation is not less so. In brief, a great end of treatment is to render the system tolerant of the lesions as much and as long as possible, and this end is promoted by such a course of management, hygienic and medicinal, as conduces to the general welfare of the economy.—*Enlargement of the Heart.* This is of two kinds, namely, enlargement due to an increase of muscular structure, and enlargement from increased size of the cavities. The first is represented by greater weight of the heart, and is called hypertrophy; the second is distinguished as dilatation, and is represented by augmented volume, without necessarily any increase of weight. But whenever the heart is considerably enlarged, the two kinds of enlargement, as a rule, are combined; and when combined, an important distinction relates to the predominance of either the hypertrophy or the dilatation. Enlargement from an increase of muscular structure, without dilatation, is called simple hypertrophy; and enlargement solely from increased size of the cavities is called simple dilatation. Enlargement by hypertrophy is the result of an abnormal growth of the muscular structure; and the growth of this involuntary muscle takes place, just as voluntary muscles are made to grow, by long continued increased exercise. An immediate effect of obstructive and regurgitant valvular lesions is an undue accumulation of blood in certain of the cavities of the heart; the organ is thereby stimulated to increased power of action, and in this consists the pathological connection between valvular lesions and hypertrophy. But hypertrophy has its limitations; like the voluntary muscles, the muscular structure of this organ can only grow to a certain extent. It is a noteworthy fact that hypertrophic growth of the heart under the circumstances noted, so far from being an evil, is a positive advantage. The muscular strength of the organ being augmented by its muscular growth, it is enabled better to carry on the circulation despite the difficulties pertaining to the valvular lesions. In this point of view, hypertrophy of the heart is conservative or compensating. When hypertrophy has reached its maximum, the undue accumulation of blood in the cavities of the heart leads to dilatation; the walls yield more and more to the distention. Thus, in general, hypertrophy precedes dilatation, the latter taking place after the muscular structure has increased to the extent of its ability to grow. Causes other than valvular lesions may give rise to enlargement by hypertrophy and dilata-

tion. Emphysema of the lungs, and sometimes other affections which impede the free circulation of blood through these organs, involve an over filling of the right ventricle with blood; and the mechanism of the hypertrophy and dilatation which follow is the same as when the enlargement is caused by valvular lesions. Enlargement also occurs in some cases of chronic disease of the kidneys, the probable explanation being that the circulation through the capillary vessels is impeded, and hence the heart is excited to increased muscular exertion. Enlargement of the heart in different cases has its primary seat in different portions of the organ, and the enlargement of certain portions predominates. Thus valvular lesions at the aortic orifice induce first and especially enlargement of the left ventricle; mitral lesions lead particularly to enlargement of the left auricle and of the right ventricle; pulmonary emphysema leads to enlargement of the right, and renal disease to enlargement of the left side of the heart. These facts are sufficiently explained by the immediate bearing of the causative conditions on the blood currents and the quantity of blood in the different cavities of the heart. It is a question whether enlargement is ever a result of the disturbances of the heart's action embraced under the name functional disorder. Cases in which this causative relation exists are certainly extremely rare.—The symptoms and morbid effects of enlargement vary much according as hypertrophy or dilatation predominates, or as either exists without the other. The effects referable to hypertrophy are due to the increased power of the heart's action, proportionate to the increase of its muscular structure. If hypertrophy exist alone, or if it greatly predominate, this increased power is represented by an increased momentum of the blood in the arteries. Active congestion, more especially within the skull, is sometimes a consequence. This effect would be of much more frequent occurrence were it not that in most cases of hypertrophy there are valvular lesions which tend to diminish the quantity of blood sent into the arteries. Aortic and mitral lesions, either obstructive or regurgitant, have this tendency, and hence they are conservative as regards the prevention of active congestion of the brain and other organs. The effects of dilatation are the opposite of those referable to hypertrophy. Dilatation involves weakness of the heart, and its ability to propel the blood through the arteries is lessened in proportion as the heart is dilated. This power of enlargement is not, like hypertrophy, compensatory or conservative, when associated with valvular lesions; on the contrary, many of the evils of organic disease of the heart are attributable to the weakness incident to it. Dilatation of the right side of the heart resulting from mitral lesions stands in immediate relation to general dropsy, and in a certain degree to the defective pulmonary circulation. Dilatation of the left ventricle resulting from aortic le-

sions renders this part more liable to become distended with blood, causing paralysis of the muscular walls and sudden death.—Enlargement of the heart and its extent are easily determined by means of physical signs furnished by the touch (palpation) and percussion. By the touch it is found that the apex beat is more or less lowered and carried to the left of its normal situation. Between the apex and the base of the organ are often found impulses not perceptible in health. By percussion the boundaries of the organ are readily ascertained in the great majority of cases. The vocal resonance also, as heard with the stethoscope, enables the physician to define the limits to which the organ extends. Palpation and auscultation furnish signs by which predominant hypertrophy may be differentiated from dilatation. If hypertrophy predominate, the impulses of the heart as felt by the hand are strong, and often there is a heaving movement extending over the region of the heart. The first sound of the heart, over the apex, is abnormally loud, long, and booming. On the other hand, if dilatation be considerable or great, weakness of the organ is denoted by feeble impulses and by diminished intensity together with shortness and a valvular quantity of the first sound of the heart in the situation of the apex. With these physical signs are associated, on the one hand, symptoms and effects denoting a morbid increase of the power of the heart's action in hypertrophy, and on the other hand, in dilatation, those proceeding from a morbid feebleness of the organ.—Hypertrophy of the heart seldom calls for treatment with a view to lessen or remove this lesion. To do this would in general not be desirable were it practicable; and it is not practicable, because the hypertrophy is in most cases a result of conditions which of necessity continue. It would not be desirable, inasmuch as the lesion protects against the evils which would otherwise flow from the causative conditions, and it is therefore a conservative provision against these evils. It is different with dilatation; it is desirable to prevent the progress of this kind of enlargement, and to obviate the weakness of the heart which it induces. Measures of treatment may do considerable toward the accomplishment of these objects. The heart may often be strengthened by dietetic, hygienic, and medicinal measures to promote assimilation and nutrition; and in as far as the muscular structure of the heart is rendered strong and vigorous, it is less likely to yield to the distention of the blood within its cavities and become more and more dilated. There are some remedies which seem to exert a direct tonic influence upon the muscular structure of the heart. Digitalis is pre-eminently a remedy of this character. By the judicious use of this remedy in conjunction with hygienic treatment, the heart sometimes regains in a measure the strength which has been impaired by dilatation, the distressing

evils which have already ensued being greatly relieved. This latter statement has reference especially to dropsy and suffering from a sense of the want of breath. Life may be often prolonged and the tolerance of the lesion promoted by appropriate management.—*Atrophy of the Heart.* This is a lesion the reverse of enlargement, the term denoting a morbid diminution of the size of the organ. The heart is greatly diminished in size, and in some cases of great emaciation its weight may be reduced to  $4\frac{1}{2}$  oz. Under these circumstances the atrophy is in accordance with the general condition, and gives rise to no special morbid effects. Atrophy may be produced by the adhesions which result from pericarditis, and the diminished muscular power thus induced may give rise to morbid effects dependent on feebleness of the circulation. As the size of the heart can be determined with much precision by physical signs, the diagnosis of atrophy is practicable. From its infrequency, however, and the very small proportion of cases in which it has pathological significance, it is not a lesion of much importance.—*Fatty Degeneration.* This term is not applied to the deposit of fat upon the heart or between the muscular fibres of its walls. The organ is sometimes overloaded with fat in these situations, and is doubtless thereby burdened; but serious consequences never follow. Fatty degeneration of the heart means a substitution of fat for the proper muscular substance, and this takes place without as well as with an increase of the adipose tissue of the organ, and is a lesion of serious import. It is evident that in proportion as fat is substituted for the muscular substance, the power of the heart's action must be weakened. If the structural change be considerable and extensive, morbid effects and danger arise from the enfeebled circulation. The pulse is small, compressible, irregular, and sometimes notably slow; there is breathlessness on exertion; the patient readily faints, and there is danger of death from over distention of the cavities of the heart. The lesion involves softening of the muscular structure, sometimes resulting in rupture. There are no special physical signs which denote this lesion, but auscultation and palpation show persistent weakness of the heart's action. The apex impulse is feeble or not appreciable, and the first sound of the heart is feeble, short, and valvular over the apex. The lesion may exist alone, or it may coexist with valvular lesions and enlargement; in the latter case its existence is not easily determined. When it exists alone the diagnosis may be made with much positiveness, taking the symptoms and signs which have been mentioned in conjunction with the following facts: Fatty degeneration occurs rarely before middle age; it exists more frequently, but by no means invariably, in connection with general obesity; and it is often accompanied by the fatty change in the cornea known as the *arcus senilis*. The treatment

consists of a highly nutritious diet, into which fatty articles should enter sparingly, together with the employment of hygienic measures and remedies designed to give tone to and to invigorate the heart. The lesion is irremediable; that is, the fibres which have undergone degeneration are never restored to their normal condition. All that is to be hoped for from treatment relates to the tolerance of the affection for an indefinite period, and the relief of symptoms.—*Miscellaneous Lesions.* Softening of the muscular structure of the heart, irrespective of fatty degeneration, may occur in connection with the continued and eruptive fevers, scorbutus, pyæmia, and other diseases. It is due to disturbed nutrition, and is accompanied by great feebleness of the circulation. Softening as thus produced is not irremediable; restoration takes place on recovery from the diseases to which it is secondary.—Rupture of the heart has been mentioned as an accident occurring in connection with fatty degeneration. It may occur also as a result of circumscribed suppurative inflammation in the muscular walls, and of aneurismal dilatation. It is one of the causes of sudden death. If the rupture be of sufficient size to admit of the free escape of blood into the pericardial sac, the loss of blood and the compression of the heart by the blood accumulating in the sac, prove immediately or quickly fatal. Sometimes, however, the opening is so small that death is slowly produced, and cases have been reported in which the orifice has been temporarily closed by a coagulum of blood, and the escape of blood in sufficient quantity to cause death has been delayed from one to two days. Cicatrization and recovery are perhaps not beyond the limits of possibility, but it may be doubted whether there is an authentic case on record.—Cancer, hydatid cysts, fibrous growths, calcareous deposits, and other affections involving serious lesions, are very rarely seated in the heart; and when they are, their existence cannot be determined during life.—Wounds of the heart with perforation of the walls are of necessity fatal, death taking place as in cases of rupture. Foreign bodies, however, may remain imbedded in the muscular substance without giving rise to any serious inconvenience for an indefinite period. The writer has seen a specimen in which a pistol ball was found in the walls of the right ventricle, the patient having received the wound 20 years before his death, and the cause of death being an attack of pneumonia. III. FUNCTIONAL DISORDER OF THE HEART. Under this name are embraced all kinds of disturbed action occurring irrespective of either inflammation or any structural lesion. The forms of functional disorder are various. A frequent form is that commonly known by the name palpitation, consisting of violent or tumultuous action, of which the patient is distressingly conscious, occurring in paroxysms very variable as regards their duration and their recurrence. In severe cases patients of

ten say that the heart seems to rise into the throat, or it seems to be struggling to get out of the chest. Frequent intermittency of the heart's action is another form; the patient is sensible of the intermissions, and feels as if there was danger at any instant of the heart ceasing to act. In some cases the heart acts regularly, but with more or less rapidity. Patients sometimes describe a sensation of fluttering in the chest. A strong beat followed by a feeble beat, the latter sometimes not giving rise to a pulsation at the wrist, and this alternation going on regularly for hours, days, or weeks, is a curious form of disorder; and want of unison in the action of the right and the left ventricle, causing reduplication of the sounds of the heart, is another equally curious. In most instances functional disorder occasions great anxiety and apprehension, patients thinking that there must be organic disease of the heart, and that they are in danger of sudden death. It is often very difficult to convince them that they have only a functional disorder, which, however distressing, is devoid of danger. The mental uneasiness caused by a functional disorder in general far exceeds that felt in cases of serious organic disease. From the sympathetic relations between the mind and the heart, functional disorder of the latter is frequently due to mental excitement and depression, and the disorder is apt to be increased or perpetuated in consequence of the attention becoming concentrated on the heart's action as represented by the beats and the pulse. Other causes which produce and keep up functional disorder are the immoderate use of tobacco, dyspeptic derangement, and abuse of the sexual function. Gouty persons are liable to it. It is especially apt to occur in connection with impoverishment of the blood (anæmia). There is a constitutional tendency to disorder of the heart's action in some persons, who may be said to have irritable hearts. These persons are often subject to it more or less during their lives. It is vastly important to discriminate between functional disorder and organic disease of the heart, inasmuch as the former is unattended with danger, and has little or no tendency to eventuate in the latter; and this assurance by the physician not only relieves needless anxiety on the part of the patient, but often does much toward effecting a cure. In determining that an affection of the heart is purely functional, a physical examination by means of auscultation and percussion must be made, and a positive conclusion can only be based on the result of this examination. If the result be negative, that is, if none of the signs of structural lesions be found, the inference is that the affection is functional. In order to reach this conclusion with positiveness, of course the physician must be confident in his ability to recognize the signs of organic diseases, and, therefore, to exclude them by finding no physical evidence of their existence. —In severe attacks of functional disorder, re-

lief is obtained by the use of narcotic remedies, such as belladonna or opium; and if persistent, cardiac sedatives, especially aconite, are useful as palliatives. An alcoholic stimulant sometimes affords temporary relief, and also the so-called antispasmodic remedies, such as valerian, asafoetida, and the ethers. With a view to permanent relief or the prevention of paroxysms, the causes which have been named are to be removed whenever these are ascertained; derangements of the digestive system, if present, are to be remedied if practicable; and if the patient be anæmic, it is important to restore the normal condition of the blood.—A remarkable affection consists in a persistent frequency of the heart's action, associated with enlargements of the thyroid gland (goitre), and in some cases with a notable projection of the eyeballs. This affection has received different names. It is often called "Graves's disease," from the fact that the connection between the functional affection of the heart and the goitre was pointed out by the late Dr. Graves of Dublin in 1835. The German writers designate it Basedow's disease, after a German observer who described it in 1840. Other names are exophthalmic goitre, exophthalmic cachexia, and anæmic protrusion of the eyeballs. A rapid action of the heart, the pulse ranging in different cases from 100 to 140 per minute, may continue uninterruptedly for many years. The goitre rarely progresses to a great extent. The projection of the eyeballs varies in different cases, being sometimes so great that the eyelids are unable to cover them, and giving to the face a strikingly ferocious expression. In most cases anæmia exists in a marked degree, and there is usually much nervous irritability. The pathology of the affection is obscure, but the disorder of the heart always precedes the goitre and the protrusion of the eyeballs. With our present knowledge, it is very little under therapeutic control. Sedative remedies to moderate the frequency of the heart's action, and measures having reference to the impoverished condition of the blood, are indicated, together with hygienic treatment to invigorate the system. Complete recovery is in general not to be expected; but the affection does not tend to destroy life, and may be tolerated for many years. The long persisting frequency of the heart's action may lead at length to enlargement of the organ. Moreover, the affection tends to impair the ability to resist any important disease which may become developed.

**HEART'S CONTENT**, a seaport of the district of Trinity, Newfoundland, on an inlet of the E. shore of Trinity bay, 37 m. N. W. of St. John's; lat. 47° 50' N., lon. 53° 20' W.; pop. about 900. It has a fine harbor, and the surrounding scenery is picturesque. The inhabitants are chiefly engaged in fishing, but farming and ship building are pursued to some extent. The Atlantic telegraph cables have their western terminus here.

**HEAT**, the natural force or principle which is known by its effects upon matter, causing it to expand, or to assume a solid, a liquid, or a gaseous condition, according to the degree with which it acts and the nature of the body. It is also known by its effects upon the sense of feeling, but only in a comparative manner; because a body at the same temperature may produce a sensation of heat at one time, and at another a sensation of what is called cold, in consequence of a variation of temperature in the organs of touch; and a body may at the same time seem cold to one hand and warm to the other. The science which treats of the phenomena and properties of heat is called thermotics. Two general theories of the nature of heat have been held from the earliest times: one regarding it as a kind of subtle matter which insinuates itself into the substance of bodies, and resides there with a greater or less manifestation of its presence; the other as simply a condition of matter, a force, or a molecular motion. Some of the ancients called it the fourth element, which by its levity rose to the highest place in the heavens and spread itself in ethereal lambent flames over the universe; and the ancient philosophers of all nations generally regarded it as a subtle efflux, an attribute or manifestation of creative power, or as the creative power itself, the vital spirit of the universe; and thus the sun was by many nations regarded with peculiar veneration, and adopted as the chief object of worship, forming the basis of religions which have been preserved by some peoples till the present time. Democritus (born 460 B. C.), regarded as the originator of the doctrine of atoms which in the hands of John Dalton twenty-two centuries later was elaborated to a highly philosophical theory, and which since his day has been placed upon a basis of almost mathematical precision, conceived heat to be an efflux of minute spherical particles, having a rapid motion by which they penetrated the densest substances. He believed that the finest of those particles formed the substance of the soul, and Lucretius held similar views. Aristotle considered it to be a condition of matter rather than a substance, and was probably the first to suggest an immaterial or purely mechanical theory. In later times Francis Bacon advocated the doctrine of its immateriality, and some passages in his *Novum Organum* are remarkable for the hints they contain of the dynamical theory of heat; he says: "Heat is a motion of expansion, not uniformly of the body together, but in the smaller parts of it; and at the same time checked, repelled, and beaten back, so that the body acquires a motion alternate, perpetually quivering, striving, and struggling, and irritated by repercussion, whence springs the fury of fire and heat." Descartes also, in his *Principia Philosophica*, has some observations foreshadowing the vibratory theory, in which he speaks of heat as being the motion of the insensibly small par-

ticles of matter, and upon this theory explains why bodies get hot under concussion. Locke, a half century later, places the theory in a still clearer light. "Heat," he says, "is a very brisk agitation of the insensible parts of an object which produces in us that sensation from whence we denominate the object hot; so that what in our sensation is heat, in the object is nothing but motion." (Works, vol. iii., p. 327, London, 1823.) The ideas of the old philosophers on the subject of heat possessed a good deal of vagueness, and were derived mainly from speculation, and not from actual experiment. They were not even put to the test of inquiry as to their adequacy to account for phenomena; and although they contained germs of truth, they cannot be regarded as much more than the remarkable opinions of great minds, who lacked the advantages of accurate chemical and physical investigations. Between the time of Descartes and Locke, Becher, a German chemist living in England, proposed a theory, more fully elaborated soon after Locke's time by Stahl under the name of the phlogistic theory, which held that phlogiston is the principle of heat, and that combustible matter is a union of this principle with ordinary matter, and that when this is burned the phlogiston is expelled. To account for the increase in weight of metals after calcination, it was held that the combination with phlogiston, in consequence of its buoyancy, rendered them lighter. The discovery of oxygen by Priestley, and the establishment of the oxygen theory of combustion by Lavoisier, overturned the phlogistic theory, but left in its place an equally material theory which regarded caloric as the imponderable element which constitutes heat. Lavoisier and Black were the great promulgators of the material doctrine, holding that caloric is an actual substance having the power of combining with ponderable matter and of passing from one body to another. The caloric theory lasted a long time, and perhaps did not obstruct the progress of science as much as is often thought, for many important results were obtained by experiments which were made under a belief in its truth. It was easier to conceive of definite quantities of a substance susceptible, as heat was, of measurement, than of quantities of motion which had not been demonstrated, and of which no definite conception had been formed. The doctrine that heat could not be produced, but was an original and indestructible element, passing from one body to another, was also a consequence of these views, and any experiments which seemed to demonstrate that heat could be generated by mechanical motion were calculated to overturn it. Such experiments were made by Count Rumford in 1796-'8, soon after by Sir Humphry Davy, and more recently by Mr. Joule of Manchester, by which it was demonstrated that mechanical power and heat were mutually convertible forces. A description of these experiments, and a discussion

of the doctrine of the convertibility of forces, will be found in the article *CORRELATION OF FORCES*. The experiments of Rumford and Davy were made about 80 years ago, but were not at the time regarded as conclusive; nor were the more refined demonstrations of Thomas Young of the truth of Huygens's theory of light. It seems to have required the later investigations of Fresnel, Cauchy, Malus, Melloni, Tyndall, Sir William Hamilton, and others, to adapt the undulatory theory to the explanation of all the phenomena of radiation, to render the mechanical demonstrations acceptable. It is interesting to observe the clearness with which Rumford and Davy so long ago stated their views upon the nature of heat. In a tract published in 1798, giving an account of his experiments at Munich, the former says: "It appears to me to be extremely difficult, if not quite impossible, to form any distinct idea of anything capable of being excited and communicated in the manner that heat was excited and communicated in these experiments, except motion." In a tract contained in a volume published at Bristol in 1799, Davy says: "Heat, then, or that power which prevents the actual contact of the corpuscles of bodies, and which is the cause of our peculiar sensations of heat and cold, may be defined a peculiar motion, probably a vibration of the corpuscles of bodies, tending to separate them." In his "Chemical Philosophy," published in 1812, he says: "The immediate cause of the phenomenon of heat, then, is motion, and the laws of its communication are precisely the same as the laws of the communication of motion." The dynamical theory of heat may therefore be stated in almost the words quoted above. It holds that heat consists in the vibratory motion of the particles of matter, and that it may be produced by mechanical force, such as friction, percussion, or compression, or by the electric current; or that it may be communicated by the undulatory ether, the medium of radiation. Its communication from one body to another when they are in contact, or through a homogeneous body, from particle to particle, constitutes conduction.—*Sources of Heat*. According to the nebular hypothesis of Laplace, heat is a primal force which caused all matter at one time to exist in a gaseous condition, which by the action of gravitation and other forces has been aggregated into masses assuming solid and liquid conditions. But the opinion has been advanced by J. R. Mayer and Waterson, and more recently elaborated by Helmholtz and Thomson, that the sun owes its heat to the force of gravitation acting upon the particles of matter, which at the beginning are assumed to have been at considerable distances from each other, and causing by their clashing together the evolution of heat. According to either theory, the sun is regarded as a vast storehouse of radiant heat from which the earth derives its supply, and has done for myriads of years, through most of the geolo-

gic ages. Estimations have been made by Pouillet which show that the sun emits a quantity of heat per hour equal to that which a layer of anthracite coal 10 ft. thick would yield in combustion. Chemical combination, including the combustion of fuel, is a secondary source of heat, originally derived from the sun, which furnished the energy necessary to the formation of the fuel. The intensity of heat produced by combustion attains its maximum in the oxyhydrogen blowpipe, in which a heat approaching 4000° F. is reached. Mechanical action, either in the form of compression, percussion, or friction, develops heat in quantities equivalent to the force converted into it. The electric current is another source of heat, and an example of the equivalent conversion of one force into another. When the current is produced by the rotation of magnets, there is a conversion of the mechanical force expended in effecting the rotation into electricity, and this under proper circumstances into heat. When the current is produced by the chemical action of a battery, the origin of whatever heat is obtained may be considered as arising from the combustion of the elements in the battery. The intensity of heat obtained by the electric current is considerably higher than that of the oxyhydrogen blowpipe, but the amount cannot be stated with any degree of accuracy.—*General Effects of Heat*. The most obvious effects of heat on matter are to cause it to expand and to assume different states, as the solid, liquid, and gaseous. Thus, under the ordinary pressure of the atmosphere, water at a temperature below 32° F. is a solid; between 32° and 212° it is a liquid; and above 212° it is in a gaseous condition. With a few exceptions, an increase of heat in bodies causes them to expand. Thus, a metallic bar which has a diameter just sufficient to enable it to be passed through an orifice, will by being heated become too large; the heat vibrations have been intensified, and the bar has increased in bulk. In what this slight expansion consists it is impossible to say with certainty; whether the molecules require greater space in which to vibrate, or whether they expand by a slight separation of the atoms of which they are composed, is not known; it is possible that both causes unite to produce the effect. When, however, a body by the application of heat is converted into vapor, a repulsive force is generated between the particles when a certain temperature is reached which produces a far different phenomenon from ordinary expansion; an active repulsion has been generated, which may exist between molecules, as in the vapor of water or alcohol, or between the atoms. Moreover, the atoms composing molecules may be completely separated, molecular disintegration, and consequently decomposition of the substance, taking place. Heat when it has such an effect is called the heat of dissociation, and is required in different degrees by different bodies. (See *DISSOCIATION*.) Thus, the atoms composing the

molecules of oxide of silver are dissociated at a comparatively low temperature, while the molecules of water require a white heat to produce dissociation between the hydrogen and oxygen atoms composing it. The elements of oxide of lead are also dissociated by a comparatively low temperature when oxygen is excluded, while to cause dissociation between the atoms of oxygen and iron in oxide of iron requires so high a heat that separation is difficult, except in the presence of a third body, an example of which is the reduction of iron ore by charcoal or anthracite, in which, however, the heat of dissociation is not reached. Advantage is taken in the arts of the expansion which heat produces in bodies for various industrial operations, such as the placing of tires on wagon wheels and the moving of immense weights or resistances, as the drawing toward each other of the walls of buildings. (See EXPANSION.) The construction of instruments for the measurement of heat is also founded upon the property of expansion. (See PYROMETER, and THERMOMETER.) It sometimes occurs that at the temperature at which a liquid solidifies there is expansion instead of contraction, as in the solidification of iron and bismuth, and also of water, a familiar example, in which the expansion is made obvious in the floating of the less dense ice; and mechanical advantage is often taken of this property of expansion during congelation to rend asunder masses of rocks or iron vessels. The phenomena and philosophy of combustion are treated under the title COMBUSTION; the expanding force of heat, particularly with reference to liquids and solids, under BOILING POINT and EXPANSION; the transmission of radiant heat, especially in connection with the diathermanous properties of different bodies, under DIATHERMANCY; the generation of heat by mechanical means and by electricity, and its correlation with these forms of energy, under CORRELATION OF FORCES, ELECTRICITY, FRICTION, and GALVANISM; and the causes of solar heat and its continuance or dissipation, under SUN. The remainder of this article will therefore be principally devoted to a consideration of the more general laws of radiant heat, of the conduction of heat, and of specific and latent heat. I. RADIANT HEAT. The undulatory theory of radiation will be treated in the article LIGHT, and only such of its laws will be given here as are necessary for the treatment of the subject, and some of the reasons which indicate the identity of the two forces. A beam of light from the sun, or from any highly incandescent body, consists of a great number of rays propagated by transverse vibrations in the ethereal particles. These vibrations are of variable amplitude, corresponding to the particular kinds of rays, and these rays have the property of being refracted when passing from one medium to another in an oblique direction, as when passing from air into glass, and again from glass into air or any other medium. Those rays which consist of vibra-

tions of greater amplitude have been found the least refrangible, and also to be those which in a greater degree than the others produce the effects of heat. When a beam of light is dispersed by a triangular prism made of rock salt, a highly diathermanous substance, there is formed a luminous spectrum of various colors in which heat is more or less distributed, abounding more in the red or least refrangible light than in other portions; but far more in that part of the spectrum which is composed of invisible rays of still less refrangibility than the red. It is estimated that the amount of heat contained in the invisible or non-luminous part beyond the red rays is more than seven times as great as that in the luminous part. Here, then, is a proof that rays of light and rays of heat are transmitted together in ordinary radiation of compound light. Now, if they are found to travel with the same velocity, their identity becomes probable, and this is shown by the fact that during an eclipse of the sun, at the conclusion of total obscuration, heat makes its appearance simultaneously with the rays of light; and finally, when it is found that the rays of light and heat observe the same laws of reflection, refraction, interference, and polarization, the conclusion is irresistible that the only difference between the two is that the less refrangible rays possess the greater heating power. Radiation of both light and heat is propagated in straight lines in a homogeneous medium, and unlike sound may be transmitted through a vacuum, a fact which indicates that it employs a different medium. If a sphere of glass, *a*, fig. 1, have a thermometer, *b*, sealed into it, with its bulb placed in the centre of the sphere, and if the air be exhausted through the tube *c*, which is afterward closed by the flame of a blowpipe, and then the sphere be surrounded by a heated body, as a piece of tin foil, the thermometer will indicate a rise of temperature. The radiation of heat follows

FIG. 1.

FIG. 2.

three important laws: 1. Its intensity is proportional to the intensity of the source. 2. It is inversely as the square of the distance. 3. Its intensity is less in proportion to the obliquity of the surface of the body emitting the rays. The first law is demonstrated by placing

a metallic cubical vessel at a certain distance from the blackened bulb of a thermometer, and filling it successively with water at different temperatures, as for instance at 20°, 30°, and 40°; the temperatures indicated by the thermometer will be in the same ratio as those of the vessel containing the water. The second law follows from the geometrical principle that the surface of a sphere increases as the square of its radius. Let *c*, fig. 2, be a centre of radiation; it will emit a certain number of rays, all of which will fall upon the inner surface of the sphere *a b*, or in the absence of this, upon the inner surface of the sphere *d e*, which has a radius twice as great as *a b*. Therefore the same amount of heat will fall upon either of the spheres. But the outer sphere has a surface four times as great as the inner one; therefore it receives upon the same extent of surface only one fourth as much heat. The same law may be demonstrated experimentally by a method invented by Tyndall. He placed a

FIG. 3.—Law of Inverse Squares.

thermo-electric pile, *S*, fig. 3, in front of a rectangular vessel filled with hot water and having its face coated with lampblack. The pile is placed in the small end of a hollow cone, having its inner surface blackened, to prevent reflection. The distance of the pile from the vessel may be changed, but the quantity of heat received will be the same. If the distance at *S'* is twice that at *S*, the surface of the circle *A' B'*, whose rays fall upon the pile at *S'*, will have twice the radius and four times the surface of the circle *A B*, whose rays fall upon the pile at *S*. The third law is demonstrated as follows: Place a cube, *a*, fig. 4, filled

FIG. 4.

with hot water, in front of a thermo-electric pile, *P*, and also place a screen, *S S*, with an opening, between the cube and the pile. If the cube is first placed with its face perpendicular to the rays *r, r*, and is then turned upon its axis without changing the distance

of the centre of its face, but giving it an oblique position, the amount of heat indicated by the pile will remain the same, although rays from a greater extent of surface on the cube will pass through the opening in the screen. All bodies are regarded as possessing a certain degree of that molecular motion which constitutes heat, and as always emitting rays of heat, no matter what their temperature may be. Every body is constantly receiving rays of heat from all other bodies within the limits of radiation, and is at the same time returning rays of heat to these bodies. But the hotter bodies emit rays of greater intensity than those which they receive, so that they all have a tendency to arrive at a condition of equilibrium. This is called the doctrine of exchanges, and was proposed by Prévost, a professor at Geneva about the year 1790, under the name of the "theory of mobile equilibrium of temperature." If a body could be so placed that it should continue to radiate more heat than it absorbed, there would come a time when its vibrations would cease, and it would possess no heat whatever; in other words, it would arrive at a state of absolute zero. Modern physicists have assumed such a theoretical zero, and have calculated it to be at 459.13° below the zero of Fahrenheit's scale, or 272.85° below that of the centigrade. Newton was the first to enunciate a law of cooling, which was that "the quantity of heat lost or gained by a body at each instant is proportional to the difference between its temperature and that of the surrounding medium;" but it has been found not to be general, and only applies when the differences of temperature are not more than 15° or 20° C.; beyond that the loss or gain is greater than the law requires. No definite results were obtained till Dulong and Petit made a series of elaborate investigations, in which they placed the thermometer both *in vacuo* and in air. A large thermometer was used, containing about three pounds of mercury, and was placed in the centre of a hollow globe of thin copper having its interior surface covered with lampblack, and kept at a uniform temperature by immersion in a vessel of water, the bulb of the thermometer being hotter than the globe. The following are the results obtained when the globe was at the temperature of melting ice:

VELOCITY OF COOLING AT DIFFERENT TEMPERATURES.		
Excess of temperature, in degrees F.		Velocity of cooling per minute.
432°	.....	10.69°
396	.....	8.81
360	.....	7.40
324	.....	6.10
288	.....	4.89
252	.....	3.88
216	.....	3.02
180	.....	2.30
144	.....	1.74

It is thus shown that the velocity of cooling at 360° is more than three times as much as at

180°. It was found by Dulong and Petit that the velocity of cooling in a vacuum for a constant excess of temperature increases in a geometrical progression when the temperature of the surrounding air increases in an arithmetical progression, and that the ratio of this progression is the same whatever may be the excess of temperature. The experiments of MM. Provostaye and Desains confirm the results of Dulong and Petit. Radiation being the propagation in the luminiferous ether of undulations in consequence of molecular vibrations in the radiating body, it would be expected that different bodies would have different powers of radiation, and experiment shows this to be true. The apparatus used by Sir John Leslie is represented in fig. 6, and is the same that he employed for determining the reflecting powers of bodies. In experimenting on radiation, the plate *d* may be removed. The cube *a* has its sides coated with different substances, which may be turned at pleasure toward the mirror *b*, and the bulb of a differential thermometer may be placed in the focus *l*. Calling the radiating power of lampblack 100, he found that of other substances as follows:

Lampblack .....	100	Varnished lead.....	45
Whiting .....	100	Mercury .....	20
Paper .....	98	Polished lead.....	19
Sealing wax .....	95	Polished iron.....	15
White glass.....	90	Tin, gold, silver.....	12

It is commonly supposed that color has much influence on the radiating and absorbing power of bodies, but this is only true of luminous heat. If the cube used in the above experiment is filled with hot water, and three of its sides are covered, one with white, another with red, and another with black velvet, all of the same texture, the fourth of polished copper being left uncovered, it will be found that the three velvet sides will radiate alike, the naked side radiating the least. This shows that texture or molecular structure, rather than color, confers radiating power upon surfaces, for obscure heat. The power of a body to absorb heat is precisely proportional to its power of radiation; or in other words, its power of propagating undulations in the ether is equal to its power of accepting motion from the undulations of the ether, and is generally possessed in a greater degree by opaque than by transparent bodies, although there are remarkable exceptions, as will be seen by reference to the article DIATHERMANCY. The method employed by Leslie in determining the absorbing powers of bodies was to cover the bulb of the differential thermometer, fig. 6, with the substance to be experimented upon, and place it in the focus, removing the plate *d*. Tyndall has made elaborate researches upon the radiating and absorbing powers of gases, vapors, and flames, and has found them proportional when the same sources of heat were employed, and inversely proportional to their transmitting powers; but he also finds these properties to

vary with the sources of heat.—*Reflection of Heat.* That dark heat rays are capable of reflection, and that they obey the same laws as the luminous rays may be shown by placing a metallic ball, *A*, fig. 5, heated below redness, in the focus of a concave mirror, *B C*, and the

FIG. 5.

bulb of a thermometer, *D*, in the focus of a mirror, *E F*, opposite and at a distance. The temperature indicated by the thermometer will approach that of the ball, but if either thermometer or ball is removed from its position, the temperature will fall. The following method was employed by Sir John Leslie to determine the heat-reflecting powers of different substances. The source of heat, which may be a cubical vessel filled with hot water, or

FIG. 6.

a metallic ball, *a*, fig. 6, is supported by a sliding standard at a distance in front of a concave metallic reflector at *b*. The focus of the mirror is at *c* for the divergent rays which come from the source of heat, but a reflecting plate *d* reflects them to *l*, where the focus is really formed. It is obvious that the heat at the focus *l* will be in proportion to the reflecting power of the plate *d*. By using plates of different materials he ascertained their reflecting power. Calling polished brass 100, he obtained the following results:

Brass .....	100	Lead .....	60
Silver .....	90	Amalgamated tin.....	10
Tin .....	80	Glass .....	10
Steel .....	70	Lampblack .....	0

This shows that the metals which are the best reflectors of light are also the best reflectors of heat. Moreover, when it is remembered that white light, which contains all the rays of the

solar spectrum (those of dark heat, those of luminous heat, and those of actinism), is reflected from polished surfaces without any decomposition, we have another proof of the fact that the laws of reflection are the same for each. The reflecting power also of a surface for heat and for light is found by experiment to be the same, allowance being made for errors; and the reflecting power of different substances varies with the angle of incidence in the same degree for heat as for light. In glass it increases rapidly with the angle of incidence, while in metals it increases slowly. It is also found that heat is diffused and scattered by the same surfaces in the same proportion that light is. II. CONDUCTION OF HEAT. If a copper rod, fig. 7, is placed on supports and a flame applied at one end, heat will flow along it toward the other end, and the rate may be measured by thermometers having their bulbs placed in cup-shaped holes containing mercury along the upper side of the bar. This was the method of Despretz, who made the first important series of experiments on the subject.

Fig. 7.

If an iron bar is substituted for the copper, the rate of flow will be much less, and a bar of platinum will be found a poorer conductor than one of iron. But the results of Despretz have been found by the later experiments of Wiedemann and Franz not to be perfectly accurate. The results obtained by these investigators are given in the following table, which also gives the electric conductions of the same metals, according to Riess and Lenz, these being very nearly the same as for heat, a fact which was first shown by Forbes:

RATES OF THERMAL AND ELECTRIC CONDUCTIVITY.

METALS.	THERMAL CONDUCTIVITY.	ELECTRIC CONDUCTIVITY.	
	Wiedemann and Franz.	Riess.	Lenz.
Silver.....	100.0	100.0	100.0
Copper.....	73.6	66.7	73.3
Gold.....	53.2	59.0	58.5
Brass.....	23.6	18.4	21.5
Tin.....	14.5	10.0	22.6
Iron.....	11.9	12.0	13.0
Lead.....	8.5	7.0	10.7
Platinum.....	6.4	10.5	10.3
Bismuth.....	1.8	....	1.9

One of the sources of error in Despretz's experiments was the employment of the holes

in the bar containing mercury, and another, a want of sensitiveness in the thermometer. Wiedemann and Franz used smooth rods, and measured the temperature with a thermo-electric pile and galvanometer. Marble and mineral substances generally are poorer conductors than any of the metals, and porcelain and glass are still poorer. The property of the thermal conductivity of metals is the basis of the invention of Davy's safety lamp for miners. (See LAMP.) The unequal conductivity of metals and other bodies is the cause of an interesting phenomenon, which is beautifully exhibited by what is known as Trevelyan's experiment, but which had been previously observed when a hot metal of good conducting power was laid against a cold one, a comparatively poor conductor, particularly if it had considerable expansion, as a copper brazing iron laid upon a block of cold lead. When the heated metal can readily acquire a slight rocking motion, the experiment succeeds the best. Trevelyan's apparatus consists of a "rocker" made of brass, having a longitudinal groove, and lying upon the cylindrical surface of a block of lead. When the rocker is heated and placed upon the lead, the ridges on each side of the groove are alternately thrown upward by the expansion in those parts of the surface of the lead which are heated by coming in contact with the hot brass, and thus a series of vibrations having a musical tone is produced. The reason why the heated metal should be a good conductor is that its surface may be kept hot uniformly with the mass, and thus be in a condition to impart sufficient heat to the surface of the lead at every moment. The advantage of employing lead as the other metal consists in its being capable of considerable expansion by heat, and in its being a poor conductor, so that in a moment the superficial portions may acquire enough heat to cause the requisite expansion to throw the rocker into vibrations. The same effect may be produced if, instead of a block of lead, one of stone is covered with a thin sheet of metal which is a good conductor, the condition required being one favorable to the rapid expansion of the surface, as was shown by Faraday. Other materials besides metals may be used, as various rocks and minerals.—Liquids are almost non-conductors of heat, as may be shown by pouring a small quantity of alcohol upon the surface of water in a tumbler and igniting it; a long time will elapse before the upper layers of the water become sensibly heated. Despretz employed an apparatus which consisted of a cylindrical wooden vessel about 3 ft. in height and 8 or 10 in. in diameter, which was filled with water. Through the sides of the cylinder 12 thermometers were placed, with their bulbs one above another in the axis of the column of water. A metal box, which was kept filled with water at 212° F., rested upon the top of the column of water. In this manner he found that the conductivity of heat for liquids follows

the same law as for solids, but is much more feeble, the conductivity of water being only about  $\frac{1}{25}$  that of copper. Liquids are readily heated by convection. When heat is applied beneath vessels containing them, the stratum next the bottom expands by heat, and in rising

FIG. 8.

the particles communicate their excess of heat to those through which they pass. Gases become heated in the same manner; they are exceedingly bad conductors, but from the mobility of their particles it is difficult to arrive at satisfactory results as to their conducting power. Porous substances containing confined air are bad conductors of heat, wherefore the walls of well built dwellings intended to exclude the heat of summer and the cold of winter are divided into partitions containing confined air. Plaster of Paris, on account of its porosity after setting with water, and its non-combustibility, is used for filling between the plates of fire-proof safes; and the efficiency of porous garments in protecting the body against cold and heat is a matter of common observation. There is a remarkable exception to the non-conductivity of gases

in the case of hydrogen, which, although the lightest of all of them, is by comparison far the best conductor of heat. This is proved by the following experiment: If a fine platinum wire is passed through a glass tube, as shown in fig. 8, and its two ends placed in connection with the poles of a galvanic battery, it will become incandescent on the passage of a moderate galvanic current, if air or any gas besides hydrogen is passed through the tube, though not to the same degree as in a vacuum; but if hydrogen gas is passed through the tube, the incandescence disappears in consequence of the heat being conducted away. III. SPECIFIC HEAT. The first important experiments upon the specific heat of bodies were made by Dr. Black in the latter part of the 18th century, and the idea of measuring specific heat originated with him. If two equal measures of water are placed in separate vessels of the same material, all being at the same temperature, and there is immersed in one an iron ball of a certain weight, and of a temperature higher than that of the water, and in the other a quantity of mercury of equal weight and temperature, after a time each of the vessels with their contents will have come to an equilibrium; but it will be found that the contents of the vessel in which the iron was placed have a higher temperature than the other, showing that the iron has communicated to the water a greater quantity of heat than the mercury. If the iron ball and the mercury had been colder than the water, on

the attainment of equilibrium the water containing the iron would have been colder than that which contained the mercury. The amount which a body is thus capable of imparting or absorbing while rising or falling through a certain range of temperature is called its specific heat. The term first used to denote this property was "capacity for heat," and was introduced by Irvine, a pupil of Dr. Black. The term specific heat, according to Whewell, was proposed by Wilcke, a Swedish chemist, and according to others by Gadolin, of Abo, in 1784. If, in the experiment just mentioned, instead of an iron ball, an equal weight of water at the same temperature had been used, the quantity of heat imparted to the water already in the vessel would have been very much greater. If equal weights of water at different temperatures are mingled, the resulting temperature will be a mean between the two; but when equal weights of iron and water at different temperatures are placed together, the resulting temperature will be nearer that of the water. In making experiments in specific heat, it is necessary to adopt some unit of measure, of which several are employed. The gramme degree (centigrade) is the quantity of heat required to raise one gramme of water  $1^{\circ}$  C.; the kilogramme degree, sometimes called a calorie, is the heat required to raise one kilogramme of water  $1^{\circ}$  C.; and the pound degree is the amount required to raise one pound avoirdupois of water  $1^{\circ}$  F. or C.—Three methods have been employed for determining specific heat: 1, the method of fusion of ice; 2, the method of mixtures; and 3, the method of cooling. 1. *The method of fusion of ice.* This was employed by Black, and simply consisted in making a deep cavity in a block of ice, fig. 9, placing the substance to be experimented on in it, and closing the cavity with a cover of ice. The substance is raised to a certain temperature, then introduced, and when cooled to zero is removed, and both it and the cavity wiped with a cloth of known weight; the increase in weight shows how much of the ice has been melted. Now, as will be seen further on, it requires as much heat to convert a pound of ice at  $32^{\circ}$  to a pound of water at  $32^{\circ}$ , as it does to raise a pound of water from  $32^{\circ}$  to  $174^{\circ}$ ; therefore water at  $32^{\circ}$  contains  $142^{\circ}$  more heat than ice at the same temperature. Let  $m$  denote the weight of water derived from the ice in the above experiment,  $w$  the weight of the body under experiment,  $s$  its specific heat, and  $t$  the number of degrees it has fallen; then there will result the following equation:  $w t s = 142 m$ ; or

FIG. 9.—Black's Ice-block Calorimeter.

$s = \frac{142m}{wt}$ ; from which formula the specific heat

of any substance is readily ascertained. A modification of this apparatus, which gave more accurate results, was devised by Lavoisier and Laplace, and called an ice calorimeter, of which fig. 10 shows a perspective and a sectional view. It consists of three concentric

FIG. 10.—Ice Calorimeter.

tin vessels, the inner one for holding the body under experiment, while the two others contain pounded ice, that in the outer one to prevent external influence, that in the middle one to measure the heat given by the body under experiment. Stopcocks are supplied to each, that connected with the middle vessel being for the purpose of drawing off the water which has been produced by the action of the experimental body.

The manner of conducting the experiment is similar to that employed with the block of ice. The principal source of error is the difficulty of estimating the quantity of ice which has melted, as more or less water will adhere to the lumps. Bunsen has devised a calorimeter especially adapted to cases in which only small quantities are experimented upon. A test tube, *a*, fig. 11, which receives the substance to be tested, is fixed in the larger leg of a wide U-shaped tube, *b*, *c*, the part *b*, containing the test tube, being filled with water, and the rest with mercury. A graduated smaller tube, *d*, open at the top, is adjusted to the top of the leg *c*, for the purpose of noting the rise or fall of the mercury in this

FIG. 11.—Bunsen's Calorimeter.

leg, which it is obvious will be effected by the expansion or contraction of the contents of the leg *b*. In making the experiment, *a* is surrounded by a freezing mixture and the water frozen. Then the substance under experiment is raised to a certain temperature and placed

in the test tube; it melts a certain quantity of ice, and thereby causes a diminution in volume of the contents of *b*, and consequently a fall of the mercury in *c*, and also in the graduated tube *d*. In this way the weight of ice melted may be estimated, and the weight and temperature of the tested substance being known, the specific heat may be readily calculated according to the formula which has been given. 2. *The method of mixtures.* An outline of this method was given in defining specific heat; it will now be applied in making determinations. A body is weighed and raised to a certain temperature, and then placed in a vessel containing cold water whose weight and temperature are also known. Let *m* be the weight of the body, *n* its temperature, and *s* its specific heat; also let *w* be the weight of cold water, and *t* its temperature. After a time equilibrium is obtained, when the temperature may be represented by *e*. The quantity of heat which the body has lost will therefore be *m s (n-e)*, and that which has been gained by the water will be *w (e-t)*, the specific heat of water being unity. Now, as the quantity of heat which is absorbed is equal to that which is given out by the body under experiment, *m s (n-e) = w (e-t)*, from whence  $s = \frac{w (e-t)}{m (n-e)}$ . To apply this

formula, suppose that three ounces of mercury at  $212^{\circ}$  is mixed with one ounce of water at  $32^{\circ}$ , and that the resulting temperature is  $48.2^{\circ}$ , what is the specific heat of mercury? In this example  $m = 3$ ,  $e = 48.2^{\circ}$ , and  $n - e = 163.8^{\circ}$ ; therefore  $s = \frac{48.2 - 32}{3 \times 163.8} = \frac{16.2}{491.4} = .033$ , the specific heat of mercury, which is therefore only about  $\frac{1}{30}$  that of water. In accurate experiments corrections are required for errors, one of which is caused by the absorption of a small amount of heat by the containing vessel. Regnault devised a method of mixtures, using a calorimeter capable of yielding more accurate results, and the elaborate experiments which were made by him have been of great value in the arts; but the method given above sufficiently illustrates the principles involved. 3. *The method of cooling.* Equal weights of bodies having different specific heats will cool through different degrees of temperature in the same time, the body having the least specific heat cooling the most rapidly. If two thermometers with blackened bulbs and of the same size are filled, one with mercury and the other with water, and then, at a common temperature, are placed in cool enclosures of the same construction and temperature, the mercurial thermometer will cool more than twice as rapidly as the one of water, the proportion being 30 to 13, because the specific heat of water is 30 times that of mercury, while the specific gravity of mercury is 13 times that of water.—*Specific Heat of Solids.* It was found by Dulong and Petit that the specific heat of a solid is greater at a high

than at a low temperature. Their results are shown in the following table:

MEAN SPECIFIC HEAT OF SOLIDS.

SUBSTANCES.	Between 32° and 212° F.	Between 32° and 572° F.
Iron.....	0.1098	0.1218
Mercury.....	0.0330	0.0350
Zinc.....	0.0927	0.1015
Antimony.....	0.0507	0.0549
Silver.....	0.0557	0.0611
Copper.....	0.0949	0.1018
Platinum.....	0.0355	0.0355
Glass.....	0.1770	0.1990

In the above table it may be seen that the specific heat of all the substances is greater at high than at low temperature, except that of platinum, which remains the same within the limits of the experiment. The reason given for this is that the melting point of platinum is very high, far higher than that of cast iron, and Regnault has found that the increase in its specific heat becomes more rapid as it approaches its melting point. Pouillet, by the method of mixtures, obtained the specific heat of platinum at higher temperatures than those employed by Dulong and Petit, but still very far below the melting point. The following are his results, which differ somewhat from those of Dulong and Petit:

MEAN SPECIFIC HEAT OF PLATINUM.

Between 32° and 212° F.....	0.0335
" 32 " 572 .....	0.0343
" 32 " 932 .....	0.0352
" 32 " 1292 .....	0.0360
" 32 " 1592 .....	0.0373
" 32 " 2192 .....	0.0382

Contrary to the results of Dulong and Petit, Pouillet found there was a variation between 32° and 572°, but it will be seen that they agree as to the increase of specific heat with increase of temperature. The specific heat of a solid depends upon its molecular conditions, which may be considerably changed by treatment, as by rate of cooling after fusion, by hammering, by compression, or by traction. An increase of density diminishes the specific heat, while expansion increases it; for which reason, probably, it increases with the temperature. The following table of specific heats of solids is by Regnault, the range being between 32° and 212° F.:

Substances.	Sp. heats.	Substances.	Sp. heats.

—*Specific Heat of Liquids.* The specific heat of liquids may be found by the method of cooling, by that of mixtures, or by the calorimeter of Lavoisier and Laplace, fig. 10, already de-

scribed. Regnault employed the following method: The liquid under experiment is placed in the reservoir *a*, fig. 12, and this is immersed in a vessel containing water at a certain temperature; a known temperature is therefore given to the liquid in the reservoir by agitating

FIG. 12.—Regnault's Method for Liquids.

the water in the bath. The stopcock *d* is then opened, and the fluid is forced into the vessel *e*, contained in the calorimeter *c*. The water in the calorimeter, which is cooler than the fluid under experiment, has its temperature raised by the introduction of the latter. The increase is measured by the thermometer *t*, and from this, the weight of the water in the calorimeter and of the fluid under experiment being known, the specific heat of the latter is determined according to the method given above. Generally, a substance has a greater specific heat when in a liquid than when in a solid state, a fact first observed by Irvine. Thus, the specific heat of ice is only half that of water. The specific heat of liquids also increases with the temperature, but in a greater ratio than that of solids. The following results were obtained by Regnault with water:

MEAN SPECIFIC HEAT OF WATER.

From 32° to 104° F.....	1.0013
" 32 " 176 .....	1.0035
" 32 " 248 .....	1.0067
" 32 " 320 .....	1.0109
" 32 " 392 .....	1.0160
" 32 " 446 .....	1.0204

It was formerly thought that water had a greater specific heat than any other liquid, but the researches of Dupré and Page indicate that the specific heat of a mixture of water and alcohol, containing 20 per cent. of the latter, is probably as high as 1.05.—*Specific Heat of Gases.* The specific heat of a gas at a constant volume differs from that at a constant pressure; in other words, it takes a greater amount of heat to raise a certain quantity of a gas through a certain number of degrees of temperature if it is allowed to expand than when it is confined. The specific heat under constant pressure exceeds that of constant volume by the amount which would be consumed in producing the expansion. The first important researches on the

specific heat of gases were those of Delaroche and Bérard. Their method consisted in passing known volumes of a gas under constant pressure and temperature through a spiral tube immersed in water, and making their calculations from the increase in its temperature. Regnault afterward made more exact experiments with a modification of the apparatus, from which he arrived at the following conclusions: 1. The specific heat of a given weight of a gas which is approximately perfect, or non-condensable, does not vary with the temperature of the gas. 2. The specific heat of a given weight of such a gas does not vary with the pressure or density, and therefore the specific heat of a given volume does vary in proportion to the density. 3. The specific heats of equal volumes of simple and uncondensable gases and of compound gases which are formed without condensation, such as hydrochloric acid and nitric oxide, are equal. 4. These laws do not hold for condensable gases, either simple or compound, as chlorine, bromine, or carbonic acid gas, the specific heat of which increases with the temperature.—*Specific Heat of Atoms.* Before treating of latent heat it will be convenient to consider the law of atomic heat, or the specific heat of atoms, which was discovered by Dulong and Petit in 1819, and which has rendered the knowledge of the specific heats of bodies of so much importance in chemical investigations. This law may be exactly enunciated as follows: The specific heats of elementary bodies are inversely proportional to their atomic weights; in other words, the product of the specific heat of any element into its atomic weight is constant. The following results verifying this law are due to Regnault; only a partial list is given:

ELEMENTS.	Sp. heat.	Atomic weight.	Product, or sp. heat of atoms.
Sulphur .....	0.1776	32	5.6832
Magnesium .....	0.2490	24	5.9976
Aluminium .....	0.2143	27.5	5.8932
Zinc .....	0.0955	65	6.2075
Cadmium .....	0.0576	112	6.3504
Cobalt .....	0.1070	58.5	6.2505
Nickel .....	0.1091	58.5	6.3823
Iron .....	0.1138	56	6.3728
Manganese .....	0.1140	55	6.2700
Copper .....	0.0951	63.5	6.0839
Silver .....	0.0570	108	6.1560
Gold .....	0.0324	196	6.3504
Antimony .....	0.0508	122	6.1976
Bismuth .....	0.0308	210	6.4680
Potassium .....	0.1696	39	6.6144
Sodium .....	0.2994	23	6.7482
Lithium .....	0.9408	7	6.5856
Lead .....	0.0314	207	6.4998
Platinum .....	0.0324	197	6.3828
Arsenic .....	0.0314	75	6.1050
Iodine .....	0.0541	127	6.8707
Bromine (solid) .....	0.0343	80	6.7740
Mercury (solid) .....	0.0319	200	6.3800

It will be observed that the products are not exactly the same, but there are the strongest reasons for believing that the variations are owing to differences in physical condition which are unavoidable under the circumstan-

ces in which the experiments are made. Assuming the theory to be correct, it follows that all elementary atoms, independent of their weight, have the same specific heat, and therefore that masses of elementary substances containing the same number of atoms and under the same physical conditions require the same amount of heat to raise them through an equal number of degrees. Thus, the atomic weight of iron being 56, and that of mercury 200, it will require the same amount of heat to raise 56 pounds of iron or 200 pounds of mercury through the same number of degrees. Neumann and Regnault have also found that the specific heats of all compound bodies of similar atomic composition are inversely proportional to their atomic weights. The following are Regnault's results with bichlorides:

SUBSTANCES.	Sp. heat.	At. weight.	Product.
Chloride of barium, BaCl <sub>2</sub> .....	0.0896	208	18.64
“ strontium, SrCl <sub>2</sub> .....	0.1199	158.5	19.00
“ calcium, CaCl <sub>2</sub> .....	0.1642	111	18.23
“ magnes'm, MgCl <sub>2</sub> .....	0.1946	95	18.49
“ lead, PbCl <sub>2</sub> .....	0.0664	278	18.46
“ mercury, HgCl <sub>2</sub> .....	0.0689	271	18.67
“ zinc, ZnCl <sub>2</sub> .....	0.1362	136	18.52
“ tin, SnCl <sub>2</sub> .....	0.1016	189	19.20

The following results were obtained with carbonates:

SUBSTANCES.	Sp. heat.	At. weight.	Product.
Carbonate of lime, CaCO <sub>3</sub> .....	0.2056	100	20.56
“ barytes, BaCO <sub>3</sub> .....	0.1104	197	21.75
“ strontium, SrCO <sub>3</sub> .....	0.1443	147.5	21.36
“ iron, FeCO <sub>3</sub> .....	0.1984	116	22.43

It will be seen that the numbers in each table agree together more nearly than those of one with the other, but the close agreement in each group justifies the adoption of the law. IV. LATENT HEAT. The doctrine of latent heat was taught by Black in 1762. He was the first to observe that when a body passes from a solid to a liquid state a quantity of heat disappears. Thus, if ice at 32° has heat applied to it, and the resulting water as well as the ice is stirred, the temperature will remain at 32° until all the ice is melted. Thus, all the heat which has during this time been absorbed will have disappeared, and was said by Black and his contemporaries to have become latent. According to modern theory, this is not strictly true, unless we consider its conversion into another force a latent power which may be again reconverted into heat by the reconversion of the water into ice. The energy which manifests itself in heat vibrations is expended in maintaining a different form, or performing a certain amount of internal work, as it is called.—*Latent Heat of Fusion.* If a pound of water at 212° is mixed with a pound of water at 32°, the resulting temperature will be a mean, viz., 122°; but if a pound of ice at 32° is mixed with a pound of water at 212°, the result will be two pounds of water at 51°.

There is thus a difference in the heat of the two mixtures of  $71^{\circ}$ , and since the temperature of one of the constituents in each mixture, viz., boiling water, was the same, this difference of  $71^{\circ}$  must represent the heat which is required to liquefy one pound of ice, and which is the same as that required to raise two pounds of water through a range of  $71^{\circ}$ , or one pound of water through  $142^{\circ}$ , or 142 pounds of water through  $1^{\circ}$ . If we take as a unit of heat that quantity which is necessary to raise one pound of water through  $1^{\circ}$ , the latent heat of water will be represented by 142 on Fahrenheit's scale, and by 78.88 on the centigrade scale. The experiment may be varied by mingling a pound of ice at  $32^{\circ}$  with a pound of water at  $174^{\circ}$ , when the resulting temperature on the fusion of the ice will be found to remain at  $32^{\circ}$ , showing as before the expenditure of  $142^{\circ}$ , which is the latent heat of water. According to the experiments of M. Person, the latent heat of water is more nearly  $142.65^{\circ}$ , or on the centigrade scale  $79.25^{\circ}$ . The following are his results with other liquids, calling the latent heat of water a thermal unit:

TABLE OF LATENT HEATS.

SUBSTANCES.	W=1.	In deg. F.	In deg. C.

—*Latent Heat of Vaporization.* Liquids in passing into a state of vapor absorb a vast amount of heat. The conversion into vapor may be rapid, as in boiling, or it may be slow, as when water evaporates in the open air at common temperatures. In either case disappearance of heat in proportion to the quantity evaporated is the result. If a flask of cold water is placed over a lamp, the temperature will continue to rise until it reaches  $212^{\circ}$  F., when ebullition will commence; but the temperature will remain at  $212^{\circ}$  until the water has all boiled away. If the water at the commencement of the operation is at  $32^{\circ}$ , and the supply of heat is uniform, the time occupied in evaporating it will be about  $5\frac{1}{2}$  times that which is occupied in raising it to the boiling point, although the temperature has not risen above  $212^{\circ}$ ; therefore  $5\frac{1}{2}$  times as much heat is absorbed in evaporating a given quantity of water as in raising it through  $180^{\circ}$ . The latent heat of steam is therefore about  $5\frac{1}{2}$  times  $180^{\circ}$ , or  $990^{\circ}$  F. If the steam is reconverted to the liquid form, precisely this amount of heat reappears; in other words, the energy into which the heat was converted to maintain a state of vapor is reconverted into heat when

the steam is reconverted into water. This is shown in the method of Despretz for determining the latent heat of vapors, which consists in condensing them in a worm immersed in water, and estimating the quantity of heat imparted to the latter. The retort C, fig. 13, heated by

FIG. 13.—Despretz's Apparatus for Latent Heat of Vaporization.

a lamp, contains the liquid whose vapor is the subject of experiment. The vapor in passing through the worm S is condensed, imparting its latent heat to the water in the vessel R, and being collected in a vessel placed under the stopcock *r*, its weight can be found; and that of R, or the calorimeter, and its contents being known, and also their temperature, the increase of the latter furnishes the data for cal-

FIG. 14.—Faraday's Apparatus for Liquefying Gases.

culating the latent heat of the vapor. Regnault used more elaborate apparatus, and his results were rather more exact. If pressure is applied to a gas confined in an enclosure, its temperature will be raised, and if the pressure is immediately removed, the gas will return to

the temperature it had before compression; but if, while under compression, it is allowed to cool to its previous temperature, and the pressure is then removed, it will fall through as many degrees as it had been raised by compression. Upon the principle here involved, gases which were formerly considered permanent have been reduced to a liquid and to a solid condition. Faraday employed the following method: Introducing materials for producing a gas in one end of a bent tube, fig. 14, and heating it previous to their combination, and then applying a gentle heat, a vast pressure was produced by the generated gases, and then by placing the other end of the tube in a freezing mixture, condensation was effected. Thilorier in 1834 constructed on this principle an apparatus which was capable of liquefying large quantities of carbonic acid gas. The operation requires a pressure of about 50 atmospheres, or about 700 lbs. to the square inch. The vessels were formerly made of cast iron, strengthened with wrought-

Fig. 15.—Thilorier's Apparatus for Liquefying Carbonic Acid.

iron hoops; but explosions occurring, attended with loss of life, the construction was modified by using leaden vessels surrounded with copper ones, bound with strong iron hoops. The apparatus is represented in fig. 15, and consists of two vessels, one a condenser and the other a generator, the latter being represented in section. Bicarbonate of soda is placed in the generator, and also a cylindrical vessel containing sulphuric acid. The generator being supported by pivots, it can be turned to spill the acid. The resulting gas, evolved in large quantities, is forced through the connecting tube into the condenser, which is surrounded by a freezing mixture, and is there condensed into a liquid. When some of the liquefied gas is allowed to escape into the air, a portion expands into gas, which so chills the remainder that it solidifies and forms white flakes, like snow, its temperature being about  $-129^{\circ}$  F.; and if this is mixed with ether, the cold which is produced is so intense as to have an effect upon the skin like that of burning with hot iron. By placing this mixture in

the exhausted receiver of an air pump, Faraday caused the temperature to fall to  $166^{\circ}$  below zero; and M. Natterer by the use of a bath of nitrous oxide and bisulphide of carbon, previously liquefied by cold and pressure, lowered the temperature to  $220^{\circ}$  below zero; and Despretz succeeded in reducing alcohol to a viscous state. Liquid carbonic acid contained in a tube and placed in this mixture instantly becomes solid, assuming the appearance of transparent ice. By the use of this mixture and very high pressure, Andrews reduced air to  $\frac{1}{175}$  of its original volume, oxygen to  $\frac{1}{554}$ , hydrogen to  $\frac{1}{566}$ , carbonic oxide to  $\frac{1}{378}$ , and nitric acid to  $\frac{1}{160}$ , but without producing liquefaction. There was some departure from Mariotte's and Boyle's law (see ATMOSPHERE), but it was less in hydrogen and carbonic oxide than in the other gases. Freezing on a large scale by Carré's apparatus, described in the article FREEZING, is effected on the principle of absorption of heat by evaporation and expansion. The absorption of heat by liquefaction has a familiar example in the ordinary freezing mixture of snow or pounded ice and common salt, by which the zero temperature of Fahrenheit's thermometer was obtained.—An interesting experiment in the absorption of heat by liquefaction and its reappearance on solidification is made by dissolving sulphate of soda in water. The two being mingled at the same temperature, the thermometer will indicate a fall. If the solution is warmed and saturated, and then allowed to cool while perfectly at rest, a point will be reached at which more of the soda will remain in solution than could have been dissolved at the same temperature. The polar relations of the molecules of the salt by which solution is maintained require, in order that solidification may take place, to be disturbed by a further reduction of temperature or by a mechanical impulse. The condition of solution is maintained by an expenditure of energy which when solidification or crystallization takes place resumes the condition or motion of heat. Agitation of the vessel, or of its contents by dropping among them a crystal of the salt, will cause crystallization to commence; and the bulb of a thermometer plunged into the mass will show a rise of temperature.—Prof. James Thomson, in a paper published in the "Transactions of the Royal Society of Edinburgh" in 1849, expressed his opinion, deduced from the mechanical theory of heat, that a liquid which expands in solidifying, like water, must have its melting point lowered by increase of pressure. Sir William Thomson soon after tested the question by experiment, and proved the correctness of the deduction. When a mixture of ice and water was subjected to pressure, the temperature fell, returning again to  $32^{\circ}$  when the pressure was removed. The addition of pressures of 8.1 and 16.8 atmospheres lowered the freezing point  $0.106^{\circ}$  and  $0.232^{\circ}$  F. respectively; results which very

nearly agree with Prof. James Thomson's prediction that the fall should be  $0.0135^\circ$  for each additional atmosphere. Mouson has since then succeeded by enormous pressure in reducing the freezing point of water several degrees. The apparatus in which pressure was effected was placed in a certain position and charged with water into which a piece of metal was dropped. The water was then frozen, and cooled to zero, or  $32^\circ$  below the freezing point. A pressure which was estimated to be several thousand atmospheres was then applied, after which the apparatus was inverted and the pressure removed, when on examination the piece of metal was found at the opposite side of the enclosure, thus showing that the ice had been melted. Those bodies which, unlike ice, expand during liquefaction, have their melting points raised instead of lowered by increase of pressure. In this manner Bunsen, Hopkins, and Fairbairn have raised the melting point of spermaceti, which is  $120^\circ$ , several degrees; a pressure of 519 atmospheres raised it to  $140^\circ$ , and one of 792 atmospheres to  $176^\circ$ . A liquid which, like water, expands on congealing, has its particles restrained by pressure, and therefore to congeal it the temperature must be lowered; but one which contracts in solidifying will have its particles assisted by pressure, and hence its melting point will be raised.—Many interesting phenomena are exhibited by liquids and gases when subjected to great heat and pressure, such as the obliteration of the line of demarkation between the liquid and vaporized portion in which what is called a critical temperature is concerned. The subject will be found treated, with that of the tension of vapors, in the article VAPORIZATION. Chemical action being always accompanied by physical change, as expansion or contraction, liquefaction or solidification, it is difficult to estimate the effects produced by each. In general it may be held that the heat of chemical combination results from the intense molecular motion imparted by the clashing of combining molecules with each other, and moreover, that whatever heat is evolved by combination will be absorbed, or will disappear in the separation of the constituents of the compound into their original form; and it is found that generally combination produces heat, and that decomposition produces cold. But the heat which is evolved by the physical changes which accompany chemical action is more easily accounted for. Take for example the condensation which accompanies the union of quicklime with water; the resulting hydrate has less bulk than the sum of the constituents previous to combination. The energy necessary to maintain this excess of volume among particles at insensible distances from each other composing liquids or solids, is enormous; consequently a reduction of the distances, whether accomplished by the influence of chemical affinity or by mechanical pressure, causes a conversion of this energy

into another, generally heat. The first change may not, however, be entirely into heat, but, as in the case of the compression of certain crystals, or the combination of a metal with an acid under certain conditions, as in the galvanic battery, there may be a transformation into electric force, but which is supposed finally to become resolved into heat. Sir William Thomson has advanced the opinion that there is a tendency to the conversion of all physical energy into the condition of heat, and to its uniform diffusion throughout all matter; a condition which he regards as involving the cessation of all physical phenomena. The conclusions of Prof. Thomson are founded upon the law of the French philosopher Carnot, which is that mechanical energy is produced by heat only when it is transferred from a body of a higher to one of a lower temperature. The subject is a difficult one, as there are many possible circumstances connected with the forces and matter of the universe which can never be reduced to an exact basis of calculation.—The following are the most important recent works on heat: "Sketch of Thermodynamics," by P. G. Tait (Edinburgh, 1868); "An Elementary Treatise on Heat," by Balfour Stewart (London, 1872); "Theory of Heat," by J. Clerk Maxwell (1871); "Heat as a Mode of Motion," and "Contributions to Molecular Physics in the Domain of Radiant Heat," by John Tyndall (1873). See also the articles "Heat" and "Radiation" in Watts's "Dictionary of Chemistry," and various articles in the reports of the Smithsonian institution.

**HEATH**, or **Heather**, the common name of plants of the genus *ericæ*, which contains about 400 species, besides numerous varieties produced by cultivation. The greater number of species of heath are natives of western Africa, some are peculiar to the western portion of Europe and the Mediterranean, and a few extend into northern Europe, one of which is sparingly found in North America. While some of the African species form shrubs 8 or 10 ft. high, those of northern countries are low, much-branched shrubs, seldom exceeding a foot. The small evergreen leaves are entire, usually revolute at the margins and in whorls of three or four, scattered or rarely opposite. The mostly drooping flowers are either axillary or in short terminal clusters; the calyx of four sepals, sometimes colored; corolla ovoid, globular, bell-shaped, or sometimes tubular, more or less four-lobed, and drying attached to the capsule; stamens eight, the anthers with two appendages at the back and opening by a chink; pistil solitary; capsule four-celled, splitting at maturity into four or eight valves. The genus *ericæ* comprises species of great beauty, even the most humble of them being attractive, and is the type of a large order, the *ericaceæ* or the heath family, noted for the showy character of many of its genera, about 50 in number, including *rhododendron*, *azalea*, *kalmia*, *andromeda*, and others well known for the beauty of

their flowers and highly prized as ornamental plants. *Erica* is the ancient name of a plant, probably of this genus; the Anglo-Saxon name heath is also applied to localities where the plant grows. Six species of heath are found in Great Britain, some of them covering tracts many miles in extent; heaths are so abundant, and so often form an important feature in the landscape, that allusions to heath and heather are frequent in prose and poetry. The species found in this country is the commonest of those of Great Britain; it is also known as ling, and is the most widely distributed of all heaths. A few years ago American botanists were greatly excited by the announcement that the heath, a plant heretofore unknown to our flora, had been found growing wild at Tewksbury, Mass. Many visited the locality, and for a while the question whether the Tewksbury heath was indigenous or an escape from cultivation was warmly discussed in scientific and other journals. Subsequent discoveries of the plant in Maine, and its occurrence in Nova Scotia and elsewhere in the British provinces, leave no doubt that the heath is a native of the American continent. This plant was named *erica vulgaris* by Linnæus, and many botanists still retain this name, while others call it *calluna vulgaris*. Its leaves, instead of being whorled as in the other heaths, are opposite; its deeply lobed corolla is shorter than the calyx; and these characters, together with the more important one, a different structure in the capsule, would seem sufficient to separate it from the *ericas* and entitle it to rank as a genus to which the name *calluna* (Gr. *καλλύνειν*, to sweep) was given by Salisbury. The common

Common Heath (*Erica vulgaris*).

heath is of slow growth and has strong, slender stems; in some unusual locations specimens 3 or 4 ft. high are found, but upon the scanty soil of the moors it is seldom above a foot. When nothing else can be obtained, cattle and sheep browse upon the herbage of the heath;

but it is not nutritious, and being powerfully astringent it unfavorably affects the health of the animals. Those who live where heath is abundant make it useful for various purposes; the branches are employed for thatching hovels and making wattled fences, and are even twisted into ropes; they also serve for making baskets and brushes of various kinds, a fact which suggested the generic name. Small fagots of heath stems are imported into this country in considerable quantities, and sold for scrubbing kitchen utensils and similar uses. The common heath frequently varies, and some of its forms are recognized as named varieties; the flowers are generally rose-colored, but they are found pure white and deep purplish red; there is a form with variegated foliage, another with double flowers, and several others are found in European gardens. This and the Mediterranean heath, *erica carnea*, with its variety *herbacea*, are quite hardy near the city of New York; and probably the Scotch heath, *E. cinerea*, the Cornish heath, *E. vagans*, and other northern species, would endure our extremes of temperature. These plants are deserving of more attention than they have yet received from cultivators in this country; their low and compact growth adapt them to form beds by themselves, or to serve as an edging to borders containing other plants. The Mediterranean heath blooms in early spring, while the common species opens its flowers at a time of scarcity of bloom, July and August. The greenhouse species and varieties, usually known as Cape heaths, are almost innumerable; they possess delicacy and beauty of habit, which united with great freedom of flowering render them valuable for decorative purposes. The flowers are wonderfully diversified in form and tint, and will reward the care required to produce them in perfection. They are comparatively neglected in this country, but in England, where the climate is especially favorable, much attention is given to their cultivation, especial houses being frequently devoted to heaths alone. Their roots, being exceedingly fine and thread-like, demand great care in respect to soil and water.

Scotch Heath (*Erica cinerea*).

**HEATH, Francis George.** See supplement.  
**HEATH, William,** a major general in the American revolution, born in Roxbury, Mass., March 7, 1737, died there, Jan. 24, 1814. When the Massachusetts congress in 1774

voted to enroll 12,000 minute men, volunteers from among the militia, Heath, then a farmer in Roxbury, was commissioned as one of the generals. On June 22, 1775, he was appointed brigadier in the continental army, and in August, 1776, became major general. When the troops moved to New York, Heath was stationed in the highlands near King's Bridge. In 1777 he was transferred to Boston, and the prisoners of Saratoga were intrusted to him. In June, 1779, he was again at the highlands, with four regiments, and he was stationed near the Hudson till the close of the war. He was the last surviving major general of the revolutionary army, and published "Memoirs of Maj. Gen. Heath, containing Anecdotes, Details of Skirmishes, Battles, &c., during the American War" (1798).

**HEATHFIELD, Lord.** See ELIOTT, GEORGE AUGUSTUS.

**HEBBEL, Friedrich**, a German lyric and dramatic poet, born at Wesselburen, Holstein, March 18, 1813, died in Vienna, Dec. 13, 1863. He was the son of a farmer, was educated at Heidelberg, and went to Hamburg, where in 1841 he wrote his tragedy of *Judith*, which was immediately successful. He then visited Copenhagen, Paris, London, and Naples, and in 1846 settled in Vienna, where he married the actress Christine Enghaus. Among his other dramas are *Genoveva* (1843), *Maria Magdalena* (1844), *Der Diamant* (1847), *Herodes und Mariamne* (1850), *Julia* (1851), *Michel Angelo* (1855), and *Die Nibelungen* (2 vols., 1862). A complete edition of his works was issued at Hamburg in 12 vols., 1865-'8. They are characterized by boldness, vigor, and originality, with a predilection for the horrible.

**HEBE** (Gr. ἥβη, youth), in mythology, the goddess of youth, a daughter of Jupiter and Juno. She served her fellow divinities with nectar at their festivals, assisted her mother in putting the horses to her chariot, and bathed and dressed her brother Mars. She is said to have been married to Hercules after his apotheosis, and to have been the mother of two sons by him.

**HEBEL, Johann Peter**, a German poet, born in Basel, May 11, 1760, died at Schwetzingen, Sept. 22, 1826. He studied at Erlangen, and in 1791 was appointed professor in the gymnasium of Carlsruhe. He became in 1805 church counsellor, and in 1819 prelate. His works include *Allemannische Gedichte*, written in a Swabian sub-dialect (11th ed., Aarau, 1860), of which there are five High German translations; *Die biblischen Geschichten* (2 vols., 2d ed., Stuttgart, 1824); *Der rheinländische Hausfreund* (3d ed., 1827); and *Schatzkästlein des rheinischen Hausfreundes* (last ed., 1860). His complete works were issued in 8 vols. in 1832-'4; new edition, 1871 *et seq.*

**HEBER, I. Reginald**, an English bishop, born in Malpas, Cheshire, April 21, 1783, died in Trichinopoly, India, April 3, 1826. At the age of seven he had translated Phædrus into

English verse. In 1800 he entered Brasenose college, Oxford, and his *Carmen Seculare* obtained the first prize for Latin verse. In 1803 he wrote his prize poem "Palestine," which is still considered the best of the kind produced at Oxford. He graduated in 1804, and in 1805 gained the bachelor's prize for an essay on the "Sense of Honor." In 1807 he took orders, and was presented by his brother Richard to a living at Hodnet in Shropshire, on which he settled in 1809, immediately after his marriage with the daughter of Dr. Shipley, dean of St. Asaph. He devoted himself to the relief of the sick and the poor, and gave his leisure to literature, frequently contributing to the "Quarterly Review," and composing hymns. His "Poems and Translations" (London, 1812) contains many original hymns written to particular tunes; some of these are at once the most popular and the most artistic in the language. Heber commenced a dictionary of the Bible, which he was compelled by other duties to relinquish, and in 1819-'22 edited the works of Jeremy Taylor, with a copious life of the author, and a critical examination of his writings. In 1822 he was appointed preacher at Lincoln's Inn, and in 1823 was consecrated bishop of Calcutta, a see which at that time embraced all British India, Ceylon, Mauritius, and Australia. He started for Calcutta in June, 1823, and 12 months later entered upon the visitation of his vast diocese. From that time until his death he was occupied with the duties of his office, making long journeys to Bombay, Madras, and Ceylon, and showing great energy and capacity. He died of apoplexy. His "Narrative of a Journey through the Upper Provinces of India, from Calcutta to Bombay" (2 vols. 4to, London, 1828), was posthumous. In 1827 his hymns were first published entire in a volume entitled "Hymns written and adapted to the Service of the Church," of which many subsequent editions have appeared. The latest edition of his complete poems, including his "Palestine," is that of 1855 (8vo, London). The Bampton lectures entitled "The Personality and Office of the Christian Comforter" (8vo, Oxford, 1813) were his only sermons published during his life. Several volumes of his sermons delivered in England and India were published posthumously, and in 1830 appeared the "Life and Unpublished Works of Reginald Heber, by his Widow" (2 vols. 4to, London). **II. Richard**, a bibliomaniac, half brother of the preceding, born in Westminster in 1773, died in October, 1833. He was educated at Brasenose college, Oxford. At 19 he edited the works of Silius Italicus (2 vols. 12mo, 1792), and a year later prepared for the press an edition of *Claudian's Carmina* (2 vols., 1793). A taste for book collecting was developed in him in childhood, and in the latter part of his life it became a ruling passion. Succeeding on the death of his father in 1804 to large estates in Yorkshire and Shropshire, which he consider-

ably augmented, he forthwith devoted himself to the purchase of rare books. After ransacking England he travelled extensively on the continent, purchasing everywhere, and leaving large depots of books in Paris, Antwerp, Brussels, Ghent, and elsewhere in the Netherlands and Germany. His residence in Pimlico, London, was filled with books from top to bottom, and he had another house in York street laden with literary treasures, and a large library in Oxford. At his death his collection in England was estimated by Dr. Dibdin at 105,000 volumes, exclusive of many thousands on the continent, the whole having cost upward of £180,000. Allibone in his "Dictionary of Authors" computes the volumes in England at 113,195, and those in France and Holland at 33,632, making a total of 146,827, to which must be added a large collection of pamphlets. This immense library was disposed of by auction after the owner's death, the sale lasting 216 days and realizing more than £60,000. Heber was elected to parliament for the university of Oxford in 1821, and served till 1826.

**HÉBERT, Antoine Auguste Ernest**, a French artist, born at Grenoble, Nov. 3, 1817. He went to Paris in 1835 to study law, but soon devoted himself to painting. In 1839 he exhibited his "Tasso in Prison," which was bought by the government for the Grenoble museum, and "The Cup found in Benjamin's Sack," to which was awarded the great prize which gave him the right to go to Rome for five years at the expense of the government. He continued eight years in Italy, and made much reputation by his "Malaria," exhibited in 1850, representing an Italian family flying from the pestilence. He obtained first class medals in 1851 and 1855; and in 1866 he was appointed director of the academy of France at Rome.

**HÉBERT, Jacques René**, a French revolutionist, known also under the assumed name of **PÈRE DUCHESNE**, born in Alençon in 1755, executed in Paris, March 24, 1794. Of low parentage and education, he went when very young to Paris, where he led an obscure life, generally supporting himself by dishonest means. When the revolution broke out he took to pamphlet writing, and soon established a scurrilous newspaper called *Le Père Duchesne*, which had considerable popularity among the lowest classes, and was instrumental in exciting several insurrectionary movements. After Aug. 10, 1792, he was one of the most active members of the self-constituted revolutionary commune, and received the appointment of substitute to the *procureur syndic*. The Girondists having obtained from the convention an order for his arrest, he was liberated in consequence of a violent outbreak of the mob, and became more popular than ever. He was a member of the commission to examine Marie Antoinette, and uttered the most outrageous calumnies against her. In conjunction with Chaumette, Anacharsis Clootz, and others, he established the worship of the "goddess Reason;" and,

relying upon the support of the commune and the club of Cordeliers, organized the ultra-revolutionist party known as the Hébertists or *enragés*. The committee of public safety, controlled by Robespierre, had them arraigned by virtue of a decree of the convention; and on the night of March 13, 1794, Hébert, Chaumette, Montmore, Ronsin, Clootz, and 14 others, were conveyed to prison. Hébert evinced great cowardice on his trial, and was executed amid the jeers of the populace. The circulation of his paper had been immense. During the year 1793 he received from the government 180,000 francs for copies gratuitously distributed. He published several pamphlets of a similar character to his journal, *Les vitres cassés, Catéchisme, Cantique séculaire, Almanach*, &c., all of them signed "Le Père Duchesne."

**HEBREWS, Israelites, or Jews** (Heb. *Ibrim, Benei Yisrael, Yehudim*), a people of Semitic race, whose ancestors appear at the very dawn of history on the banks of the Euphrates, Jordan, and Nile, and whose fragments are now to be seen in almost every city of the globe. Their history is the history of a nation, of a religion, and of a literature, and must thus exceptionally be treated. For its chief characteristic is the intimate blending and joint working of the national and religious elements in the development and preservation of the people; and Hebrew literature is almost entirely national or religious. The opening event of this history, as recorded in Scriptures, is the emigration (about 2000 B. C.) of the Semite Abraham from Ur of the Chaldees. (See **CHALDEA**.) He was by his father Terah a descendant of Eber, and as such may have borne the name Ibri (Hebrew), but more likely he was first designated by it in the land west of the Euphrates, as an immigrant from beyond (*eber*) the "great river." The name Israelite was applied to his descendants after a surname of Jacob, his grandson, and that of Yehudim (Jews) at a much later period (first mentioned about 712 B. C.), when, after the dispersion of the ten tribes, the house of Judah became the representative of the whole people. Separating from his relatives, who were idolaters, Abraham passed over from Mesopotamia (Aram Naharaim) to Canaan or Palestine, where he lived the life of a nomad, being rich in herds, flocks, and attendants, and worshipping the "Creator of heaven and earth," to whose service, "to walk before him and to be innocent," he bound himself and his house, in after life, by the covenant of circumcision. Having repaired to Egypt during a famine and returned, he rescued his nephew Lot, who lived in the valley of the lower Jordan, from the captivity of Amraphel, a king of Shinar, and his allies; lived for some time in the land of the Philistines; and finally settled near Hebron, where he died, leaving his main inheritance and his faith to Isaac, his son by his relative Sarah. Isaac thus became the second Hebrew patriarch, while his brother Ishmael, the son of Ha-

gar, an Egyptian woman, sought a separate abode in Arabia. Of the two sons of Isaac, only Jacob (afterward Israel), the favorite of their mother Rebecca, imitated the peaceful and pious life of his fathers and propagated the Hebrew line in Palestine, while his brother Esau (or Edom) settled in the mountainous land of Seir (Idumæa). Jacob had 12 sons, of whom he distinguished Joseph, the child of his favorite wife Rachel. This excited the envy of the others, who secretly sold their brother as a slave to Egypt, where he rose through his wisdom to the dignity of prime minister to one of the Pharaohs. The latter allowed him to bring the whole family of his father, numbering 70 males, over from the land of Canaan, and to settle them in the province of Goshen (E. of the Pelusiac branch of the Nile, it is supposed), where they could continue their pastoral life, unmolested by the Egyptians, who held that mode of existence in great contempt, and where they would be uncontaminated by Egyptian idolatry. Jacob closed his life, having adopted the two sons of Joseph, Manasseh and Ephraim, for his own. The book of Genesis, the only record of that earliest period of Hebrew history, closing with the death of Jacob and Joseph, also contains the last blessing of the former, a specimen of the most ancient Hebrew poetry. After the death of Joseph the Hebrews were not only oppressed but degraded to the condition of slaves, were overtasked and employed in the public works, while the fear of their joining a foreign enemy finally led one of their tyrants to decree what may be called their slow extermination, they having in the mean while increased to a prodigious number. How long they remained in the "house of slaves" (for the Hebrews were not the only slaves in Egypt) cannot be determined, there being Scriptural testimony for 430, as well as for about 210 years; nor can the precise date of their arrival, which Bunsen endeavors to fix almost 1,000 years earlier than it is fixed by Scriptural chronology; nor of their exodus, which, according to some of the most celebrated Egyptological critics, took place about 1300 B. C., while according to a distinct Biblical passage (1 Kings vi. 1) it must have happened early in the 15th century. (See *EXODUS*.) Nor is it easier or more important to find the reigns during which these events took place. (See *EGYPT*, and *EXODUS*.) Some writers have attempted to identify the Hebrews with the Hyksos, which is little less absurd than the fables of Manetho mentioned by Josephus. The last named Jewish historian has also some traditional additions to the early life of Moses, concerning his exploits in Ethiopia. Born at the time when the oppression of his people had been carried to its extreme, Moses, the younger son of Amram, a descendant of Levi, the third son of Jacob, was doomed to perish in the Nile with all new-born males of the Israelites, but was saved by the love of his mother Jochebed and his sister Miriam, and the compassion of a

daughter of the Pharaoh. Adopted as a son by the princess, who gave him his name, but nursed by his mother, he united the highest Egyptian education with the sentiments of a Hebrew. And "when Moses was grown he went out unto his brethren, and looked on their burdens." Seeing an Egyptian man smiting one of his brethren, he killed him, fled to Midian, married Zipporah, the daughter of Jethro, a wise priest or prince of that country, by whom he had two sons, and tended the flock of his father-in-law, leading it into the desert, as far as Mount Horeb, the N. E. eminence of Mount Sinai, in the S. part of the peninsula between the two gulfs of the Red sea. It was not till the decline of his life that he returned to Egypt to become the "shepherd of his people." He appeared with his brother Aaron, his spokesman, assembled the elders of Israel, and announced to them their approaching deliverance and return to Canaan in the name of the Everlasting (Hebrew, *Yehovah*, Being) and Unchangeable (*Ehyeh-asher-ehyeh*, I-am-that-I-am), the God of Abraham, Isaac, and Jacob, who "had seen their affliction." He now repaired to the palace of the king, proved superior to his priests, gained the admiration of his ministers and people (Exod. xi. 3), and finally compelled him to grant his demand by a series of disasters, the last of which was the sudden destruction at midnight of all the first-born Egyptians (possibly then a privileged class). The Israelites had received their secret instructions, and immediately departed toward the desert. Moses led them across the northern extremity of the gulf of Akabah or Suez, the western prolongation of the Red sea (Heb. *Yam Suf*, reedy sea); and the king of Egypt, who, repenting of having let them go, pursued them with his cavalry and heavy war chariots, perished there with his army. The "song of Moses," which celebrates this event (Exod. xv.), is an admirable monument of ancient Hebrew poetry, though surpassed in grandeur by that which closes the narrative of his life (Deut. xxxii.). After having repulsed an attack of the Amalekites, a roving and predatory Arabian tribe, Moses led the people to Mount Sinai, which from the delivery of the ten commandments now received the name of the mountain of God. This divine decalogue not only contained the common fundamental points of every moral and legal code ("Honor thy father and mother," "Thou shalt not murder," &c.), but also included the sublime doctrine of monotheism, the great social institution of the sabbath, and the lofty moral precept, "Thou shalt not covet." These commandments, which formed the basis of a "covenant between God and Israel," together with the successively promulgated statutes, precepts, &c. (according to the rabbis, altogether 365 positive and 248 negative obligations), constitute the Mosaic law (*Torath Mosheh*), which is contained principally in the second and third, and repeated in the fifth book of the Pentateuch, and for about 15 centuries

remained, and with the exception of a strictly national part still is, the general code of the Hebrews. Its aims are the moral perfection of the individual and the welfare of society. Its means are chiefly a common and central worship, under the direction of the Aaronites (*Kohanim*), whose restrictive obligations are, however, not equalled by the privileges they enjoy; three festivals for the commemoration of great national events, thanksgiving and rejoicing, as well as for the annual gathering of the whole people; a fast day for repentance; periodical readings of the law; general education through the Levites its guardians (Deut. xxxiii. 10); a weekly day of rest (sabbath) for the people and their animals; the seventh year as a periodical time of rest for the earth, as well as for the extinction of various pecuniary claims; numerous and most frequently repeated obligations for the support of the fatherless and widow, the poor and the stranger; an organized judiciary and police; a severe penal code; strict rules for the preservation of health and cleanliness; circumcision as a bodily mark of the covenant; and numerous other rites and ceremonies designed to guard the nationality, or to lead to the preservation of truths and principles. The chief principles are: self-sanctification and righteousness, in imitation of God, who is holy and righteous (Lev. xix. 2, &c.); brotherly love and equality, for all people are his children (Deut. xiv. 1); freedom, for all are bound exclusively to his service (Lev. xxv. 55); limited right of property, for the whole land belongs to him (Lev. xxv. 23). The principal promise of reward is the natural share of the individual in the happiness of society; the principal threat of celestial punishment, his natural share in its misfortunes. The form of government is the republican (though a limited monarchy may be established if the people demand it), with the moral theocratic dictatorship of a prophet (*nabî*) like the lawgiver, with the sovereignty of the people who judge the merits and claims of the prophet above it, and above all the majesty of the divine law, which can be explained and developed, but not altered. The whole system is entirely practical, containing no definitions of supernatural things, except in a negative form, no articles of belief, no formulas of prayer. —But the difficulties of introducing this system of institutions were as immense as those of maintaining the nation in the desert. The first census showed 22,000 male Levites above one year of age, and 603,550 males of other tribes over 20, including 22,273 first born. Provisions were scanty, water was scarce, dangers were constant; the people were an unruly mass of freed slaves, who often regretfully thought of the flesh pots of Egypt and of the quiet carelessness of bondage; a multitude of non-Israelites who had joined them regretted the visible gods of their former worship; envy and ambition often augmented the existing dissatisfaction. Moses was still on Mount Sinai when

the people compelled his brother Aaron to give them, in a golden calf, an imitation of the Egyptian Apis, a visible god. Moses, descending, broke the tablets of the covenant in his anger, and restored order by a massacre of the idolatrous rioters, but almost despaired of his mission and desired to die. A pompous worship was now introduced, and sacrifices were ordained, of which a later prophet, Jeremiah (vii. 22), significantly says in the name of God: "For I spake not unto your fathers, nor commanded them in the day that I brought them out of the land of Egypt, concerning burnt offerings or sacrifices." Moses removed his tent from the camp. All difficulties, however, were conquered by the "man of God," who consoled himself with the idea that a generation educated under his guidance would replace that of the desert. Having passed around the lands of the Edomites, Moabites, and Ammonites, he conquered those of Sihon, king of the Amorites, and of Og, king of Bashan (Batanaea), E. of the Jordan, giving them to the tribes of Reuben and Gad and to half the tribe of Manasseh, and died on Mount Nebo before entering the land of promise. The man who was "meek above all men that were on the face of the earth" died in voluntary loneliness, and "no man knoweth of his sepulchre unto this day." Joshua, his pupil and appointed successor, an Ephraimite, now led the 13 tribes of Israel, named after 11 sons of Jacob and the two sons of Joseph, across the Jordan into Canaan (or Palestine proper), which was conquered after a war of extermination, and allotted to the tribes of Judah, Ephraim, Manasseh (the other half), Benjamin, Simeon, Zebulun, Issachar, Asher, Naphtali, and Dan. The Levites, who were to live by tithes, received no separate division, but a number of cities within the limits of every tribe, among others the historical places of Gibeon, Geba, Beth-horon, Mahanaim, Heshbon, Jazer, Hebron, Shechem, Golan, Kedesh, and Ramoth-Gilead; of which the last five together with Bezer were selected as towns of refuge for involuntary murderers, while Shiloh became the central city, receiving the tabernacle with the ark of the covenant. Phinehas, son of Eleazar, the zealous priest, and Caleb, son of Jephunneh, were among the most distinguished assistants of Joshua. Before his death, Joshua held an assembly of the whole nation at Shechem, in which he called upon them to choose once more between the gods of their ancestors beyond the Euphrates, those of the conquered Amorites, and the God whom he was determined to follow with his house. The people chose their Deliverer and Preserver, and confirmed their choice by a new covenant; but scarcely were the elders gone who had witnessed the whole work of deliverance and maintained the order of Joshua, when idolatry and anarchy became general. Parts of the country remained unconquered, principally in the hands of the Phœnicians in the N. W., of the Philistines in the S. W., and of the Jebusites

in the centre. With these, and with other neighbors on the borders, frequent warfare had to be waged, while the young state, forming a loose confederacy of 12 (or, counting Manasseh as two, of 13) almost independent members, had neither natural boundaries nor a capital, neither a hereditary head nor an elective federal government, the only bond of union being the common law, and the only centre the seat of the ark of the covenant, whose guardians probably enjoyed the privilege of convoking a general assembly of the people in cases of urgent necessity. Such national assemblies were often held at Mizpah. But the enmity and frequent attacks of the surrounding idolatrous tribes was less pernicious than their friendly relations in times of peace, when the voluptuous rites connected with the worship of Ashtoreth and other divinities of the Phœnicians, Syrians, and Philistines, were too seductive for a people in an undeveloped state, whose own religion required a rigid observance of a strict morality. To remedy these evils, heroic men arose from time to time, repulsed the enemies, restored order and the law, were acknowledged as leaders and judges, at least by a part of the people, and thus revived its unity. This period of republican federalism under judges (*shophetim*, a name which also designated the chief magistrates of the Carthaginians in their language, which was also Semitic) is described in the book of that name, a continuation of that of Joshua, and forms one of the most interesting portions of Hebrew history. But criticism labors in vain to arrange chronologically the striking but in part probably contemporaneous events of the narrative. Othniel, a younger brother or nephew of Caleb, of the tribe of Judah, was the first of the judges. Ehud, a Benjamite, delivered Israel from the oppression of the Moabites, having killed with his own left hand Eglon, the king of the invaders. "And after him was Shamgar, the son of Anath, who slew of the Philistines 600 men with an ox goad," at a time when "no shield was seen or a spear among 40,000 in Israel." Barak, a Naphtalite, inspired by Deborah, a female prophet and judge, who afterward celebrated the event in her great song (Judges v.), gained together with her a signal victory near Mount Tabor and the brook Kishon over the army of Sisera, commander of Jabin, a Canaanite king on the N. of Palestine, which numbered 900 iron war chariots. Sisera fled, but was killed in sleep by Jael, a woman of the nomadic and neutral Kenite tribe, in whose tent he had sought refuge. Gideon, characterized as the youngest son of one of the weakest families in Manasseh, surprised with 300 select men the immense camp of the Midianites and Amalekites, dispersed them, called the surrounding tribes to arms, exterminated the invaders, appeased the Ephraimites, who were jealous of the glory gained by their neighbors, and refused to accept the royal dignity offered him by the gratitude of the people, declaring,

"I will not rule over you, neither shall my son rule over you: the Lord shall rule over you." Abimelech, however, his son by a concubine, gained adherents among the idolatrous friends of his mother in Shechem, destroyed the numerous family of his father, was proclaimed king in that city, was afterward expelled, but reconquered the city, and finally perished while besieging the tower of the neighboring Thebez by a piece of millstone cast from its top by a woman. Jotham, the only son of Jerubbaal (as Gideon was called from his destruction of the Baal worship) who escaped from the massacre of his brothers, had predicted the bloody end of the usurper in his fable of "the trees that went forth to anoint a king over them" (Judges ix.), which is probably the most ancient specimen of that kind of poetry now extant. Of the judges Tola, of the tribe of Issachar, and Jair, from Gilead in Manasseh beyond the Jordan, little more is preserved than their names. Jephthah, another Gileadite, of illegitimate birth, having been expelled from his home, was recalled by his native district to combat against the Ammonites, who had attacked it, carried the war into the land of the enemy, and returned after a signal victory, of which his daughter, in consequence of a vow, became a victim. The Ephraimites, who had not been called to participate in the combat, now threatened vengeance on the conqueror, who, unlike Gideon, terminated the quarrel with a bloody defeat of the troublesome tribe, which is the first example of civil war among the Israelites, soon to be followed by others. Ibzan of Bethlehem in Judah, Elon, a Zebulunite, and Abdon, an Ephraimite, are next briefly mentioned as judges. Dan, too, gave Israel a judge in the person of Samson, who braved and humiliated the Philistines; he was a Nazarite of prodigious strength, whose adventurous exploits in life and death much resemble those of the legendary heroes of Greece. The greatest anarchy now prevailed. The Danites not having yet conquered their territory, 600 men among them made an independent expedition north, and conquered a peaceful town of the Phœnicians, Laish, which was by them named Dan, and is henceforth mentioned as the northernmost town of the whole country, the opposite southern point being Beersheba. The concubine of a Levite having been outraged to death on a passage through Gibeah in Benjamin by some inhabitants of that place, her lover cut her corpse into pieces and sent them to all the tribes, calling for vengeance. The people assembled at Mizpah, and demanded from Benjamin the surrender of the criminals. The Benjamites refused, and a bloody civil war ensued, in which they were nearly exterminated. The people wept over their fratricidal victory, and 600 Benjamites who alone survived were allowed to seize wives (for the victors had sworn not to give them any) from among the girls dancing in the valley of Shiloh, on a sacred festival annually celebrated there. The little book

of Ruth, which contains the idyllic narrative of the Moabitish widow of that name, who, faithfully sharing the fate of her unfortunate mother-in-law, adopted her Hebrew home and religion, and married Boaz, is supplementary to the book of Judges. The first book of Samuel begins with the continuation of the latter. The priest Eli, who died suddenly on receiving the news of the defeat of his people by the Philistines, the death of his two sons, and the capture of the ark of the covenant, and his pupil, the prophet or seer Samuel, the son of Elkanah and the pious Hannah, were the last of the judges. The latter reestablished the exclusive worship of the Lord, routed the Philistines, restored the ark, and introduced schools of prophets, residing in Ramah, his native place, and regularly visiting Bethel, Gilgal, and Mizpah; and when he finally resigned the executive power, he could say to the assembled people at Gilgal, "Behold, here I am; witness against me before the Lord: Whose ox have I taken? or whose ass have I taken? or whom have I defrauded? whom have I oppressed? or of whose hand have I received any bribe to blind mine eyes therewith?" And the people testified to the purity of his career. But his sons, whom he appointed in his old age, acted very differently, and their corruption, but still more the desire for a strong military head, so natural after the previous long period of war, anarchy, and disunion, finally decided the people to urge the appointment of a king to rule them "like all other nations." The seer, deeply grieved by the proposed change of the Mosaic form of government, which is distinctly branded in the narrative as a repudiation of the divine rule itself, in vain painted to the people all the oppression, extortion, and degradation inseparable from monarchical rule (1 Sam. viii.); they persisted in their demand, and he was obliged to yield. Saul, the son of Kish, was appointed the first king of Israel, and the constitution of the monarchy (1 Sam. x. 25) was written and deposited in the sanctuary. The new rule was strengthened and became popular by a series of victories over the Ammonites, Moabites, Idumeans, Syrians, and Philistines. The eldest son of the king, Jonathan, distinguished himself as a heroic youth. Abner, a cousin of Saul, became commander of the army. Gibeah was the capital of the monarchy. But an expedition against the Amalekites, though successful, was not executed according to the ordinance of Samuel, who now turned his influence against Saul. The spirit of the latter became troubled, and David, the son of Jesse of Bethlehem, was brought to soothe his temper with music. This young shepherd excited the jealousy of Saul by his triumph over Goliath, the Philistine giant, which decided a campaign, as well as by his subsequent successes when he married the princess Michal, and became the intimate friend of her brother Jonathan. Foreseeing the future destinies of the aspiring youth, Saul repeatedly attempted

to take his life, and, exasperated by his failures, and the protection bestowed on David by his children, Samuel, and the priests, he exterminated the inhabitants of Nob, a city of the latter, and passed his life in pursuit of his rival, who, with a band of desperate outlaws roving on the southern borders of the country, baffled every attempt to capture him. The extermination of wizardship was one of the acts of Saul. His reign was terminated by a catastrophe. A battle was fought against the Philistines at Mount Gilboa; the Hebrews fled, Jonathan and two other sons of Saul fell, and the king slew himself with his own sword. David, whose skill in poetry equalled his musical genius, honored in a touching elegy the memory of his fallen friend and foe (2 Sam. i.), who, "lovely and pleasant in their lives, were even in their death not divided: they were swifter than eagles, they were stronger than lions." Repairing to Hebron, he was anointed there by his own tribe of Judah as king, while Abner proclaimed a surviving son of Saul, Ishbosheth, at Mahanaim, who was acknowledged by all the other tribes (about 1055 B. C.). Bloody conflicts stained this double reign, David continually gaining the ascendancy through his heroic officers, the brothers Joab, Abisai, and Asabel, until the assassination of Abner and soon after of Ishbosheth, caused by private revenge, gave him the whole kingdom. He now conquered Zion from the Jebusites, made Jerusalem his capital, organized the national worship as well as the military power of the state, and by continual victories over all surrounding neighbors, except Phœnicia, a friendly country, extended the limits of his dominions N. E. as far as the Euphrates, and S. W. as far as the Red sea. Justice was strictly administered; literature and arts, especially poetry and music, flourished. Asaph, the founder of a family of sacred singers, rivalled the king in psalms; Nathan and Gad assisted him as prophets, Zadok and Abiathar as priests; Joab held almost continually the chief command of the army. But the palace of the king was often stained with crimes; David himself had much to repent of; the infamous deeds of his sons by various wives, Amnon, Absalom, and Adonijah, distracted the peace of his house and kingdom, and the two former had perished, and two great insurrections had been quelled, when he died after a reign of 40 years (about 1015). Solomon, his son (by Bathsheba, the widow of the assassinated patriot Uriah), ascended the throne at the age of twelve, and commenced his reign with the execution of his half brother Adonijah and the aged Joab, who had conspired against his succession; but he soon became famous for personal wisdom and scientific attainments, as well as for the splendor of his court and the prosperity of his subjects. He inherited a large army and a full treasury, but he used the former only to preserve peace and secure tribute from his neighbors, and the lat-

ter for the adornment of his country by numerous gorgeous public structures. He built the temple, which more than all contributed to his glory, and a royal palace (both in Jerusalem and with the assistance of Tyrian architects), an armory, Palmyra (Tadmor) in the desert, and other cities; made common naval expeditions with the king of Tyre, from Ezion-geber, a port on the eastern gulf of the Red sea, to the distant land of Ophir, which brought back gold, gems, precious woods, and rare animals; imported horses from Egypt for his numerous cavalry and war chariots; and introduced general luxury. The fame of his wisdom attracted visitors, among them the queen of Sheba (Saba) in southern Arabia. The authorship of 3,000 proverbs and 1,005 songs is mentioned among his literary merits; for he wrote "of beasts, of fowl, of creeping things, and of fishes," and of all kinds of plants from the cedar in Lebanon to the hyssop on the wall; and the extant philosophical book of Proverbs and the graceful Song of Songs (the latter of which, however, criticism assigns to a much later period) bear his name. But, while he was teaching wisdom in writings, his personal example taught extravagance and folly. His court was as corrupt as it was splendid. The magnificence which he exhibited was not exclusively the product of foreign gold, tribute, and presents, but in part based on the taxes of his subjects. The army served not only to secure peace, but also as a tool of oppression. The public structures were built with the sweat of the people. Near the national temple on Mount Moriah, altars and mounds were erected for the worship of Ashtoreth, Moloch, and other idols, introduced by some of his numberless wives from their native countries, Phœnicia, the land of Ammon, Idumæa, and Egypt. Rezon was suffered to establish a hostile dynasty in Damascus, and Hadad to make himself independent in Idumæa. When Solomon died, after a peaceful reign of 40 years, the people felt themselves so exhausted that they demanded a considerable change from his son Rehoboam before they proclaimed him king at Shechem, where they had assembled for the purpose. Jeroboam, an Ephraimite who had already attempted an insurrection against the late king, now returned from his exile in Egypt and headed a deputation of the most distinguished citizens. Rehoboam promised an answer after three days. The experienced councillors of his father advised him to yield for the moment in order to be master for life; but the advice of his younger companions better suited his disposition, and his reply to the people was accordingly: "My father made your yoke heavy, and I will add to your yoke; my father also chastised you with whips, but I will chastise you with scorpions." The consequence of this was an immediate defection of ten tribes, who proclaimed Jeroboam their king, while only Judah and Benjamin remained faithful to the

house of David. Rehoboam, having fled from Shechem, where his receiver general of taxes was stoned by the revolted people, returned to Jerusalem and assembled a powerful army to reconquer his lost dominions; but the prophet Shemaiah dissuaded the people in the name of God from the civil war. Thus the division of the state into two separate kingdoms was consummated (975). The northern, comprising the country N. of Benjamin and all E. of the Jordan, was called Israel, or, from its principal members, Ephraim and Manasseh, the house of Joseph, and poetically Ephraim; its capital was Shechem, subsequently Tirzah, and finally Samaria (Shomeron). The southern, from its chief tribe called Judah, had the advantage of possessing the sanctuary in the old capital, and being supported by the Levites and the priests, who gathered around it. To destroy the influence of the religious element upon his own subjects, who according to the Mosaic law were bound to repair three times in the year to the chosen sacred spot, Jeroboam revived the not yet extinct Egyptian superstitions of his people, established two golden calves as emblems of their divinity, at Dan and Bethel, on the N. and S. boundaries of his state, admitted non-Levites to the priestly office, and introduced new festivals and even a new calendar. The Mosaic institutions being thus systematically excluded from the state, idolatry, despotism, and corruption prevailed throughout the 250 years of its existence, almost without interruption. While these evils remained permanent, the condition of the people was made still worse by a continual change of masters. Usurpation followed usurpation; conspiracy, revolt, and regicide became common events. The house of Jeroboam was exterminated with his son Nadab by Baasha, who reigned at Tirzah, and whose son Elah was assassinated while drunk by Zimri, one of his generals. At the same time another of his officers, who commanded an army besieging Gibbethon, a city of the Philistines, was proclaimed king by his troops, marched upon Tirzah, and took it, and Zimri after a reign of seven days burned himself with his palace. A part of the people now wanted Tibni, but Omri prevailed, and Tibni died. Omri, who built Samaria and made it his capital, was succeeded by his son Ahab, whose wife Jezebel, a Sidonian princess, was fanatically zealous in propagating the worship of the Phœnician Baal, and in persecuting the prophets of monotheism, who were almost exterminated. Ahab having died of a wound received in the battle of Ramoth-Gilead against the Syrians under Benhadad II. (897), his two sons Ahaziah and Jehoram successively reigned after him; but with the latter the idolatrous house of Omri was exterminated by Jehu, who was proclaimed king by the officers of the army which he commanded against Hazael of Syria in Gilead (884). Jehu, who had been anointed by the prophet Elisha, abolished the worship of Baal, but left the institutions of

Jeroboam. His dynasty, assisted by the influence of Elisha, was in many respects prosperous. To it belonged the kings Jehoahaz, Joash, Jeroboam II., and Zechariah, with whose murder by Shallum it ended (773). Shallum met with the same fate after a month through Menahem, whose son Pekahiah was slain and succeeded by his chariot driver Pekah. The murderer of the latter, Hoshea, was the last of the usurpers, and the last king of Israel. This state, which during all its existence was exposed to violent shocks from its neighbors, Judah, the Philistines, Moab, which revolted, and especially from the Syrians of Damascus, against whom its possessions beyond the Jordan could seldom be defended, had recovered some strength by repeated victories under Joash and Jeroboam II.; but soon after, rotten and decayed through idolatry, despotism, and anarchy, it became an easy prey to the growing power of Assyria, to whose king Phul it became tributary after an invasion in the reign of Menahem. Tiglath-pileser conquered its E. and N. provinces, carrying off the inhabitants to Assyria, in the time of Pekah, and Shalmaneser destroyed it entirely, conquering the capital, Samaria, after a siege of three years (721), taking Hoshea prisoner, and dispersing the inhabitants throughout the N. E. provinces of his empire, where their idolatrous habits made them likely to lose their nationality and soon to disappear among their neighbors, though scattered remnants may occasionally have emerged at later periods, and in various countries, as representatives of the ten tribes of Israel. The prophets Ahijah of Shiloh, who contributed to the election of Jeroboam I., Elijah, the hero of the Mosaic religion under Ahab, his great disciple Elisha, the two contemporaries of Jeroboam II., Amos and Hosea, Micah, who lived in the last period, and many others, strove in vain to check the growing power of evil by appeals to the conscience of rulers and people, boldly denouncing the despotism, hypocrisy, and licentiousness of kings, princes, and priests, the selfishness, pride, and extravagance of the rich, the extortions, deceptions, and seductions practised on the people, and again and again kindling the spirit of justice, truth, patriotism, humility, or hope. The rival state of Judah enjoyed more frequent periods of prosperity and lawful order, as well as a longer duration. There the interest of the dynasty, which continued in a direct line of succession down to the latest period, was identical with that of the people. Their common enemy was the idolatry which reigned in Israel. Their common safeguard was the law, which was here supported by the Levites, and more effectively defended by the prophets. Corruption, however, often led both government and people to break down their only wall of protection, and to imitate the pernicious example of their neighbors. This tendency prevailed as early as the reign of Rehoboam, the most important

event of which was the invasion of Shishak (Sheshonk), king of Egypt, who pillaged the temple and the royal palace. War against Jeroboam was almost continually waged during this and the following short reign of Abijam. The successor of the latter, Asa, abolished idolatry, checked public immorality, routed an invading army of Ethiopians, resisted the attacks of Baasha of Israel through an alliance with the king of Damascene Syria, and fortified Gibeah and Mizpah against an invasion from the north. Jehoshaphat, his son, made peace with Israel, and even fought in alliance with Ahab against Benhadad of Syria (897), subdued Idumæa, and fought successfully against the Moabites and their allies, but was unfortunate in an attempted expedition to Ophir. Internally, too, his reign was one of the most successful, the salutary reforms of his father being further developed. But his son Jehoram, having married Athaliah, a sister of Ahab, followed the example of the court of Samaria, and also lost his father's conquest, Idumæa, by a revolt. Ahaziah was equally attached to the house of Ahab, whose fate he shared. Having gone to visit Jehoram, he was mortally wounded by the conspirators under Jehu, and expired on his flight at Megiddo (884). On receiving news of that event, Athaliah his mother usurped the government, exterminating all the royal princes except one, Joash, a child of one year, who was saved by his aunt and secreted in the temple. Six years later Jehoiada, an old priest, matured a conspiracy, the legal heir to the house of David was produced in the temple, and the queen, who hastened thither, was slain. The altars of Baal were now destroyed, and the temple was repaired under the influence of Jehoiada; but an invasion of Hazael from Syria could not be repulsed, and the capital itself was saved only by an immense ransom. After the death of Jehoiada Joash abandoned his teachings, and even the son of his benefactor, Zechariah, who boldly reprimanded him, fell a victim to his tyranny, which was ended with his life by a conspiracy (838). His successor Amaziah punished the murderers of his father, and made a successful expedition to Idumæa, but was made prisoner in a battle against Joash, king of Israel, which he had wantonly provoked by a challenge, and, having returned after the death of that king to his conquered and unfortified capital, was deprived by a conspiracy of his throne and life. The following reign of Uzziah or Azariah was not only one of the longest in the history of the Hebrews, lasting 52 years, but also distinguished by victories over the Philistines, Arabians, and Ammonites, and by the flourishing condition of husbandry, mechanical arts, and literature. Besides Amos and Hosea, who were active also in Judah, Jonah and Joel were among the prophets of that period. Of the last we still possess a beautiful poetical description of a dreadful devastation by locusts, perhaps alle-

gorically of barbarians, when "the land was as the garden of Eden before them, and behind them a desolate wilderness." Another destructive event was a long remembered earthquake. Jotham, the son of Uzziah, who during the last years of his reign acted as regent, continued after his father's death (759) his beneficent rule; but his son Ahaz again introduced idolatry, and his reign was disgraceful and disastrous. Rezin and Pekah, allied against him, advanced as far as Jerusalem, which was saved only by the dearly purchased aid of Tiglath-pileser, king of Assyria, who conquered Damascus, carried its inhabitants into captivity, and slew Rezin. Ahaz declared himself the subject of his Assyrian deliverer, and also suffered attacks by the revolted Philistines, while the state of the interior of the country provoked the immortal denunciations of Isaiah and Micah. But these prophets expressed in no less glowing words their hopes of a better future, which seemed to be realized in the succeeding reign of Hezekiah the son of Ahaz. This pious king followed almost entirely the injunctions of Isaiah, who was bold enough to advise an uncompromising abolition of ancient abuses and restoration of the Mosaic law, war against the Philistines, independence of Assyria, and at the same time the rejection of any alliance with Egypt; and was powerful enough to brave the general corruption, to baffle the plots of the court, and to maintain the courage of the people as well as of the sick king during the great invasion of Sennacherib, when the state was on the brink of ruin. Thus Judah escaped the fate of her sister state, which had a few years before been conquered and devastated by the Assyrians, and which now began to be repopled principally by Outhæans, an idolatrous people subject to their rule, who, mingling their rites with those of their new territory about Samaria, became afterwards known under the name of Samaritans (*Kuthim*), while scattered portions of the ancient Hebrew inhabitants augmented the number of the subjects of Hezekiah. But the reign of his son Manasseh, longer than that of Uzziah, was more disgraceful than that of Ahaz. Idolatry was not only publicly introduced, but had its altars even on Mount Moriah. The most abominable practices prevailed, including the bloody worship of Moloch, and Jerusalem was filled with the blood of the innocent victims of tyranny, while the limits of the country were narrowed by hostile neighbors. Amon, the son of Manasseh, followed in his father's footsteps, but was murdered after two years. Josiah, his successor, however, was a zealous imitator of Hezekiah, and was assisted in his radical reforms by the reviving influence of the prophets, among whom were Nahum, Zephaniah, the young Jeremiah, and their female colleague Huldah. Nahum celebrated the final fall of Assyria, and the destruction of Nineveh its capital, "the bloody city full of lies and robbery, (whence) the prey

departeth not," which was then completed by the allied Babylonians and Medes. But the power of Babylonia, lately founded by Nabopolassar, was now growing to a threatening extent, and the position of the weak kingdom of Judah between this and the rival power of Egypt doomed it to a sudden catastrophe. Pharaoh Necho having commenced a campaign against Babylonia through Philistia, Josiah opposed his march, and fell in the battle of Megiddo. His son Jehoahaz was sent prisoner to Egypt, and the younger Jehoikim (or Eljakim) appointed king in his stead. The great victory of the Babylonians, however, over Necho on the Euphrates, soon made Jehoikim a vassal of their empire. He afterward revolted, against the advice of Jeremiah, who saw the impossibility of resisting the sway of Nebuchadnezzar, the successor of Nabopolassar. The king was as little inclined to listen to his council in his foreign as he was in his domestic policy. Jeremiah's prophecies were burned. Another prophet, Uriah, was punished for the boldness of his rebukes with death. The Chaldeans soon invaded the country, and were joined by its neighboring enemies. After the death of his father and a short siege of Jerusalem, Jehoiachin or Jeconiah, the son of Jehoikim, terminated the war by a voluntary surrender to Nebuchadnezzar, who sent him with his family, his army, and thousands of the most important citizens, to Babylonia as captives. The treasures of the temple and royal house were plundered. Mattaniah, an uncle of the dethroned king, was appointed his successor, as vassal of the conqueror, under the name of Zedekiah (598). It was the last reign of the house of David. Zedekiah, a weak prince, was induced by a misguided patriotism to revolt against Nebuchadnezzar. Jeremiah in vain exerted all his zeal and eloquence to dissuade the king and the people from this pernicious step. He was persecuted by both; the seductive influence of false prophets prevailed. The second siege of Jerusalem by Nebuchadnezzar now ensued (588). It fell after a desperate defence. The king, who attempted to escape with the remnants of his troops, was made prisoner in the neighborhood of Jericho, was deprived of his eyes after having seen the slaughter of his children, and was sent in chains to Babylon. The temple was burned, its vessels were plundered, the walls and palaces of Jerusalem destroyed, and all important or wealthy citizens carried into the Babylonish captivity. Jeremiah was spared and allowed to remain with Gedaliah, whom Nebuchadnezzar appointed his viceroy at Mizpah, and around whom a number of the remaining people soon gathered. But this last centre, too, was soon destroyed by the assassination of Gedaliah. A number of the surviving officers emigrated with their followers and Jeremiah, who tried in vain to dissuade them, to Egypt, whither the sword of the Chaldeans still followed them. The annihilation of the state of Judah was complete. The book

of Lamentations contains touching elegies on this tragic end. Ezekiel too laments the dispersion of his nation. Providence is arraigned by Habakkuk and Jeremiah, and also in the book of Job, a sublime lyrical drama, which numerous critics regard as a production of that time. A number of psalms, too, belong to the last period of the kingdom of Judah. But Babylon, the prison of the Jewish nation (for this name had now become the most familiar), was destined also to become the cradle of its regeneration. The most eminent of the people had been transplanted there with Jeconiah, and afterward, among others, Ezekiel, Daniel, and his pious companions at the court of Nebuchadnezzar, Hananiah, Mishael, and Azariah; and their activity in reviving the spirit of religion and nationality is evident from the numerous contributions to the Hebrew literature of that period, all glowing with enthusiasm and unconquered hope. The court, that source of corruption, was no more; the priests of Baal and Moloch, so long fattened on lies, had disappeared with the altars of their idols; the voluptuous groves of Ashtoreth could not be transplanted into the land of dreary captivity; Zion was regretfully remembered, and the true admonishers of the people, who had predicted all this, now found more willing ears. Their consolations, too, and the deliverance which they promised, were soon to be confirmed; and the captives, who were full of revengeful hatred toward their oppressor, the profligate and treacherous mistress of the world, heard with secret delight of the warlike preparations of the Medo-Persian empire against her. The last ruler of Babylon, Belshazzar, was drinking wine with his lords, his wives, and his concubines, from the golden and silver vessels of the temple of Jerusalem, when "one messenger was running to meet another" to tell him "that his city was taken at one end" (538). The Persian conqueror did not disappoint those who had predicted, and perhaps secretly promoted, his triumph. He allowed the Jews to return to their country, where they could be useful by forming a kind of outpost against Egypt, and to rebuild their capital and temple. The first and largest body of returning patriots consisted of more than 42,000 persons, under the lead of Zerubbabel, a prince of the house of David, and the high priest Jeshua. But the idolatrous Samaritans, whom the Jews would not admit to have a share in the new temple, exerted themselves to prevent their rebuilding and fortifying Jerusalem, calumniating them at the court of Persia, particularly under Cambyes (529-'22) and Pseudo-Smerdis (522). Darius, however, fully confirmed the permission of Cyrus (521). The prophets Haggai and Zechariah (assisted, perhaps, by Obadiah, who seems to have been their contemporary) inspired Zerubbabel, the priests, and the people with fresh zeal, and after five years the new temple was completed (516). The events which are described in the book of Esther—the elevation of the Jewess of that

name (or Hadassah) to the dignity of Persian queen, the high official career of her relative Mordecai, the schemes of Haman, a courtier and personal enemy of the latter, to destroy all the Jews of the Persian empire, his fall, and the almost miraculous escape of the people through Mordecai and Esther—probably refer to the reign of Xerxes (486-'65), the son of Darius, though the name Ahasuerus is used in the Scriptures to designate various monarchs of the Persian empire. Under the following reign of Artaxerxes, Ezra, the pious scribe (or critic, *sopher*), led a new colony of Jews from beyond the Euphrates to Jerusalem, where he carried through a series of important reforms, completing the restoration of the Mosaic law, for which he was afterward revered as the second lawgiver of his people. The condition of the Jews in Palestine, however, or rather in Jerusalem and its vicinity, was not cheering. The city had no walls or gates, and poverty prevailed. To remedy these evils Nehemiah, the Jewish cup-bearer of Artaxerxes, started from Susa with the permission of the monarch and the dignity of governor (445). The work of restoring and fortifying Jerusalem was now carried on and executed with the utmost zeal, though the laborers were often obliged to work under arms, the Samaritans and their friends threatening an attack. Notwithstanding his dignity, Nehemiah voluntarily shared the toils and privations of his brethren. He restored order, assisted the poor, abolished the abuses of the rich, and strengthened the observance of the law. After a long absence at the royal court, during which fresh disorder had arisen, he resumed his pious and patriotic work, in which he was assisted by Malachi, the last of the known prophets. The enmity of the Samaritans, though baffled in its first assaults, remained active down to a much later period, their separation having been sanctioned by a rival temple on Mount Gerizim. The Jewish temple on Mount Moriah had a successive line of hereditary high priests in the direct descendants of Jeshua, of whom Jaddua held that most influential office at the time of the conquest of the Persian empire by Alexander, whose wrath he is said to have diverted from Jerusalem (332). The names of the Persian governors during the last century of that empire are unknown, this being altogether the most obscure period in the history of the Jews. It seems to have been a time of comparative tranquillity and prosperity; at least it included no particular national disaster, as it added no day of fasting to those recently established in commemoration of the fall of Jerusalem, the death of Gedaliah, &c. But the same century, together with the time of Ezra, may certainly be regarded as the period of the most important religious developments, of a permanent consolidation of Judaism. The first impulse had probably been given in Babylon, during the active literary period of the captivity. But Ezra the *sopher*, his contemporaries Haggai, Zechariah, Nehe-

miah, and others, "the men of the great assembly" (*anshei keneseṯ haḡgedolah*), and the successive *sopherim*, are the real authors of the restoration and the new developments connected with it. The sacred Scriptures were collected, authenticated, and arranged into a canon, including the most precious remnants of a vast literature, among the lost parts of which were the often mentioned and quoted *Sepher hayashar* (in the English version, "book of Jasher"), probably a collection of historical songs, the book of the "Wars of the Lord," the special "Chronicles" of the kings of Judah and Israel, the prophecies of Nathan, Ahijah, Iddo, and others, the "History of Solomon," various works of this king, and an endless multitude of others; their great number was complained of in the philosophical book of Ecclesiastes, a work commonly attributed to Solomon, but by numerous critics assigned to a very late period. The Pentateuch was publicly read, taught in schools, explained, hermeneutically expounded (*midrash*), and translated into the Chaldee language, which the common people had adopted in Babylonia, together with various eastern notions concerning angels, spirits, and other supernatural things. The legal or religious traditions, explanatory of or complementary to the law of Moses, were traced back through the prophets and elders to that lawgiver, and systematically established as the oral law (*torah* or *debarim shebbeal peh*). New obligations were added to form a kind of "fence" (*seyag*) around the law, preventing its infraction, and founded on the authority of the scholars and wise men of the age (*dibrei sopherim, mitzvath zekenim*). The following century and a half, when Judea was a province of the successors of Alexander in Egypt and Syria, the Ptolemies and Seleucidæ, is marked by new features. Greek refinement, science, and philosophy spread among the Jews, particularly among the flourishing colonies in Alexandria and other cities of the Ptolemies. A part of the people, especially the wealthier, adopted the Epicurean notions of the demoralized Greeks of that time, and were finally organized as a sect, denying the immortality of the soul, rejecting the authority of tradition, and adhering to the literal sense of the Mosaic law; while the teachings of the Stoics agreed well with the more austere life of the followers of the "great assembly," who maintained their preponderance with the people. As a sect the former were called Sadducees, the more ascetic of the latter Pharisees. The derivation of both these names is as little settled as is that of the name of the Essenes, who appear about the close of this period, forming secluded, industrious, and socialistic communities, and engaged in medical, mystical, and ascetic practices. The Samaritans, who, adopting in part the Mosaic rites, had succeeded in attaching to their temple a part of the neighboring Jews, now followed the example of the Hellenizing cities of Syria, and made little opposition to the spreading worship of the Greek gods. The

Greek language became common in Judea, and the Greek translation of the Pentateuch prepared under Ptolemy Philadelphus in Egypt (the Septuagint) was used in the synagogues of that country. A Syrian dialect of the Aramaic was used for the same purpose by the Samaritans, and the pure Chaldee prevailed among the Jews beyond the Euphrates. Politically, no less than in matters of religion, Judea seems to have been ruled by the high priests, who had to be confirmed by the Egyptian or Syrian kings, and the sanhedrim of Jerusalem, a college of 70, with a president (*beth din haḡadol*, high court). After the death of Alexander (323), the little province frequently changed masters, until it was definitively attached to the empire of Ptolemy I. Soter, under whom the celebrated Simon the Just (or Righteous) officiated as high priest, and Antigonos of Socho as president of the sanhedrim. The uncertainty of possession made the foreign rulers more lenient. The country was growing in wealth and population, in spite of large colonies drawn to Alexandria by Alexander the Great, Soter, and others. These were particularly well treated, and enjoyed privileges which made them an object of envy. They, like their brethren of Babylonia and other countries of Asia, enriched Jerusalem and the temple by their gifts and visits during festivals. Ptolemy II. Philadelphus (285-'47) was especially favorable to the Jews. Under his successors, however, Judea grew impatient of the Egyptian rule, and when Antiochus the Great attacked the young Ptolemy V., the Jews willingly aided him in driving the Egyptians from their land (198). They soon had reason to regret this change of dynasty. The Seleucidæ were bent on Hellenizing their empire, and were offended by the determination of the Jews to preserve their own national and religious peculiarities. The treasures, too, which had been slowly accumulated in the temple of Jerusalem, tempted their avarice, while they also augmented the number of priestly office-seekers. Tyranny and corruption growing together, the dignity of high priest was finally converted into an office for sale. One Onias was robbed of it for the benefit of his younger brother Jason, who offered 360 talents to the court of Syria; a third brother, Menelaus, wrested it from him, giving 300 more, and strove to maintain himself in his usurpation by scandalously promoting the arbitrary schemes of Antiochus Epiphanes. Being driven from the city by Jason and his followers, and besieged in the citadel, he was rescued by Antiochus, who destroyed a part of the city, sold many of his opponents into slavery, and robbed the temple (170). But worse was to follow. During the second expedition of the Syrian king against Egypt, a false report of his death spread in Judea, and Jerusalem immediately rose against his officers. But the Hellenizing Jews opened its gates to the returning king, and an unparalleled slaughter of the religious inhabitants

ensued (169). Not satisfied with this, Antiochus destroyed the walls of the city, garrisoned a new citadel with his soldiers, and decreed the general and exclusive introduction of Greek idolatry. The image of the king was placed in the temple, swine were sacrificed on the altar, new altars were everywhere erected for the obligatory worship of the Olympian Jupiter, the Hebrew Scriptures were burned, circumcision was prohibited, and every act of opposition made a capital crime and punished with extreme cruelty. Thousands after thousands were dragged into captivity, sold as slaves, or butchered. Finally the king departed on an expedition against the Parthians, leaving the completion of his work to his general Apollonius (167). The latter continued it in the spirit of his master, but soon met with a sudden check. Mattathias, an old priest of the village of Modin, and of the distinguished house of the Asmoneans, and his five sons John (Johanan), Simon, Judas, Eleazar, and Jonathan, commanded to sacrifice to Jupiter, drew their swords in defence of their religious liberty, and soon after were able to defend that of others. The people flocked after them into the wilderness, whence they sallied forth to destroy the altars of their oppressors. Contempt of death gave victory, and victory created new warriors. The work of liberation was successfully commenced when the old patriot died (166), leaving the command in the hands of Judas, who well deserved by his overwhelming victories the surname of the Hammer (*Makkab*), though the name of Maccabees, which is applied to the whole house, and the title of the apocryphal books of their history, may have been derived from the initials of a supposed Scriptural sign, M(i), K(anokha) B(aelim) Y(ehovah) ("Who is like thee among the gods, O Everlasting?"), or from those of the name of the father, Mattathias Kohen (the priest) ben (son of) Johanan. Terror reigned among the Syrians in Judea. Their greatly superior forces suffered defeat after defeat under Apollonius, Seron, Lysias, Timotheus, Nicanor, and other generals. Jerusalem was reconquered, the temple purified, a treaty of alliance concluded with the Romans, the traitor Menelaus was executed by order of Antiochus, and the latter soon after died (164). But the bold struggle of the heroic brothers again became desperate. Eleazar (or perhaps another warrior of the same name), rushing through the thickest of the enemy to transpire an elephant, on which he supposed the young king Eupator himself to be seated, was crushed to death under the falling animal. Judas, seeing himself deserted by most of his followers at the approach of an immense host under Bacchides, and having no alternative but flight or death, chose the latter, attacked the Syrians with 800 men, broke through one of their wings, but was surrounded by the other, and perished with all his companions (160). The surviving brothers again fled to the wilderness of the south, carrying on a desultory warfare, in which

John soon after fell. But the protracted struggles for succession to the throne of Syria, between the various kings and usurpers who followed Eupator, Demetrius Soter the son of Epiphanes, his pretended brother, Alexander Balas, Demetrius Nicator the son of Soter, Antiochus the son of Balas, Antiochus Sidetes the son of Nicator, and Tryphon, gave Jonathan, who now commanded, and after him Simon, ample opportunity to restore the fortune of the war. Jonathan's friendship was soon sought by the rival pretenders; he made peace with the one or the other, was acknowledged as high priest, *strategus*, and ethnarch of Judea, and was successful in his long wars, but was finally enticed to an interview with Tryphon, and assassinated with his sons. Simon conquered the citadel of Jerusalem, renewed the alliance with Rome, and was proclaimed an independent prince. The independence of Judea was successfully defended against Antiochus Sidetes under the command of John and Judas his sons, but the old man was soon after assassinated with his sons Judas and Mattathias by his own son-in-law Ptolemy (135). His surviving son, John Hyrcanus, who succeeded him, resisted the invasion of Antiochus Sidetes, concluded a peace, and further developed the independence of the country, extending its limits by the conquest of Idumæa, and of the city of Samaria, which he destroyed, as well as the temple on Mount Gerizim. The Samaritans were thus crushed, but the Sadducees attained great influence under his reign, and the religious dissensions, assuming also a civil aspect, gradually undermined the foundations of the newly restored state. John Hyrcanus and his sons Aristobulus (106-'5) and Alexander Jannæus (105-78), belong to the small number of Maccabees who died a natural death; for the race of priestly warriors, who conquered their dignity by the sword, were doomed to perish by the sword, and only the earlier members of the house who fought for the liberty of their people fell in glorious battles. Aristobulus, who assumed the royal title, ordered the murder of his brother Antigonus, while their mother was starved in a dungeon. Alexander Jannæus proved equally barbarous in a war of six years against the majority of his people, who abhorred him as a debauched tyrant and Sadducee, and stained his victory by the execution of 800 of the most important rebels before the eyes of his revelling court. Thousands sought refuge in flight, and he was allowed to continue his reign till his death, when he advised his wife Alexandra (or Salome) to follow an opposite line of policy. She accordingly chose her councillors from among the distinguished men of the national party, and recalled the exiles. Of her two sons, she appointed Hyrcanus high priest, keeping the political rule herself. Dissatisfied with this arrangement, the younger, Aristobulus, sought for support among the Sadducees, and after the death of their mother (71) a long civil war was waged by the

two brothers, which was terminated only by the interference of the Romans, to whom both applied. Scaurus, the lieutenant of Pompey the Great in Syria, decided for the younger of the brothers (63). But Pompey soon after reversed the sentence, besieged Aristobulus in Jerusalem, took the city and the temple, entering both amid streams of blood, and confirmed Hyrcanus as high priest, in which capacity he became tributary ethnarch of the Romans. Aristobulus and his sons, Alexander and Antigonus, were carried as captives to Rome. Judea, with narrowed limits, was now a province of the Roman republic, which was just advancing to its furthest boundary in the East. In the name of Hyrcanus it was governed by Antipater, his crafty Idumæan minister, who ruled his feeble master, and was finally himself established by Cæsar, after the fall of Pompey (48), as Roman procurator of Judea. Aristobulus and his two sons escaped from Rome, and made desperate efforts to recover their dignity, but all of them perished in the successive attempts. Antigonus procured aid from the Parthians, who, having vanquished Crassus (53) and other Roman generals, invaded Judea and carried Hyrcanus into captivity. But he finally succumbed to the son of Antipater, Herod, who on his flight to Rome had gained the favor of the new triumvirs, and who now inaugurated under their auspices, as a powerful independent king, the last dynasty in Judea, the Idumæan (39). This prince, who as if in irony has been called the Great, was the slave of his passions, as well as of the Romans, and the bloody master of his subjects. His ambition made him rival in splendid structures, among which was the rebuilt temple, in the erection of new fortresses, citadels, and cities, and in unlimited sway, the glory of King Solomon, but did not prevent him from basely cringing before Mark Antony, his mistress Cleopatra of Egypt, and his rival Octavius, and from sacrificing the most sacred customs and usages of the people in order to flatter the vanity of his foreign supporters. Gladiatorial games, statues, and other things abhorred by the Jews, were introduced in their cities, and the Roman eagle was placed on the top of the new temple. The desire of the people for the national house of the Maccabees was to be stifled in the blood of its last descendants, though Herod was himself the husband of Mariamne, the granddaughter of Hyrcanus by her mother Alexandra, and of Aristobulus by her father Alexander. Antigonus was executed by the Romans at Damascus; the old Hyrcanus was enticed from Babylon to share the same fate in Jerusalem; the young and beautiful brother of the queen, the high priest Aristobulus, was treacherously drowned by direction of the king. Herod's own house followed, treacherous intrigues and the dread of conspiracies demanding new victims. His uncle Joseph, his frantically beloved, beautiful, and noble Mariamne, her mother Alexandra, his two sons by

Mariamne, the favorites of the people, perished successively at his order; and finally, five days before his own death, his son by another wife, Antipas or Antipater, next to Herod's sister Salome the chief cause of the last murders and of the king's dreadful agonies. The blood of many other innocent persons was shed, attempts at insurrection or regicide being quelled or punished with remorseless rigor. In extent of possessions, however, Herod's reign by far surpassed the power of his predecessors. Augustus divided his territory among his three surviving sons. Archelaus, as ethnarch, received half of them, viz.: Judea (proper), Samaria to the north, and Idumæa to the south; Philip and Herod Antipas, as tetrarchs, the other half—the former, Batanæa, Trachonitis, and Auranitis, E. of the Jordan (Peræa), and the latter, Galilee W. of the Jordan and N. of Samaria, with some slight additions. Anarchy was a natural consequence of this arbitrary arrangement, and it came with all its horrors.—Such was the political condition of the Jewish state in the first year of the Christian era, about three years after the birth of the founder of the Christian religion, for an account of whose life, doctrine, and death (in the year 33, under the sway of the Roman procurator Pontius Pilate, the possessions of Archelaus having been annexed to the Roman province of Syria) we refer the reader to special articles under the appropriate heads. The religious and literary institutions of the people had in the mean while received a remarkable development during the Asmonean period, on the basis of the *sopherim*, and principally under the lead of the successive schools of the *hakhamim* (scholars) Jose of Zeredah and Jose of Jerusalem, Joshua ben Perachiah and Nittai of Arbel, Judah ben Tabbai and Simeon ben Shetah, and Shemaiah and Abtalion; and it reached a most flourishing condition under the school of the great Hillel the Babylonian, president of the sanhedrim like all the first of the above named pairs, and the rival school of the austere Shammai, in the reign of Herod. The eminent philosophical book of Ben Sirach and the first book of the Maccabees are the products of the earlier part of that period, while the age of the books of Tobit, Judith, Baruch, and other apocryphal writings, is unknown. The simultaneous literary activity of the Jews in Africa is evinced in the book of Wisdom, by their numerous contributions to Hellenistic poetry and history (Jason, Alexander Polyhistor, Ezekiel, &c.), and especially to Platonic philosophy, from Aristobulus, the Jewish teacher of Ptolemy Euergetes, to Philo, the distinguished deputy of the Alexandrian Jews to the Roman emperor Caligula. The emperors were already becoming the exclusive masters of Palestine. Archelaus was carried captive to Gaul under Augustus (8), and separate procurators ruled Judea, Samaria, and Idumæa. Philip's possessions were attached to Syria after his death (35) by Tiberius, but afterward given by Caligula to Herod Agrippa,

a grandson of Herod, and brother of Herodias, who, being unlawfully married by Herod Antipas, caused the deposition of the latter, and the annexation of his tetrarchy to the dominion of Agrippa, who even succeeded in reuniting for a short time, in the reign of Claudius, the whole of Palestine. After his death (44) his territory was again ruled by procurators, and only a small portion was afterward given to his son Agrippa II. (53). The condition of the country was dreadful. The emperors, at that time the vilest of men, demanded divine honors, their statues were erected in the temple, the procurators grew rich by extortions, the petty Herodian courts shamelessly imitated the licentiousness of the imperial, robbers infested the mountainous regions, impostors and fanatics raised the standard of rebellion, and insurrections led to new oppression, both religious and civil. Nero's rule, and the extortions of his procurator Gessius Florus, finally drove the people to despair. Death to the Romans or to themselves became the cry of the fanatics and the poor. The Sadducees and the rich opposed it in vain, though aided by the troops of Agrippa. The temple of Jerusalem, the ancient capital itself, and numerous strongholds in the country were taken by the insurgents (66). The Roman governor of Syria, Cestius Gallus, who hastened to Jerusalem, was routed near that city. The zealots now organized a general rising. The priest Josephus, the historian, was sent to arm and defend Galilee. But one of Nero's best generals, Vespasian, was already approaching from the north (67); and Titus, his son, brought new legions from Egypt. The Jews fought with Maccabean valor near Joppa, at Mount Gerizim, in the streets of Gamala, at Jotapata, and other places. But Josephus's army perished in the struggle about Jotapata, and he was made prisoner; Galilee was lost, and civil carnage raged within the walls of Jerusalem between the moderates under the priest Eleazar, the terrorists under John of Giscala, and the volunteers commanded by Simon the Idumæan. Vespasian now advanced and took most of the strongholds (68). The events which followed the death of Nero, however, checked his progress. Vespasian himself being proclaimed emperor by his legions (69), Titus took the command. Jerusalem, Masada, Machærus, and Herodium were still to be besieged. The northern part of Jerusalem, Bezetha, was first taken by the Romans with the external wall. The middle wall, too, fell into their hands, but the defenders, now united and heroically fighting, drove them out. The Roman resolved upon conquering by hunger, and this brought pestilence to his assistance. Hay, leather, and insects were finally consumed; the victims could no longer be buried, but were thrown over the wall. Deserters and fugitives were mutilated by the besiegers or driven back. The castle Antonia, and with it the second wall, were finally taken (June, 70). John and Simon

still refused to hear of surrender. In August the temple was stormed, and Titus was unable to prevent its becoming a prey to the flames. The last defenders retired to the fortified upper city, which fell in September. Jerusalem was razed to the ground, its surviving inhabitants were slaughtered by thousands, sold into slavery, or doomed to perish in public fights with wild beasts before Romans and Greeks, at the command of the future *amor et deliciæ generis humani*. Herodium, Machærus, and Masada still defended themselves for a time. In the latter the conquerors found only a few children, the last men having died by their own hands. A million of Jews perished in this war, which found an eloquent but partial historian in the learned captive Josephus. The later and still more furious risings of the scattered people in the reigns of Trajan and Hadrian in Cyrene, Egypt, Cyprus, and Palestine, where Bar-Cokheba for years victoriously maintained himself against the Roman generals until he fell with his last stronghold Bethar, are known only from scattered passages full of exaggerations, dictated by hatred on one side and patriotic admiration on the other.—The last insurrection, and the bloody persecutions which followed it, finally broke the strength and spirit of the people. Their leaders prohibited every attempt at insurrection in the name of religion, and were obeyed. Hadrian's *Ælia Capitolina* rose on the sacred ground of Jerusalem, and his decrees forbade the Jews to enter its precincts. Its environs were desolate. The land of Israel was no more; the people scattered all over the world. The previous invasions, and conquests, civil strifes and oppression, persecution and famine, had carried hosts of Jewish captives, slaves, fugitives, exiles, and emigrants, into the remotest provinces of the Medo-Persian empire, all over Asia Minor, into Armenia, Arabia, Egypt, Cyrene, Cyprus, Greece, and Italy. The Roman conquest and persecutions completed the work of dispersion, and we soon find Jews in every part of the empire, in the regions of Mt. Atlas, on both sides of the Pyrenees, on the Rhine and Danube. Palestine, however, for some time continued to be a national centre through its schools of religious science, which after the desolation of Jerusalem flourished at Jamnia, Lydda, Usha, Sepphoris, Tiberias, and other places, principally under the lead of the presidents of the sanhedrim (patriarchs, *nesiim*) of the house of Hillel, of whom Gamaliel Hazzaken (the Elder), his son Simeon, his grandson Gamaliel, and great-grandson Simeon, with their celebrated fellow *tanaim* (teachers or scholars) Johanan ben Zakkai, Eliezer, Joshua, Eleazar, Ishmael, Tarphon, the great Akiba, and others had been successfully active during the previous disastrous period. The succeeding rabbis (*rabbi*, my master), Ben Azai, Ben Zoma, the five pupils of Akiba, Eliezer, Meir, Jose, Jehudah, Simeon, Nathan, and others, continued their work by public teaching, as well as by collect-

ing, elucidating, systematizing, and further developing the decisions (*halakhoth*, collectively termed *Halakhah*) of the oral law, which was finally converted into a written code or compendium of teachings (*Mishnah*) by the patriarch Judah the Holy and his school, during the mild reigns of the Antonines. To this were added the partly supplementary, partly explanatory works, *Tosephta*, *Mekhilta*, *Saphra*, and *Siphri*. These works became the basis of religious study in the subsequent three centuries, in Palestine, as well as in Babylonia, where the schools of Sura, Pumbeditha, Nehardea, and others, flourished under more favorable circumstances, the most renowned teachers (in this period *amoraim*) of both countries being Rab, Samuel, Joshua ben Levi, Johanan, Simeon ben Lakish, the patriarch Jehudah II., Ame, Ase, Abahu, Eleazar, Jehudah, Hunna, Hisha, Nahman, Rabbah, Joseph, Zera, Jeremiah, Abbaye, Raba, Pappa, Ashe, Abina, and Mar bar (ben) Ashe (died 467). After new persecutions by the Christian emperors, which destroyed the schools (353) and the patriarchate (429) of Palestine, and by the Persian kings Yezdegerd II., Hormuz, Firuz, and Kobad in the latter part of the 5th century, which destroyed the schools of Babylonia, the results of those studies were also collected, though in chaotic disorder, in the two Gemaras or Talmuds (literally, studies), the Palestinian and Babylonian. Other extant products of the time of the *tanaim* and *amoraim* were various ethical treatises (*Derekh eretz*, *Aboth*, &c.), historical, legendary, and cosmogonical writings (*haggadoth*, stories, collectively *Haggadah*, a vast branch), prayers (*tephilloth*), additions to the Chaldee paraphrase (*Targum*) of Scriptural books, a new calendar, admirably adapted to the religious duties of the people, by Hillel (340), and some Greek fragments by Aquila and Symmachus. The Chaldee, often with an admixture of Hebrew, was now generally used in literary works, while the people used the various languages of the countries in which they lived. More and more oppressed and degraded by the emperors, of whom only Julian was favorable to his Jewish subjects, and even attempted to rebuild the temple of Zion, and by the decrees of the councils, the Jews of Palestine once more hoped to recover their independence when they assisted the Persians in conquering Jerusalem (616), but were soon severely chastised for their rash attempt by the victorious emperor Heraclius. But a new power springing from the Arabian desert was destined to humiliate all the contending parties and sects between the Tigris and the Nile, the Byzantine emperors and the Sassanide shahs, Christians, fire worshippers, and Jews. A new Semitic prophet arose in the vicinity of the Red sea, teaching his disciples and people a monotheism which was to be carried triumphantly over a great part of Asia, Africa, and Europe (622). Mohammed himself after a long struggle conquered the castles of the independent Jews in Arabia, who, liv-

ing from a very remote period in that country, were masters both of the poetical tongue and the sword of the desert, their warlike Samuel ben Abdiah, among others, being one of the most distinguished early poets of the peninsula. Omar and his generals conquered Jerusalem, Tiberias, Damascus, Antioch, and Alexandria from the Byzantines, and subdued Persia, thus bringing most of the eastern Jews under the rule of Islam. This proving comparatively mild, and the later caliphs favoring every science, Jewish studies revived, especially in Babylonia, where the Jews lived under the immediate rule of a prince of the captivity (*resh gelutha*), and where their great schools, having been reorganized under the *seboraim* (thinkers), were made flourishing under the *geonim* (the eminent). Of these Saadia, the translator of the Pentateuch into Arabic (died 941), and Hai (died 1037), the son of Sherira, and son-in-law of Samuel ben Hofni, are eminent as theological writers, poets, and linguists. Numerous works of *Haggadah*, now mostly known as *midrashim*, and ethical writings, were composed; the critical notes of the Masora and the "Targum of Jerusalem" elaborated; the admirable system of Scriptural vocalization introduced; talmudical compendiums written; medical, astronomical, and linguistic studies, and also cosmogonical speculations (*Kabbalah*), pursued. An anti-rabbinical sect, besides the extinct Sadducees the only one which deserves that appellation, was founded about the middle of the 8th century by Anan in Babylonia, receiving from their strict adherence to the letter of the Bible the name of Karaites (Scripturists). Their scholars, Salmon, Jeshua, and Japheth, flourished in the 10th century. Scientific pursuits also spread among the Jews in Africa, who with slight interruptions enjoyed peace under the Saracenic princes; and among the theological writers of Fez and Kairowan in that period, of whom Nissim and Hananel (both in the first half of the 11th century) are the most celebrated, we find the physician and critic Isaac ben Soleyman, the lexicographer Hefetz, and the grammarians Ben Koraish, Dunash, and Hayug. The Arabic was generally used by the scholars.—The political and intellectual condition of the Jews was worse in the Byzantine empire and in the feudal states which arose on the ruins of the West Roman. Deprived of most civil rights, they were now and then bloodily persecuted, as by the Franks and Visigoths in the 6th and 7th centuries, by the Byzantines in the 8th, when many of them fled and even spread their religion among the Khazars about the Caspian sea, and again in the 11th, about which time they appear in Russia, though only for a short time, and in Hungary. More tolerable, however, was their situation in Italy, Sicily, and Sardinia, where they often found protection through the influence of the popes. Bari and Otranto became the principal seats of Jewish learning. The renowned Eleazer ben Kalir

and other writers of *piyutim* (liturgical songs in Hebrew rhymed verse), the historian Josipon, and the astronomer Shabthai Donolo, flourished in Italy in the 9th and 10th centuries, and the lexicographer Nathan in the 11th. From Italy science spread to the cities on the Rhine, to Lorraine and France. In the 11th and 12th centuries we find in Germany Simeon, the author of the talmudical *Yalkut* ("Gleaning Bag"), the poet Samuel the Pious, and the writer of travels Petahiah; in northern France, Gerson, surnamed the "light of the exiled," the liturgical poet Joseph Tob Elem, the renowned commentators Solomon Isaaki and his grandson Solomon ben Meir, and the authors of the talmudical *Tosafoth* ("Additions"), Isaac ben Asher, Jacob ben Meir, &c. Spain, after the conquest by the Saracens, who carried thither culture, science, and poetry, was destined to develop the most prosperous and flourishing condition which the Jews enjoyed in the middle ages. Persecutions became rare and exceptional. The Jews enjoyed civil rights and rose to high dignities in the state under the Moorish princes, and were almost as well treated by the Christian monarchs; and their culture and progress in science not only kept pace with their prosperity, but also outlived occasional adversity. In the 10th century we see there the lexicographer Menahem, the astronomer Hassan, and the rich, liberal, and scientific Hasdai, the friend and physician of the caliph Abderrahman III., at Cordova; in the 11th the talmudical scholars Samuel Hallevi and Isaac Alfasi (of Fez), the grammarian Abulwalid, the philosopher David Mokamez, the ethical writer Behai, and Solomon Gabirol, equally celebrated as Hebrew poet and Arabic philosopher; in the 12th the theologian Abraham ben David, the astronomer and geographer Abraham ben Hiya, the poet Moses ben Ezra, the traveller Benjamin of Tudela, the philosophical poet Jehudah Hallevi, whose glowing songs rival the beauties and purity of the Psalms, the great critic, philosopher, and poet Aben Ezra, and finally Moses Maimonides, who as a philosopher and writer on the law by far surpassed all his contemporaries. The diffusion of science among the Jews now attained its height in Europe, as well as in Egypt, whither Maimonides fled after a persecution at Cordova (1157), and where he and his son Abraham officiated as physicians to the court of the sultan. Spain numbered among its vast number of scholars in the 13th, 14th, and 15th centuries, the poets Harizi, the Hebrew imitator of the Arabian Hariri, and Sahola; the astronomers Aben Sid, one of the authors of the Alfonsine tables, Israeli, and Alhadev; the philosophical theologians Palquera, Lattef, Caspi, Hasdai, Albo, and Shemtob; the celebrated commentators Nahmanides, Adereith, Gerundi, Behai, Yomtob, and Nissim; the cabalists Todros, Gecatilia, Abelafia, and De Leon. In Provence and Languedoc, where high schools flourished in Lunel, Nîmes, Nar-

bonne, Montpellier, and Marseilles, from the 12th to the 15th century, we find the three grammarians Kimbi and their follower Ephodi; the poets Ezobi, Jedaiah, and Calonymus; the commentators Zerahiah Hallevi, Abraham ben David, and Menahem ben Solomon; the philosophers Levi ben Abraham, Levi ben Gerson, and Vidal; the four Tibbons, all translators from Arabic into Hebrew, and the lexicographer Isaac Nathan. Italy had in the 13th, 14th, and 15th centuries the poets Immanuel, an imitator of Dante, Moses di Rieti, and Messir Leon; the talmudists Trani and Colon; the cabalist Recanate; the astronomer Immanuel; various grammarians and translators from Arabic and Latin; and finally the philosopher Elias del Medigo. Germany had in the same period the talmudists Meir, Mordecai, Asher and his son Jacob, and Isserlin, the cabalist Eleazar, and others. The Karaites, too, had a number of scholars, as Hadassi, the two Aarons, and others. During the earlier part of this long period of literary activity in the West the Jews enjoyed peace and prosperity, with various interruptions, in Spain, Portugal, Italy, Greece, the islands of the Mediterranean, in Hungary, especially under the national kings, and in Poland, which hospitably received the numerous exiles from all neighboring countries, under the Piasts, particularly the last of them, Casimir the Great; but there were none in Muscovy and in the Scandinavian states; and in England, where they appear before the time of Alfred, in France, where only the early Carolingians, and especially Charlemagne, favored them, and throughout Germany, their condition was in the last degree deplorable. Circumscribed in their rights by decrees and laws of the ecclesiastical as well as civil power, excluded from all honorable occupations, driven from place to place, from province to province, compelled to subsist almost exclusively by mercantile occupations and usury, overtaxed and degraded in the cities, kept in narrow quarters and marked in their dress with signs of contempt, plundered by lawless barons and penniless princes, an easy prey to all parties during the civil feuds, again and again robbed of their pecuniary claims, owned and sold as serfs (*Kammerknechte*) by the emperors, butchered by mobs and revolted peasants, chased by the monks, burned in thousands by the crusaders (who also burned their brethren of Jerusalem in their synagogue), tormented by ridicule, abusive sermons, monstrous accusations and trials, threats and experiments of conversion, the Jews of those countries offer in their mediæval history a frightful picture of horrors and gloom. In England they had their worst days in the reign of Richard I., at whose coronation they were massacred at York (1189), John, Henry III., and Edward I., who expelled them altogether from the realm (1290). From France they were for the last time banished under Charles VI. (1395). Germany, where the greatest anarchy prevailed, was the scene

of their bloodiest persecutions, the most frightful of which took place in the cities on the Rhine during the great desolation by the black plague which depopulated Europe from the Volga to the Atlantic (1348-'50). Pointed out to the ignorant people as having caused the pestilence by poisoning the wells, the Jews were burned by thousands on the public squares, or burned themselves with their families in the synagogues. Almost every imperial city had a general persecution of the Jews. The Swiss towns imitated their neighbors, almost all banishing their Jews. With the growing influence of the inquisition, the Jews of southern Europe, too, suffered the same fate. The protection of the popes being gradually withdrawn, they were banished from the cities of Italy into separate quarters (*ghetti*), and obliged to wear distinctive badges; persecutions became more frequent; in 1493 all the Jews of Sicily, about 20,000 families, were banished. In Spain, during a long drought in 1391-'2, the Jewish inhabitants were massacred in many cities. The condition of the Jews grew worse in the following century, until their extirpation from the whole country was determined upon, and, after repeated but fruitless attempts at conversion by the stake, finally carried into effect by Ferdinand and Isabella (1492). More than 70,000 families sought refuge in Portugal, where for a large sum of money the fugitives were allowed to remain for a few months, in Africa, Italy, Turkey, and other countries. Not the fifth part of them survived the horrors of compulsory expatriation, shipwreck, and subsequent famine. The feeling observer may find a compensation in the fact that while these events happened, propitious winds carried three small caravels across the Atlantic to a new world, whose enervating treasures were destined to assist the inquisition in undermining the power of the oppressors, and whose future institutions were to inaugurate an era of freedom to the descendants of the oppressed. The Jews of Portugal were banished soon after (1495) by King Emanuel, being robbed of their children under 14 years of age, who were sent to distant islands to be brought up as Christians. The numerous converted Jews of the peninsula and their descendants were still persecuted for more than two centuries by governments, inquisitors, and mobs. These persecutions, which eventually carried the bulk of the European Jewish population into the provinces of Poland and Turkey, similar events in the East during the crusades, a long series of persecutions in Germany, and in central and southern Italy in the 16th century, and bloody massacres by the revolted Cossacks under Chmielnicki in the S. E. regions of Poland, together with a general and minutely developed system of petty oppression, extortion, and degradation, to which the Jews were subjected in most parts of Europe during the 250 years following their expulsion from the Iberian peninsula, could not but exercise a disastrous influence upon the cul-

ture and literature of the people. The spirit of cheerful inquiry, study, and poetry which distinguished the Spanish-Provençal period, was gone. The critical knowledge and use of the Hebrew was neglected, the study of the Talmud and its commentaries became the almost exclusive occupation of the literary youth, and cabalistic speculations replaced philosophy, producing in Poland various schools of religious enthusiasts called '*Hasidim*' (pietists). A bold Turkish Jew, Shabthai Tzebi, who, like the Persian Aldaud or Alroy in the 12th century, was proclaimed by his cabalistic followers the expected Messiah of Israel, found numerous adherents even in various parts of Europe (1666), whose delusion was destroyed only by his compulsory conversion to Mohammedanism. Literature and science, however, still found scattered votaries, especially in northern Italy, Turkey, and Holland; and besides the great talmudists, theologians, or commentators of this period, Don I. Abarbanel, I. Arama, J. and L. Habib, Mizrahi, O. Bartenura, O. Sforno, I. Luria, J. Karo, the author of the talmudical abridgment or code *Shulhan arukh*, E. Ashkenazi, Alsheikh, S. Luria, M. Isserels, M. Jafeh, Sirks, S. Cohen, Lion of Prague, E. Lentschütz, J. Trani, J. Hurwitz, H. Vital, S. Edels, Y. Heller, Shabthai Cohen, A. Able, D. Oppenheimer, the collector of the best Hebrew library (now in Oxford), Tzebi Ashkenazi, H. Silva, J. Rosanis, D. Fränkel, J. Eybeschütz, J. Emden, H. Landau, Elias of Wilna, &c., we find the philosophers and men of science Bibago, S. Cohen, Amatus, Almosnino, De Castro, A. Zachuto, J. del Medigo, M. Hefetz, and Nieto; and among the poets, grammarians, critics, lexicographers, and historical writers, De Balmes, Elias Levita, A. Farissol, Solomon ben Melekh, Jacob ben Hayim, Gedaliah, Yahiah, A. de Rossi, De' Pomi, D. Gans, S. Arkevolte, Lonsano, Manasseh ben Israel, the defender of the Jews before Cromwell, S. Norzi, S. Luzzato, Leo de Modena, S. Mortera, J. Orobio, Shabthai ben Joseph, B. Mussaphia, De Lara, J. Cardoso, J. Abendana, S. Hanau, M. H. Luzzato, J. Heilprin, Azulai, and others. Beyond the limits of the Turkish empire there was scarcely any trace of Jewish literature in the East, though there were and are still numerous Jewish communities in Persia, northern Arabia, Independent Tartary, and Afghanistan, as well as scattered colonies, mostly of more or less mixed race and religion, in India, China, Cochin China, Yemen, Abyssinia, and other parts of Africa, partly of very ancient date, partly founded by escaped Portuguese and Spanish New Christians, some of whom also settled in parts of Brazil and Guiana during the occupation by the Dutch. In Europe the last of the three great religious struggles, against paganism, against Mohammedanism, and between the contending Christian sects, all of which were destructive to the Jews, was terminated by the peace of Westphalia (1648). Catholicism was triumphant in the south and

in France, Protestantism in the north and northwest. The greater persecutions of the Jews now ceased. They became flourishing in the republics of Holland and Venice and their dependencies, were readmitted into England by Cromwell (having also entered Denmark and returned into France), spread with the Dutch and English to various parts of America, reentered Russia under Peter the Great (to be expelled afterward), were admitted in Sweden, and were protected and often employed in high stations by the sultans of Turkey and Morocco. In Germany and Switzerland, where the struggle was not terminated by any decisive triumphs, the mediæval treatment of the Jews was continued longest, its worst features being maintained and developed in Austria (excepting in the reign of Joseph II.). In this empire, down to the revolution of 1848, the Jews were excluded from all civil rights, numerous professions, and various provinces, districts, towns, villages, and streets, paying besides a tax for toleration in Hungary (in spite of the remonstrances of the legislatures), a tax upon their sabbath lights in Galicia, and a residence tax when visiting Vienna, and being subject to Pharaonic marriage restrictions in Bohemia and Moravia. The general progress of freedom was promoted in the age of philosophy by the appearance of Spinoza and of Mendelssohn (1729-'86) among this long despised people. The influence of the latter upon Jews and Christians through his works, example, fame, and friends (the great Hebrew poet Wessely, Euchel, Löwe, Friedländer, &c., among Jews, and Lessing, Dohm, Abt, Nicolai, Engel, Ramler, &c., among Christians), was immense; and his admirers could say, "Between Moses (the lawgiver) and Moses (Mendelssohn) there was only one Moses (Maimonides)." Progress now became general among the Jews, and the noble philosopher lived to see the first dawn of freedom in the land of Franklin and Jefferson. The great revolution in that of Voltaire and Rousseau came next, and the triumphs of republican and imperial France destroyed the mediæval institutions on the Rhine and Po. Liberty, crushed in Poland by the Russians, when 500 of Kosciuszko's Jewish volunteers fell fighting to the last on the ramparts of Praga (1794), was successively victorious in the West. Proclaimed in the United States and France, the rights of the Jews were recognized in Holland, Belgium, Denmark, parts of Germany, Canada, and Jamaica; in 1848-'9 throughout Germany, Italy, and Hungary; and finally in Norway and England. Among the most zealous defenders of the rights of the Jews we may mention the Frenchman Grégoire, the Pole Czacki, the German Welcker, the Irishman O'Connell, the Englishman Lord John Russell, the Italian D'Azeglio, and the Hungarian Eötvös, all Christians; the Jews by descent Börne and Disraeli, and the professing Jews Jacobsohn, Riesser, Philipsohn, Montefiore, and Crémieux. The revolutionary movement

of 1848-'9 proved the immense progress of the Jews as well as of public opinion since Mendelssohn and Lessing. The Jews Crémieux, Goudchaux, and Fould were among the ministers of the French republic; Pincherle was a member of the provisional government in Venice; Jacoby of Königsberg was the leader of the opposition in the Berlin parliament; Riesser was vice president of that of Frankfurt; Dr. Fischhof stood at the head of affairs in Vienna after the flight of the court; Meisels, the rabbi of Cracow, was elected to the Austrian diet by Polish patriots; and Hungarian barons and counts willingly fought under Jewish officers. The subsequent reaction, as in Austria, where it was checked by the events of 1859, was mostly temporary, and the Mortara case in Italy in 1858 excited a very general expression of opposition to the antique legislation by which it was decided. Of the vast number of Jewish writers after Mendelssohn (excluding all converts to Christianity like Heine, Neander, or Gans) we mention only a few: the talmudists Jacob of Dubno, Jacob of Slonim, Pick, Jacob of Lissa, Bonet, Eger, Sopher, Chajes; the Hebrew poets, philologists, or critics, E. Luzzato, S. Cohen, Satanow, Wolfsohn, Bensey, Pappenheim, Tropelowitz, Heidenheim, Löwisoohn, S. Bloch, Simha of Hrubieszów, Jetteles, Landau, Reggio, Perl, N. Krochmal, the great rabbinical critic Rapoport, S. D. Luzzato, Letteris, Eichbaum, P. M. Heilprin, S. Sachs, Kirchheim, Schorr, A. Krochmal; the historians, critics, or publicists on Jewish subjects in modern languages, Zunz, Jost, Riesser, Geiger, Fürst, Philippon, Salvador, Munk, Cahen, Dukes, Frankel, M. Sachs, Jellinek, Herzfeld, Saalschütz, Steinschneider, Grätz, Löw, Bernays, Neubauer, Harkawy, Kayserling, Raphall (New York), Leeser (Philadelphia), Wise (Cincinnati); the conservative theologians Plessner, Johlsohn, Steinheim, and Hirsch; the advocates of religious reform (besides Geiger and Herzfeld) Chorin, Creizenach, Stein, Herxheimer, Holdheim, Hess, Stern, Einhorn (New York), Lilienthal (Cincinnati); the pulpit orators Mannheimer, Kley, Salomon, Frankfurter; the philosophers Maimon, Bendavid, Frank; the mathematicians Wizenhausen, Sklow, A. Stern, Cassel, Hirsch; the astronomers W. Beer, Stern, Slonimski; the ichthyologist Bloch; the physiologist Valentin; the anatomist Hirschfeld; the botanist Pringsheim; the poets Kuh, M. Beer, Frankl, Léon Halévy; the miscellaneous writers Auerbach, Bernstein, M. M. Noah, Grace Aguilar, Jules Janin; the orientlists Weil, Dernburg (Derenbourg), Oppert, E. Deutsch, Levy (besides Munk). Politics, law, medicine, and the arts, including the stage (Mlle. Rachel, &c.), have had numerous representatives, and especially music (Moscheles, Meyerbeer, Halévy, &c.).—The number of Jews in all parts of the world is hardly less than 6,000,000, or more than 7,000,000.—THE HEBREW LANGUAGE (Heb. *Ibrith*, or *lashon Ibrith*, Hebrew tongue, also *leshon hakkodesh*, sacred tongue, in

post-Biblical Jewish works; *Yehudith*, Jewish, in the Biblical history of the period following the captivity of the ten tribes; in Isaiah, poetically, also *sefath Kena'an*, language of Canaan), together with scanty remnants of the Phœnician and Punic, belongs to the so-called Canaanitic branch of the Semitic family of languages. (See SEMITIC RACE AND LANGUAGES.) In the antiquity of its extant literary remnants the Hebrew by far surpasses all other Semitic idioms, and in richness and development exceeds all others except the Arabic. The Hebrew is deficient in grammatical technicalities, especially in moods and tenses of the verb, and consequently also somewhat in precision; but in euphony, simplicity, brevity, variety of signification, and power of poetical expression, it is hardly excelled by any tongue. In its full purity the Hebrew appears in the earlier books of the Bible, in the mediæval poetical works of Judah Hallevi, Aben Ezra, &c., and in the modern poems of Wessely, S. Cohen, and others. The prose writings posterior to the Babylonish captivity are generally tinged with Aramaisms, especially the Mishnah, which also contains numerous Greek words, while the mixed idiom of the Gemara and its commentaries may be termed Chaldaic rather than Hebrew. (See TALMUD.) In the middle ages pure Hebrew was used only in poetry and poetical prose; in modern times it is used also in simple prose. In the East and in Poland the Hebrew is often used in correspondence, in the East occasionally also as a medium of conversation with occidental Jews. Of the various modes of Hebrew pronunciation, the Sefaradic (improperly Portuguese), or that of the descendants of the exiles from Spain and Portugal, is regarded by scholars as the most genuine. There are three kinds of Hebrew alphabets now in use: the square, also called the Assyrian (properly Babylonian), which is generally supposed to have been introduced by Ezra, the most common in print; the rabbinical or mediæval, used chiefly in commentaries and notes; and the cursive, in writing. The most ancient Hebrew, however, is believed by many critics more to have resembled the Phœnician (see ALPHABET), and to be best represented by the Maccabean coins and the alphabet of the Samaritan version of the Pentateuch. The writing is from right to left. The alphabet consists of 22 letters or consonants, called *aleph*, *beth*, &c. (see ALPHABET), the vowels being expressed by marks above or below the letters, thus: א, *a*; ב, *be*; ג, *gi*; ד, *do*. Five letters (*kaph*, *mem*, *nun*, *pe*, *tsade*) have a separate final form. There are no capital letters. The accents and marks of punctuation are very numerous. The following examples will exhibit some of the most interesting features of the language: *Kol*, (a) voice, *hakkol*, the voice; *gan*, garden, *haggan*, the garden; *shem*, name, *hashshem*, the name. *Dod*, uncle, *dodah*, aunt; *dod zaken*, an old uncle, *dodah zekenah*,

an old aunt; *dodim zekenim*, old uncles, *dodoth zekenoth*, old aunts; *dod e'had*, one uncle, *dodah a'hath*, one aunt; *shenei dodim*, two uncles, *shetei dodoth*, two aunts. *Oznayim*, *raglayim*, *alpayim*, two (a couple of) ears, feet, thousands. *Banim*, sons, *banoth*, daughters; *benei david*, *benoth david*, sons, daughters of David. *Ani gadol*, I am great, *hu gadol*, he is great, *hem gedolim*, they are great. *Koli*, my voice, *kolo*, his voice, *kolam*, their voice, *kolan*, their voice, speaking of females. *Lemosheh*, to Moses, *bemosheh*, in Moses, *kemosheh*, like Moses, *middavid*, from David. *Bo*, in him, *lo*, to him; *banu*, in us, *lanu*, to us. *Bein*, between; *bein mosheh vedavid*, between Moses and David; *beini ubeino*, between me and him. *Min*, from; *gadol middavid*, greater than David; *haggadol baaretz*, the greatest in the land. *Golyath raah eth david*, Goliath saw (looked at) David; *golyath hereph eth david*, Goliath insulted (mocked at) David; *david hikkah eth golyath*, David struck (at) Goliath. *Shamor*, to guard; *eshmor*, I shall guard, *tishmor*, thou wilt guard, *nishmor*, we shall guard; *shamarti*, I (have) guarded, *shamaranu*, we guarded, *shemartem*, ye guarded; *ani shomer* (I am guarding), I guard, *hu shomer*, he guards, *hi shomerah*, she guards, *hem shomerim*, they guard; *shamar*, (he) guarded, *nishmar*, was guarded, *hishtammer*, guarded himself; *lishmor*, to guard, *bishmor*, in guarding; *mosheh shamar*, Moses guarded; *miryam shamerah*, Miriam guarded; *shemarani*, (he) guarded me, *shemaro*, guarded him; *yishmerenu*, will guard us; *shomer* (guarder), guardian, *nishmar*, guard, watch, confinement, *ashmoreth*, night watch, *mishmereth*, thing to be watched, observance, trust. *Akhal*, (he) ate, *ikkal*, consumed, *heekhil*, caused to eat, *neekhal*, was eaten, *ukkal*, was consumed.—Among the eminent modern Christian writers (besides the Jewish previously mentioned) on Hebrew history, literature, or language are Reuchlin, the Buxtorfs, Lowth, Basnage, Michaelis, Eichhorn, Herder, Rosenmüller, Jahn, Gesenius, De Wette, Ewald, Quatremère, Milman, Robinson, Noyes, Stuart, Conant, Bush, and Renan.

**HEBREWS**, *Epistle to the*, one of the canonical books of the New Testament, addressed to converted Jews, and designed to dissuade them from relapsing into Judaism and to fortify them in the Christian faith. It aims to demonstrate the preëminence of Christ over Moses and the angels of the Lord, and of the gospel over the law, and to show that the latter was typical of the former, and was abolished by it. The epistle was addressed to a congregation of converted Jews, whether at Jerusalem or at some other place is still a controverted point. It is the opinion of most commentators that it was written between 64 and 66. The Greek fathers unanimously ascribed the epistle to Paul, and its Pauline authorship was generally accepted in the western church from the 5th century, though in the first three centuries no Latin writer attributed it to him. Among modern writers its Pauline origin has

been defended by Stuart, Forster, Hug, and others. In Germany the tendency of opinion has been to ascribe it to some other author. Luther suggested Apollon, and has been followed by Bertholdt, De Wette, Bleek, and Tholuck. Böhme and Mynster ascribe it to Silas; others to Clement, Luke, or Barnabas. Among the best modern commentaries on this epistle are those by Stuart (1827), Bleek (1828), Tholuck (1836), Delitzsch (1850), Ebrard (included in Olshausen's commentary, 1850), Turner (1852), Moll (included in Lange's commentary, 1861), Reuss (1862), and Ewald (1870).

**HEBRIDES, or Western Islands** (the *Ēbuda* of Ptolemy and the 30 *Hēbudes* of Pliny), the general name of the islands on the W. coast of Scotland, lying between lat. 55° 26' and 58° 32' N., and lon. 5° and 8° W.; pop. about 99,000. They are usually classed as the outer and the inner Hebrides. The outer, which are separated from the mainland and the inner islands by a channel called the Minch, extend from the Butt of Lewis on the north to Barra head on the south, forming a kind of natural break-water 130 m. long. The principal ones of this group, which collectively are called the Long Island, are Lewis, North Uist, Benbecula, South Uist, and Barra. The inner Hebrides are irregularly disposed along the coast and in the firth of Clyde, the principal ones being Skye, Raasay, Canna, Rum, Eigg, Coll, Tiree, Mull, Ulva, Staffa, Iona, Lismore, Kerrera, Scarba, Colonsay, Oronsay, Jura, Islay, Arran, Bute, and the Cumbrays. The total area of all the islands, of which there are several hundred, is upward of 3,000 sq. m. Of this surface about 200,000 acres are arable, 700,000 hill pasture, and 65,000 in fresh-water lakes; the remainder is morass and peat bogs, barren sands, and rocks. Only about 120 of them are inhabited. The most are rugged and mountainous, and the coasts, especially of those fronting the Atlantic, are bold and rocky and indented with numerous bays. Arran, Jura, Mull, and Skye have mountains 2,000 or 3,000 ft. high. The lakes are generally small, and none of them are more than three or four fathoms deep. There are many small streams, which in the larger islands abound in salmon. The outer Hebrides are geologically of gneiss formation and have a poor soil. Of the inner islands the more northerly are trap, the southerly ones on the coast are slate, and those in the firth of Clyde are trap, sandstone, and limestone. Marble, limestone, and slate are quarried, the last in considerable quantity. Iron ore is abundant in many of the islands, some copper is found, and lead is worked in Islay to some extent. Coal also exists, but is not mined, peat being used for fuel. The climate, on account of the proximity of the Gulf stream, is exceptionally mild, pleasant, and healthful. In winter the temperature is rarely lower than 27° F., and snow seldom lies long on the lowlands; but fogs and mists prevail and drizzling rains are frequent. In the uplands from 30 to 36 inches of rain

falls annually; on the coast about 25 inches. Violent storms from the southwest are prevalent from August to March. There is little wood on any of the islands, and on many none, although they were mostly clothed with forests several centuries ago; but large plantations have been successfully made, particularly in Skye, Islay, and Mull. Oats, barley, and potatoes are the staple crops, but agriculture is very backward, and nothing is raised for export. In unproductive seasons the harvest is not sufficient for home consumption, and famine has visited the islands more than once. Extensive improvements, however, have been introduced of late years by wealthy proprietors. The principal industry is the raising of kyloes or black cattle. The native sheep are small, not weighing more than 20 lbs., but the Cheviot breed has been introduced with success. The horses are small, hardy, and docile, but not so handsome as the Shetland ponies. Of wild animals, a few red deer, wild cats, and foxes remain, and hares, rabbits, and other small game are plentiful. Many of the islands swarm with wild fowl, and the coasts are rich in fish and mollusks. The tenure of land is unfavorable to enterprise, much of the soil being held by tacksmen, an intermediate class between proprietors and cultivators. Many tenants hold their farms at will or on short leases, and sublet on the same terms to cottiers and crofters, most of whom pay rent in services. Excepting where the population has been thinned to make large estates, the farms are generally small, renting at from £5 to £50 each. This division of the arable land occasions an excess of population in some of the islands, which the proprietors have attempted to remedy by encouraging emigration. The condition of the people generally is much depressed, and their dwellings, which are clustered along the coast, are miserable. In some of the southern islands, such as Islay, Arran, and Bute, a better system prevails, and agriculture is in an advanced state. Lines of steamers have been established between Glasgow and the Hebrides, which convey large numbers of tourists to Fingal's cave in Staffa, the ruins in Iona, &c. Gaelic is generally spoken, but English is gradually superseding it. Both languages are taught in the schools. Politically the Hebrides are distributed among the counties of Ross and Cromarty, Inverness, Argyle, and Bute. The principal towns are Stornoway in Lewis, Portree in Skye, Tobermory in Mull, and Rothesay in Bute.—The name Hebrides is a corruption of Pliny's *Hēbudes*. The islands were colonized originally by emigrants from Norway about the beginning of the 9th century. They remained subject to the crown of Norway till 1266, when they were attached to Scotland. They were then held by various native chieftains in vassalage to the Scottish crown, but in 1346 the chief of the Macdonalds reduced them to subjection and assumed the title of lord of the isles. They were finally annexed to Scotland by James V.

in 1540; and the abolition of hereditary jurisdictions by act of parliament in 1748 gave a final blow to the nominal independence of the lords of the isles.

**HEBRON** (originally *Kirjath Arba*; Arab. *El-Khulil*), a city of Palestine, 18 m. S. of Jerusalem; pop. about 5,000. Most of the inhabitants are Moslems; about 50 families are Jews; there are no resident Christians. The city stands partly on the declivities of two hills and partly in the deep and narrow valley of Mamre. At the S. extremity of the town is a mosque, which, according to the Arabs, covers the cave of Machpelah, with the tombs of Abraham, Isaac, and Jacob, and their wives. The architecture of this mosque plainly indicates its original use as a Christian church. Hebron figures in the history of Abraham, who

he succeeded. He was the author of a geographical work entitled *Περίοδος Γῆς*, or *Περιήγησις*, and of a historical one entitled *Γενεαλογία*, or *Ἱστορίαι*. The former contained a description of various countries in Europe, Asia, and Africa; the latter was a prose account of the mythical history of the Greeks. Some fragments of these works are extant, published in various collections of Greek fragments.

**HECATE**, a divinity of ancient Greece, who was commonly called a daughter of Perses or Persæus and Asteria. She had dominion in heaven, on earth, and in the sea, and could bestow on mortals wealth, victory, and wisdom. This caused her to be confounded with Ceres, Rhea, Diana, and Proserpine. She was worshipped in Samothrace and Ægina, and at Athens, where small statues of Hecate were

placed in front of houses and at cross roads. Her favorite sacrifices were dogs, honey, and black ewe lambs. In works of art she is sometimes represented as a single being, sometimes as a three-headed monster.

**HECKER, Friedrich Karl Franz**, a German politician, born in Eichersheim, Baden, Sept. 28, 1811. He early acquired distinction as a lawyer and politician, and was elected to the second chamber of Baden in 1842. In 1845 he travelled with Itzstein for the

Hebron.

bought Machpelah. It was taken by Caleb at the conquest of Palestine by the Hebrews, and became the residence of David in 1055 B. C. It was recovered from the Edomites by Judas Maccabæus, and burned by the Romans under Vespasian. In A. D. 1167 it became the seat of a Latin bishopric. It was taken by Saladin in 1187, and after an insurrection stormed by Ibrahim Pasha in 1834.

**HEBRUS**, in ancient geography, a river of Thrace. See MARITZA.

**HECATEUS**, a Greek historian and geographer, born in Miletus about 550 B. C., died about 476. He visited Egypt and other provinces of the Persian empire, Libya, Greece, Italy, and other countries. On his return he found the Ionians generally meditating a revolt against Persia, which in spite of his remonstrances was carried out, and ultimately led to the Persian invasion of Greece. After the suppression of the revolt, Hecateus, still high in the esteem of his countrymen, was sent as ambassador to the satrap of the great king to solicit mercy for the vanquished, in which

purpose of disseminating radical views. At Berlin they received an order to leave Prussia in 24 hours. In the diet of 1846-'7 Hecker even opposed the liberal ministry of Bekk, and voted against taxation; but not being sustained by his party, he resigned his seat in March, 1847. He shortly afterward availed himself of a fusion between the democrats and liberals to enter the assembly again. Having allied himself with the republican and socialist Struve, and taken an active part in a meeting at Offenburg (Sept. 12, 1847), where the radical programme was drawn up, he was about to be tried for treason, but was allowed to retain his place in the chamber, where he continued to be the leader of the extreme left. He was a member of the provisional Frankfort parliament in 1848, but as his party was here left in the minority, he became a leader with Struve of the insurrection of April in the south of Baden, the object of which was the republicanizing of Germany. The gathering at Donaueschingen, however, which they announced by proclamation from Constance, proved a to-

tal failure; Hecker and Struve were beaten at Kandern; Freiburg, which the insurrectionists had occupied, was retaken by the government troops; and a legion of German volunteers from France, led by Herwegh, was dispersed at Dossenbach. Hecker fled into Switzerland, where he established the *Volksfreund*. In September he emigrated to America, but was recalled by the provisional government of Baden in 1849. In July he arrived in Strasburg, but, finding that the revolutionary party had been completely defeated, returned to the United States, where he became a farmer in Belleville, Ill. He commanded a regiment during the civil war, was wounded at Chancellorsville, and retired to his farm soon after the battle of Chattanooga.

**HECKER, Isaac Thomas**, an American clergyman, born in New York, Dec. 18, 1819. He became connected in 1843 with the Brook Farm association at West Roxbury, Mass., and subsequently spent some time with the "conscientious family" at Fruitlands, in Worcester co., Mass. In 1845 he was received into the Roman Catholic church, and in 1847 became a member of the congregation of the Most Holy Redeemer. He was ordained priest in London in 1849, and after two years of missionary labor in England he returned to New York. In 1857 he and several of his brother Redemptorists were released from obedience to their order, and founded, with the approbation of the archbishop of New York, a missionary society since known as the congregation of St. Paul the Apostle (commonly called Paulists), having its first house in New York city. In 1865 Father Hecker established the "Catholic World," a monthly magazine. In 1869 he was present at the Vatican council as procurator of Bishop Rosecrans, of Columbus, O. In 1873, on account of ill health, he travelled in Europe and the East. He is the author of "Questions of the Soul" (12mo, New York, 1855) and "Aspirations of Nature" (1857).

**HECKEWELDER, John**, a Moravian missionary, born in Bedford, England, March 12, 1743, died in Bethlehem, Pa., Jan. 21, 1823. At the age of 12 he came with his father to Pennsylvania. He accompanied Mr. Post in 1762 in his expedition to the Indian tribes on the Ohio, and in 1771 took up his residence among them as a missionary. After 40 years of missionary service, he went to Bethlehem, the principal establishment of the Moravians in America,

and there remained till his death. He wrote several memoirs on the Delaware and Mohegan Indians, the principal one being published in the "Transactions" of the philosophical society of Pennsylvania (1819). See Rondthaler's "Life of Heckewelder" (Philadelphia, 1847).

**HECLA**, or **Hekla**, a volcanic mountain of Iceland, situated in the southwestern part of the island, in the district of Rangarvalla, 40 m. from the coast. Hecla rises to the height of 5,104 ft., to the eastward of a large and comparatively fertile plain intersected by the rivers Hvita and Thjorsa. Its approach is over vast lava beds lying irregularly one above the other. The peak or cone itself surmounts a long palagonite ridge 2,000 ft. high, running N. E. and S. W., and forming in reality a single volcanic fissure along which the points of eruption are continually changing. It is the middle one of five main ridges composing the Hecla system, all

Mount Hecla.

dominated by the conical crest of the volcano. This is built up with scorïæ, slag, and ashes, kept together by the streams of lava. Though above the snow limit (in Iceland from 2,000 to 2,500 ft. above the sea), it is not entirely covered with snow in summer. Down the western side slopes a snow *fond* of considerable dimensions. The top of the mountain is nearly flat, forming a broad table a quarter of a mile long by 50 rods across. The ground feels warm; on digging to the depth of six inches smoke bursts forth, and smoking heaps of lava are scattered over the surface. There are five craters on the peak, four of them on its side. The highest, on the summit, has been quiescent for ages. It is an irregular chasm about a quarter of a mile long, 300 ft. wide, and 250 ft. deep. The bottom is covered with volcanic sand, moist earth, and in some places with snow; but from many fissures on its sides issue smoke and hot steam. The recent craters are filled with black smoke, red scorïæ, and sulphur.

Of the 86 volcanic outbursts to which Iceland has been subjected since 874, Hecla has contributed 39, Katla 13, and the submarine volcano off Cape Reykjanes 12. The longest period of Hecla's inactivity has been 79 years, and the shortest 6; but the violence of the eruption bears no proportion to the preceding period of rest. The first recorded outbreak of Hecla occurred in 1004, the last in 1845. The most disastrous began on April 6, 1766, when enormous columns of ashes were discharged, accompanied with thunder and lightning, and in the space of two hours destroyed five farm houses in the valley of Rangadair; scoriæ of two feet in circumference were hurled two miles, large extents of birch copse were buried, and the pastures almost utterly ruined; thick masses of slag and scoriæ covered the surface of the distant Thjorsa and dammed up the Ranga river, causing the lowlands to be inundated; and the prodigious quantities of loose volcanic matter which these rivers bore down to the sea hindered the progress of the fishing boats, and covered the southern coast for 20 miles, in some places to a depth of two feet. At noon of the first day a strong southerly wind carried these ashes toward the northern districts, turning the daylight into pitchy darkness, while deafening reports reverberated over the island. On April 9 a stream of lava poured down toward the southwest, issuing from two craters, one on the summit, and another toward the southwest. On the 21st the column of ashes from the main craters rose to a height of 17,000 ft. Continuous and disastrous shocks of earthquake accompanied the eruption. Epidemics raged among human beings and cattle; and great quantities of snow fell, accompanied by storms from the northwest, which lasted a week. The eruption of 1845 was preceded by unusual atmospheric conditions. The snow patches on Hecla's ridge had diminished in a marked way during the summer; the hot springs to the southeast of the mountain had increased in numbers and activity. On the morning of Sept. 2 dull detonations were heard, and a slight vibration of the earth was perceptible, the summit of Hecla remaining shrouded in black clouds, which about noon spread over the whole sky, discharging a thick rain of yellowish gray, slaggy pieces. At noon it was dark as in the deepest winter night; then a dark, shining volcanic sand began to fall, lasting until noon on the 3d. Sounds as of cannonading were heard at a great distance, and terrific crashes in the vicinity, which were succeeded by regular detonations, and then a violent rumbling noise. Exhalations, brightly illumined by the glowing mass in the crater, canopied the ridge, as if a steadily increasing sheet of flame shot out from the summit, amid which glowing masses of stone were continually hurled up and down. At nightfall on the 2d a lava stream issued from the N. W. side of Hecla; the watercourses to the west were suddenly swollen by the melted

snows, and carried down vast quantities of mud, earth, and stone. Ships in the neighborhood of the Faroes, the Shetlands, and the Orkneys were overtaken on the 2d and 3d by a shower of ashes coming from the northwest. The flow of lava continued with slight intermissions till April 5, and on the following day the last column of ashes was discharged. As the lava only covered the track of former eruptions, no dwellings were destroyed. Sheep and cattle suffered severely from want of grass. The lava stream poured forth in 1845-'6 is 9 m. long, 2 m. broad in some places, and from 50 to 100 ft. high.

**HECTOR**, a Trojan hero, and the noblest character of the Iliad. He was the eldest son of Priam and Hecuba, the husband of Andromache, and the father of Astyanax. He disapproved of the conduct of Paris, and advised the surrender of Helen to Menelaus; but when his remonstrances and warnings were disregarded, he devoted all his energies to the service of his native city. After fighting some of the bravest of the Hellenic warriors, and among others slaying Patroclus, the friend of Achilles, he was at length vanquished and killed by the latter, who dragged his corpse to the Greek fleet, or according to later tradition thrice around the walls of Troy; but afterward relenting, he restored it for a ransom to Priam.

**HECUBA** (Gr. Ἑκάβη), a daughter of Dymas of Phrygia, or of Cisseus, king of Thrace, second wife of Priam, king of Troy, and the mother of Hector, Paris, Cassandra, Creüsa, and 15 other children. According to Euripides, she was enslaved by the Greeks after the capture of Troy, and carried to the Thracian Chersonesus, where she saw on the same day her daughter Polyxena sacrificed and the body of her youngest son Polydorus cast on the shore after he had been murdered by Polymestor, king of the Chersonesus. She determined on revenge, and, sending for Polymestor and his two sons, under pretence of wanting to inform them of hidden treasure, she slew the children on their arrival, and tore out the eyes of their father. According to other accounts, she became the slave of Ulysses, and in despair killed herself by leaping into the sea.

**HEDDING**, Elijah, an American bishop, born at Pine Plains, N. Y., June 7, 1780, died in Poughkeepsie, April 9, 1852. He became a member of the Methodist Episcopal church in 1798, and commenced his labors as an itinerant preacher on Essex circuit, Vermont. He was received into the New York annual conference in 1801, and sent to Plattsburgh. In 1802 he labored on the Fletcher circuit, Vermont, which then extended from the Onion river to 15 or 20 miles beyond the Canada line, including all the territory between the Green mountains and Lake Champlain. Here he was accustomed to travel 300 miles a month on horseback, to ford rivers, to sleep in log cabins, and to preach once and often two or three times daily. In 1803 he was sent to Bridgewater circuit, New

Hampshire, which then embraced 13 towns. In 1804 he was at Hanover, N. H.; in 1805 at Barre, Vt.; and in 1806 at Cheshire, Vt. During 1807-'9 he was presiding elder of the New Hampshire and New London districts. In 1808 he was a delegate to the general conference at Baltimore, and took an active part in the discussion of the policy of a delegated general conference. From 1809 to 1816 he preached in Nantucket, Lynn, and Boston, and from 1816 to 1824 in Portland, Lynn, and New London, being also superintendent of the Boston district. In 1824 he was elected bishop. During the 26 years of his administration he was distinguished for his clear and comprehensive views of the doctrines and polity of the church, and for his intimate acquaintance with ecclesiastical law. His manual on the "Discipline" is of high authority. In 1848 he was chosen to represent the Methodist Episcopal church in the British conference. He was one of the chief movers in the founding at Boston of "Zion's Herald," the first journal of the Methodist Episcopal church of the United States.—See "Life and Times of the Rev. E. Hedding, D. D.," by D. W. Clark, D. D. (New York, 1855).

**HEDGE**, a fence of living plants, designed for protection or for ornament. Hedges are seldom over 5 or 6 ft. high, and are kept low and compact by annual trimming; where trees are set near together and allowed to grow tall, to protect buildings or crops from prevailing winds, they are called screens and wind breaks. In the early attempts in this country at hedging, English examples were followed in forming the hedge and in selecting the plants; these resulted so generally in failure that this method of fencing fell into disrepute, and for many years was almost entirely abandoned. With the settlement of the woodless prairies the practice of hedging was revived, and it is at present receiving much attention, many miles being set annually in some of the western states; and it is becoming extensively adopted in some of the older states. In certain parts of Delaware and Maryland one may travel all day over the country roads and see but few fences. The hawthorn, so generally used for hedges in England, is entirely worthless in this country; its foliage appears late, becomes injured by the hot sun, and falls early, and the plant is badly infested by various insects; our several native thorns are but little better. For a protecting hedge there are but two plants employed to much extent in the northern and two others in the southern states. The Osage orange is more used than any other plant. This, the *Maclura aurantiaca*, also called bodock or *bois d'arc* in the southwest, where it is native, is a handsome tree, with glossy leaves and a fruit in structure like a dry mulberry, of the size and shape of an orange. The seed, obtained by rotting the balls and washing away the pulp, is scalded and kept warm and moist until it sprouts; it is then sown in rows and kept well cultivated during the season; at

the north the plants are taken up in the autumn, assorted, and buried in a dry place. The hedge row being well prepared, the plants are set the following spring six inches to a foot apart, first shortening both top and root. It is impossible to make a good hedge unless the plants are carefully cultivated and kept free from weeds until the hedge is formed. The after treatment varies. Some form the hedge by a systematic cutting made each year to induce a dense growth at the base; this course requires five years to form the hedge. The other method is to allow the plants to grow without pruning for three or four years, when they are laid down or lopped; the stem of each is cut half way through close to the base, and the top laid down on the ground, each plant being bent down upon the preceding one; this is done in spring, and by autumn an abundance of new shoots will have formed an impenetrable thicket, which is brought into proper shape by trimming.—The Osage orange is hardy in the climate of New York city, but in much colder localities the most serviceable hedge plant is the honey locust, *Gleditsia triacanthos*, also called three-thorned acacia, a well known tree of the *leguminosæ*. (See HONEY LOCUST.) The seeds, if scalded before sowing, germinate readily; they are sown in a seed bed, and the following spring the plants are set in the hedge rows; they are brought into shape by annual cutting back. Several years ago there was much discussion as to the use of white willow as a hedge plant, but it is better fitted to form a windbreak. At the south one of the best hedge plants is the pyracanth or evergreen thorn, *crataegus pyracantha*, from southern Europe; it has dense, dark-green foliage, white blossoms, and brilliant scarlet fruit; it is propagated by cuttings and by seeds, which germinate slowly. This variety is not hardy at the north, but one with light-colored fruit, lately introduced, survives the winter near New York. The Macartney rose, *rosa bracteata*, is a favorite at the south, as it forms an impenetrable barrier to animals, and is almost constantly in bloom. The buckthorn, *rhamnus catharticus*, and the common barberry, *berberis vulgaris*, are used for hedges to a limited extent. For ornamental hedges, in which great powers of resistance are not required, a large number of plants may be used; almost any shrub or tree which grows tall enough may by proper pruning be made to serve. Among evergreens, the most elegant hedge plant is the hemlock spruce, *abies Canadensis*. The Norway spruce, *A. excelsa*, and the arbor vitæ, *thuja occidentalis*, are also frequently employed. At the south the holly, English and Portugal laurels, and many other broad-leaved evergreens, including the camellia, are set in hedge rows. Of the deciduous plants, the privet, *ligustrum vulgare*, the Japan quince, *cydonia Japonica*, and even the beech and other forest trees, and the pear and other fruit trees, are sometimes used.

**HEDGE, Frederick Henry**, an American clergyman, born in Cambridge, Mass., Dec. 12, 1805. His father was for a long time professor of logic and metaphysics in Harvard college. In 1818 the son accompanied Mr. George Bancroft to Germany, and there studied at Ilfeld and Schulpforte. In 1823 he returned to America, and in 1825 graduated at Harvard college. After three years of study in the theological school, he entered the ministry in 1828, and was settled in the Congregational church at West Cambridge. He became pastor of the Unitarian church in Bangor, Me., in 1835, of the Westminster church in Providence, R. I., in 1850, and of the first Congregational church in Brookline, Mass., in 1856. In 1847-'8 he made the tour of Europe, revisiting Germany, and spending a winter in Italy. In 1852 he received from Harvard college the degree of D. D., and in 1857 was chosen professor of ecclesiastical history in the theological school in Cambridge. In the same year he took charge of the "Christian Examiner," then the organ of the Unitarian body. In 1859 he was made president of the American Unitarian association. In the same year he was chosen by the Germans of Boston to deliver an oration on the centennial anniversary of Schiller's birth (Nov. 10). In 1866 he gave at the annual commencement of Harvard college an address to the alumni, in which he advocated changes in the system of study which have since been partially adopted by the government of that university. In 1872 he was appointed professor of German at Harvard, an office which he still holds (1874). His largest work is the "Prose Writers of Germany" (8vo, Philadelphia, 1848), in which extracts from 28 authors, from Luther to Chamisso, are given, each series preceded by a careful original sketch of the author and estimate of his genius and influence. A large portion of the extracts were translated for the work by the compiler. Dr. Hedge has also published versions of many of the minor poems of eminent German writers, especially Schiller and Goethe. In 1853, in connection with the Rev. Dr. Huntington of Boston, he published a volume of hymns, many of the best of which are his own compositions and translations. In the same year also appeared his "Liturgy for the Use of the Church." In 1865 he published "Reason in Religion," a collection of essays on the philosophy of religion, which has passed through several editions. In 1870 appeared his "Primeval World of Hebrew Tradition," of which a German translation was published at Berlin in 1873. He has also published many sermons, orations, and reviews.

**HEDGEHOG**, an insectivorous mammal, of the genus *erinaceus* (Linn.). The teeth are 36 in number, but have been differently divided by zoölogists. F. Cuvier gives the following: incisors  $\frac{2}{1}-\frac{2}{1}$ , canines none, false molars  $\frac{3}{2}-\frac{3}{2}$ , and true molars  $\frac{4}{2}-\frac{4}{2}$ ; according to Owen, they are developed as incisors  $\frac{3}{2}-\frac{3}{2}$ , premolars  $\frac{4}{2}-\frac{4}{2}$ , and molars  $\frac{3}{2}-\frac{3}{2}$ . The central incisors of the upper

jaw are separated from each other, those of the lower nearly touching; behind the first upper incisor on each side are two small single-rooted teeth, resembling false molars, but evidently incisors from their development in the intermaxillary bone; after these, and separated from them by a small interval, are three false molars, the first the largest; then the four true molars, the second the largest, the fourth very small, and all tuberculated; in the lower jaw, after the single incisor of each side, are three small single-pointed and single-rooted teeth resembling false molars, and after these, with a short interval, four molars, the second and third the largest; the crowns of the teeth lock into each other, as in other animals preying chiefly on insects. When full grown, the common hedgehog (*E. Europæus*, Linn.) is about 9 in. long, of a heavy form, short limbs, and slow plantigrade motion; the upper part of the body is covered with sharp prickles, about an inch long, arranged in clusters, divergent and

Hedgehog (*Erinaceus Europæus*).

crossing each other, of a brownish black with a white point; the head is clothed with harsh brownish hairs, and the under parts of the body with a dirty white fur; the ears and tail are short; the paws, end of nose, and tail are nearly naked; the eyes are prominent, and the opening of the ears may be closed by a valvular arrangement of the cartilages; the nose is considerably longer than the jaws, and fringed at the end; the lips are entire, and there are no cheek pouches; the five toes are armed with long nails, the middle the longest, suitable for digging; the soles are covered with naked tubercles, possessing an exquisite sense of touch; the mammæ are ten, six pectoral and four ventral. By means of the development of the *panniculus carnosus* muscle, belonging entirely to the skin, the animal is able to roll itself into a ball, and preserve this attitude as long as it pleases without much effort, presenting to its enemies a thorny mass which the most voracious and powerful dare not attack. The hedgehog is nocturnal, concealing itself during the day in burrows or natural holes, coming out at

night in search of worms, insects, snails, roots, and fruits; though possessing very limited intelligence, it has been so far domesticated as to be brought up in gardens, where it proves of great service in destroying noxious insects; the flesh is said to be good eating. The young are born in May, covered with prickles, with eyes and ears closed, and about two inches long. When at rest, the hedgehog has the power of lowering the prickles, and of retaining them smooth on a level with the body. This species occurs throughout temperate Europe, and was well known to the ancients. The popular name urchin and the French *hérisson* are evidently derived from the Latin *ericus*, of which *erinaceus* is a synonyme; it is the *ερίνος* of the Greeks. The prickles were formerly used to hatchel hemp. A second species, the long-eared hedgehog (*E. auritus*, Pall.), is found in the eastern regions of the Russian empire; the ears are nearly as long as the head; the body and limbs are more slender, and the under hair finer, than in the preceding species. Like the other hedgehog, it hibernates in winter in holes a few inches below the surface of the ground; it can eat cantharides and other vesicating insects with impunity; it grows very fat in autumn, preparatory to hibernating. Other species are described. There is no proper hedgehog in America; the rodent porcupine, similarly armed with quills, is erroneously so called in some parts of the United States.

**HEDJAZ**, a dependency of the Turkish empire in Arabia, on the coast of the Red sea, bounded N. by the desert, E. by the desert, Shomer, and Nedjed, S. by Yemen, and W. by the Red sea, and its arm the gulf of Akabah. The coast is generally low and sandy, and lined with coral reefs and islets, which afford shelter for small vessels in all weather. Large vessels find good anchorage in roadsteads, but there are few safe harbors. The principal seaports are Jiddah and Yembo, the former the port of Mecca, the latter of Medina. A range of mountains which attain in some places an elevation of 8,000 ft., often covered with snow, traverses Hedjaz from N. to S. and extends into Yemen. West of this chain, which is generally visible from the coast, and sometimes approaches near to it, is a tract of sandy lowland (el-Tehama), once the bed of the sea; east of it is a highland (*nejed*), which recedes gradually into the desert, excepting near lat. 24°, where an offshoot from the range extends N. E. to Jebel Shomer. These mountains are of granitic formation, but porphyritic rocks, supporting sandstone and limestone, occur in many places. Traces of volcanic fires are numerous throughout the Tehama, and porous lavas are found, particularly around Medina. The lowlands are scored by wadies or beds of torrents, which are rarely filled, as but little rain falls during the year. There are no rivers, but a few small streams find their way down from the mountains, where there are more copious rains and consequently well watered val-

leys. In the Tehama the wild plants are few and offer little sustenance for animal life. In the uplands, various cereals, many fruits, and the vegetables peculiar to Arabia are raised. Wild goats abound in the mountains, and hyænas and foxes are numerous along the coasts, where they subsist on fish which they find on the coral reefs. A few gazelles, hares, jerboas, and lizards are found on the plains. Falcons are the principal birds. Fish are very plentiful, and constitute a large part of the food of the inhabitants; great quantities are salted and sold in the markets of Mecca. Three species of dolphin are taken along the coast, and tortoise shell and mother of pearl are abundant. The climate of Hedjaz is generally unhealthy. Fevers are prevalent on the coast, owing to the foulness of the water; and in the interior the humidity and rank vegetation of the irrigated valleys render them almost equally insalubrious. The heat is excessive, and is tempered only by the sea breeze. The N. part of Hedjaz has few towns or villages, and is inhabited chiefly by wandering Bedouins. The pilgrim route from the north to the holy cities is guarded by isolated castles. At the N. extremity of the gulf of Akabah is the fortified village of the same name. In the S. part Medina and Mecca are the chief inland places. Tayf, about 60 m. S. E. of Mecca, is on high ground, and is defended by several forts; it supplies Jiddah and Mecca with fruits, which grow abundantly in its vicinity. Gunfudah is a coast town S. of Jiddah, opposite a group of islands of the same name. Kali, another small coast town further S., in lat. 18° 35' N., is on the borders of Yemen. Besides these places there are only a few scattering villages, mostly in the highlands.—The country immediately around Mecca is under the jurisdiction of the sherif of Mecca, an officer elected by the sherifs, or nobles who claim descent from the family of the prophet; but he is subordinate to the representative of the sultan, who resides at Jiddah. When the Wahabees cut off the communication between Constantinople and the sacred cities, the sherif of Mecca revolted, attacked the Turkish pasha in Jiddah, and removed him by poison. The Wahabees soon checked his increasing power, and they in turn were driven east in 1818 by the troops of Mehemet Ali, who made himself master of Hedjaz and assumed the protectorate of the holy cities. At the close of the war between Turkey and Egypt in 1840, the sultan recovered his rights, and Hedjaz now constitutes a vilayet of the Turkish empire. The great caravans of pilgrims, which were frequently intercepted and despoiled when the country was in an unsettled state, are now comparatively protected, although still subject to numerous extortions.

**HEEMSKERK.** See HEMSKERK.

**HEER**, Oswald, a Swiss naturalist, born at Glarus, Aug. 31, 1819. He went to Zürich in 1832, and has been engaged there for more than 30 years as professor of botany and en-

tomology, and as director of the botanical garden, which he helped to establish. He was likewise for upward of 20 years a member of the great council of Zürich. He has published *Die Käfer der Schweiz* (2 vols., Solothurn, 1837-'40); *Fauna Coleopterorum Helvetica* (3 vols., Zürich, 1839-'41); *Die Insektenfauna der Tertiärgelände von Oeningen und von Rodolphe in Kroatien* (3 vols., Leipsic, 1847-'53); *Flora tertiaria Helvetiae* (3 vols., Winterthur, 1854-'6); *Die Pflanzen der Pfahlbauten* (Zürich, 1865); *Die Umwelt der Schweiz* (1869; French translation by Demole, Geneva and Basel, 1872); and *Die fossile Flora der Polarländer* (2 vols., Winterthur, 1861-'7).

**HEEREN, Arnold Hermann Ludwig**, a German historian, born at Arbergen, near Bremen, Oct. 25, 1760, died in Göttingen, March 7, 1842. He studied at Bremen and at Göttingen under the guidance of Heyne, whose daughter he afterward married, and of Spittler, and was appointed professor of philosophy, and in 1801 of history, at Göttingen. He was for some time one of the editors of the *Bibliothek der alten Literatur und Kunst*, and after the death of J. G. Eichhorn in 1827 edited the *Göttinger gelehrte Anzeigen*. The subject of his lectures at the university was chiefly the history of Greek and Roman antiquities and of literature, and a principal merit of his numerous historical writings consists in an original elucidation of the commercial affairs and relations, as well as of the origin and political development, of the ancient states. Besides the edition of Menander's *De Encomiis* (1785), and the *Eclogæ Physicæ et Ethicæ* of Stobæus (4 vols., 1792-1801), the following are his most important works: *Ideen über die Politik, den Verkehr und den Handel der vornehmsten Völker der alten Welt* (2 vols., 1793-'6; 4th ed., 6 vols., 1824-'6; the part relating to Greece translated into English by George Bancroft, Boston, 1824); *Geschichte des Studiums der classischen Literatur seit dem Wiederaufleben der Wissenschaften* (2 vols., 1797-1802; 7th ed., 1822); *Handbuch der Geschichte der Staaten des Alterthums* (1799; 5th ed., 1826; translated by Bancroft, Northampton, 1828); *Geschichte des europäischen Staatensystems und seiner Colonien* (1809; 5th ed., 1830; translated by Bancroft, Northampton, 1829); *De Fontibus et Auctoritate Vitarum Parallelarum Plutarchi* (1820); all of which were published in Göttingen, where also a collection of his historical works appeared in 15 volumes (1821-'6). Among his minor writings are sketches of Johannes von Müller, Spittler, and Heyne, a treatise on the influence of the Normans upon the French language and literature, and a dissertation on the crusades. His "Ideas" were translated into English, and published at Oxford by Talboys, under the title of "Historical Researches." A uniform edition of his translated works, under the title of "Heeren's Historical Researches," has been published by Bohn (7 vols., London, 1846-'54).

**HEFELE, Karl Joseph von**, a German historian, born at Unterkochen, Württemberg, March 15, 1809. He studied at Ellwangen and Ehingen, graduated in 1834 at the university of Tübingen, and became in 1840 professor of theology there, lecturing successively on church history, Christian archæology, and patristics. From 1842 to 1845 he was a member of the Württemberg chamber of deputies. He was consecrated bishop of Rottenburg in 1869, and in the council of the Vatican maintained the inopportune-ness of defining the pope's official infallibility, but accepted the doctrine when it was defined. He has strenuously opposed the new legislation in Germany relating to the religious orders and the relations of church and state. His most important works are: *Die Einführung des Christenthums im südwestlichen Deutschland* (Tübingen, 1837); *Patrum Apostolicorum Opera* (1839; 4th ed., 1855); *Das Sendschreiben des Apostels Barnabas* (1840); *Der Cardinal Ximenes und die kirchlichen Zustände Spaniens im 15. Jahrhundert* (2 vols., 1844; 2d ed., 1851; English translation by Canon Dalton, London, 1860); *Chrysostomus-Postille*, selections from Chrysostom (1845-'57); *Concilien-geschichte* (7 vols., Freiburg, 1855-'74; English translation of part i. by W. R. Clark, Edinburgh, 1871); *Beiträge zur Kirchengeschichte, Archæologie und Liturgik* (2 vols., 1864-'5); and *Die Honorius-Frage* (1870).

**HEGEL, Georg Wilhelm Friedrich**, a German philosopher, born in Stuttgart, Aug. 27, 1770, died in Berlin, Nov. 14, 1831. From his 8th to his 18th year he was thoroughly trained in philology, mathematics, and history, in the gymnasium of his native town. His scholarship was already productive. He began a system, which he never abandoned, of making and arranging copious extracts from all the books and even journals that he read; and he was always a great reader of newspapers. In 1788 he became a student of theology at Tübingen, having a stipend on a ducal foundation. He heard Storr on dogmatics, Schnurrer in exegesis, Flatt in philosophy; and was also well taught in botany, anatomy, and other sciences of observation. With some of the students he read Plato and Kant; but his subsequent philosophical fame took them by surprise. In 1790 Schelling, then 15 years old, went to Tübingen; he and Hegel studied, talked, and roomed together, little aware of that strange destiny by which the younger became the leader of the elder, and the elder supplanted the younger, and the younger again succeeded the elder in the development of German idealism. After quitting the university, Hegel (like Kant and Fichte) was for a long time a tutor in private families; from 1793 to 1796 at Bern in Switzerland, and from 1797 to 1800 in a more eligible position at Frankfort-on-the-Main. His studies meanwhile took a wide range. He read Thucydides, Montesquieu, Gibbon, and Hume, and thoroughly pondered the Greek and German metaphysics. He be-

gan a "Life of Christ;" wrote and rewrote a "Criticism of Religious Ideas;" and corresponded with Schelling about his essay on the Ego (*Vom Ich*), which was stirring the pulses of ardent thinkers. He passed through, in his own experience, the conflict between the older supernaturalism and the prevalent rationalism, neither of which harmonized with his speculative tendencies. Yet, to the end of his life, he professed accordance with the Lutheran orthodoxy, and one of his later public addresses was a eulogy upon the principles of the Augsburg Confession, pronounced as rector of the Berlin university upon the tricentennial celebration in 1830 of the adoption of that instrument. Before 1800 he had drawn up the outline of a system of philosophy in three parts: the first on logic and metaphysics combined; the second on the philosophy of nature; the third on the philosophy of mind or spirit. Here was already foreshadowed that identification of logic and metaphysics which is one of the marked peculiarities of the Hegelian system. But as yet he had not clearly mastered the idea or the method of his scheme; he needed sharper thought and conflict to know whereto all this study was to grow. Hegel's father died in 1799, leaving him a patrimony of 3,000 florins, and he at once determined to devote himself to philosophy at Jena. This university had been made illustrious in literature by the new romantic school of the Schlegels, Novalis, and Tieck; Fichte had just been driven thence to Berlin on the accusation of atheism; Schelling was now there, arousing the enthusiasm of the novices in the mystery and marvel of the new philosophical intuition; and here, too, Fries, Krause, and Ast were commencing their fruitful philosophical career. To the philosophical world Hegel presented as his introduction an essay on the "Difference between Fichte and Schelling," advocating, more definitely than the latter had done, the position that this difference was not adequately designated by saying that the former taught a subjective and the latter an objective idealism, but rather that Schelling's system included both. This was published in the spring of 1801; in the autumn its author became tutor in the university. His dissertation on his appointment was *De Orbitis Planetarum*, a zealous advocacy of the German Kepler against the English Newton, containing also an unlucky polemic against Bode's law about the proportional distances of the planets; he went so far as to suggest that, according to the true law, the space between Mars and Jupiter should not be filled up, ignorant that Piazzi had already discovered the asteroid Ceres. From 1801 to 1806 (in which last year he became professor) he lectured on logic, the philosophy of nature, psychology, ethics, &c. His first course was given to four auditors. Awkward in his delivery, encumbered by his thoughts, he failed to interest any but the most thoughtful. "He thinks in substantives," said one of his audi-

tors; often the structure of his sentences was incomplete. Carrying to his lecture a mass of loose papers, he would fumble among them, arranging them dialectically, under his rigid categories, as he went along. But as his "dry light" became warm, his eye and voice would grow keen, and he would often break out into an aphorism, a sarcasm, or a pregnant antithesis, long to be repeated. His best manuscripts were copied from the students' notes. At Jena, too, in conjunction with Schelling, he edited the *Kritisches Journal der Philosophie*; and these two philosophers were still so nearly agreed, that the authorship of one of the most important articles was afterward claimed by both; it is on the "Relation of the Philosophy of Nature to Philosophy in General," and is included in Hegel's works. Hegel's lectures at this period on the philosophy of history contain some of the strongest statements, afterward modified, implying a pantheistic confusion of God and the world. But even then God was to him, not a mere substance (as in Spinoza), but a subject, and as such spiritual, the absolute spirit. The statement that Hegel identified God and nothing, and that this is the sense of the system, is an entire misconception. His career in Jena was brought to a close by the French invasion of 1806. In the turmoil of that campaign, his chief solicitude was about the fate of some of the last sheets of his "Phenomenology," which he was sending to a publisher in Bamberg. The manuscript was saved, but the philosopher's house was sacked by French troops, and he was reduced to his last penny. In 1807-'8 he was editor of a political sheet in Bamberg, and there he projected a work on the political constitution of Germany, which was never completed. At Nuremberg he was rector of the gymnasium from 1808 to 1816, and gave philosophical lectures to the lads, issued as the 18th volume of his collected writings under the title *Propädeutik*—a simple, clear outline of the main points of his general system, in a style as popular as the abstruse subject admits. His administrative ability was here seen to be of a high order; he was ever punctilious as to all fit rules and observances. In September, 1811, he married Marie von Tucher, of an ancient Nuremberg family, 22 years his junior—a lady of refinement, decided in her Christian convictions, indefatigable in her daily charities, to whom he was attached with singular love and tenderness. To his constant friend Niethammer he wrote that "when a man has found a position and a wife that he loves, he is quite complete for life." Often would he praise her in verse, and his best letters are those he wrote her on his journeys. Two sons, Karl and Immanuel, were born to them. His domestic affairs were carefully arranged; his family life was one of unbroken peace; and it may have mitigated, as in the case of Comte, the abstractions of his system. Some of the severest parts of his "Logic," as the writer happens to

know, were written while he was watching as a nurse at the bedside of his wife. Hegel's "Phenomenology," which he used to call his "voyage of discovery," was issued at Bamberg in 1807. The object of this work is to describe the stages and process through which the mind must proceed from the simplest form of consciousness up to absolute knowledge; and to exhibit this, not merely as a matter of fact, but also as a (logically) necessary ascent. One of his disciples says that in this most finished of his writings he is the Dante of philosophy, since he shows how consciousness passes from the inferno of sense, through the purgatory of the understanding, into the paradise of philosophic freedom. In principle and method it is a protest against Schelling's imagination of a special intellectual intuition. The absolute is not "shot out all at once, like a ball from a pistol;" it is, and it is attained by, a process. The stadia of this process are, simple consciousness, self-consciousness, reason, spirit (here used as equivalent to objective morality), religion (including art), and absolute knowledge. The process itself is necessary; the method is immanent in thought. Its moving principle is that of contradiction or negation. Each lower stage is contradicted or negated in thought; this negation does not give zero as its result, but rather an opposite or antagonistic principle; and these antagonistic principles struggle through (the negation of the negation) to a higher unity; and so on, until we arrive at that absolute knowledge which is the result as it was the source of these evolutions, in which all these antagonisms are both abolished and preserved. Arrived at this state of knowledge, the spirit knows itself to be identical with universal reason; the finite self-consciousness and the absolute self-consciousness are one; the infinite is no longer foreign to and outside of the finite. With a knowledge of this high consummation, the race enters upon a new epoch; the old has passed away; the conflicts of all the schools are adjusted. Man knows the absolute reason; the absolute reason knows itself in man. To this all history, all thought have been tending; the history of thought is this very process; the completion of thought is found in the science of the absolute. Such was the daring prophecy with which a secluded student, in the ancient and quiet city of Nuremberg, heralded a revolution in the world of mind. Nor did he stop with the proclamation. In his "Logic," published in two volumes, three parts, between March, 1812, and July, 1816, he developed his system in its most rigorous and abstract form. This is one of the boldest and subtlest works of human speculation. It is designed to answer the question to which the "Phenomenology" led, viz.: What is that absolute knowledge which has been shown to be necessary? It is the completion of the system of categories, which Kant had elaborated, after Aristotle. It is not logic alone, nor metaphysics alone; it is both to-

gether. It is not the science of thought alone, nor that of being alone; it is the science of both thought and being, viewed as identical and pervaded by the same logical law. The whole system is reason itself, or the absolute idea—absolute idealism. The terms logic, idea, and reason are used in an unusual, in a universal sense. Reason and idea are not merely subjective; logic gives the law of being as well as of thought. That Hegel reduced all knowledge to that of mere relations and all being to mere logic, is an entire misconception of his theory. The system of logic, as the first part of philosophy, contemplates reason (the idea) as it is in itself, and not in its manifestations. Hegel used to call it "the kingdom of the shades;" his "voyage of discovery" led him first into this kingdom. He also speaks of it as equivalent to "God in his eternal being, before the finite world was created." In Platonic phrase, it is the ideas of the Divine mind, before they assume finite forms and modes. These ideas (this idea) are developed by an immanent law, the dialectic process of which we have spoken above; and herein consists the peculiarity of the work. The process is that of the idea itself, and all that we can do in the matter is to stand by and see how it is done; though there must be "speculation in the eyes" that see this process carried through and out. Thus, we begin with the conception of being, the most universal and indeterminate of all. As entirely indeterminate, it is the same as nothing. Being and nothing are thus the same, but they are also different; they are identical, but antagonistic; and, as such, they result in a process of becoming (*das Werden*), for the very idea of becoming includes being and not-being. This is ingenious and acute as an analysis of the conceptions; but is it a real or possible process in being as such? The whole science of logic is distributed into three parts—being, essence, and conception; the first two are the ontological logic, the third is the subjective logic. The categories that fall under being are three—quantity, quality, and measure. The categories under essence are also three—essence in itself, phenomena as expressing essence, and actual existence as the union of the other two. Here also, of course, come the discussions about the antinomies of the understanding. The categories of the third part of logic, that is, of conceptions or notions, are three—the subjective conception, the object, and last and highest of all, the idea. This logic, now, forms the first great division of Hegel's whole scheme of philosophy. This was fully presented, in outline, in his *Encyklopädie der philosophischen Wissenschaften*, published in 1817, in a third edition in 1830, and issued in his collected works with additional notes from his lectures. Here the categories of the "Logic" are applied to all the particular sciences. Of his whole system, the most general idea is that of God or the Absolute Spirit. This spirit is not mere substance, as in Spinoza, but also

subject, and as such contains the principle and law of its own evolution. This law is a perpetual trichotomy—thesis, antithesis, synthesis. Accordingly the "Encyclopædia" has three main parts, viz.: "Logic," the "Philosophy of Nature," and the "Philosophy of Spirit." Each of these has, again, a threefold division; and these three yet other three; and this rhythm of triads makes the harmony of the system. Logic, as we have already indicated, presents this absolute spirit or idea, as it is in itself, in its shadowy, ghostly form. In the "Philosophy of Nature" we have the same idea in its objective manifestation, in the forms of space and time. Here the idea or spirit becomes, as it were, a stranger to itself, yet this, too, by an inward necessity. How it comes to do this is one of the knots of the system; but that it does so is evident from the fact that nature is. Nature is here reconstructed—or, Hegel would say, we see how it is constructed—according to the high *a priori* method, in its three departments of mechanics, physics, and organized beings. These refined demonstrations have not had much effect upon the naturalists. But the absolute spirit, having run through the round of nature, emerges into its third sphere (in an equally recondite way), that of mind or spirit itself; spirit here finds and knows itself, of course, in three stadia. First, it is subjective spirit, including anthropology, phenomenology, and psychology. Then it passes over into objective spirit, or the sphere of ethics, which has three subdivisions: 1, law or right; 2, morality, private and personal; 3, public ethics, including the family, society, and the state. In fine, spirit becomes absolute spirit, and as such shows itself in three modes, art, religion, and philosophy; and in the last the circle is completed, the end returns to the beginning, the absolute spirit knows itself, and the Hegelian system is all in all. This "Encyclopædia" was first issued while Hegel was in Heidelberg, where he became a professor in 1816, declining invitations to Erlangen and Berlin—the latter, it is said, in part because the Prussian minister proposed that he should be examined as to his capacity for lecturing after his eight years' seclusion in Nuremberg. His fame now rose rapidly. His disciples began to be ardent and prophetic. His system was proclaimed as completing the structure of German idealism. Kant had critically prepared the way; Fichte had taught a subjective idealism; Schelling had not risen above an objective idealism; but in the absolute idealism the partial was dethroned and the universal made supreme. Cousin, passing through Heidelberg, proclaimed to the world that in Hegel (whose "Logic" he said he could not grasp) he had found a man of genius; and in his later brilliant course at Paris, in 1828, he availed himself of the generalizations and methods of the great idealist for the interpretation of history and the history of philosophy. A second invitation to

Berlin in 1818, urged by the minister Von Altenstein, Hegel's warm personal friend, was welcomed by him. He was now in the ripeness of his manhood, and animated by the consciousness that all thought had found its culmination in him. As the devoted Michelet has it, he was "the crown of the whole past and the seed of the most fruitful future." His new position was most favorable for the propagation of his opinions. Berlin university had always been enthusiastic for speculation. His lectures soon became the rage. Officers of state and the literati and savants of Berlin sat on the students' benches. The government provided liberally for his salary, and also for journeys to Paris, Holland, &c. He took the bearing of the founder of a new and great school. Hegelianism was the road to office. The master became sometimes overbearing; even Varnhagen von Ense says that he was "tyrannical." Professor Gans was one of his most zealous disciples, but Hegel called him to a sharp account for having dared to "recommend," on the university bulletin, his work on ethics. "What had he done, that Gans should recommend him!" He mixed more freely in general society, and indulged himself in his two chief relaxations, snuff-taking and card-playing. His previous lectures on the different branches of philosophy were carefully revised, and he wrote two new courses, on the "Philosophy of Religion" in 1821, and on the "Philosophy of History" in 1827, in both of these branches introducing an original and scientific elaboration of the materials. His "Outlines of the Philosophy of Right" was issued in 1821, combining in one exposition natural rights, ethics, and the philosophy of society and the state. Man's moral being expresses itself completely in the state; to this, natural rights, private morals, and even the church, are rightfully subordinate. The preface to this work aroused more controversy than the work itself, since it summed up its teachings in the noted aphorism: "The rational is actual, and the actual is rational." This was interpreted in an ultra-conservative sense; explained in any different sense, it was a mere truism. In fact, he was understood as supporting the existing Prussian system as the perfection of reason and freedom. This for a time helped his metaphysics; though his extreme disciples soon "changed all that." He used to fight his battles in his prefaces. In a preface he declared against the position of Schleiermacher, that the feeling of absolute dependence is the essence of religion. These two men were then at the height of their fame, both at Berlin; neither liked the other, and their disciples have perpetuated the struggle to the present time. The theologian opposed the admission of the philosopher into the academy of science; and the philosopher would not allow the theologian to take part in his scientific journal. The real difficulty was that Schleiermacher tried to find in human nature a foot-

hold for religion independent of philosophy, and Hegel's speculations did not allow this to be done. His system received concentration and impulse from the establishment, with the favor of government, of the Berlin *Jahrbücher für wissenschaftliche Kritik* (1827). All things were here discussed in the light of absolute knowledge. The school became haughty and uncompromising; they had solved the problem of the universe, and nothing remained but to bring all thoughts into subjection. Germany was alive with speculation; it had never known such a philosophical ferment. Even orthodox men gave in their adhesion, and Hegel was not loath to encourage them. Göschel, the jurist, wrote "Aphorisms on Science and Nescience," applying Hegelianism to the defence of the mysteries of Christianity; and Hegel reviewed the work, with an almost eager welcome, in the *Jahrbücher*, to show that his system was the same thing in the sphere of speculation that the Christian religion was in the sphere of faith. In the preface to a new edition of his "Encyclopædia," he quoted from Tholuck on the oriental trinities to show that he held to the Trinity more thoroughly than did this genial divine. The mystics he eulogized with Baader, and the theosophic Boehm he declared to be not merely fantastical, but also profound. The rationalists had no more violent foe than this prophet of the universal reason; he defended against them the truths of the incarnation, of sin, and of redemption. Conservative rationalism was indignant; the popular philosophy was dumb with amazement. There were many who said the long conflict between philosophy and faith was now to be adjusted; the absolute idealism was to do it, and it was to be done in Berlin. Enthusiastic students declared that the refined ideas of the "Logic" were "the new gods" of a new Pantheon. The triumph of his system seemed to be coming on. In 1829 he was rector of the university, and administered its affairs with the punctuality and painstaking of an accomplished disciplinarian. In 1831 Hegel published the first volume of a new edition of his "Logic," and revised for the press his lectures on the "Proof of the Being of God." In the autumn he commenced his course in the university with more than usual freshness and vigor. But cholera attacked him in its most malignant form on Nov. 13. On the next day at 5 o'clock he was dead. He was buried near Fichte and Solger, and over his remains was celebrated the worship of genius by disciples almost idolatrous.—Rosenkranz has written a full biography, from which we have derived many of our statements. Every subsequent philosophical writer of note in and out of Germany has criticised his system. The fullest accounts are in the histories of philosophy by Michelet, Erdmann, and Willm; the ablest criticisms are those of Schelling, Trendelenburg, Ulrici, Weiss, Fischer, and the younger Fichte. The Hegelian literature would make

a collection of several hundred volumes. In Holland, Van Ghert, Prof. Sieber, and Dr. Krahl espoused his system; Heiberg in Copenhagen; Tengström and Siendwall in Finland; a Hungarian wrote to him that he was learning his "Logic" by heart. Apart from the main peculiarity of his system, the impulse which this extraordinary thinker communicated to the various departments of philosophy was almost unexampled. He compelled men to think for him or against him. His "Logic" led to the treatises of Werder, Weisse, Erdmann, Trendelenburg, and Ulrici, as well as to a total revision of Schelling's system. His "Psychology" was followed by Massmann, Wirth, Erdmann, Rosenkranz, and the "Anthropology" of Daub. His "Ethics" gave a more philosophical model for this science, and produced the treatises of Von Henning, Michelet, Vatke, Daub, and Wirth, and influenced the systems of Chalybäus, Fichte, and Rothe. In the "Philosophy of History" he made the boldest attempt to construct the whole according to the evolution of the idea of freedom. His "Æsthetics" almost transformed the science, and led to the works of Weisse, Hotho, Rötischer, and Vischer. In the "History of Philosophy" he first introduced the general method of treatment, followed by Marbuch, Michelet, Bayrhammer, Barchou de Penhoen, Willm, Zeller, and Schwegler; his criticism of Aristotle has contributed more than any other to the understanding of Aristotle's real metaphysical system. Even in the "Philosophy of Nature," though many of his views are not proved by observation, and though his deductions are often arbitrary, he has yet added to the materials for a truly philosophical construction of the cosmos; he early advocated Goethe's theories about colors and the metamorphosis of the plants. In jurisprudence, the conservative tendencies of his system were soon annulled by his more advanced followers, and the most radical German revolutionists of 1848 expressed their extreme views in the dialect of the absolute idealism; *e. g.*, Ruge in the *Hallische Jahrbücher* (1838). But the chief conflicts were in theology, and in the relations of his system to Christianity. Soon after his death his school fulfilled the master's prediction, and illustrated his theory of antagonisms. His lectures on the "Philosophy of Religion" were twice edited: first in a conservative sense by Marheineke, and then in a revolutionary sense by Bruno Bauer. Passages in his "History of Philosophy," from his lectures of 1805, were declared to be much more pantheistic than his matured views; Strauss thought that he was opposing Hegel until these lectures were published. The conflicting elements came out at first in discussions upon three points, the personality of God, immortality, and the person of Christ. Strauss's "Life of Jesus" (1835) brought the last decisive point to an articulate statement; and in his subsequent controversial writings he ranged

the school, after the French political pattern, in three divisions, the right, the centre, and the left. This division was first made in reference to Christianity. The right wing asserted that Hegelianism and orthodoxy were harmonious; Göschel, Gabler, Erdmann, Marheineke, and Bruno Bauer for a time, stood here. The middle was represented by Rosenkranz, Gans, and Vatke. On the left stood Michelet, Strauss, Ruge, the radicals in religious opinion, who denied immortality, the divine personality, and the incarnation as specific in the person of Christ. The Tübingen school of F. C. Baur has worked in the interests of a destructive criticism. Against all these modifications of the system the great body of the German divines, especially the school of Schleiermacher, have protested from the beginning, evidently believing that the tendencies of Hegel's speculations were pantheistic, whatever judgment might be formed about his personal opinions. The transformation of Hegelianism into naturalism by Feuerbach and others, and the direction taken by the development of the natural sciences, have placed Hegel's philosophy in the heart of the materialistic controversies of recent times. Even Hartmann's "Philosophy of the Unconscious" (1869) has embraced the main doctrines of Hegel.—The leading works of Hegel appeared in the following order: *Phänomenologie* (1807); *Logik* (1812-'16); *Encyclopädie der philosophischen Wissenschaften* (1817); *Grundlinien der Philosophie des Rechts* (1821). His collected works were published in 18 vols. in 1832-'54. Recent works of note on the Hegelian philosophy are Haym's *Hegel und seine Zeit* (Berlin, 1857); J. F. K. Rosenkranz's *Apologie Hegels gegen Dr. R. Haym*, and Dr. Aloys Schmid's *Entwicklungsgeschichte der Hegel'schen Logik* (1858); F. Reiff's *Ueber die Hegel'sche Dialektik* (1866); Rosenkranz's edition of the *Encyclopädie* with *Einleitung und Erläuterung*, *Hegel als deutscher Nationalphilosoph* (1870), and *Hegel's Naturphilosophie und ihre Erläuterung durch den italienischen Philosophen A. Vera* (1868); C. L. Michelet's *Hegel, der unwiderlegte Weltphilosoph*, Max Schasler's *Hegel, Populäre Gedanken aus seinen Werken*, Karl Köstlin's *Hegel in philosophischer, politischer und nationaler Beziehung für das deutsche Volk dargestellt*, and F. G. Biedermann's *Kant's Kritik der reinen Vernunft und die Hegel'sche Logik* (1870); and Stirling's "Secret of Hegel" (1865). Important translations of Hegel are Ch. Bénard's *Cours d'esthétique* (1840-'43), and *La poétique* (1855); A. Vera's *Logique* (1859), *Philosophie de la nature* (1863-'5), and *Philosophie de l'esprit* (1867-'70); and H. Sloman and J. Wallon's *La logique subjective* (1854). English translations are the "Subjective Logic," by H. Sloman and J. Wallon (1855); the "Philosophy of History," by J. Sibree, in Bohn's "Philosophical Library" (1857); and "The Logic of Hegel," translated by W. Wallace (1874). "The Jour-

nal of Speculative Philosophy" (St. Louis) contains many admirable translations and expositions of Hegel's philosophy, by W. T. Harris and others.

**HEGIRA** (Arabic, *hejrah*, emigration, usually but incorrectly translated "flight;" the full expression is *hejrat al-nabi*, the migration of the prophet), the migration of Mohammed from Mecca to Medina. The most probable date assigned to this event is Sept. 13, 622. Mohammed died in 632, and seven or eight years afterward the caliph Omar, with the aid of Harmozan, a Persian, instituted a new calendar founded upon the hegira. But instead of commencing the new era with the actual date of the hegira, he began it with the first day of Moharrem, the first month of the Arabic year, corresponding to July 16, 622. The Arabian astronomers maintain that it was one day earlier, but their opinion has never been adopted in either official or popular practice. This date, July 16, is in most books of chronology given erroneously as the date of the hegira itself. The Mohammedan calendar is regulated entirely by the moon, without regard to the sun or the seasons. The year consists of 12 lunar months. The odd months contain each 30 days, the even months each 29 days except in intercalary years, when the 12th month also contains 30 days. The year thus consists of 354 or 355 days. Whether a given year consists of one or the other number of days is decided as follows: the time from the commencement of the era is divided into cycles of 30 years. The year 1873, being the 1290th of the hegira, was the last year of the 43d cycle. In each of these cycles the 2d, 5th, 7th, 10th, 13th, 16th, 18th, 21st, 24th, 26th, and 29th years consist of 355 days, one day being added to the 12th month. The other years of the cycle consist each of 354 days. The Mohammedan year is thus on an average 10 days, 21 hours, and 15 seconds shorter than the tropical year, and consequently the first day of each Mohammedan year comes 10 or 11 days earlier than it did the preceding year, and thus retrogrades through all the different seasons. Hence the exact transfer of a Mohammedan date to our calendar is a very difficult and complicated operation. But the year can be fixed with sufficient accuracy in a simple manner. There are 11,694 days in 33 Mohammedan years, and 11,688 days in 32 Christian years; hence we may assume that 33 Mohammedan are equal to 32 Christian years, and we have the following rule: subtract from the year of the hegira its 33d part, and add 622; the result is the year of the Christian era. Thus to find the year corresponding to 1290 of the hegira:  $1290 - 39$  (*i. e.*,  $1290 \div 33$ ) + 622 = 1873 A. D. To turn a year of the Christian era into a year of the hegira, subtract 622 and add to the remainder the 32d part of itself. Thus Constantinople was taken by the Moslems in 1453; in what year of the hegira was it?  $1453 - 622 = 831$ ; adding 26 (*i. e.*,  $831 \div 32$ ), we have 857.

**HEIBERG, Johann Ludwig**, a Danish author, born in Copenhagen, Dec. 14, 1791, died there, Aug. 25, 1860. He entered the university in his native city in 1809 to study medicine, but in 1814 gave that up and devoted himself to dramatic literature. When 23 years old, he brought out a version of the story of Don Juan, and a play entitled "The Potter" (1814). He now familiarized himself with the Spanish drama, making a journey into Spain for that purpose, and then went to Paris, where he remained three years. On his return to Denmark in 1822, he was appointed professor at the university of Kiel. In 1824 he went to Berlin, and studied the system of Hegel and his followers, returning home in 1825. He is the most popular dramatic author of Denmark, and his plays were all translated into German by Kannegiesser. He was director of the royal

theatre in Copenhagen from 1849 to 1856, and afterward censor of the theatre. He published a complete edition of his poetical works (8 vols., 1845-'7), and one of his prose writings (3 vols., 1841-'4). An edition of his complete works was brought out after his death (22 vols., Copenhagen, 1861-'3).

**HEIDELBERG** (Lat. *Edelberga*; anc. *Myrtilletum*), a city of Baden, on the left bank of the Neckar, 10 m. S. E. of Mannheim, and 31 m. N. N. E. of Carlsruhe; pop. in 1871, 19,988. It is chiefly celebrated for its university, founded by the elector Rupert toward the end of the 14th century, and reformed by the grand duke Charles Rupert in 1803 under the title of Ruperto-Carolina. The university library, containing 200,000 volumes and 2,000 manuscripts, is exceedingly rich in antique works and early editions. After the capture of Hei-

Heidelberg.

delberg by Tilly in 1622, the library, which at that time numbered besides the printed books 3,500 manuscripts (exclusive of the French), was presented by the duke of Bavaria to Pope Gregory XV., and by the latter made, under the name of Bibliotheca Palatina, a special section of the Vatican library. In 1797 Napoleon gave 38 of the best manuscripts, obtained at the peace of Tolentino, to the Paris library; but in 1815 these, as well as all the Old German manuscripts of the Palatina, were restored to Heidelberg. The university is very complete in details, embracing a museum of natural history and antiquities, a physiological cabinet, a chemical laboratory, a lying-in asylum, two botanical gardens, a college of agriculture and forestry, an observatory, and a philological, theological, pedagogical, homiletical, and Biblical seminary. It was attended in 1873 by 707 students, under 108

professors. A chair of English literature, the first of the kind in Germany, was established in 1873. There are also an excellent gymnasium and two female schools of high reputation. The situation of Heidelberg, in a picturesque and fertile country, not far from the junction of the Neckar with the Rhine, having on one side the Königstuhl and on the opposite the Heiligenberg, the hills covered with vineyards, and its curious bridge, renders it attractive to the tourist. To travellers its greatest attraction is the ruined castle, which presents in its different portions every phase of architecture from the 14th to the 17th century. Having been restored in 1718-'20, it was set on fire by lightning in 1764, and it has never been rebuilt or tenanted since. In its vaults is the celebrated *Heidelberger Fass* (tun), once the largest in the world. The principal manufacture of Heidelberg is beer; its trade is confined

chiefly to linseed oil and tobacco.—Heidelberg was attached in 1362 to the Palatinate. Rupert I. enlarged it and made it an electoral residence. In 1384 the emperor Wenceslas signed here the union of Heidelberg, by which the different leagues of German cities were united in one. Heidelberg was plundered and partly ruined by Tilly in 1622, by Turenne in 1674, by Melac in 1688, and by Marshal de Lorges in 1693. These misfortunes led to its decline in political importance, which was finally completed by the residence of the electors being removed to Mannheim in 1719. It was united to Baden in 1802.

**HEIDENHEIM**, a town of Würtemberg, 46 m. E. S. E. of Stuttgart; pop. in 1871, 5,167. It has manufactories of woollen and cotton goods, cloth, tobacco, yarn, and machines. An important trade is carried on in corn and cattle. The town is connected by railway with Aalen and the Stuttgart and Nördlingen railway. Ruins of the castle of the lords of Hellenstein, to whom Heidenheim and the neighboring country belonged till 1307, are still to be seen on the rock which overlooks the town.

**HEIGHTS, Measurement of.** See **BAROMETRICAL MEASUREMENT.**

**HEILBRONN**, a fortified town of Würtemberg, on the right bank of the Neckar, 26 m. N. of Stuttgart, with which city it is connected by railway; pop. in 1871, 18,955. It has a gymnasium with a library of 12,000 volumes, and three Catholic and two Protestant churches, among which the church of St. Kilian is remarkable for the pure Gothic architecture of its choir and its beautiful tower, 220 ft. high. It stands on the site of a Roman station. In its vicinity is the castle in which Götz von Berlichingen was imprisoned in 1525. Heilbronn was a free imperial city until the beginning of the present century. In 1633 Oxenstiern here concluded a treaty with the allies of Sweden for the continuation of the thirty years' war.

**HEILIGENSTADT**, a town of Prussia, in the province of Saxony, 47 m. N. W. of Erfurt, on the Leine; pop. in 1871, 4,882. The town is regularly built, and surrounded by walls, with three gates. It has a castle, a Protestant and two Catholic churches, a gymnasium, formerly a Jesuit college, a workhouse, a hospital, and an orphan asylum. The principal manufactures are of woollen yarns and wooden clocks; it has a considerable trade in cattle. In the neighborhood is the famous Calvarienberg. Heiligenstadt is said to have been built by Dagobert around the tomb of Bishop Aureus of Mentz, who was slain by the Thuringians; it was anciently the capital of the principality of Eichsfeld. It was destroyed by fire in 1333, and was captured in 1478 by Count Henry the younger of Schwarzburg, and in 1525 by Duke Henry of Brunswick. From 1807 to 1813 it belonged to the kingdom of Westphalia.

**HEIM, François Joseph**, a French painter, born in Belfort, Dec. 16, 1787, died in Paris, Oct. 2,

1865. He decorated the ceiling of the gallery of Charles X. in the Louvre with a representation of Vesuvius receiving from Jupiter the fire which was to destroy Pompeii and Herculaneum. His allegory of the *renaissance* of the arts, on the ceiling of the French gallery in the same building, was much admired.

**HEINE, Heinrich**, a German poet and critic, of Jewish parentage, born in Düsseldorf, Dec. 12, 1799, or as Steinmann asserts in 1797, died in Paris, Feb. 17, 1856. His first poem was written on Napoleon's visit to Düsseldorf (Nov. 2, 1810). At the lyceum of Düsseldorf he made great progress in the regular studies, mastering also English, French, and Italian. In 1815 he was sent to Frankfort to qualify himself for mercantile life, but showed such repugnance to it that in 1819 he was sent to Bonn to study law, but studied everything except law. In September, 1820, he went to Göttingen, which he learned to dislike and satirized bitterly in after years. He next removed to Berlin, where his character and feelings rapidly assumed that satirical indifference and reckless audacity now identified with his name. While in Berlin he earnestly studied philosophy under Hegel, and became intimate with Chamisso, Fouqué, Bopp, and Grabbe. Here in 1822 appeared his *Gedichte*, subsequently published as "Youthful Sorrows" in his "Book of Songs." Though favorably received by eminent critics, they attracted at the time but little attention. A single sorrow, the early disappointment of Heine in his love for his cousin Evelina van Geldern, runs through all these poems. He also published at this period his plays *Almansor* and *Radcliff*, with the *Lyrisches Intermezzo*. In the summer of 1822 he made a journey to Poland. He returned to Göttingen in 1823, was made doctor of law in 1825, and in the same year went to Heiligenstadt, where on June 28 he is said to have been baptized into the Lutheran church. Heine had taken his legal degree because his uncle, the eminent Hamburg banker and philanthropist Salomon Heine, had made it a condition of giving him his education. He however continued to aid him in his chosen literary career. He now went to Hamburg, where in 1826 he published the *Harreise*, the first part of his *Reisebilder*. Very few books ever excited in Germany such an extraordinary sensation. In 1827 he went to Munich to edit with Dr. Lindner the *Politische Annalen*. In 1829 he returned to Berlin, and here occurred the famous quarrel with the poet Platen, who, having satirized Heine, received in return the most bitter sarcasm and withering abuse. Literature hardly affords any parallel to this cynical retort. In 1831 Heine went to Paris, having become so obnoxious to the Prussian government as a liberal writer that he had to choose between exile and imprisonment. From this time till 1848 his influence in Germany was very great, and he acquired in France the reputation of being the wittiest French writer

since Voltaire. In 1831 he wrote a series of articles on the state of France for the Augsburg *Allgemeine Zeitung*, which were collected and published both in French and German. In 1833 appeared his *Beiträge zur Geschichte der neuern schönen Literatur in Deutschland* (2 vols., Hamburg), and *L'Allemagne*, a characteristic and daring work, in which he attacked with relentless severity the romantic writers, the philosophers, and in fact nearly everybody. This book created a storm of fury in Germany, where democrats, pietists, Teutomaniaes, and state officials united in denouncing it; while in France no other work has done so much to stop the current of romanticism. In 1840 he published a violent work on his former friend Börne, then dead. This involved him in a duel with the husband of a lady who was stigmatized in the book as having entertained illicit relations with Börne. In 1843 he paid his last visit to Germany to see his mother. His public bitterness and literary cruelties were in strange contrast with his personal good qualities. He was generous, even self-sacrificing, especially to poor literary men, and during the cholera risked his life by remaining to nurse a sick cousin. In 1847 he was attacked by a painful spinal complaint, which tormented him almost without cessation until his death. By his own request all religious rites were omitted at his funeral. The bold infidelity, the reckless licentiousness, and the unqualified faith in the world and the flesh, which characterized Heine's life as well as his writings, were counterbalanced by such sincere belief in his own doctrines, such sympathy for suffering, and such acute perception of the beautiful in every form, that it is difficult for those unfamiliar with the social developments of modern continental European life and literature to appreciate his true nature or position. He received from the French government an annual pension of 4,000 francs from 1836 to 1848, but did not criticise it the less severely in his writings. In his later years Heine returned from unbounded skepticism, if not to an evangelical faith, at least to theism, the Bible being constantly read by him, and appearing to him, as he said, like a suddenly discovered treasure. As he still retained his love of paradox and of mystification, the real degree of his conversion became the subject of no little controversy and comment. In the latter part of his life Heine married "Mathilde," of whom he often speaks tenderly in his writings. His works, in addition to those mentioned, are: *Französische Zustände* (Hamburg, 1833); *Der Salon* (1834-'40); *Shakespeare's Mädchen und Frauen* (Leipsic, 1839); *Neue Gedichte* (Hamburg, 1844); *Ballade über die Schlacht von Hastings* and *Atta Troll* (1847); *Romanzero* (1851); *Doctor Faust, ein Tanzpoem* (1851); *Vermischte Schriften* (1854); and *Les aveux d'un poète de la nouvelle Allemagne*, in the *Revue des Deux Mondes* (1854). A collection of his works was published in German at Philadelphia in 1856 (6 vols. 8vo; new ed., 7 vols. 12mo, 1865), and a complete edition at Ham-

burg in 1861-'7 (21 vols. 8vo). There is also a French version executed by Heine himself, under the revision of Gérard de Nerval and others, and several translations of special poems have appeared. The following works on Heine have appeared since his death: *Heinrich Heine, Erinnerungen*, by Alfred Meissner (Hamburg, 1856); *H. Heine's Wirken und Streben*, by Strodtmann (1857); *H. Heine's Denkwürdigkeiten aus meinem Leben mit ihm*, by Steinmann (1857); *Ueber H. Heine*, by Schmidt-Weissenfels (1857); *H. Heine's Leben und Werke*, by Strodtmann (1867-'8); *Heinrich Heine und seine Zeit*, by his niece, Helene Hirsch (published simultaneously in German and French, 1873); and "Life and Opinions of Heine," by William Stigant (2 vols., 1873). English versions of Heine's works are: the "Pictures of Travel," translated by Charles G. Leland (Philadelphia, 1856); the "Book of Songs," by J. E. Wallis (London, 1856), and by C. G. Leland (Philadelphia, 1864); the "Poems of Heine, complete, translated in the Original Metres," by Edgar Alfred Bowring (London, 1859); and "Scintillations from the Prose Works of Heinrich Heine," translated by S. A. Stern (New York, 1873).

**HEINECCIUS, Johann Gottlieb**, a German jurist, born in Eisenberg, Saxony, Sept. 11, 1681, died in Halle, Aug. 31, 1741. He was educated at Leipsic and at Halle, where he became professor of philosophy in 1713, and of law in 1721. He went to Franeker in 1723 and to Frankfurt-on-the-Oder in 1727, but resumed his professorship at Halle in 1733. His works are very numerous and of great value to the legal student. A collective edition was published at Geneva under the title of *Opera ad Universam Jurisprudentiam, Philosophiam, et Literas Humaniores Pertinentia* (9 vols. 4to, 1769).

**HEINECKEN, Christian Heinrich**, a precocious child of Lübeck, born Feb. 6, 1721, died June 27, 1725. He could speak at the age of 10 months, recite the principal events of the Old Testament two months afterward, and had committed to memory the history of antiquity when little over two years old, besides speaking fluently Latin and French. At three years he was familiar with universal history and geography. From all sides people came to see him, and on the invitation of the king of Denmark he visited Copenhagen. His constitution was very delicate, and until four years old he was supported only by the milk of his nurse. His biography was written by his teacher, Christian von Schönerich.

**HEINICKE, Samuel**, a German educator, born at Nautschütz, near Weissenfels, April 10, 1729, died in Leipsic, April 30, 1790. At 21 years of age he joined the life guards of the elector of Saxony, in which he served four years, and taught himself Latin and French. He afterward engaged in teaching, studied for a time at Jena, became a private tutor in Hamburg, and in 1768 chorister in Eppendorf. He

had several years previously been successful in teaching deaf mutes, and now taught a deaf and dumb boy to speak. Large numbers of deaf mutes were consequently put under his care, and his reputation became so great that the elector of Saxony solicited him to return to his native country. He went to Leipsic, and on April 14, 1778, opened the first institution for the instruction of the deaf and dumb in Germany. He also took great interest in public education, and vigorously attacked the old system of learning by rote. After his death his wife continued to direct the institution. His principal writings are: *Beobachtungen über Stumme und die menschliche Sprache* (Hamburg, 1778); *Ueber die Denkart der Taubstummen* (Leipsic, 1780); *Ueber alte und neue Lehrarten* (1783); and *Wichtige Entdeckungen und Beiträge zur Seelenlehre und zur menschlichen Sprache* (1784).

**HEINSE, Johann Jakob Wilhelm**, a German author, born at Langewiesen, Schwarzburg-Sondershausen, about 1749, died in Mentz, July 22, 1803. His first publication was a very free translation of Petronius Arbiter, followed by *Laidion*, an apotheosis of the voluptuous and beautiful in art. Heinse defended himself against the charge of indecency, while Goethe, impressed by the extraordinary merit of *Laidion*, apart from its immorality, praised it highly. In 1776 he left Gleim to accompany Jacobi to Düsseldorf, whom he there assisted in editing a periodical entitled *Iris*. In 1780 he went to Italy, proceeded in 1782 with the artist Kobel to Naples, and returned with Angelica Kauffmann to Rome. Having returned to Germany, principally on foot, he became librarian to the elector of Mentz, and published the famous romance of *Ardinghello*. This was succeeded by *Anastasia*, a romance consisting of problems in chess and scenes turning on the game; and this by *Hildegard von Hohensthal*, the conclusion of *Ardinghello*. In addition to the above, he wrote *Sinngedichte* (Halberstadt, 1771), and translated Ariosto's "Orlando" and Tasso's "Jerusalem Delivered."

**HEINSIUS, Antonius**, grand pensionary of Holland, born in 1641, died at the Hague, Aug. 13, 1720. He was an intimate friend and confidential agent of Prince William III. of Orange, and during 40 years was the moving spirit of Dutch politics. After William became king of England (1689), Heinsius managed for him, greatly to his satisfaction, the affairs of Holland, and was instrumental in rendering the states general favorable to friendly action with England. The grand alliance on the subject of the Spanish succession, between the emperor, the kings of England, Prussia, and Denmark, Holland, the duke of Savoy, and the elector of Hanover, against Louis XIV. and Philip V., was in great measure due to the exertions of the grand pensionary. The defeats of Blenheim (1704), Ramillies (1706), and Turin (1706), with their results, compelled Louis XIV. to open negotiations. He made overtures to Hol-

land; but Heinsius answered that the Hollanders were inseparably bound to their allies, and exacted as a preliminary condition the recognition of the right of the house of Austria to the Spanish succession. To this France refused to accede; the war was continued disastrously for her, and in 1709 her renewed application met with the same response. Louis XIV. now consented to treat on this basis, and negotiations were commenced; but the allies demanding still greater sacrifices, he renewed the war, and after the defeat of Malplaquet (1709) conferences were again opened at the castle of Gertruidenberg and continued unsuccessfully for four months, Heinsius obstinately adhering to his terms. France, everywhere beaten, was in great danger when, in 1711, Queen Anne of England secretly offered peace to Louis XIV. The congress of Utrecht, opened in January, 1712, resulted in England's ceasing hostilities; but Prince Eugene, the Hanoverians, and the Dutch persevered in the war, and took Le Quesnoy, July 4. The defeat of the allies at Denain (July 24) changed the whole state of the war. In a few days several important places were recaptured by the French, and armistices were separately concluded with England and Portugal. Notwithstanding these reverses, Heinsius did all in his power to prevent a general peace. In spite of his efforts, one was agreed upon and signed at Utrecht, April 11, 1713, but the signature of Heinsius was the last affixed. He died seven years later, while vigorous in mind and body.

**HEINSIUS. I. Daniel**, a Dutch philologist, born in Ghent, June 9, 1580, died in Leyden, Feb. 25, 1655. He was educated at the university of Leyden, where in his 25th year he succeeded Joseph Scaliger as professor of politics and history. In 1618 he acted as secretary to the synod of Dort. He edited the principal Greek and Latin classics, and wrote two Latin tragedies entitled *Auriacus* and *Herodes Infanticida*; *Exercitationes Sacre ad N. T. Libros* (Leyden, 1639, and Cambridge, 1640); a poem in four books styled *De Contemptu Mortis*; and various other valuable works. **II. Nicolaas**, a Dutch poet, son of the preceding, born in Leyden, July 29, 1620, died at the Hague, Oct. 7, 1681. He was educated at the university of his native city. In 1649 he went to Sweden at the invitation of Queen Christina, and settled at Stockholm, where he remained till his father's death in 1655. His latter days were unhappy, and passed for the most part in his native land. He was the author of Latin poems, the graceful style of which gained for him the appellation "swan of Holland."

**HEIR** (Lat. *heres*), in law, one entitled by descent and right of blood to lands, tenements, or other hereditaments. There are two ways in law in which the title to real estate may pass, by purchase and by descent. It is said to be by purchase when it is transferred by the owner by any species of gift, grant, or conveyance, to take effect either in his lifetime or by

way of testamentary disposition; and it is by descent when, by reason of his dying intestate, it passes to such relative or relatives as by law are designated to succeed to his real property in that contingency. The word heir is sometimes used in a popular sense as signifying any one to whom property of any description is to pass on the death of its owner, whether by conveyance or by operation of law; and when it is thus employed in wills or other instruments, the law seeks to give effect to the instrument according to the real intent of the party, though the word is misapplied. In a legal sense no one is heir to personal property, and though the law in this country usually gives the real and personal property of an intestate to the same persons, the latter goes first to the administrator, through whom it is distributed after the debts are paid. In the Roman civil law, the word *heres*, which we translate heir, meant any one called to the succession, by blood, devise, or bequest, and whether the property to which he succeeded was fixed or movable.—An heir apparent is one who must be the heir if he survive the owner, as the eldest son in England, or all the children in the United States. But the phrase “heir apparent” is not strictly applicable here. In England, the birth of a younger son cannot affect the rights of inheritance of the eldest son, for they are fixed, and he alone can be heir by descent. But in this country the younger son has an equal right with an elder son; and therefore the exclusive right of inheritance can never be fixed in any children living.—An heir presumptive is one who, if things do not change, will be the heir at the death of the owner, as the elder son of a deceased brother in England, or all the children of a brother in the United States, where the owner has no children; for they will be heirs if he dies without issue. As an heir presumptive may lose his heirship by a change of circumstances, he does not become an heir apparent so long as this change is legally probable, although physically or naturally impossible.

**HELDER**, *The*, a fortified seaport town of Holland, at the N. extremity of the province of North Holland, 40 m. N. W. of Amsterdam; pop. in 1871, 17,296. From an obscure fishing village Napoleon I. converted this place into a fortress of the first rank, capable of containing a garrison of 10,000 men. Its batteries command at once the entrance to the Zuyder Zee and that of the harbor of the ship canal at Nieuwe Diep. It is connected with Amsterdam by a canal 50 m. long, 125 ft. broad, and 21 ft. deep. The port and coasts are protected from the aggressions of the ocean by dikes, one of which is 6 m. long and 40 ft. broad, and has an excellent road on its summit.

**HELEN** (Gr. Ἑλένη; Lat. *Helena*), in Greek legends, the wife of Menelaus, and the most beautiful woman of her time. Her parentage is variously assigned to Jupiter and Leda, the wife of King Tyndareus, to Jupiter and Nemesis, and to Tyndareus and Leda. Before Hel-

en was 10 years of age she was carried off by Theseus, who concealed her at Aphidnæ, under the care of his mother Æthra. Her brothers Castor and Pollux released her, and carried her back to Sparta with Æthra as her slave. She now had suitors from all parts of Greece, among whom was Ulysses. By the advice of this hero Tyndareus left the choice to Helen, and she accepted Menelaus, to whom she bore Hermione, and according to some Nicostratus also. Three years after this marriage she was seduced by Paris, the son of Priam, and fled with him to Troy. The Grecian princes, in accordance with an oath which they had taken when suitors together at the court of Tyndareus, took up arms to restore to Menelaus his wife, and the Trojan war was the consequence. Paris was killed during the siege, and Helen then married Deiphobus, another son of Priam; but when the city was taken, she treacherously introduced the Greeks into his chamber in order to appease Menelaus. She returned to Sparta, and received her first husband's forgiveness. The accounts of her death differ. According to one, after the death of Menelaus, she was driven into exile by Nicostratus and Megapenthes, and retired to Rhodes, where the queen of that island, Polyxo, whose husband Tlepolemus had been killed in the Trojan war, caused her to be seized while bathing, tied to a tree, and strangled. The Rhodians commemorated the murder by a temple raised to *Helena Dendritis*, or Helen tied to a tree. The Spartans honored her as a goddess, and built a temple to her at Therapne, which had the power of conferring beauty upon all ugly women who entered it.

**HELENA**, a town and the capital of Phillips co., Arkansas, on the right bank of the Mississippi river, about 100 m. E. by S. of Little Rock, and 80 m. below Memphis, Tenn.; pop. in 1870, 2,249, of whom 1,109 were colored. It is the terminus of the Arkansas Central, the Helena and Iron Mountain, and the Mobile and Northwestern railroads, is rapidly improving, and is an important commercial point. It contains a court house, a jail, two daily and three weekly newspapers, four schools, and seven churches.—In the summer of 1863 Helena was held by a Union force of about 4,000, commanded by Gen. Prentiss, strongly intrenched, the river also being commanded by a gunboat. On July 4 an unsuccessful attempt to seize the place was made by a confederate force of about 7,600, under Gen. Holmes. The confederate loss in the engagement was officially reported as 173 killed, 687 wounded, and 776 missing, in all 1,636; but Gen. Prentiss reported that he had buried 300 confederate dead and made 1,100 prisoners. The entire loss of the Union force did not exceed 250 in killed and wounded, with no prisoners.

**HELENA**, a town and the capital of Lewis and Clarke co., Montana, on the W. side of the valley of Prickly Pear and Ten Mile creeks, at the foot of the Rocky mountains, 15 m. W. of the

Missouri river, and 110 m. N. of Virginia City; lat.  $46^{\circ} 35' 36''$  N., lon.  $111^{\circ} 52' 45''$  W.; pop. in 1870, 3,106, of whom 641 were Chinese. It is the largest town of the territory, and is connected by stage with Virginia City and Corinne, Utah, on the Central Pacific railroad, 445 m. S. It is chiefly supported by the rich quartz and placer gold mines in the vicinity. The neighboring mountains are covered with forests of pine and fir, which supply several saw mills. The streams and mountain springs furnish abundant water. About 4 m. N. W. of the town are medicinal hot springs. A large portion of the buildings are constructed of brick, granite, and blue limestone, obtained in the vicinity. The town contains a court house, jail, almshouse, masonic hall, and the offices of the United States surveyor general, register and receiver of lands, collector of customs, and marshal. There are 3 cabinet factories, 2 carriage factories, 1 foundry, 3 assay offices, 4 breweries, 1 distillery, 5 bakeries, 4 hotels, 2 national banks with a capital of \$200,000, about 60 stores, 4 schools, 2 daily and weekly newspapers, 6 religious societies, and 3 churches. Helena was settled in 1864. It has been visited by several conflagrations, the last and most destructive of which occurred Jan. 9, 1874.

**HELENA, Saint**, an island. See SAINT HELENA.

**HELENA, Saint**, wife of the emperor Constantius Chlorus and mother of Constantine the Great, born in Drepanum (Helenopolis), Bithynia, in 247, died in Nicomedia about 327. She was probably of obscure parentage, though some historians pretend that she was a British princess. When her husband was made Cæsar

in 292, he put her away and espoused Theodora, stepdaughter of the emperor Maximian; but in his will he acknowledged Constantine, his son by Helena, as his sole heir. Constantine on assuming the purple (306) brought his mother to reside in the imperial palace at Treves, loaded her with honors, gave her the title of Augusta, and conferred her name upon several cities of the empire. She erected and endowed a number of churches, and at the age of 79 made a pilgrimage to Jerusalem, where, according to the earliest Byzantine historians, she discovered the true cross. (See CROSS.) She died in the arms of her son, and her body was carried to Rome, where a mausoleum was raised to her.

**HELIANTHUS.** See SUNFLOWER.

**HELICON**, a mountain range of Greece, in Bœotia, between Lake Copais and the Corinthian gulf. Its loftiest summit, now called Paleo-Vuno, is 5,738 ft. high. In antiquity the slopes and valleys of Helicon were renowned for their fertility, and it was considered the favorite abode of the muses. Above Asra was a grove sacred to them, and near it the famous fountain of Aganippe, which was believed to inspire those who drank of it. About two miles higher up was the fountain of Hippocrene, produced, according to the legends, by Pegasus's striking the ground with his hoofs.

**HELIGOLAND**, or *Helgoland* (holy land), an island in the North sea, belonging to Great Britain, 40 m. N. W. of the mouth of the Elbe; lat. of its lighthouse,  $54^{\circ} 11' 36''$  N., lon.  $7^{\circ} 53' 12''$  E.; pop. in 1871, 1,912. Heligoland is triangular, about a mile long from N. to S. and

Heligoland.

$\frac{1}{3}$  m. broad from E. to W. It was formerly much broader, but the action of the sea is continually wearing it away. There is a good port on the N. side, and another on the S. About the middle of the last century a portion was separated from the main island, and is now known as Sandy island; this is much resorted to for its fine sea bathing. The highest part of the island, its W. side, is 200 ft. above the sea. Heligoland is supposed to have been the island mentioned by Tacitus, where the German goddess Hertha was worshipped. St.

Wilbrord preached Christianity there early in the 8th century, and gave it its present name. In 1714 it was taken from the duke of Holstein-Gottorp by the Danes, from whom it was captured by the English in 1807, for whose fleets it served as a station during the war with France, and as a depot for their manufactures, whence they were smuggled into Germany. It was formally ceded to Great Britain in 1814. The inhabitants are descendants of Frisians, and speak the Frisian language as well as the Low German. The men are mostly fisher-

men and pilots, and leave nearly all domestic and agricultural labor to the women. The trading part of the population are chiefly emigrants from the mainland of Germany. The chief products are haddocks and excellent lobsters, which are exported to Germany. The islanders own 100 small fishing vessels and several larger ones, which make voyages to England and the Baltic ports. The soil is very rich, and grain and vegetables are raised, though most of the land is devoted to the sustenance of flocks of sheep, which are fed on fish in winter. There are a few trees and two or three springs on the island, but most of the people depend on rain for their supply of water. Of late the inhabitants have begun to turn their attention to building houses for rent to summer visitors, with whom it is a favorite bathing place. The government consists of a governor appointed by the crown, aided by an executive council; a form of government established by the queen in 1868.—See “Heligoland, an Historical and Geographical Description of that Island, its Ancient Fortunes and Present Opportunities as a British Colony,” by William Bell (London, 1856).

**HELIODORUS**, a Greek romance writer, born in Emesa, Syria, flourished at the close of the 4th century A. D. In his latter days he became a Christian, and bishop of Tricca in Thessaly, where he introduced the regulation that every priest should be deposed who did not repudiate his wife. His *Æthiopica*, written in early life, treats of the loves and adventures of Theagenes and Chariclea. Its style is simple and elegant. Translations of it now exist in all the European languages, but before the 16th century its very existence was unknown to Europe. The best edition of the Greek text is that of Paris, 2 vols. 8vo, 1804.

**HELIOGABALUS**. See ELAGABALUS.

**HELIOMETER** (Gr. *ἥλιος*, the sun, and *μέτρον*, measure), an instrument to measure the diameter of the sun, or other small arc in the heavens. Several instruments receive this name, but it is now usually applied to a telescope whose object glass is divided into two parts, capable of sliding by each other, so that they may be directed to opposite edges of the sun. Two images of it are thus formed, tangent to each other, and the displacement of the parts of the object glass measures the diameter of the sun.

**HELIOPOLIS** (Gr., city of the sun; called in old Egyptian *On* or *An* and *Ha-Ra*, in Hebrew *Bethshemesh*, and by the modern inhabitants *Matariyeh*), one of the most ancient cities of Egypt, below the S. E. point of the delta, on the E. side of the Pelusiac arm of the Nile, near the canal which connected that river with the Red sea, about 8 m. N. E. of the site of modern Cairo. From the remotest epoch it was renowned for its temples and priesthood. It was the chief seat of the Egyptian worship of the sun, and also of the sacred bull Mnevis; and the legends of the wonderful bird phoenix centred about it. Its priests were the most

learned in the land, and so important that they sent one third of all the deputies to the great council which assisted the Pharaohs in the administration of justice. Those belonging to each temple were organized among themselves with great exactness, and the office of the high priest, who was one of the first persons of the state, was hereditary. The Hebrew Joseph married Asenath, the daughter of one of these high priests. To the Heliopolite priests resorted foreigners who wished to learn the wisdom of the Egyptians. Solon, Thales, Eudoxus, and Plato all studied under them; and when Strabo visited the place (24 B. C.) he was shown the halls which Plato was said to have occupied for 13 years. After being for ages a sort of university city, Heliopolis had much declined as early as the invasion of Cambyses (525 B. C.), and was a city of ruins when visited by Strabo. Abdallatif, an Arab physician of the 12th century, described among its ruins colossal figures in stone, standing or sitting, and more than 30 cubits high. An obelisk of red granite, inscribed with the name of Osortasen I., whose date is fixed at about 3000 B. C., still remains, and is regarded as the most ancient known specimen of Egyptian sculpture; there are also some fragments of sphinxes and of a colossal statue which adorned the ancient temple of the sun. Near the hamlet of Matariyeh, which occupies a part of the site of Heliopolis, Kléber gained a victory over Turkish troops, March 20, 1800. (For Heliopolis in Syria, see BAALBEK.)

**HELIOS** (the Sol of the Romans), in Greek mythology, the god of the sun, the son of Hyperion and Thea, and the brother of Selene (Luna) and Eos (Aurora). Helios gave light both to gods and to men. He rose in the east from Oceanus, ascended to the highest point in the heavens, and then descending arrived in the evening at the west, and returned to Oceanus. He had two magnificent palaces, one in the east, the other in the west, where he sat enthroned surrounded by ministering Horæ. The horses that drew the chariot in which he made his daily journey were pastured in the islands of the blessed, and the golden boat in which he voyaged nightly from the west to the east was the work of Hephæstus (Vulcan). Helios saw everything. The island of Sicily was sacred to him, and he there had flocks of sheep and herds of oxen, which never increased or diminished in number, and which were tended by his daughters, Phætusa and Lampetia. In later times Helios was frequently confounded with Apollo, though originally they were quite distinct. Among the Greeks this identification was never fully carried out; for no Hellenic poet ever made Apollo to ride in the chariot of Helios, and the representation of Apollo with rays around his head belongs to the time of the Roman empire. Temples of Helios existed in Greece at a very early period, and subsequently his worship was established in Corinth, Argos, the island of Rhodes, and vari-

ous other places. The sacrifices offered to him were rams, boars, bulls, goats, lambs, white horses, and honey. Among the animals sacred to him the cock was preëminent. Helios was usually represented as riding in a chariot drawn by four horses.

**HELIOSCOPE.** See **TELESCOPE**.

**HELIOSTAT**, and **Heliotrope**, instruments used by surveyors for rendering distant stations visible. The heliostat was invented by 's Gravesande about 150 years ago, and consists of a mirror turned by clockwork in the pathway of the sun, in such a manner that it will reflect his rays in a certain direction. A mirror of only one inch diameter can be seen eight miles, and appears as a brilliant star at a distance of two miles. The heliotrope is simply a mirror fixed permanently at a station so as to throw its rays to another station, or always in one direction. This requires of course that an observation should be taken at a certain moment, as the direction of the reflected beam is constantly changing. For most observations the latter instrument answers all the purposes of the former, and is much less expensive.

**HELIOTROPE** (*heliotropium*, Linn.), the name of annual or perennial plants belonging to the natural order *boraginaceæ*. *H. curassavicum* is a smooth annual found in Virginia, Illinois, and southward. *H. Europæum* occurs sparingly in the southern states as an introduced weed. The species in cultivation are *H. Peruvianum* and *H. corymbosum*; these have woody stems, oblong hairy leaves of a pale green color, and terminal, branching flower stalks. The pleasantly fragrant flowers are small, but they grow compactly in the recurved spikes. The corolla

Heliotrope.

is intersected at its mouth with five folds, and is of a purple-lilac color, with a greenish white throat. The principal difference between the two species is that the last named has larger, darker colored, and less strongly scented flowers. Numerous seedling varieties

have been raised, chiefly distinguished by the tint of the corolla, a yellowish or pure white throat, or else by the greater size of the spikes or "trusses." Heliotropes are readily propagated from cuttings of tender shoots, and great numbers are raised annually by florists for sale as bedding plants; though it is a shrub, small plants from the unripe wood will flower freely. Plants for the greenhouse may be trained as standards or pyramids, or they may be trained to the wall of a greenhouse; thus treated they will grow 4 or 5 ft. high. The odor of the heliotrope is compared by some to that of vanilla; in England it is frequently called "cherry pie" on account of its fragrance. Pliny and Dioscorides assert that the flowers of the heliotrope turn toward the sun, whence its ancient and generic name. For the same reason it has also been called turnsole and girasole.—False heliotrope (*Tournefortia heliotropioides*) is a garden annual, with flowers closely resembling those of the heliotrope in everything except odor; the plant when bruised is disagreeably scented; in some southern gardens where it has been raised for ornament it has established itself as a weed. Indian heliotrope (*heliophyllum Indicum*) is a coarse hairy annual with much the aspect of a heliotrope, which has been introduced from India, and is found in waste places in Illinois and southward.

**HELIOTYPE.** See **supplement**.

**HELIX** (Gr. *ἑλῆξ*, a whorl or coil), in architecture, a spiral winding around a central axis, according to some authorities without approaching it, in which case it would be designated a spiral. The little volutes under the flowers of the Corinthian capital are also called helices.—In electro-magnetism, a helix is a coil of wire wound around any body which is to be magnetized by the passage of the electric current through the wire. The power is increased with the number of turns, the wire being insulated, so as to prevent lateral discharge, by winding cotton thread about it.

**HELIX**, in conchology. See **SNAIL**.

**HELL, Maximilian**, a Hungarian astronomer, born in Schemnitz, May 15, 1720, died in Vienna, April 14, 1792. At 18 years of age he entered the society of Jesus, and in 1745 was made assistant astronomer at the observatory in Vienna belonging to the order, and keeper of the museum of experimental philosophy. In 1751 he took holy orders. Subsequently he filled the chair of mathematics at Klausenburg in Transylvania for four years, and in 1756 was appointed astronomer and director of the new observatory in Vienna. In April, 1768, he undertook a journey to Vardöhuus in Lapland to observe the transit of Venus, June 3, 1769, in which he succeeded perfectly, and returned to Vienna in August, 1770. His chief work is a series of *Ephemerides*, commenced with *Ephemerides Anni 1757 ad Meridianum Vin-dobonensem Calculis definitæ*, continued to the year 1791 (35 vols. 8vo, Vienna).

**HELLAS.** See **GREECE**.

**HELLE**, in Greek legends, a daughter of Athamas, king of Thebes, by the goddess Nephele. When her brother Phrixus was about to be sacrificed, the mother rescued him, and placing the two children on the back of the ram with the golden fleece, which she had received from Mercury, fled with them to Asia; but between Sigeum and the Chersonesus Helle fell into the sea, and thenceforward that part of it was called Hellespontus, the sea of Helle.

**HELLEBORE**, in pharmacy, the roots of the various species of the genus *helleborus*, of the natural order *ranunculaceæ*, and of the *veratrum album* and *V. viride*, natural order *melanthaceæ*, now considered a suborder of *liliaceæ*.

Black Hellebore (*Helleborus niger*).

The black hellebore, *helleborus niger*, is a plant growing wild in the mountainous parts of southern and central Europe, and cultivated in gardens for the sake of its beautiful rose-like flowers, which bloom in midwinter and give to the plant the name of the Christmas rose. In the United States its time of blooming is very early in spring. The fibres of the roots are used for preparing the extract, decoction, or tincture. They are exceedingly acrid and burning to the taste, and when fresh produce inflammation and even vesication on being applied to the skin. They are irritant to all mucous membranes with which they may be brought in contact. The extract is a drastic purgative and emetic, but it is now seldom prescribed, except as an emmenagogue. Gradual paralysis and convulsions are among its poisonous effects upon the human system. Until the discovery of the *H. orientalis* it was supposed to be the same that furnished the black hellebore or *melampodium*, a famous medicine with the ancient Greeks and Romans, who used it in the belief that it gave clearness and activity to the mental faculties; and the most celebrated philosophers are said to have drunk its infusion for this purpose. It was also employed in mania, dropsy, and va-

rious other affections.—*H. fatidus*, or bear's foot, is a perennial European plant of extremely acrid properties, a powerful emetic and cathartic, and long used in Great Britain as a domestic remedy for worms. It has even been known to cause the expulsion of the tapeworm.—White hellebore is the rhizoma of *veratrum album*, an herbaceous plant indigenous to the Alps and Pyrenees, and imported from Germany. Its virtue resides in the alkaloid veratria, which however is usually obtained from the seeds of *veratrum sabadilla*, growing in Mexico. This alkaloid, which has the formula  $C_{24}H_{52}N_2O_{16}$ , is a powerful irritant when applied externally, and when absorbed diminishes the activity of the heart and the irritability of the nerves and muscles. It is also emetic and cathartic. It is seldom used in medicine except as an external application, in the form of an ointment, in gout, rheumatism, and neuralgia. It has of late become an important horticultural appliance, as it is found to be the most effective destroyer of the currant worm, *abraxas ribearia*, which in some localities defoliates the plants and destroys the crop of fruit. The powdered white hellebore is sifted upon the leaves, or stirred with water and applied

White Hellebore (*Veratrum album*).

with a syringe.—American hellebore is the rhizoma of *V. viride*, or Indian poke, a common plant in the swamps and meadows of the northern and middle states. It resembles the European species in its violent action as an emetic, and also in stimulating the secretions. It acts powerfully upon the nervous system, producing vertigo and dimness of vision, and dilating the pupils. The frequency and force of the pulse are diminished under its influence. By careful management it may be used for reducing the pulse in inflammatory diseases without the unpleasant effects just mentioned. Its action is supposed to depend upon two alkaloids, veratroidia, very similar to if not identical with

veratria and viridia, which produces the sedative effect upon the circulation just mentioned, and very little if any emetic or cathartic action. The fluid extract and tincture of *V. viride* have been largely employed, in doses of one, two, or three drops frequently repeated, in diseases attended with fever. It is doubtful, however, whether the curative effect over the disease corresponds to the lowering of the pulse. Pneumonia, peritonitis, and cardiac diseases are the affections in which it has been most employed.

**HELLEN.** See GREECE, vol. viii., p. 187.

**HELLER, Joseph**, a German author, born in Bamberg, Sept. 22, 1798, died there, June 4, 1849. He left mercantile pursuits for the study of art, made extensive collections, and wrote biographies of Lucas Cranach, Albrecht Dürer, and other artists. Among his other works are *Geschichte der Holzschnidekunst* (Bamberg, 1822), and *Handbuch für Kupferstichsammlung* (3 vols., 1823-'36).

**HELLER, Karl Bartholomäus**, a German naturalist, born in Moravia in 1824. In 1845 he made collections of natural history in Mexico and Central America for the horticultural society of Vienna, and on his home journey in 1848 he visited Cuba and the United States. In 1851 he became adjunct and in 1853 titular professor of natural history at the university of Gratz. His publications include *Beiträge zur näheren Kenntniss Mittelamerikas* (Gratz, 1853), *Reisen in Mexico* (Leipsic, 1853), and *Das dioptrische Mikroskop* (Vienna, 1856).

**HELLER, Stephan**, a German composer, born in Pesth, Hungary, May 15, 1814. At the age of nine he played in public with his teacher Dussek's concerto for two pianos. He went soon after to Vienna, and received lessons from Czerny and Halm. In 1827 and 1828 he gave concerts in Vienna, and in 1829 went on a concert tour through Hungary and Germany. At the age of 16 he took up his residence at Augsburg, remaining there until he went to Paris in 1838, where he has since for the most part resided. His compositions are almost exclusively for the pianoforte, and are distinguished by originality of thought and treatment, elevation of style, and poetic refinement. Fétis ranks him as a composer for the pianoforte above Chopin. While this praise may be exaggerated, it is nevertheless true that Heller is one of the most poetic and captivating writers for that instrument. His published works number about 150, including many admirable arrangements for piano of the songs of Schubert, Mendelssohn, and other composers, and such original series as the *Nuits blanches* and the *Wanderstunden*.

**HELLESPONT** (Gr. Ἑλλησποντος, sea of Helle), in ancient geography, the narrow strait (now the Dardanelles) connecting the Ægean sea with the Propontis (sea of Marmora), and separating the Thracian Chersonesus (peninsula of Gallipoli) from Asia Minor.

**HELL GATE.** See BLASTING, vol. ii., p. 702.

**HELLIN**, a town of Murcia, Spain, in the province and 35 m. S. by E. of the city of Albacete, situated on the slope of the Segura mountain chain, near the E. bank of the Mundo; pop. about 10,000. It contains a large square and a number of smaller ones, a fine old parish church, and remains of a Roman castle. Trade is carried on in various goods manufactured here, in grain, wine, and silk, but chiefly in sulphur, from celebrated mines about 13 m. distant, which belong to the government, and were known to the Romans. Near the town is the hermitage of San Rosario, and at a distance of about 6 m. the springs of Azaraque.

**HELM.** See STEERING APPARATUS.

**HELMERS, Jan Frederik**, a Dutch poet, born in Amsterdam in 1767, died Feb. 26, 1813. His principal work is his national poem *De Hollandsche natie* ("The Dutch Nation") (Amsterdam, 1812, and many later editions), which has been translated into French by Auguste Clavereau. He published a collection of his poems (2 vols., Amsterdam, 1809-'10), and his posthumous writings appeared in Haarlem in 1814-'15.

**HELMET SHELL** (*cassis*), a genus of gastropod mollusks, separated by Lamarck from the Linnæan genus *buccinum*. About 40 species

Helmet Shell.

are described, living in shallow tropical seas in the East and West Indies, on the east coast of Africa, in the Pacific, and in the Mediterranean; nearly as many fossil species have been found in

the eocene of Chili and France. The shell is ventricose, with irregular rows of protuberances on the whorls; spire short; aperture long, with the outer lip reflected and toothed, and the inner lip spread over the body whorl. The species are of considerable size, and many are used for the manufacture of cameos, the different colors of the layers of the shells rendering them well adapted for this purpose. In the *C. cornuta* the cameo would be white on an orange ground; in *C. tuberosa* and *Madagascariensis* (the queen conch of Madagascar), white on a dark claret color; in *C. rufa*, pale salmon color on orange. (See CAMEO.)

**HELMHOLTZ, Hermann Ludwig Ferdinand**, a German physicist and physiologist, born in Potsdam, Aug. 31, 1821. At the age of 17 he was admitted to the royal military school in Berlin, and commenced the study of medicine. In 1842, in his graduating thesis entitled *De Fabrica Systematis Nervosi Evertebratum*, he endeavored to prove the existence of an anatomical connection between the nerves of motion and those of sensation through the intermediate means of ganglion cells, and presented the results of numerous examinations of the delicate nerve fibres of bugs, spiders, crabs, and many lower animals. Until 1843 he was assistant physician at the Charité hospital, and then be-

came military surgeon stationed at Potsdam. During the five years following he practised medicine, contributed a great number of articles on mathematical and physical science to various periodicals, and laid the foundation for his scientific reputation by a finished work "On the Conservation of Force" (Berlin, 1847). He was at once recognized as one of the chief investigators and promoters of the new philosophy of force. A popular lecture on the same subject, delivered some years later in Königsberg, was translated by Prof. Tyndall of London for the "Philosophical Magazine," and attracted a great deal of attention throughout the world. In 1843 he had written "On the Nature of Putrefaction and Fermentation" (Müller's *Archiv für Anatomie, Physiologie und wissenschaftliche Medicin*), proving putrefaction to occur independently of microscopical living beings, but modifiable thereby and then constituting fermentation; in 1845, "On Animal Heat," with especial consideration of the question whether the living animal body gives off as much heat as is produced by the combustion and change of the food it takes in (*Berliner encyclopädisches Wörterbuch der medicinischen Wissenschaften*); also, "On the Consumption of Tissue during Muscular Action" (Müller's *Archiv*, 1845); and "Proof of a Development of Heat during Muscular Action" (Müller's *Archiv*, 1848). He for the first time proved by actual experiments a difference of chemical composition in the active and in the quiescent muscle. In 1848 he returned to Berlin as prosector of anatomy and tutor in the art academy, and in 1849 became professor of physiology in the university of Königsberg. Soon afterward he began his celebrated investigations as to the rapidity of propagation of nerve excitation. The first report of them appeared in the *Berichte über die Verhandlungen der Königlich-Preussischen Akademie der Wissenschaften zu Berlin* under date of Jan. 21, 1850; and he published two elaborate articles in Müller's *Archiv* for 1850 and 1852. By means of ingenious methods for ascertaining exceedingly small differences of time, he demonstrated that thought is not instantaneous, that when we touch anything with the hand it takes a definite period to become conscious of the fact, and that when we determine to make a movement a certain measurable time elapses between willing the movement and executing it; he succeeded in accurately measuring these small fractional portions of a second. He was also the first who gave the correct explanation of the fact that on looking at a person's eye the pupil appears black, and why we cannot under ordinary circumstances see into the interior of the eye; and in 1851 he invented the ophthalmoscope, an instrument by means of which the retina of the living eye can be inspected, and which has completely revolutionized the knowledge of its condition in health and disease, and saved thousands of

persons from blindness. It is said that he was led to this invention by reflecting on the circumstance that while it is impossible during the daytime to see clearly into a room on the opposite side of a street, it can, however, be done at night, when the room is illuminated, and also during the day by throwing into it sunlight reflected by a mirror or a sun glass. His original invention is described in a separate work "On the Ophthalmoscope" (Berlin, 1851), an improvement in the *Archiv für physiologische Heilkunde* (1852), and the ophthalmometer in the *Archiv für Ophthalmologie* (1854). In 1855 Helmholtz became professor of anatomy and physiology in Bonn, in 1858 of physiology in Heidelberg, and since 1871 he has been professor of physics in Berlin. He is the author of two books, each of which forms an era in the branch of science to which it relates. The first, entitled *Handbuch der physiologischen Optik* (Leipsic, 1867), is in very many respects a pioneer labor. In addition to the anatomical description of the eye, it contains three divisions, "Dioptries of the Eye," of which two sections were first published in 1856, "Doctrine of Visual Sensations" (1860), and "Doctrine of Visual Perceptions," finished in 1866. Helmholtz traces his subject from the remote past, establishes the so-called empirical theory of vision, and not only clearly points out the knowledge attained, but also shows the way in which further advance is to be made. The author's original researches in this work include every portion of the subject, from the investigation of the limits of human power of perception to that of the details of vision, and the analysis, combination, and appreciation of colors. His second important work is entitled *Die Lehre von den Tonempfindungen, als physiologische Grundlage für die Theorie der Musik* (Brunswick, 1862; 3d ed., 1870). In this he throws the light of natural science upon the inmost principles of music and æsthetics. In vain had philosophers and musicians for more than 2,000 years endeavored to explain musical harmony; the discovery of its cause, an achievement of the most recent times, is mainly due to Helmholtz. He invented the method of analyzing sound, thereby furnishing us a means of acquiring knowledge until then unthought of. The invention essentially consists in the use of hollow bodies, called resonators, the volume of air in which vibrates in the presence of a previously determined sound. Investigation by means of resonators may in the future lead to discoveries more important still than those hitherto attained; but it has already solved many puzzling questions of the past. Thus it had long been known that the note of many musical instruments is accompanied by its octave and the fifth of its octave; but by the employment of resonators it has been found that every sound, as it generally occurs in nature, and as it is produced by most of our musical instruments

or the human voice, is not a simple single sound, but a compound of several tones of different intensity and pitch, all of which different tones combined are heard as one. Helmholtz discovered that the difference of quality or *timbre* of the sounds of different musical instruments resides in the different composition of these sounds, *i. e.*, is due to the fact that different compound sounds may contain the same fundamental tone, but differently mixed with other tones. He also discovered the acoustic cause of the vowel sounds of human speech, and not only analyzed or decomposed them into their constituent elementary tones, but also imitated or rather artificially produced vowel sounds from elementary tones of tuning forks. Helmholtz has propounded a hypothesis of the manner of excitation of the acoustic nerve which in its physiological aspect has been generally accepted, although its anatomical basis is not yet sufficiently established. He has demonstrated that beats occasion dissonance, and that the perception of the relationship of two musical sounds is due to the sensation of one or more common simple sounds in them, and the perception of that of two chords to the sensation of one or more common compound sounds; shown how beats and foreign ingredients in sounds produce an intermittent excitation of certain fibres of the auditory nerve, and thereby become unpleasant; and suggested a reasonable explanation of the adaptability of music for emotional expression. A list, probably incomplete, of his contributions to various periodicals, published lectures, &c., enumerates more than 70 articles besides those already mentioned. Some of the more important are: "Course and Duration of certain Electric Currents," "Theorem on the Distribution of Electric Currents," "Analysis of Sunlight," "On the Theory of Composite Colors," "On the Accommodation of the Eye," "Comparison of the Luminousness of Different Colors," "Explanation of the Stereoscopic Phenomena of Lustre," "On Combination Tones," "On the Persistence of Visual Impressions," "On the Notes of Various Musical Instruments," "On the Normal Movements of the Human Eye," "Intermittent Movements of Liquids," "On the Friction of Liquids," "The Mechanism of the Ear Ossicles and Tympanic Membrane," "On a Theorem concerning geometrically similar Motions of Fluid Bodies, applied to the problem of guiding aerial balloons," and "On the Limits of the Power of the Microscope." Helmholtz's readiness and ability to present to the public at large in intelligible language the results of his researches, sometimes the most abstruse, have contributed largely to his fame. He has been delivering popular scientific lectures for more than 25 years. One on human vision was delivered in Königsberg in aid of Kant's monument (Leipsic, 1855), and in May, 1853, appeared one on Goethe's labors in natural science. This, together with three others, was

issued in book form (Brunswick, 1865; second series, 1871). All these have been translated by Prof. E. Atkinson, under the title of "Popular Lectures on Scientific Subjects," with an introduction by Prof. Tyndall (London and New York, 1873). The French academy admitted him to foreign membership in 1870, after a discussion during which a well known author said: "You will place yourselves in the worst light before the world if, for any reason, you refuse to admit Helmholtz, the foremost and greatest naturalist of the age;" adding, "Nothing is wanting to his glory, but he is wanting to ours."

**HELMINTHS.** See ENTOZOA.

**HELMONT, Jan Baptista van**, a Flemish physician, born in Brussels in 1577, died near Vilvoorden, Dec. 30, 1644. He was educated at the university of Louvain with a view to the church, but refused to take orders, and spent several years in the universities of Italy and France, studying chemistry, natural philosophy, and medicine. On returning home he settled upon his estate near Vilvoorden. Dissatisfied with the works of Hippocrates, Galen, and Paracelsus, he attempted a reform in medicine. His system is mingled with considerable mysticism, but he did much to introduce exactness into science. He was the first to apply the term gas to the elastic fluids which resemble air in physical properties. His *gas sylvestre* was what is now known as carbonic acid, for, he says, it is evolved during the fermentation of wine and beer, and when charcoal is burned in the air, and also when carbonate of lime is dissolved in vinegar or nitric acid. To the combustible gases found in the intestines he gave the names *gas pingue*, *gas siccum*, and *gas fuliginosum*. He had no accurate knowledge of the gases which he produced or examined, but made the important discovery that air diminishes in bulk when bodies are burned in it. He believed that respiration consisted in the drawing of air into the pulmonary arteries and veins, which caused a fermentation necessary for its revivification. He believed with Paracelsus in the existence of an *archæus*, or spiritual essence or power which presided over digestion and fermentation. Water he considered capable of furnishing all the material of plants, and ultimately of fish and other animals, and also that it produced elementary earth or pure quartz, and the chemical principles salt, sulphur, and mercury. He excludes fire from the number of the elements because it is not a substance. The *archæus* has the power to draw all bodies from water where a ferment exists. This ferment preëxists in the seed which is developed by it. The ferment expels an odor which attracts the generating spirit of the *archæus*. This spirit consists of an *aura vitalis*, which forms matter after its own idea. In man the seat of the *archæus* is in the stomach, and it presides also over the spleen; and in consequence of its influence man is much nearer to

the realm of spirits than to the earth. As all diseases were in his opinion caused by the archæus, his treatment consisted in calming it, relying upon dietetics and the imagination of his patients. Mercurials, antimonials, opium, and wine he believed to be agreeable to the archæus. His preference for chemical remedies raised chemistry to a higher rank in the opinion of the medical men of his time. On account of the extraordinary cures that he was believed to have made, he is said to have been arrested as a sorcerer. The most important of his works is his *Ortus Medicinæ, id est Initia Physicæ inaudita, Progressus Medicinæ novus in Morborum ultionem ad Vitam longam*, which was published by his son four years after his death, and translated into Dutch, French, German, and English. A volume of translations of some of his works was published by W. Charlton in 1650, entitled "The Ternary of Paradoxes," "The Magnetic Cure of Wounds," "The Nativity of Tartar of Wine," and "The Image of God in Man."

**HELMSTEDT**, or **Helmstädt**, a town of Germany, in the duchy and 21 m. E. of the city of Brunswick; pop. in 1871, 7,469. It contains five squares, two churches, a town house, a gymnasium, several schools, and three hospitals. The university of Helmstedt was founded in 1575 by Duke Julius of Brunswick, and for some time held a high rank among the schools of Germany, but was abolished in 1809. The chief manufactures are flannel, hats, soap, vinegar, and liqueurs. There is a trade in cattle.

**HELMUND**, or **Helmend**, a river of Afghanistan, which rises between two ridges belonging to the offshoots of the Hindoo Koosh, 35 m. W. of Cabool, upward of 10,000 ft. above the sea. After flowing S. W. for the greater part of its course, it gradually sweeps round to the north-west and west, enters the plain of Seistan, and flows by several branches into the lake of Hamoon, or Zurrah. Its entire length is about 650 m. Its principal affluent is the united stream of the Urgundab and Turnuk, from the east. Even in dry seasons the Helmund has a considerable volume of water.

**HÉLOÏSE**, abbess of the Paraclete, born probably in Paris in 1101, died at the convent of the Paraclete, Champagne, May 16, 1164. Of her parentage nothing is certainly known. In 1116 she was living with her uncle Fulbert, canon of Notre Dame, on the island of the Cité in Paris. At this time Pierre Abélard was at the height of his renown as a teacher, and Fulbert invited him to complete the education of his niece. The teacher and pupil fell in love with each other, and Abélard was compelled to conceal their guilt by conducting his pupil to the home of his parents in Brittany, where she became the mother of a son, who was christened Pierre Astrolabe. (See ABÉLARD.) To appease Fulbert, they were married, and at once separated; but to avoid hindering Abélard's ecclesiastical advancement, Héloïse denied the marriage, and was then

obliged to fly from her enraged uncle. Abélard placed her in the convent of Argenteuil, where she took the vows, and soon became abbess. Here she remained for nine or ten years, until a decree of the king, confirmed by the pope, alienated the property of this among other convents, and compelled the nuns to find a retreat elsewhere. The vacant oratory of the Paraclete in Champagne was formally made over to them by Abélard, at that time abbot of a monastery in Brittany, and Héloïse became the first of a long line of noble abbesses. Some years later a papal bull confirmed the gift. The rule adopted by the new convent was that of St. Benedict; but Abélard became the spiritual adviser and the father confessor of his friend, and added some statutes of his own to the ancient rule. Only one personal interview was held; but a correspondence arose which was continued for several years. Abélard died in 1142. Héloïse lived 22 years longer, devoting herself wholly to the enlargement and the discipline of her religious house. She was universally regarded as a saint, and gifts of every kind were brought to her convent. Her remains, after many removals, have rested since 1817 with those of her husband in the cemetery of Père la Chaise in Paris. The letters of Héloïse and Abélard have been many times published. The most complete edition of the originals is by Victor Cousin (4to, Paris, 1849). They form a unique monument of the middle ages, and the internal evidence of their authenticity is so strong as to set aside the supposition of their forgery. The letters of Héloïse especially are called by Hallam "the first book that gives any pleasure in reading produced in Europe for 600 years, since Boëthius's 'Consolations.'"—Besides the works mentioned under ABÉLARD, see *L'Histoire d'Héloïse et d'Abélard*, by Marc de Montfaucon (Paris, 1873).

**HELOS**, a town of ancient Greece, in the territory of Laconia, situated in a fertile plain near the Eurotas and the sea. Its foundation was ascribed to Helius, the youngest of the sons of Perseus, and in very early times it appears to have been the principal town of that region. On being taken by the Dorians, its inhabitants, as a punishment for the obstinacy of their resistance, were reduced to slavery, and their name, according to some writers, became in time the general designation of the Spartan bondmen. In the age of Strabo Helos had dwindled into a small village, and in that of Pausanias it was a heap of ruins. Its site was probably near Bizani, where there are some Hellenic remains.—Helos at the present day is the name of a district in the plains on the banks of the Eurotas, extending from the mountain of Bizani to the frontier of Maina. Most of the villages of the district are on the low hills which encircle the plain.

**HELOTS** (Gr. *ἐῷλαροι*), slaves of the Spartans, serfs bound to the soil, and tilling it for the benefit of the proprietors. The three

classes in Sparta were the Spartans, the Perioeci, and the helots. The first two were united and constituted one national aggregate, known by the common name of Lacedæmonians; but the last was for ages an entirely separate and inferior class. Several derivations of the name helots are given, including that from Helos, the Laconian town, but perhaps the most probable is that from *ἐλείν*, to take, making the name signify captives. They were regarded as the property of the state, which reserved the power of emancipating them, and were attached to the soil, each Spartan citizen receiving the number that belonged to his allotment of land, without any power to sell or free them. With the exception of the few who lived in the city as domestic servants, the helots occupied rural villages apart from their masters, and with only the obligation to till the land and pay a certain proportion of the produce to their masters as rent. The amount of rent was 82 medimni (about 120 bushels) of barley and a proportionate amount of wine and oil for each allotment, which was inhabited by six or seven families. This rent had been established at a very early period, and any increase of the amount was imperatively forbidden. Their number has been variously estimated, but it is certain that, though few at first, they increased through the conquest of rebel towns, till they far exceeded the Lacedæmonians themselves. O. Müller computes their number to have been about 224,000, at a time when the Lacedæmonians numbered but 156,000. They were liable to service in time of war, generally as light-armed troops, and a certain number of them attended on each Spartan. They were also in later times much employed in the navy. Only in particular emergencies did they serve as heavy-armed troops, and then they were generally emancipated after the war. The manumitted helots were not received into the Perioeci, but still were a separate class, under the name of neodamodes, or newly enfranchised. Particularly liable to suspicion, they were often employed on foreign service, or among the different trades at Sparta. At the end of the second Messenian war, 668 B. C., the Messenians were reduced to slavery and incorporated with the helots. In 464 the helots revolted, and marched directly against Sparta, which they nearly succeeded in taking. After long and obstinate struggles they were finally subdued. They were constant subjects of apprehension to the Spartans, and were sometimes cruelly massacred, in order to keep down their numbers, the young men being sent out secretly to slaughter them. The most noted of these massacres was in 424, when 2,000 of the helots who had rendered distinguished services in war were slain.

**HELPS**, Sir Arthur, an English author, born about 1817, died March 7, 1875. He was educated at Trinity college, Cambridge, became private secretary to Lord Monteagle, then chancellor of the exchequer, and was appointed

commissioner of French, Danish, and Spanish claims. He was afterward secretary to Lord Morpeth, chief secretary for Ireland, in 1859 became clerk of the privy council, and was knighted in 1872. His earlier publications, all of which appeared anonymously, are: "Thoughts in the Cloister and the Crowd" (London, 1835); "Essays written in the Intervals of Business" (1841); two dramas entitled "King Henry II." and "Catharine Douglas" (1843); and "The Claims of Labor" (1844). A work which much enhanced his reputation as a subtle thinker and graceful writer was entitled "Friends in Council, a Series of Readings and Discourses thereon" (1847; 2d series, 1859), a collection of essays with conversations interspersed. It was followed by a similar work entitled "Companions of my Solitude" (1851). His "Conquerors of the New World, and their Bondsmen" (2 vols., 1848-'52) was enlarged into "The Spanish Conquest in America" (3 vols., 1855-'7), in which he narrates the origin and growth of negro slavery. His later works are: "Realmah" (1868); "The Life of Pizarro" (1869); "Casimir Maremma" and "Brevia, or Short Essays and Aphorisms" (1870); "Conversations on War and general Culture," "Life of Cortes," and "Thoughts upon Government" (1871); "Life and Labors of Mr. Brassey" (1872); "Oulita the Serf, a Tragedy" (1873); and "Ivan de Biron, or the Russian Court in the Middle of the Last Century" (1874). All his writings are marked by a philosophical tone and moral fervor, and Ruskin confesses his obligations to "the beautiful quiet English of Helps." He is understood to have assisted Queen Victoria in the preparation of her "Leaves from the Journal of our Life in the Highlands" (London, 1869).

**HELSINGBORG**, a town of Sweden, in the län and 32 m. N. N. W. of the town of Malmö, at the narrowest part of the Sound; pop. in 1871, 7,560. It lies just opposite Elsinore, with which there is regular communication. Several battles have been fought here, and several Swedish diets held.

**HELSINGFORS**, a city of Russia, capital of the grand duchy of Finland, on the gulf of Finland, 180 m. W. by N. of St. Petersburg; pop. in 1870, 32,113. It was founded by Gustavus I. of Sweden in the middle of the 16th century, burned by the Russians in 1728, taken by them in 1742 and again in 1808, and finally ceded to them with the whole of Finland in 1809. The government was transferred from Abo to Helsingfors in 1819, and a few years later the town was almost rebuilt. The streets were laid out with great regularity, public buildings were erected, and it has risen to be a large and handsome city. It has a fine harbor, capable of containing 60 or 70 men-of-war, protected by the fortress of Sveaborg, built on seven islands, presenting a front of about a mile, and mounting about 800 cannon. In 1827, Abo having been burned, the emperor Nicholas reestablished its university at Helsing-

fors. It is now called the Alexander university, and has four faculties, more than 50 professors, and about 500 students. In the senate house is a large and valuable library. The town contains a military academy with about 140 students, a Finnish society of art and one of sci-

again at the time of the first triumvirate, invading Gaul, which had been assigned as a province to Cæsar, under the command of Orgetorix, one of their chiefs. Cæsar routed them at Bibracte (Autun in Burgundy), and the survivors returned beyond the Jura. Numerous

Helsingfors.

Roman castles and colonies were now planted in their land, which was known as Ager Helvetiorum, until it was attached to Transalpine Gaul. Having refused to acknowledge Vitellius as emperor, they were rigorously chastised by his generals. After that the Helvetii almost disappear. Their territory was occupied by the Alemanni, and in its S. W. part by the Burgundians during the last period of the West Roman empire. (See SWITZERLAND.)

**HELVÉTIUS, Claude Adrien**, a French philosopher, born in Paris in January, 1715, died Dec.

ence, fine museums of mineralogy and zoölogy, botanical gardens, an observatory, and several journals. There are manufactories of linen, sail cloth, and tobacco. The exports are fish, iron, timber, and grain. The trade in grain and in naval stores is active during summer.

**HELSINGÖR.** See ELSINORE.

**HELST, Bartholomeus van der**, a Dutch portrait painter, born in Haarlem in 1613, died in Amsterdam about 1670. His picture in the town house at Amsterdam, representing 30 full-length figures of a train band, with the Spanish ambassador in the midst, was called by Sir Joshua Reynolds "the first picture of portraits in the world." He occasionally painted historical pictures, but his reputation rests almost exclusively upon his portraits, which are numerous in the Netherlands.

**HELVELLYN**, a mountain of Cumberland, England, between Keswick and Ambleside. It is one of the highest mountains in England, its summit being 3,313 ft. above the sea.

**HELVETII**, an ancient people of Celtic origin, who in historical times occupied the country between the Rhine, the lake of Constance, the Rhône, the lake of Geneva, and the Jura; that is, somewhat less than the territory of modern Switzerland (Helvetia). They first appear in history toward the close of the 2d century B. C., when one of their divisions, the so-called *pagus Tigurinus*, joined the Cimbri on their march to invade Italy, and defeated the Roman consul Lucius Cassius (107). After the defeat of the Cimbri and Teutons by Marius, they retired to their territory, where they numbered 12 towns and 400 villages. They left it

26, 1771. He was of German descent, and his name was a translation of Schweitzer. His father was physician to Queen Maria Leeczczynska of France. When scarcely 23 years old, he was appointed farmer general with an annual revenue of about \$60,000. He became the patron of philosophers, wits, and men of letters, and associated with Voltaire, Montesquieu, and Buffon. In order to devote himself exclusively to study, he resigned his office in 1750, married a few months later the countess de Lignville, and led a retired life, mostly at his country seat of Voré, in the province of Perche. Here, while engaged in the composition of his philosophical works, he labored to improve the condition of the peasantry. In 1758 he published anonymously, under the title *De l'esprit*, a free and bold exposition of materialism, the last word, as an eminent French historian designates it, of the philosophical movement of his age, which was translated into the principal foreign languages. The work was proscribed by the pope, the Sorbonne, and the parliament, and burned by the common hangman; but Helvétius lost nothing of his popularity at home, where his private life and character offset his doctrine. When he visited England and Germany, princes, nobles, and literary men vied with each other to welcome him; he was treated with special distinction by Frederick II., who received him in his own palace. On his return to Voré, he completed a poem, *Le bonheur*, in six cantos, and a philosophical treatise, *De l'homme, de ses facultés intellectuelles et de son éducation*, both of which were published after his death, the latter

by Prince Gallitzin (1772). The best edition of his complete works is that published under the supervision of Lefebvre de La Roche, by P. Didot (14 vols. 18mo, Paris, 1795).—His wife, who contributed much to make his life happy and his home agreeable to friends and visitors, survived him; she retired to Auteuil, near Paris, and her house was still open to philosophers. Dying in August, 1800, at the age of 81, she bequeathed her property to her friend, the celebrated physician Cabanis.

**HELVOETSLUIS**, or **Hellevoetsluis**, a strongly fortified seaport town of the Netherlands, in the province of South Holland, on the island of Voorne, and on the Haringvleet and the Voorne canal, 6 m. S. of Briel; pop. in 1867, 3,810. It is a very important naval station, with large docks. Thousands of vessels enter the port annually, including the largest Indianmen, which pass through the Voorne canal on their way to Rotterdam. Helvoetsluis was in former times the great point of departure for English ports, and generally for Harwich; and William of Orange embarked here for England Nov. 1, 1688, with 50 war ships and 14,000 men.

**HÉLYOT, Pierre**, a French historian, born in Paris in 1660, died Jan. 5, 1716. He was descended from an English Catholic family that took refuge in France, and in 1683 entered the third order of St. Francis in the convent of Picpus at Paris as Père Hippolyte. He was twice sent to Rome on affairs of his order, and there projected the work by which he is best known, a history of the various religious orders. He was assisted in his researches by Anquetil, Hardouin, Mabillon, Ruinart, and other scholars. Two volumes were published in 1714 (4to, Paris), entitled *Histoire des ordres monastiques, religieux et militaires, et des congrégations séculières de l'un et de l'autre sexe*. The six remaining volumes appeared in 1715, 1718, and 1719. It was reprinted in 1721 and 1792. An inferior edition, edited by Philippon de la Madeleine, appeared at Paris in 1838; and an edition in five volumes in Migne's *Encyclopédie théologique*, with a continuation to the time of publication (5 vols., Paris, 1847). The volumes that appeared after Hélyot's death were edited by Maximilian Bullot. Hélyot wrote also *Le Chrétien mourant* (Paris, 1705).

**HEMANS, Felicia Dorothea**, an English poetess, born in Liverpool, Sept. 25, 1794, died near Dublin, May 12, 1835. Her father, a merchant named Browne, was a native of Ireland, but her mother was of Venetian descent. When she was five years of age commercial disasters compelled the family to remove to an old mansion at Gwryrch, in Denbighshire, Wales, where her childhood was passed. A collection of her juvenile poems was published in 1808, under the title of "Early Blossoms," and met with harsh treatment from the critics. A second volume, entitled "The Domestic Affections," published in 1812, was more successful. In the same year she married Capt. Hemans, by whom she became the mother of five sons. In-

compatibility of tastes and temperaments rendered the union unfortunate, and after Capt. Hemans went to Italy in 1818 to recover his health they never again met, although letters frequently passed between them with reference to the education of their children. Mrs. Hemans now rejoined her mother in Wales, and commenced an active literary life. She studied German and the languages of southern Europe, translated from Camoëns and Herrera, and contributed numerous pieces in prose and verse to the magazines and annuals. About this time she published "Tales and Historic Scenes," "Modern Greece," "Dartmoor," a prize poem, and "The Skeptic." At the suggestion of Reginald Heber she wrote her play of "The Vespers of Palermo," which failed on the London stage, but was well received in Edinburgh. Her works gained her the friendship of many distinguished men. She visited Scott at Abbotsford and Wordsworth at Rydal Mount. In 1831, after a temporary residence near Liverpool for the benefit of her children, she removed to Dublin, where one of her brothers was living. Her last poem was "A Sabbath Sonnet," dedicated to her brother. In 1839 appeared the first collective edition of her poems, with a memoir by her sister (7 vols. 12mo), followed in 1848 by one chronologically arranged (1 vol. 8vo), and by another in 6 vols. in 1850. In 1836 were published "Memorials of Mrs. Hemans," by H. F. Chorley (2 vols. 12mo). Her popularity in the United States dates from 1826, when an edition of her poems, accompanied by a notice of the authoress, was published by Prof. Andrews Norton. Numerous other editions have been published here, one (1850) including an essay on her genius by H. T. Tuckerman. Freiligrath has published an admirable German version (*Das Waldheiligthum*) of her "Forest Sanctuary."

**HEMATINE** (Gr. *αἷμα*, blood), the coloring matter of the red globules of the blood. Hematine belongs to substances of the albuminoid class, consisting of carbon, hydrogen, nitrogen, and oxygen, with which is associated a small proportion of iron. It forms a little over 1½ per cent. of the substance of the blood globules, but even in this small proportion is sufficient to communicate to them, and to the whole mass of the blood in which they are suspended, the strong and rich deep red color by which they are so readily distinguished. It is rapidly altered in hue by the action of chemical substances, and has not therefore been made available in the arts for the production of dye-stuffs. It is soluble in water, and a very small quantity of hematine will communicate a distinctly red tinge to a very large quantity of fluid.

**HEMATITE.** See IRON ORES.

**HEMIGALE**, a mammal of the family *viverridæ*, coming near the ichneumons, so named from its weasel-like body. The grayish brown fur is marked on the back by six or seven wide dark stripes, arranged saddle-wise, broad above and narrowing toward the ribs; the head is

pointed, ears short, hind limbs stout, and tail long. It is a native of the East Indies, is about

Hemignale Hardwickii.

the size of the ichneumon, and feeds on eggs and small birds and mammals.

**HEMIPTERA**, an order of insects, including what are generally called bugs, harvest flies, tree hoppers, plant lice, &c. They are sucking insects, having neither mandibles nor maxillæ proper, but a horny beak, curved along the breast when not in use, containing in its groove delicate sharp bristles by which their punctures are made. They have four wings, of which the upper are generally thick at the base and membranous at the ends, being as it were half elytra and half wings, whence the name of the order (from *ἡμισυς*, half, and *πτερόν*, wing); in a few all the wings are membranous, and some are wingless, as the bedbug. The eyes are large, the antennæ generally small, and the tarsi in most three-jointed. They undergo a partial transformation, the larvæ and pupæ resembling the adults except in the absence of wings and the smaller size; in all the stages they live in the same way, and in all are equally active. The bugs or true *hemiptera* (*H. heteroptera*) have the semi opaque wing covers laid horizontally on the top of the back, crossing each other obliquely at the end; their wings are horizontal and not plaited; the beak issues from the fore part of the head, and is bent abruptly backward beneath the breast. English entomologists have separated the harvest flies, tree hoppers, plant lice, &c., under the name of *H. homoptera*, because the wing covers are of the same texture throughout, either transparent or opaque; they do not cross each other, are not horizontal, but with the wings are more or less inclined at the sides of the body; the beak issues from the under side of the head; the insects of this division live on vegetable juices, while those of the preceding live also upon animal fluids. In the first division, the family *geocorisæ* (Latr.), or earth bugs, have the antennæ exposed and longer than the head; most are terrestrial, but

some live on the surface of water; many emit a disagreeable odor. The genus *pentatoma* (Oliv.), or wood bugs, occur chiefly in warm countries, where they attain a considerable size, and are marked with brilliant colors; they live on vegetable juices, and sometimes on those of other insects; they exhale a disagreeable odor, and adhere to whatever they touch; De Geer relates that the young of the *P. griseum* (Linn.) in troops of 30 or 40 follow their mother on trees as chickens follow a hen. In the genus *coreus* (Fab.) the head is generally triangular, sunk without apparent neck into the thorax; the eyes small but prominent; the legs long and slender; they feed both on vegetable and animal juices, exhale a strong odor, and present often strange forms and spiny armature. Here belongs the well known squash bug (*C. tristis*, De Geer), which emits a powerful odor when handled. In the genus *lygaeus* (Fab.) belong the chinch bugs, so destructive in the fields of corn and wheat at the south and west; the white-winged species (*L. leucopterus*, Say) is provided with wings, and is about  $\frac{3}{8}$  of an inch long; the general color is black, with white wing covers margined with black, and reddish yellow legs, beak, and hinder edge of thorax; the young and wingless ones are bright red. Small plant bugs of the genus *phytocoris* are very destructive in flower and vegetable gardens; one species in particular enters into the long list which have been erroneously supposed to produce the potato rot. The genus *syrtis* (Fab.) have a single claw on the anterior feet, with which they seize flies and other insects; the "tiger" so destructive to pear trees in Europe belongs to the genus *tingis* (Fab.); the bedbug (*cimex lectularius*) has been described under *EPISOA*; a species of *reduvius* is destructive to the cotton crop, staining the balls red, and causing them to fall prematurely; *hydrometra* and some allied species run upon the surface of water, and have been found in considerable numbers in mid ocean in the tropics. In the family *hydrocorisæ*, or water bugs, belongs the genus *nepa* (Linn), commonly called water scorpions, from having the anterior legs in the form of hooked nippers; they prey upon other insects, and are very voracious; in some tribes the posterior legs are much ciliated, resembling oars, enabling them to swim with great swiftness, and often on their backs.—In the homopterous division, the three principal tribes are the *cicadada*, already described under HARVEST FLY; *aphididæ*, or plant lice, noticed under APHIS; and the *coccidæ*, or bark lice, described under COCHINEAL. In some of the *cicadada*, according to Dufour, the stomach or chylic ventricle is remarkably long, with many convolutions of an intestine-like tube ascending and reopening into its cavity—a remarkable physiological fact. The lantern fly (*fulgora*), said to give forth a light from the end of its prolonged snout, has been alluded to under FIRE-FLY. The tree hoppers (*membracis*, Fab.)

have the habits of the harvest flies, but they make no drumming sound, and leap and fly to a considerable distance, even to 250 times their length; they pass their time on plants, always placed lengthwise of the limbs, with the head toward the end of the branches; from their

1, 2. Tree Hopper (*Membracis*). 3. Water Scorpion (*Nepa*).

conical shape, dark color, and fixed position, they look much like the thorns of a tree; locust and oak trees and many vines suffer from the abstraction of their sap by these insects and from the injury done to their leaves. Tree hoppers are often surrounded by ants, for the sake of their droppings or for the sap which oozes from their punctures. The frog hoppers (*cercopis*, Fab.) possess still greater leaping powers; the larvæ extract the sap of alders, willows, &c., in such quantity that it oozes from their bodies continually in little bubbles, whose white foam completely covers them during the period of their transformation; this is called frog spittle and cuckoo spittle. The leaf hoppers (*tettigonia*, Geoffr.) are very small, but handsome, agile, and destructive to vegetation; vines, rosaceous plants, beans, &c., suffer much from their exhausting punctures; tobacco fumigations and the application of whale-oil soap in solution are the best remedies. Some plant lice have the power of leaping, though both sexes, when mature, are winged; these belong to the genus *psylla* (Geoffr.), live on pear and other trees, sucking the juices of the young twigs, and are far less prolific than the *aphides*; these sap suckers are attended by swarms of ants and flies, attracted by the sweet fluid which flows from their bodies; young trees are often killed by them. From the family *coccidae* are obtained the scarlet grain and cochineal of commerce, now ascertained to be insects or bark lice of the genus *coccus* (Linn.) (see COCHINEAL); the mealy bug of our greenhouses is the *C. Adonidum*; the *C. hesperidum* infests the myrtle. These lice are destroyed by the wren, chickadee, and ichneumon flies; strong soap and alkaline solutions will also kill them.

**HEMLING.** See MEMLING.

**HEMLOCK**, a name applied to *conium maculatum* (see CONIUM) and *cicuta maculata* (see CICUTA), as well as to *abies Canadensis* (see

HEMLOCK SPRUCE). It is probable that the hemlock or κόνειον which caused the death of Socrates was identical with the plant now known as conium.

**HEMLOCK SPRUCE**, the common name of the tree *abies Canadensis*, of the order *coniferae*, which is quite as frequently called hemlock simply. The hemlock spruces mainly differ from the spruces proper in having flat two-ranked leaves, and the cells of the anthers opening transversely instead of lengthwise; from the firs they differ in having persistent cones and in the wing of the seed remaining attached to it; while in the firs the scales fall from the axis of the cone and the seed separates from its wing. On account of these differences Carrière proposed to place the hemlock spruces in a separate genus, to which he gave the barbaric name *tsuga*; botanists do not accept his views, and regard the firs (*picea*), the spruces (*abies*), and the hemlock spruces (*tsuga*) as subgenera of *abies*. The hemlock spruce is essentially a northern tree. Making its appearance in the southern states only on the mountain ranges, it increases in frequency toward the northern borders of the United States, where large forests of it are not rare, while in Canada it covers vast tracts often without the presence of any other species, and extends to the northernmost limits of arborescent vegetation, and across to the Pacific. It grows in almost every situation except in a very dry one. The hemlock spruce is one of the finest of our native conifers, reaching the height of 60, 80, and not rarely 100 ft.; when it occurs as a solitary specimen, it appears as a fine pyramid of verdure, being furnished

Hemlock Spruce (*Abies Canadensis*).

from the ground to the top with long gracefully drooping branches; but when it grows in the forest the straight trunk is without branches for the greater part of its length. The smaller branches and twigs are very slender; the leaves, about half an inch long

with very short petioles, spread horizontally in two directions, and appear as if in two rows. They are flat, dark green above, and glaucous beneath. The cones are about three fourths of an inch long, of a few scales, greenish when young, but turning brown with age, and placed at the ends of the pendent branches of the preceding year. The wood of the tree is coarse, splits irregularly, and when exposed to the weather decays rapidly; yet with all these disadvantages it affords a large share of the lumber of commerce, and as the white pine disappears hemlock lumber comes more and more into use. It is stronger than white pine, and gives a better hold to nails, and for all work not exposed it is preferred to pine; for beams, rafters, roof sheathing, and all parts of a house to be covered over, hemlock lumber is largely consumed, as it is for a great deal of other rough work. The great economical value of the hemlock is in its bark, which is largely used for tanning leather, either alone or in conjunction with oak bark; large forests have been destroyed by stripping the bark from the trunks, which were left to decay. As an ornamental tree the hemlock is not excelled in beauty by any native or exotic conifer. As single specimens, in a screen, or in a hedge, it is unequalled. For an ornamental hedge it has the advantage over deciduous plants, as it retains its beauty at all seasons; and the manner in which it bears cutting is a sufficient refutation of the common but erroneous belief that plants which naturally grow to large trees are unfit for hedges. The hemlock may be raised from seeds, but nurserymen get their supplies from the forest; young seedlings a foot high are taken up and planted closely together under a temporary screen of brush to shade them; those which survive the first summer are then planted in nursery rows, and afterward may be removed with safety. Hemlock gum, incorrectly so called, is a resinous exudation of the hemlock spruce. The tree while growing contains but little resinous juice; but when it begins to decay, resinous exudations in the form of nodules, from the size of a walnut to nearly that of a hen's egg, are found upon the surface. The bark and chips to which these nodules adhere are boiled in water and the melted resin dipped off. It has a limited use in the preparation of stimulating plasters. In some localities this resin is largely used by the young for chewing, and was formerly sold for this purpose; but at present the most approved "chewing gum" is made from paraffine. The young shoots and leaves afford a volatile oil by distillation, which has a local reputation as a rubefacient. It has been used to produce abortion, with fatal results to the mother.—The Indian hemlock spruce (*A. Brunoniana*), from Nepal, *A. tsuga*, from Japan, *A. Mertensiana*, *A. Hookeriana*, and *A. Albertiana*, from the N. W. coast, are species of hemlock spruce to be found in collections of rare evergreens.

**HEMP**, the common name of the plant *cannabis sativa*, of the order *cannabineæ*, which is by some botanists included in the nettle family (*urticaceæ*) as a suborder. The same name is applied to the fibre of the inner bark, which is largely used in the manufacture of cordage. It is also used for the fibres of plants of widely different genera; for the most important of these, see MANILA, JUTE, and RAMIE. The true hemp is an annual plant, probably a native of India, which has been in cultivation from very early times; it grows from 4 to 12 ft. high, with a branching, angular, rough stem; the lower leaves are opposite, the upper alternate, and all digitately divided, with five or more coarsely toothed leaflets; the flowers are diœcious, and without petals; the staminate flowers in drooping panicles, each with five sepals and stamens, the pistillate clustered in erect spikes, each consisting of an ovary with two styles embraced by a calyx of one sepal. Hemp is a plant influenced in a remarkable degree by

Staminate and Pistillate Flowers of Hemp.

climate, soil, and other conditions; in India it produces a resinous exudation of a marked character (to be presently mentioned), which is entirely wanting in the plant grown in northern climates, and there is a great difference in the hemp produced upon the plains and the mountainous regions in the same latitude; when the plant is so grown that seeds may be developed, the fibre is nearly worthless. In many countries hemp is an important agricultural product. The principal hemp-producing countries are Russia, Italy, Holland, Turkey, Great Britain, the East Indies, and the United States. St. Petersburg exports this product largely, receiving it from various parts of Russia. Special attention is given to its storage and shipment, and great care is taken to prevent the bundles from becoming damp, in which condition the hemp would be liable to ferment as in the rotting process. The best Russian hemp is said to be that of Riga, which is brought

down the Düna. That known as "Italian garden hemp," the fibre of which is obtained from plants raised by spade culture, is of unusual fineness and length, and superior to all other kinds. English hemp is chiefly woven into coarse sheeting and shirting for laboring men, and into the cloth called huckaback, of which coarse towels and table cloths are made. The material improves in whiteness as it is worn, and the finer varieties of it much resemble Irish linens.—Attempts were made at a very early period to cultivate both flax and hemp in the Plymouth colony, the seeds being ordered there in 1629. In Virginia hemp was raised and spun by Capt. Matthews previous to 1648. In 1651 its culture was encouraged by bounties offered by the government, as was that of flax in 1657. But the greater profit derived from tobacco has always operated against the culture of hemp. In Pennsylvania also the bounties offered by the government of the colony in 1730 failed to render this an important crop. Its culture has proved most successful in Ohio, Kentucky, and Indiana, and more recently in Missouri. It has also prospered to considerable extent in the other northern, and in the northeastern states. In the northern part of New York the crop is valued chiefly for the seed, of which from 20 to more than 40 bushels are obtained to the acre. But little American hemp has ever been exported. The product to the acre is from 700 to 1,000 lbs. According to the census of 1870, the total production of the United States was 12,746 tons, of which Kentucky produced 7,777, Missouri 2,816, and Tennessee 1,033 tons.—The soil best suited to hemp is a rich alluvial loam, but it will thrive in a moderately tenacious one if it is well pulverized. It is usually sown broadcast as early as possible without the risk of exposing the young plants to late frosts; four to six pecks are sown to the acre, but if sown in drills less is required. As the plants soon completely shade the ground, no after cultivation is required. It is customary to sow at intervals, that the harvesting may not all come at once. The crop is ready to harvest when the blossoms turn yellow and the leaves begin to drop; formerly the plants were pulled, but now they are cut by means of a heavy cradle, or where they are tall and heavy by means of a sickle or hook something like a brush scythe. The stalks are made to fall evenly, and at the end of three days they are bound into sheaves and put up in stacks or large ricks, so capped as to prevent rain from penetrating. To separate the fibre, the hemp is dew-rotted or water-rotted. In the former process the hemp is spread upon the ground in October or a month or two later, according to the climate; when the lint readily separates upon breaking a stalk, the process, which requires about two months, is completed; if hemp were exposed in this manner in warmer weather, there would be danger of injuring the fibre. In water-rotting the hemp is im-

mersed in water for ten days or more, according to the season; this is done in streams, in artificial pools made near the margin of a river, or in large wooden vats under cover; the last mentioned method gives the brightest and best fibre; when rotted in vats, the hemp is subjected to a partial breaking which lessens its bulk. After the hemp is rotted and dried it is taken to the break, which is either a rude affair worked by hand like a flax break, or an improved machine operated by steam or other power; 100 lbs. is an ordinary day's work with the hand break. After breaking, the hemp is twisted into bundles and baled for market.—When hemp is raised for the seed, the cultivation is quite different from that when raised for the fibre. A richer soil is selected, and prepared as for a crop of corn; hills are marked off about  $3\frac{1}{2}$  ft. apart each way, and a dozen or more seeds put in each and lightly covered; the ground is from the beginning kept clear of weeds by use of the cultivator and hoes; when well up the plants are thinned to seven or eight in each hill, and when a foot or more high they are again thinned to leave but four to a hill; subsequently the plants in the hill are reduced to three. As soon as the plants have sufficiently developed to allow the male or staminate ones to be distinguished, these are so far removed as to leave but one to every four hills, and after these have shed their pollen they are cut away. When ripe the seeds are threshed out, and if intended for sowing are kept spread in a thin layer until cold weather to prevent them from heating, which on account of their oily nature they are apt to do. The Russians and Poles roast the seeds and eat them upon bread as a condiment; they are used as food for cage birds, and are said to greatly improve the brilliancy of their plumage, and in the case of the bullfinch and some others to cause it to turn black. Hemp seeds upon expression furnish about 25 per cent. of hempseed oil, the commercial supply of which comes principally from Russia; it is a drying oil, greenish yellow at first, turning yellow, with an acrid odor but a mild taste; it is very soluble in boiling alcohol, but requires 30 parts of cold alcohol for its solution; it solidifies at  $17^{\circ}$  F. It is used in preparing soap, in mixing paint, for making varnish, and for burning, but on account of its drying tendency it is apt to form a viscid varnish upon the wick.—INDIAN HEMP. The hemp produced in India and other eastern countries is covered with an adhesive resinous exudation, which under favorable circumstances is so abundant as to come off and adhere to the hands if the plant be handled. For a long time it was supposed that this was a different species from the common hemp, and the name *cannabis Indica* was given to it; but Royle and other eastern botanists were unable to find any difference between it and the European plant; and from this and the fact that hemp grown in some portions of India is almost without this resin, botanists

now regard the Indian hemp as only a form of the common, though as a matter of convenience the term *C. Indica* is retained in the pharmacopœias. The stimulant and narcotic properties of Indian hemp have been known from early times; it is known in India by various names expressive of these qualities, such as "causer of the reeling gait," "laughter mover," &c.; and Royle ("*Materia Medica*") suggests that it is as likely as any other plant to have been the nepenthe, the "assuager of grief," of the ancients. The plant and its preparations are found in the eastern bazaars in several forms, some of which are imported. *Gunjah* is the dried plant, collected after flowering, and consists of the stems, leaves, and petioles pressed together; it is also called *quazah*. *Bang*, also *subjee* or *sidhee*, consists of the larger leaves and seed vessels without the stalks. *Hashish* is the tops and the tender parts of the plant gathered after flowering; this name is also applied to some preparations of the plant. *Churrus* is the resinous exudation collected by men clad in leather, who go through the fields and beat the hemp violently; the resinous matter adheres to the leather, and is afterward scraped off. A finer kind, collected by pressing the plant in the hands and removing the adhering resin, is known as the *Momeea* or waxen churrus; this is the most highly prized and costly variety. Extract of hemp is prepared by boiling the adhesive tops in alcohol, which is afterward distilled off, leaving a resinous extract which has a somewhat fragrant odor, and a warm, bitterish, acrid taste; this extract is imported, as also is *gunjah*. An electuary, made of the resin with musk, essence of roses, and other aromatics, and an oleaginous extract made with butter or oil, are among the forms in which different eastern nations prepare the hemp for intoxicating purposes. The effect of Indian hemp upon different persons is as various as that of alcohol; with some it simply produces stupor, while others experience a mental ecstasy and see the most pleasurable visions. The habitual use of the drug is accompanied by both physical and mental imbecility. The effects of hashish have been frequently described by those who have experienced them. (See ASSASSINS.) Indian hemp has long been used medicinally; a Chinese surgeon is said to have employed it as an anæsthetic as long ago as A. D. 220, and to have operated upon patients while they were under its influence. It is employed as an anodyne and narcotic, and to affect the mental functions; it is considered safer than opium, belladonna, and similar remedies, and it does not check the secretions or impair the digestion; its action seems to be exerted chiefly upon the cerebrum, producing but little effect upon the functions even of the other portions of the nervous system. It is given in the form of the extract, in doses of a quarter of a grain to several grains, or in tincture from 10 to 15 drops.—This name is also applied to an American fibrous and medicinal

plant, *apocynum cannabinum*. (See INDIAN HEMP.)—SISAL HEMP is the fibre of the leaves of *agave Sisalana*, a large species of Yucatan, closely related to the American aloe or century plant. (See AGAVE.) Under the name of Sisal hemp or *jenequen* are included the fibres of probably several species of agave and one or more of *Fourcroya*, the name referring to the product rather than the plants which yield it. An attempt to give the native names of several of the fibre-producing plants of Yucatan may be found in the report of the United States department of agriculture for 1869, but it gives little botanical light upon the subject. Fibres of different agaves and related plants were in use by the Indians long before the Spaniards planted colonies on this continent, and the Spanish Americans have since been content with the rude methods by which the aborigines extracted the fibre, which was simply to lay the large fleshy leaves upon a flat stone and beat them with a billet of wood or rude mallet, and afterward to scrape away the pulp and bruised thick epidermis with a blunt knife. After numerous failures, Americans have contrived machines to separate the fibre successfully and rapidly. *A. Sisalana*, which is propagated readily from suckers, has been introduced into Florida, and become naturalized in the southern portion of the state. Sisal hemp is used for coarse bagging and for cordage.—*Pita* is another name applied indefinitely to fibres; in Mexico it is the fibre of *agave Americana*, while in Central America it is that of some *Bromelia*. *Istle* or *iattle* is another term for the bromelia fibre.—SUNN HEMP, also called Bengal and Bombay hemp,

Sunn Hemp (*Crotalaria juncea*).

is the fibre of *crotalaria juncea*, an annual leguminous plant, 8 to 12 ft. high, with silvery-hairy leaves and bright yellow flowers. The fibre is extracted by beating and washing the stems after they have been steeped in water for a few days. It is employed for all the pur-

poses of ordinary hemp, to which it is considered equal if not superior.

**HEMPEL, Charles Julius**, an American physician, born in Solingen, Prussia, Sept. 5, 1811. He studied medicine in Paris, and in 1835 emigrated to the United States, where he has since resided. He graduated at the university of New York, and practised medicine in that city according to the system of Hahnemann. In 1857 he was appointed professor of materia medica and therapeutics in the homœopathic medical college of Pennsylvania, at Philadelphia. He has published "A Grammar of the German Language" (1842); "True Organization of the New Church" (1848); and translations of Hahnemann's *Materia Medica Pura* (4 vols. 8vo, 1846), of Jahr and Possart's "New Manual of the Homœopathic Materia Medica" (1849), and of Jahr's "New Manual" (2 vols.), to which a third volume was added by Dr. Hempel as a separate work, under the title of "Complete Repertory of Homœopathic Materia Medica" (1853). He has also published "A Comprehensive System of Homœopathic Materia Medica and Therapeutics" (1859), "Homœopathic Theory and Practice, with the Homœopathic Treatment of Surgical Diseases," with Dr. I. Beakley (1865), and "The Science of Homœopathy" (1874).

**HEMPSTEAD**, a S. W. county of Arkansas, bounded N. E. by the Little Missouri, and S. W. by Red and Little rivers; area, about 1,000 sq. m.; pop. in 1870, 13,768, of whom 6,329 were colored. The surface is hilly, the soil sandy and fertile. Red river is navigable by steamboats. The chief productions in 1870 were 1,608 bushels of wheat, 683,425 of Indian corn, 40,541 of sweet potatoes, and 10,664 bales of cotton. There were 1,706 horses, 1,354 mules and asses, 9,399 cattle, 1,986 sheep, and 23,393 swine. Capital, Washington.

**HEMSKERK**, or **Heemskerk**, **Martin van**, a Dutch painter, born at the village of Heemskerk in 1498, died in Haarlem, Oct. 1, 1574. He was the son of a mason named Van Veen, who placed him under the instructions of a painter at Haarlem, but afterward employed him in his own trade. Martin ran away, found a teacher in Jan Lucas, a painter of Delft, and then entered the studio of J. Schorel, who had recently returned from Rome. At this time Hemsmerk painted his "Saint Luke painting the Virgin and the Child Jesus," which he presented to the painters' society of Haarlem. He afterward spent three years in Italy. When in 1573 Haarlem was surrendered to the Spaniards, Hemsmerk's house was destroyed, and his best works were ruined; consequently his paintings are rare, but there are many engravings of them by himself and others. At his death he left a sum of money to his parish, to furnish a marriage portion for a certain number of young girls each year, on condition of their dancing over his grave on their wedding day.

**HEMSTERHUIJS**. **I. Tiberius**, a Dutch critic and philologist, born in Groningen, Jan. 9, 1685,

died in Leyden, April 7, 1766. He entered the university of Groningen at the age of 14. At 19 he was appointed professor of mathematics and philosophy at Amsterdam, where in 1706 he published his edition of the *Onomasticon* of Pollux. In 1720 he became professor of Greek at Franeker, and in 1740 of Greek history at Leyden. His works include editions of Lucian's "Dialogues" and "Timon" (1708), and of the "Plutus" of Aristophanes (1744), and "Notes and Emendations on Xenophon of Ephesus" (1784). **II. Frans**, a philosopher, son of the preceding, born in Groningen in 1722, died at the Hague in 1790. He was in the service of the United Provinces as first assistant to the secretary of state. He was a laborious student, and spent his leisure hours in cultivating belles-lettres and philosophy. His complete philosophical works were published at Paris in 1792.

**HEN**. See **Cock**.

**HENBANE** (*hyoscyamus*, Tournefort), a somewhat rare but highly dangerous weed, belonging to the nightshades (*solanaceæ*), seen in

Henbane (*Hyoscyamus niger*).

waste places and on rubbish heaps, and on the sites of old houses; remarkable for the singular beauty of its flowers, as well as for its fetid, viscid stems, and clasping, sinuate-toothed, and angled leaves. There are many species of henbane, but the one most common in the United States is an adventitious weed from Europe, *H. niger*. Its seeds are small, flat, kidney-shaped, resembling beans, and suggesting the classic name of *hyoscyamus*, i. e., swine beans, being, it is said, eaten with impunity by the hog, though avoided by other creatures.—*Hyoscyamus* is used in medicine in the form of a tincture, extract, and fluid extract. Its action is very similar to that of belladonna and stramonium, at first diminishing and then increasing the frequency of the pulse, and producing dry-

ness of the throat, headache, delirium, and dilated pupils. The tendency of large doses to produce coma, and of small ones to cause sleep, seems, however, somewhat greater than with belladonna, though by no means equalling opium in this respect. It is used, though not very extensively, in certain nervous affections, as in some forms of neuralgia and insomnia, and occasionally to diminish the irritability that leads to cough. It may be regarded as a succedaneum of opium, though far inferior in power to that drug, and having less action upon the secretions. It is sometimes used in place of belladonna for dilating the pupil. Its activity is due to an alkaloid, hyoscyamia, which is white and crystalline, and forms crystallizable salts with the acids. The dose of the tincture is a fluid drachm or less; of the solid extract, two or three grains; of the fluid extract, five to ten drops.

**HENDERSON**, the name of five counties in the United States. **I.** A S. W. county of North Carolina, bordering on South Carolina, bounded S. by the Blue Ridge, and drained by French Broad river; area, 425 sq. m.; pop. in 1870, 7,706, of whom 1,208 were colored. The surface is hilly, and the soil adapted chiefly to grazing. The chief productions in 1870 were 4,348 bushels of wheat, 22,298 of rye, 212,914 of Indian corn, 21,101 of oats, 14,960 of potatoes, 22,886 lbs. of tobacco, 14,434 of wool, 82,916 of butter, and 417 tons of hay. There were 825 horses, 2,249 milch cows, 4,347 other cattle, 6,235 sheep, and 9,817 swine. Capital, Hendersonville. **II.** A N. E. county of Texas, bounded E. by the Neches and S. W. by Trinity river; area, 934 sq. m.; pop. in 1870, 6,786, of whom 1,654 were colored. The surface is undulating and the soil fertile and well watered. There is some timber, but the greater portion of the county is prairie. The chief productions in 1870 were 156,804 bushels of Indian corn, 23,075 of sweet potatoes, and 2,967 bales of cotton. There were 1,538 horses, 5,109 milch cows, 11,828 other cattle, 1,345 sheep, and 15,980 swine. Capital, Athens. **III.** A W. county of Tennessee, drained by Beech and Big Sandy rivers, and other streams; area, 780 sq. m.; pop. in 1870, 14,217, of whom 2,408 were colored. It has a nearly level surface, is well timbered, and has a fertile soil, suitable for grain, grass, and the vine. The Mobile and Ohio railroad touches the S. W. corner. The chief productions in 1870 were 41,274 bushels of wheat, 547,805 of Indian corn, 30,736 of sweet potatoes, 15,134 lbs. of tobacco, 15,923 of wool, 142,847 of butter, and 4,191 bales of cotton. There were 2,816 horses, 1,679 mules and asses, 3,649 milch cows, 1,308 working oxen, 5,318 other cattle, 10,168 sheep, and 32,559 swine. Capital, Lexington. **IV.** A N. W. county of Kentucky, separated from Indiana on the N. by the Ohio river, and drained also by Green river; area, 725 sq. m.; pop. in 1870, 18,457, of whom 5,990 were colored. It abounds in coal, has a

hilly surface, and is fertile in grain and tobacco. The St. Louis and Southeastern railroad runs through the county. The chief productions in 1870 were 47,586 bushels of wheat, 739,652 of Indian corn, 6,600,506 lbs. of tobacco, 19,985 of wool, and 84,174 of butter. There were 2,867 horses, 1,656 mules and asses, 2,664 milch cows, 4,355 other cattle, 7,681 sheep, and 19,652 swine. Capital, Henderson. **V.** A W. county of Illinois, bordering on Iowa, bounded W. by the Mississippi, and drained by Henderson river and other streams; area, 890 sq. m.; pop. in 1870, 12,575. It has a diversified surface, occupied by fertile prairies and tracts of timber. Coal and limestone are found. The Chicago, Burlington, and Quincy railroad and Carthage branch, and the Rockford, Rock Island, and St. Louis railroad traverse the county. The chief productions in 1870 were 230,174 bushels of wheat, 96,430 of rye, 1,712,901 of Indian corn, 229,286 of oats, 59,711 of potatoes, 23,317 lbs. of wool, 267,268 of butter, and 12,326 tons of hay. There were 7,075 horses, 4,485 milch cows, 8,797 other cattle, 6,146 sheep, and 27,762 swine; 10 manufactories of carriages, 6 of saddlery and harness, 1 of woollen goods, 3 distilleries, 6 flour mills, and 2 saw mills. Capital, Oquawka.

**HENDERSON**, a city and the capital of Henderson co., Kentucky, on the Ohio river, about 200 m. below Louisville, and 150 m. W. of Frankfort; pop. in 1870, 4,171, of whom 1,489 were colored. It is situated in a well timbered region, productive of grain and tobacco, and abounding in coal and salt. Steamers run regularly to Louisville, Memphis, and other points, and the St. Louis and Southeastern railroad furnishes communication with St. Louis and Nashville. Large quantities of tobacco, corn, and wheat are shipped, and there are 16 tobacco stemmeries, a cigar factory, four manufactories of wagons, two of carriages, two of saddlery and harness, a foundery, car works, a brewery, two distilleries, and three flour mills. The city has handsome fair grounds, water works, six hotels, a fine station house, court house and jail, two public school houses, three weekly newspapers, and 11 churches.

**HENDRICKS**, a central county of Indiana, drained by White and Eel rivers; area, 389 sq. m.; pop. in 1870, 20,277. It has a level and well timbered surface, and a fertile soil. The Indianapolis and St. Louis and the Indianapolis, Bloomington, and Western railroads traverse it, and the Indianapolis and Vincennes line touches the S. E. corner. The chief productions in 1870 were 376,992 bushels of wheat, 975,825 of Indian corn, 53,501 of oats, 47,620 of potatoes, 70,233 lbs. of wool, 218,526 of butter, and 12,180 tons of hay. There were 7,500 horses, 1,176 mules and asses, 5,492 milch cows, 13,946 other cattle, 21,460 sheep, and 30,380 swine; 16 manufactories of carriages, 11 of bricks, 5 of cooperage, 10 of saddlery and harness, 3 of woollen goods, 13 flour mills, and 15 saw mills. Capital, Danville.

**HENDRICKS, Thomas Andrews**, an American statesman, born in Muskingum co., Ohio, Sept. 7, 1819. In 1822 his father settled in Shelby co., Indiana. Thomas graduated at South Hanover college in 1841, studied law at Chambersburg, Pa., was admitted to the bar there in 1843, and returned to Indiana to practise. In 1848 he was a member of the legislature, and in 1850 a delegate to the state constitutional convention. From 1851 to 1855 he represented the Indianapolis district in congress, from 1855 to 1859 was commissioner of the general land office, and from 1863 to 1869 was a member of the United States senate, in which he was regarded as the democratic leader. In the democratic national convention of 1868 in New York, he was strongly supported for the nomination to the presidency. As candidate for governor of Indiana he was defeated in 1860 and in 1868, but was elected in 1872 for the term ending Jan. 1, 1877. In 1876 he was the democratic candidate for vice president.

**HENGIST**, a Jutish prince, founder of the kingdom of Kent, who is said to have died about 488, but whose very existence is doubted by recent historians. He was a reputed descendant of Woden or Odin, and in company with his brother Horsa, with 300 men in three vessels, landed in 449 on the British coast at Ebbsfleet, near Richborough, in the isle of Thanet. Finding the British chieftains in need of assistance against the Picts and Scots, the Saxons agreed to assist in repelling the northern invaders, and, having been reinforced by 1,300 of their countrymen, they defeated them with such slaughter as effectually put a stop to their incursions. Hengist and his brother, perceiving the feebleness of their employers, forthwith sent envoys to their native country, who returned shortly with an army of 5,000 men. They brought with them also Rowena, the daughter of Hengist, who acted as cup-bearer at a feast given by her father to Vortigern, the principal British king. Vortigern became enamored of the Saxon beauty, and demanded her in marriage, to which Hengist consented. The Britons, alarmed at these proceedings, intimated to their auxiliaries that the time was now arrived for their departure. But Hengist and Horsa allied themselves with the northern tribes whom they had lately repelled, and made war upon the Britons, spreading havoc and desolation, according to the Venerable Bede, from the "East sea to the West." The Britons formed a more vigorous system of defence, and, having deposed Vortigern, marched under the leadership of his son Vortimer. Hengist and Horsa were defeated in three battles, Horsa was slain in action at Eaglesford, now Aylesford (455), and Hengist then withdrew to his native country. On the death of Vortimer, Hengist returned with his forces much augmented. He is represented as soliciting a treaty of peace with Vortigern, who had been restored to power among the Britons.

The latter, trusting in the honor of the Saxon, invited his people to a great feast at Stonehenge, where, at a signal from Hengist, a fearful massacre took place. The life of Vortigern was spared; but the result was the speedy conquest of the whole southern country. Meanwhile Ambrosius, a Briton of Roman descent, endeavored to reunite his countrymen. Hengist received large reinforcements, under the command of his brother Octa, and of Ebissa the son of Octa, who occupied Northumberland. He remained himself in the south, completing his conquests in a great battle at Crayford, in 457. The Britons fled in terror to London, having lost the flower of their warriors, and abandoned Kent. The kingdom which bore this name under Hengist is said to have consisted of the county so called, Middlesex, Essex, Sussex, and part of Surrey, though Sharon Turner restricts it to Kent proper. The victor established his court at Canterbury, and reigned about 30 years. The Britons meanwhile had made several desperate exertions to expel him. Their last effort (473) was conclusive of their destinies, as, suffering a more signal defeat than ever, they are declared to have fled from the Saxons as from fire. The romantic character of the British tradition of Hengist and Horsa has been established by modern historians; and Lappenberg shows that the Anglo-Saxon stories on the subject are purely mythical.

**HENGSTENBERG, Ernst Wilhelm**, a German theologian, born at Fröndenberg, Westphalia, Oct. 20, 1802, died in Berlin, May 28, 1869. He studied philology, especially the oriental languages, at Bonn. In 1823 he went as a private tutor to Basel, in 1824 became *Privatdocent* of theology at the university of Berlin, in 1826 extraordinary professor, and in 1828 ordinary professor of Old Testament exegesis. He soon acquired a commanding influence in the church by the publication of the *Evangelische Kirchenzeitung* (1827), which was started as the organ of the evangelical party in the church and the conservative aristocratic party in the state. Hengstenberg soon fell out with the theologians who were attached more to evangelical Biblical than to orthodox Lutheran principles, and his journal became more and more the organ of a high-church Lutheran party. The order of freemasons, although the prince of Prussia was known to be one of its chief patrons, was denounced by him as infidel. His principal works are devoted to the interpretation of the Bible, and to the defence of its genuineness, integrity, inspiration, and divine authority, against the attacks of modern critical and skeptical schools. The most celebrated among them is his *Christologie des Alten Testaments* (3 vols., Berlin, 1829-'35; 2d ed., 1854-'7; translated by Dr. Reuben Keith, 3 vols., Alexandria, 1836-'9). His *Commentar über die Psalmen* (4 vols., 1842-'5; 2d ed., 1849-'52; translated into English) is regarded as a masterpiece of orthodox exegetical theology. His other works are: *Beiträge zur*

*Einleitung ins Alte Testament* (3 vols., 1831-'9); *Die Bücher Moses und Aegypten* (1841; English translation by R. D. C. Robbins, Andover, 1843); *Die wichtigsten und schwierigsten Abschnitte des Pentateuchs* (1842); *Commentar über die Offenbarung des heiligen Johannes* (2 vols., 1850-'51; 2d ed., 1861-'3); *Das Evangelium des heiligen Johannes erläutert* (1862-'3; 2d ed., 1867); *Das Hohelied Salomonis ausgelegt* (1853); *Die Weissagungen des Propheten Ezechiel* (2 vols., 1867-'8); *Geschichte des Reiches Gottes unter dem alten Bunde* (2 vols., 1869-'70); and *Das Buch Hiob erläutert* (1870).

**HEN HAWK.** See HARRIER.

**HENLE, Friedrich Gustav Jakob, or Julius,** a German physiologist, born in Fürth, Bavaria, July 9, 1809. He studied medicine at Heidelberg and at Bonn, receiving his degree of doctor in the latter place in 1832, and went to Berlin, where he was appointed assistant at the anatomical museum. In 1834 he became professor to the medical faculty of the university, but having been convicted of affiliating with the secret societies of the students called the *Burschenschaften*, he was imprisoned, and, though soon pardoned and released, was not able till 1837 to establish himself in the university as a private tutor. For three years he gave instructions in pathology and in microscopic anatomy, the latter a branch of science which he was the first to develop; and in 1840 he accepted the professorship of anatomy and later of physiology in the university of Zürich. Previous to this he had been a contributor to the "Annual Reports" of Canstatt, and had published *Ueber Schleim- und Eiterbildung* (Berlin, 1838); *Vergleichende Anatomie des Kehlkopfes* (Leipsic, 1839), describing the development of the larynx in animals, from man down to the lowest types of creation; and *Pathologische Untersuchungen* (Berlin, 1840), a series of observations on the nervous system, the periodical nature of certain maladies, miasma, &c. While at Zürich he aided Pfeufer in establishing the *Journal de médecine rationnelle*. Between 1844 and 1852 he filled the chair of anatomy, physiology, pathology, and anthropology at Heidelberg. Within this period appeared his most important work, *Handbuch der rationellen Pathologie*. In 1852 he became professor of anatomy and director of the anatomical institute at Göttingen. His employment of the achromatic microscope for anatomical purposes opened a wide and interesting field of observation to scientific men. Among his remaining works are *Handbuch der allgemeinen Anatomie* (Berlin, 1841), and *Handbuch der systematischen Anatomie des Menschen* (3 vols., Brunswick, 1855-'64, and 1868).

**HENLEY, John,** an English clergyman, better known as "Orator Henley," born at Melton Mowbray, Aug. 3, 1692, died Oct. 4, 1756. He entered St. John's college, Cambridge, at the age of 17, and while an undergraduate addressed to the "Spectator" two letters which

were published in numbers 396 and 518. Having taken orders, he was made assistant curate of the parish of Melton. Soon afterward he was chosen assistant preacher at Ormond street and Bloomsbury chapels, London. In 1723 he obtained the living of Chelmondiston, Suffolk, with the privilege of non-residence; but reports having been spread damaging to his reputation, the bishop ordered him to remove to his parish, whereupon he resigned the living. He now rented a building in Newport market, and fitted it up as a place of worship. "The Oratory," as he called it, was opened in 1726, and for about 30 years he lectured twice a week to large audiences, mainly of the lowest classes of the people. All except those who rented seats were charged a shilling for admittance. He endeavored to found a new sect to be called Henleyarians, and drew up a form of prayer under the title of the "Primitive Liturgy," discarding the Nicene and Athanasian creeds. He also conceived the idea of connecting with his system an enlarged course of liberal education. For some time he edited a weekly journal of nonsense called the "Hyp-Doctor," designed to ridicule the arguments of the "Craftsman," for which he received from Sir Robert Walpole £100 a year. When this gratuity was withdrawn, he became so violent an opponent of government that in 1746 some adherents of the ministry broke up one of his Sunday evening meetings and caused him to be arrested, but he was soon set at liberty. He used to put forth the most preposterous announcements. On one occasion he advertised to teach shoemakers a short way of making shoes, which was by cutting off the tops of ready-made boots. He interlarded his orations with satire, invective, and buffonery, and accompanied them with all the extravagances of a theatrical delivery. Pope apostrophized him in the "Dunciad." Yet Henley was a man of learning and a diligent student. He wrote a poem entitled "Esther," which is said to contain fine passages; a "Compleat Linguist, or a Universal Grammar of all the Considerable Tongues in Sweden;" a number of pamphlets, various controversial pieces, and the "Oratory Transactions" published in numbers.

**HENLOPEN, Cape.** See CAPE HENLOPEN.

**HENNA**, the East Indian name for a shrub of the genus *Lawsonia* (Willdenow), belonging to the natural order *lythraceæ*, found in Asia and Africa. The genus consists of but a single species, *L. alba*, which, being variable, has received other names. It is 8 or 10 ft. high, and bears abundantly corymbose, white, and very fragrant flowers; the leaves are smooth, opposite, oval, and lanceolate. It is cultivated in India, Egypt, and other eastern countries, where it has been in use as a cosmetic from very early times, the yellow color on the nails of some of the Egyptian mummies being supposed to be derived from henna. It is used by the women to color their finger and toe nails, the tips of their fingers, the palms of the

hands, and the soles of the feet; the men use it to color their beards, and the manes and tails of their horses. It produces a reddish-orange color, which it is said the subsequent application of indigo will turn to black. The leaves and young twigs are reduced to a fine powder, made into a paste with hot water, and spread upon the part to be dyed, where it is usually left over night. The shrub is grown in greenhouses as the Egyptian privet, and is naturalized in the West Indies, where it is called Jamaica mignonette.

**HENNEPIN**, a S. E. county of Minnesota, bounded E. by the Mississippi, N. W. by Crow river, and S. by the Minnesota; area, about 600 sq. m.; pop. in 1870, 31,566. It has an undulating surface, covered with good timber, and contains Minnetanka lake. The St. Paul and Pacific, the Milwaukee and St. Paul, and the Minneapolis and Sioux City Junction railroads pass through it. The chief productions in 1870 were 379,063 bushels of wheat, 259,418 of Indian corn, 226,361 of oats, 98,863 of potatoes, 333,146 lbs. of butter, 89,414 of maple sugar, 62,800 of flax, and 25,454 tons of hay. There were 3,633 horses, 5,361 milch cows, 1,318 working oxen, 5,449 other cattle, 5,672 sheep, and 5,592 swine; 6 manufactories of agricultural implements, 2 of bags, 8 of boots and shoes, 2 of bricks, 10 of carriages, 11 of clothing, 2 of confectionery, 8 of barrels and casks, 16 of furniture, 3 of iron castings, 7 of machinery, 1 of vegetable oil, 2 of paper, 5 of saddlery and harness, 6 of sash, doors, and blinds, 1 of soap and candles, 8 of tin, copper, and sheet-iron ware, 2 of woollen goods, 14 flour mills, 4 breweries, 3 planing and 23 saw mills, and 5 pork-packing establishments. Capital, Minneapolis.

**HENNEPIN, Louis**, a Franciscan (Recollect) missionary and explorer of the Mississippi river, born at Ath, Belgium, about 1640, died in Holland subsequent to 1701. After his entrance into the Franciscan order, he made a tour through Germany and Italy, at the close of which he was settled for a year as preacher at Halles in Belgium. His superiors then sent him to Artois, whence he journeyed to Holland, and for eight months had charge of a hospital at Maestricht. At the battle of Senef, between the prince of Condé and William of Orange, in 1674, he was present as regimental chaplain. The next year he was ordered to Canada, and embarked in company with Bishop Laval, whose favor he managed to secure on the voyage, and with the sieur de la Salle. He preached for a while at Quebec. In 1676 he went to the Indian mission at Fort Frontenac, whence he visited the Mohawk country. In 1678 he was attached to La Salle's expedition, and accompanied the chevalier de Tonty and the sieur de la Motte from Fort Frontenac to Niagara, where La Salle constructed the Griffin, a vessel for navigating the lakes above the falls. This accomplished, La Salle on Aug. 7, 1679, began his voyage. He passed through

Lakes Erie, Huron, and Michigan, to the mouth of the St. Joseph's river, ascended this in canoes to the portage, carried them five or six miles to the Kankakee, and floated down this stream and the Iroquois to the Illinois, on which they built Fort Crèvecoeur, a little below the present site of Peoria. Hearing no tidings of the Griffin, which he had sent back, La Salle returned to Fort Frontenac for supplies, charging Michel Acau, Father Hennepin, and one other with a voyage of discovery, the precise object of which is unknown, but making the mouth of the Wisconsin a rendezvous. Hennepin set out in a canoe, Feb. 29, 1680, and followed the Illinois to its mouth. The party then explored the Mississippi till April 11, when they were taken by a party of Sioux and carried up the river to their villages. During this time Hennepin discovered and named the falls of St. Anthony. Daniel Greysolon du Luth had penetrated to the Sioux country by way of Lake Superior, and made peace with the tribe. Hearing that three Frenchmen were held prisoners, he advanced to where they were, and rescued them in July. He took them down the Mississippi to the Wisconsin, and passed up that river and down the Fox, and so through Green bay to Lake Michigan. From Quebec Hennepin sailed for France, where he published in 1683 his *Description de la Louisiane, nouvellement découverte au sud-ouest de la Nouvelle France*, &c. (12mo, Paris), containing the fullest published account of La Salle's first expedition, and of Hennepin's own explorations, with a description of the upper Mississippi. Notwithstanding the writer's vanity and fondness for exaggeration, this work is valuable. Hennepin was now appointed guardian of a convent at Renti in Artois; but refusing to return to America in obedience to his ecclesiastical superiors, he was compelled to leave France, and proceeding to Holland in lay dress sought the favor of William III. of England. In 1697, 10 years after La Salle's death, Hennepin published his extraordinary *Nouvelle découverte d'un très grand pays situé dans l'Amérique entre le Nouveau Mexique et la Mer Glaciale*, &c. (12mo, Utrecht). In this work, which embodies his *Description de la Louisiane*, written anew and enlarged, he asserts that he descended to the mouth of the Mississippi, and was the first European who floated on that river. He gives a journal, description of the scenery, Indian tribes, and the distances along the route, identical with that of Père Membre published by Le Clercq. Hennepin explained his long silence on this important point by saying that he feared the enmity of La Salle, who had ordered him to follow a different course, and who prided himself upon being the first who descended the Mississippi to the gulf of Mexico. Notwithstanding the utter impossibility of reconciling the dates given in Hennepin's narrative, the story obtained general credence until its falseness was exposed by Jared Sparks. (See "Life of La Salle," by

Sparks, in the "Library of American Biography.") His third work, published at Utrecht in 1698, *Nouveau voyage dans un pays plus grand que l'Europe*, was a compilation describing La Salle's voyage to the mouth of the Mississippi. Of these three works at least 24 editions appeared in various languages. He tried to return to Canada in 1699, but Louis XIV. ordered his arrest if he arrived there. He is said to have been at Rome in 1701, seeking to establish a mission on the Mississippi.

**HENNESSY, William J.** See supplement.

**HENNINGSEN, Charles Frederick**, an English soldier and author, of Scandinavian extraction, born in 1815, died in Washington, D. C., June 14, 1877. In 1834 he entered the service of Don Carlos, was a captain in the body guard of Zumalacarreghi, and was made colonel. Being taken prisoner, he was liberated on parole. He then entered the Russian army, and served in Circassia. Returning to England, he wrote "Revelations of Russia," which was translated into French (3 vols., Paris, 1845). He afterward took part, on the national side, in the Hungarian war of 1848-'9. After its termination he visited Kossuth at Kutaieh in Asia Minor, and followed him to the United States. In 1856 he joined Walker's force of filibusters in Nicaragua. During the civil war he served in the confederate army, with the rank of brigadier general. Subsequently he resided in Washington, and became interested in the cause of Cuba. His principal writings are: "Twelve Months' Campaign with Zumalacarreghi" (Philadelphia, 1836); "The Past and Future of Hungary" (Cincinnati, 1852); "The White Slave," a novel; "Eastern Europe;" "Sixty Years Hence," a novel of Russian life; and "Analogies and Contrasts."

**HENRICO**, a S. E. county of Virginia, bounded S.W. by James river, and N. E. by the Chickahominy; area, 291 sq. m.; pop. in 1870, 66,179, of whom 31,031 were colored. The surface is diversified with hills of no great height; bituminous coal abounds in the W. part, but most of the soil is light and poor. The James river and Kanawha canal has its E. terminus in this county, and five railroads, viz., the Chesapeake and Ohio, the Richmond, Danville, and Piedmont, the Richmond, Fredericksburg, and Potomac, the Richmond and Petersburg, and the Richmond and York River, radiate from Richmond. The chief productions in 1870 were 81,502 bushels of wheat, 127,166 of Indian corn, 89,601 of oats, 37,634 of Irish potatoes, 10,228 of sweet potatoes, and 2,112 tons of hay. The value of live stock on farms was \$216,497. The principal manufactories were 5 of agricultural implements, 8 of tobacco boxes, 16 of bread, &c., 13 of carriages, 4 of cars, 81 of clothing, 27 of furniture, 1 of gas, 10 of iron, 10 of saddlery and harness, 20 of tin, copper, and sheet-iron ware, 38 of tobacco and snuff, 19 of cigars, 9 printing establishments, 3 flour mills, 1 distillery, 2 breweries, and 2 saw mills. Capital, Richmond, also the capital of the state.

**HENRIETTA ANNA**, duchess of Orleans, daughter of Charles I. of England and Queen Henrietta Maria, born in Exeter, June 16, 1644, died at St. Cloud, June 29, 1670. She was carried to France while an infant and reared by her mother in a convent at Chaillot. As she grew up she did not please the young king, Louis XIV., her cousin, and was consequently regarded with indifference by the rest of the court. But when her brother Charles II. was restored to the throne of England, a marriage was arranged between her and the French king's only brother, Philip, duke of Orleans. She returned to France from England, whither she had accompanied her mother, and where she first displayed those powers of fascination for which she became celebrated. Her marriage took place on March 31, 1661, at the Palais Royal, and she at once became the delight of the French court. But the charms of madame, as she was called, produced no impression on her husband, and his coolness was changed into aversion after the attentions of the count de Guiche and of the king himself had become so marked as to attract notice. In 1670 the king induced her to visit her brother's court, and through her influence England was detached from the alliance with Holland and Sweden which had been formed in opposition to the interests of France. Shortly after her return she died suddenly in great suffering and in the belief that she had been poisoned. The discourse which Bossuet pronounced at her funeral was considered one of the noblest specimens of his eloquence. Her memoirs were written by Madame de La Fayette.

**HENRIETTA MARIA**, queen of England, born in Paris, Nov. 25, 1609, died at Colombes, near that city, Sept. 10, 1669. She was the youngest child of Henry IV. of France by his second wife, Maria de' Medici, and on March 30, 1625, was married at Paris by proxy to Charles I., king of England, a few days after his accession to the throne. She soon secured the affection of her husband and acquired great influence over him, but became obnoxious to the English nation by her undisguised partiality for the Catholic faith. She was charged by the king's opponents with being the adviser of his arbitrary policy and the enemy of English liberties. Her unpopularity was increased by her participation in the strife between Charles and the parliament. In 1642 she went to Holland, and procured money and troops, which she undertook to bring to England. Notwithstanding a violent storm, which drove her fleet toward the continent, she landed her forces at Bridlington, and joined her husband at Oxford. In 1644, a few days after being delivered of Henrietta Anna, her last child, at Exeter, she narrowly escaped being taken prisoner by Essex, and went to Falmouth, whence she sailed to France on board a Dutch ship. During her residence in France she suffered from the effects of the hardships she had undergone, and although granted a pension by the French government

she was rendered uncomfortable through the civil dissensions of the country. When Charles II. was recalled to England in 1660, she paid him a visit with her daughter Henrietta Anna, but soon returned to France, where she continued in retirement at her house in Colombes. She died suddenly, and her remains were buried in the abbey of St. Denis, with the exception of her heart, which was intrusted to the nuns of Ste. Marie de Chaillot. Bossuet delivered a funeral oration in her honor. The private correspondence of Henrietta and Charles I. during the civil war was published at London in 1857, edited by Mrs. Green.

**HENRIQUEL-DUPONT, Louis Pierre**, a French engraver, born in Paris, June 13, 1797. After attending for several years the school of Pierre Guérin the painter, he took to engraving under the direction of Bervic. His principal works are: a full-length portrait of a lady and her daughter, after Vandyke (1822); Gustavus Vasa, after Hersent (1831), the more valuable since the original painting was destroyed in 1848 at the Palais Royal; a full-length portrait of Louis Philippe, after Gérard (1837); "Lord Strafford on his Way to the Scaffold," after Delaroche (1840); "Christ the Consoler," after Scheffer (1841); portrait of Peter the Great of Russia, after Delaroche (1842); the "Hemicycle" of the *palais des beaux-arts*, after Delaroche's fresco (1853); the "Virgin and Child," after Raphael (1855); the "Enshrouding of Our Saviour," after Delaroche (1856); "Moses on the Nile," after the same (1858); the "Mystic Marriage of St. Catharine," after Correggio, the "Pilgrims of Emmaus," after Paul Veronese, and others (1867); and the "Disciples at Emmaus," after Paul Veronese (1869). He is one of the most eminent engravers of France, and succeeded Richomme as member of the academy of fine arts in 1849. At the exhibitions of 1853 and 1855 he obtained the grand medal of honor, and in 1863 he was appointed professor of copperplate engraving at the school of fine arts. He is also a skilful draughtsman, and his exquisite crayon portraits are much sought after by amateurs.

**HENRY**, the name of ten counties in the United States. **I.** A S. county of Virginia, bordering on North Carolina, and drained by Smith's river, a tributary of the Dan; area, 358 sq. m.; pop. in 1870, 12,303, of whom 5,581 were colored. It has a hilly surface. The chief productions in 1870 were 23,651 bushels of wheat, 154,794 of Indian corn, 75,229 of oats, and 1,129,617 lbs. of tobacco. There were 865 horses, 536 mules and asses, 1,747 milch cows, 2,379 other cattle, 3,442 sheep, and 7,448 swine, and 4 tobacco factories. Capital, Martinsville. **II.** A N. W. central county of Georgia, bounded N. E. by South river, a branch of the Ocmulgee, and drained by several affluents of the latter stream; area, 594 sq. m.; pop. in 1870, 10,102, of whom 3,833 were colored. The surface is diversified and well wooded, and the soil is of middling

quality. Iron, quartz, and a small quantity of gold are found. The Macon and Western railroad passes through the W. part. The chief productions in 1870 were 45,488 bushels of wheat, 166,210 of Indian corn, 16,619 of oats, 22,714 of sweet potatoes, and 4,888 bales of cotton. There were 860 horses, 1,125 mules and asses, 1,897 milch cows, 2,903 other cattle, 3,525 sheep, and 7,648 swine. Capital, McDonough. **III.** A S. E. county of Alabama, bounded S. by Florida, separated from Georgia on the E. by the Chattahoochee river, here navigable by steamboats, and drained by the east branch of the Choctawhatchee river; area, 975 sq. m.; pop. in 1870, 14,191, of whom 4,657 were colored. It has a diversified surface, and a light, sandy, but very fertile soil, drained by many small streams, and in some parts overgrown with pine forests. The chief productions in 1870 were 248,470 bushels of Indian corn, 48,988 of sweet potatoes, and 7,127 bales of cotton. There were 1,240 horses, 1,061 mules and asses, 3,551 milch cows, 7,231 other cattle, 3,953 sheep, and 22,186 swine. Capital, Abbeville. **IV.** A N. W. county of Tennessee, bordering on Kentucky, bounded E. partly by Tennessee river and partly by the Big Sandy; area, 600 sq. m.; pop. in 1870, 20,380, of whom 5,204 were colored. The surface is level and the soil rich. The Louisville and Nashville and Great Southern railroad traverses the county, and the Nashville and Northwestern line passes near the S. W. corner. The chief productions in 1870 were 98,435 bushels of wheat, 767,220 of Indian corn, 26,816 of oats, 31,882 of sweet potatoes, 1,715,001 lbs. of tobacco, 16,459 of wool, 174,000 of butter, and 2,385 bales of cotton. There were 3,658 horses, 2,722 mules and asses, 3,600 milch cows, 4,631 other cattle, 10,878 sheep, and 34,384 swine; 8 manufacturing of carriages, 2 of cotton goods, 6 of tobacco, 6 wool-carding and cloth-dressing establishments, and 7 saw mills. Capital, Paris. **V.** A N. county of Kentucky, bounded N. E. by the Kentucky river, which is here navigable by steamboats; area, 260 sq. m.; pop. in 1870, 11,066, of whom 2,438 were colored. It has an undulating surface, partly covered with forests, and a fertile soil of limestone formation. The Louisville, Cincinnati, and Lexington railroad passes through it. Drennon Springs, on the Kentucky river, is noted as a fashionable resort. The chief productions in 1870 were 57,123 bushels of wheat, 25,516 of rye, 591,528 of Indian corn, 63,913 of oats, 1,375,364 lbs. of tobacco, 26,501 of wool, 114,160 of butter, and 2,879 tons of hay. There were 3,595 horses, 2,376 milch cows, 4,203 other cattle, 6,389 sheep, and 19,080 swine; 2 flour mills, 2 saw mills, and 1 woollen factory. Capital, Newcastle. **VI.** A N. W. county of Ohio, traversed by Maumee river and drained by several of its branches; area, 410 sq. m.; pop. in 1870, 14,028. It has a level surface and a rich soil. The Wabash and Erie canal, and

the Toledo, Wabash, and Western, and the Dayton and Michigan railroads pass through it. The chief productions in 1870 were 175,151 bushels of wheat, 145,522 of Indian corn, 78,190 of oats, 67,347 of potatoes, 80,482 lbs. of wool, 297,973 of butter, and 11,811 tons of hay. There were 3,764 horses, 3,958 milch cows, 4,735 other cattle, 14,692 sheep, and 9,359 swine; 4 manufactories of carriages, 4 of tin, copper, and sheet-iron ware, 1 of woollen goods, 2 flour mills, and 25 saw mills. Capital, Napoleon. **VII.** An E. county of Indiana, having a level or rolling surface, originally covered with dense forests; area, 385 sq. m.; pop. in 1870, 22,986. The soil is fertile and watered by several small streams. The Pittsburgh, Cincinnati, and St. Louis, and the Fort Wayne, Muncie, and Cincinnati railroads traverse it. The chief productions in 1870 were 610,721 bushels of wheat, 1,152,164 of Indian corn, 98,677 of oats, 52,599 of potatoes, 64,953 lbs. of wool, 384,481 of butter, and 10,000 tons of hay. There were 6,894 horses, 4,985 milch cows, 9,385 other cattle, 17,089 sheep, and 33,847 swine; 18 manufactories of carriages, 6 of barrels and casks, 4 of bricks, 12 of saddlery and harness, 2 of sash, doors, and blinds, 5 of tin, copper, and sheet-iron ware, 4 of woollen goods, 11 flour mills, and 17 saw mills. Capital, Newcastle. **VIII.** A N. W. county of Illinois, bounded N. W. by Rock river, and drained also by its affluents, Green and Edwards rivers; area, 880 sq. m.; pop. in 1870, 35,413. It has an undulating surface, diversified with forests and fertile prairies, and contains good building stone and coal. The Chicago, Burlington, and Quincy railroad and the Galva and Keithsburg branch, the Chicago, Rock Island, and Pacific, and the Peoria and Rock Island railroads traverse it. The chief productions in 1870 were 462,824 bushels of wheat, 35,766 of rye, 2,541,683 of Indian corn, 668,367 of oats, 65,760 of barley, 156,734 of potatoes, 40,991 lbs. of wool, 644,494 of butter, and 37,229 tons of hay. There were 11,960 horses, 8,872 milch cows, 15,780 other cattle, 6,266 sheep, and 34,843 swine; 11 manufactories of carriages, 2 of barrels and casks, 5 of furniture, 13 of saddlery and harness, 1 of sash, doors, and blinds, 2 of soap and candles, 6 of tin, copper, and sheet-iron ware, 1 brewery, and 5 flour mills. Capital, Cambridge. **IX.** A S. E. county of Iowa, traversed by Skunk river, an affluent of the Mississippi; area, 432 sq. m.; pop. in 1870, 21,463. The surface is undulating and diversified by prairies and timber land. Coal and limestone are abundant, and the soil is of excellent quality. The Burlington and Missouri River railroad passes through it. The chief productions in 1870 were 219,474 bushels of wheat, 1,095,846 of Indian corn, 231,631 of oats, 99,459 of potatoes, 129,187 lbs. of wool, 490,181 of butter, and 27,991 tons of hay. There were 9,400 horses, 7,003 milch cows, 11,214 other cattle, 30,805 sheep, and 30,855 swine; 2 manufac-

ries of agricultural implements, 2 of boots and shoes, 19 of carriages, 4 of furniture, 7 of saddlery and harness, 6 of tin, copper, and sheet-iron ware, 1 of woollen goods, 1 tannery, 8 flour mills, and 6 saw mills. Capital, Mount Pleasant. **X.** A W. central county of Missouri, drained by Grand river, an affluent of the Osage; area, 750 sq. m.; pop. in 1870, 17,401, of whom 642 were colored. It has a diversified surface, abounds in coal, timber, and water power, is mostly fertile, and is well adapted to stock raising. The chief productions in 1870 were 239,828 bushels of wheat, 1,167,590 of Indian corn, 298,581 of oats, 34,117 of potatoes, 181,945 lbs. of butter, and 5,167 tons of hay. There were 7,066 horses, 1,256 mules and asses, 5,262 milch cows, 12,157 other cattle, 12,162 sheep, and 27,252 swine; 2 manufactories of bricks, 6 of carriages, 5 of saddlery and harness, 2 of tin, copper, and sheet-iron ware, 2 of woollen goods, and 9 flour mills. Capital, Clinton.

**HENRY**, the name of several sovereigns of England, France, and Germany.

#### I. ENGLAND.

**HENRY I.**, surnamed **BEAUCLEUC**, the third English monarch of the Norman line, and first prince of that line of English birth, born at Selby, Yorkshire, in 1068, died near Rouen, Dec. 1, 1135. Having received from his father, William the Conqueror, who died when Henry was 19 years old, £5,000 in silver, he bought from his brother Robert the district of Cotentin, comprising one third of Normandy. On the belief that he was leagued with William Rufus of England, Robert imprisoned him, but released him at the intercession of the Norman nobles. When William attacked Robert in 1090, Henry sided with the latter, and displayed great energy, courage, and cruelty. In the following year William and Robert became reconciled and turned their combined forces against Henry, compelling him to surrender all his possessions. For some years he lived in seclusion, when the people of Domfront, one of Robert's strongest places, called him to rule over them. He made other acquisitions at Robert's expense, became reconciled with William, and went to England. On Aug. 2, 1100, he was hunting in the New forest when William was there slain; and, riding immediately to Winchester, he claimed and obtained the crown, to the prejudice of Robert, who was then in the Holy Land, a leader in the first crusade. Three days later his coronation took place. He owed his success in part to his boldness, and in part to his liberal promises and concessions. He conciliated the clergy, inviting Anselm back to England. He promised to remedy abuses and to maintain the old Anglo-Saxon laws and usages, the charter he granted becoming the basis of all subsequent reforms. By marrying Matilda of Scotland, daughter of Malcolm Canmore and Margaret, and niece of Edgar Atheling, he conciliated the

Saxon but disaffected the Norman portion of his subjects. Robert, returned from the East, landed at Portsmouth (1101) with a considerable force, and summoned Henry to surrender to him possession of England. A negotiation ensued, and Robert, having been guaranteed the undisturbed possession of Normandy, resigned his pretensions to the English throne. But Henry occupied himself for several years in strengthening his position in England, and in 1105 called upon Robert to yield up Normandy also. Robert indignantly refused, whereupon Henry invaded Normandy and captured several places of importance. The next year he renewed his invasion and laid siege to the castle of Tinchebrai. Robert hastened to its relief, and a severe battle was fought beneath its walls. Henry was victorious and took Robert prisoner. The latter having attempted to escape, Henry, according to some authorities, put out his eyes; it is certain that he kept him in prison 28 years. Henry's right to the throne was disputed by Robert's son, whose claims were supported by the counts of Flanders and Anjou and the king of France. Peace was made with France in 1113, and tranquillity was maintained for some years. The question of investiture led to trouble with Rome, which was aggravated by the papal claim to send legates to England. In consequence of the continued troubles in Normandy, and the renewal of the war with the French king, Henry passed much of his time in France, to the discontent of the English. In 1114 he married his daughter Matilda to Henry V., emperor of Germany. The victory of Brenneville decided the war with France favorably for Henry (1119), and peace was made, so that in 1120 his power was established. The same year his son William was lost while sailing from France to England, and the king never recovered from the shock. Queen Matilda had died in 1118, and Henry married Adelia, daughter of the count of Louvain; no children followed from this union. New difficulties on the continent caused Henry to return there in 1123; success again attended him, and peace was restored. The death of his nephew William in 1128 relieved him from an active enemy. His daughter Matilda returned to England on the emperor's death, and in 1126 her father prevailed on a numerous assemblage of the clergy and laity to swear that, in the event of his death without male issue, she should be recognized as queen and duchess. In 1127 Matilda was privately married to Geoffrey Plantagenet, count of Anjou, and the quarrels between them caused the king much annoyance. The nobility, too, declared that the marriage had absolved them from their oath. The Welsh having given him much trouble throughout his reign, he was about to attempt their conquest when he died. His death was attributed to over-indulgence in his favorite dish, lampreys.

**HENRY II.**, founder of the Plantagenet dynasty, grandson of the preceding, and son of

Geoffrey Plantagenet and the ex-empress Matilda, born in Le Mans in March, 1133, died at the castle of Chinon, July 6, 1189. On the death of Henry I., his nephew Stephen, count of Blois, usurped the thrones of England and Normandy. A long series of contests followed, in the latter part of which Prince Henry much distinguished himself. These were terminated by an arrangement in 1153, by which it was settled that Henry should succeed to the English throne on Stephen's death, which event took place Oct. 25, 1154. Henry had become duke of Normandy in 1150, and count of Anjou and Maine in 1151; and by marrying Eleanor, duchess of Aquitaine, who had been divorced from Louis VII. of France, he obtained in 1152 possession of nearly the whole of southern France. He was his wife's junior by upward of ten years. They were crowned at Westminster, Dec. 19, 1154. Henry's continental possessions comprised more than a third of France, including Normandy, Maine, Touraine, Anjou, Poitou, Guienne, and other provinces; and in a few years he made himself master of Brittany. He brought to the throne a high reputation for talent and courage. He restored the coinage, revoked improper grants, dismissed mercenaries, suppressed lawlessness, and destroyed many of the feudal castles which had been erected in Stephen's reign. But for his troubles with the church, he would have been the greatest, as he was one of the ablest, of English monarchs. These disputes began in 1162. Henry had resolved to curb the clergy, and made Thomas à Becket, upon whom he thought he could rely for assistance, archbishop of Canterbury, he having held the chancellorship since 1158. But Becket became the most austere of churchmen and the most vehement champion of the independence of his order, and placed himself in direct opposition to the king. The first open collision between them occurred at an assembly of bishops called by the king at Westminster in 1163, in which the prelates, following Becket's lead, refused to yield to Henry the customary jurisdiction of the ecclesiastical courts. This led to an attempt to overthrow the whole system of clerical immunities, and for that purpose a convocation of bishops and barons was held at Clarendon, Jan. 25, 1164. The primate, who since the former assembly had been induced to promise unconditional acquiescence, now demanded of the king to make known what these "customs" were, which he and his brother bishops were to observe. A committee of inquiry was thereupon appointed, and the sixteen constitutions or "customs" of Clarendon were drawn up. By these it was enacted that clerks charged with crime should be tried in the civil courts; that no appeals in spiritual causes should be carried beyond the king without his consent; that if, in any lawsuit between a clergyman and a layman concerning a tenant, it was disputed whether the land were a lay or an ecclesiastical fee, this should

be decided by the verdict of twelve lawful men, and if found to be a lay fee, the cause should be determined by the civil courts; that laics should not be accused in spiritual courts, except by legal and reputable witnesses; that no chief tenant of the crown should be excommunicated, nor his lands be put under an interdict, except with the king's consent; that no person, particularly no clergyman, should leave the kingdom without that consent; that the civil courts should decide all suits concerning the advowson and presentation of churches; that the churches belonging to the king's fee should not be granted in perpetuity without his consent; that the revenues of vacant sees should belong to the king, that the election to such sees should be held by the king's consent and in his chapel, and that the bishop elect should do homage to the crown; that goods forfeited to the king should not be protected in churches or churchyards; and that archbishops, bishops, and other spiritual dignitaries should be regarded as barons of the realm, possessing the privileges and subject to the burdens belonging to that rank, and bound to attend the king in his great councils, and assist at all trials. The power of excommunication was lessened, the clerical privileges respecting the collection of debts were annulled, and the sons of villeins were forbidden to be ordained clerks without the consent of their lords. Three copies of these were the next day, Jan. 26, presented for subscription. When the primate was asked to affix his seal, he refused, saying that he had performed all that he had promised. When, afterward, the pope officially disapproved of these constitutions, Becket retracted his former promise. The quarrel between him and the king was renewed, and lasted for seven years, when Becket was killed by four Norman barons (Dec. 29, 1170). During the quarrel Becket was banished, the king of France began hostilities with England, and the war lasted three years. The murder of Becket annoyed Henry, as he feared the pope would carry out his threat of excommunication; but his negotiators succeeded in confining the papal anathemas to those who had committed the crime. In 1171 Henry undertook the conquest of Ireland, the expedition being approved of by a papal bull in 1156, and a few of his subjects having already waged a successful war in that island. He met with little resistance. Having taken a solemn oath that he had not instigated Becket's murder, and having made various concessions to the church, he was confirmed by Rome in the grant of Ireland. The troubles in his family, which clouded the latter portion of his life, now commenced. He had associated with him his eldest son, Henry, in the government of England, Normandy, Anjou, and other territories; Richard was made ruler of Guienne and Poitou; Geoffrey was to be duke of Brittany; and John was to receive Ireland. But from 1173 these sons gave him much vexation, be-

ing encouraged to rebel by their mother, who was enraged by Henry's conjugal infidelities, by the French king, who was the father-in-law of the eldest, and by the nobles in various parts of his dominions. Henry now did penance at the tomb of Becket, fasting and praying there, and submitting to flagellation at the hands of the monks. The Scots, having invaded England, were defeated, and the rebels, including his sons, returned to obedience. The king of Scotland did homage to him, and surrendered portions of his dominion. In the interval of quiet that followed, Henry made several legal reforms. The disputes that broke out in his family were fatal to his peace. His sons quarrelled with him and with each other. The eldest died in 1183, and Geoffrey was killed in 1186. In 1188 Richard rebelled, and was aided by France, though both Henry and the French king had taken the cross, intending to embark for Palestine. Henry was beaten, and submitted to the terms dictated by his enemies. Shortly after he died of a fever brought on by mental irritation.

**HENRY III.**, son of John, king of England, and of Isabella of Angoulême, born Oct. 1, 1207, died at Westminster, Nov. 16, 1272. He became king Oct. 17, 1216, being then but nine years old. The desperate state to which England had been reduced by the misgovernment of John makes the period of the accession of Henry III. the darkest in English history; but, owing to the talents and wisdom of the earl of Pembroke, who was protector, the state of the country was rapidly improved. He confirmed Magna Charta, conciliated the discontented barons, defeated the French both by sea and land, and restored peace. Pembroke soon dying, power passed to the hands of the bishop of Winchester and Hubert de Burgh, the latter being justiciary and having most weight in the government. They had not the influence of Pembroke, and could not control the barons. War was made with France, but it was found impossible to recover the French provinces lost by John. In 1231 the justiciary, who had received large gifts and been made earl of Kent, was overthrown, and Winchester, an able but unprincipled man, monopolized power. He was a Poitevin, and many of his countrymen going over to England, they were intrusted with office, to the discontent of the English of all ranks, whom they oppressed and plundered. This evil was aggravated by the marriage of the king in 1236 with Eleanor of Provence, many of whose countrymen came to England, and shared in the king's bounty. An expedition into France in 1242 terminated disastrously. The pope offered Henry the crown of Sicily for his son Edmund, and the king was involved in debt by his endeavors to support the claim. The chief interest of his reign belongs to the disputes between the king and the barons. These came to a head in 1258, when Simon de Montfort, earl of Leicester, was chief of the baronial party and held possession

of the king's person. The "provisions of Oxford," enacted by the parliament which met there in that year, provided for the election of knights of the shire, four from each, for three sessions of parliament in each year, and for the annual election of sheriffs. Measures hostile to foreigners were also adopted. Government was now in the hands of the barons, who lost the popularity they had once enjoyed. Louis IX. of France made a treaty with Henry in 1259, on terms favorable to the latter. Circumstances enabling the king to renew the contest with the barons, war ensued, and the royalists were defeated at Lewes, May 13, 1264, Henry being taken prisoner. Prince Edward was compelled to make the treaty of Lewes with Montfort, and himself to become a hostage. In January, 1265, a new parliament assembled in London, called by Montfort, to which were summoned two knights from each county, and two deputies from each of certain cities and boroughs, such deputies never having previously been summoned; and the writs were addressed, not to the sheriffs, but to the boroughs. This was the commencement of the house of commons. Prince Edward having escaped from Leicester, the royal party renewed the war, and Leicester was defeated and slain at Evesham, Aug. 4, 1265. The king's authority was reestablished, and tranquillity restored. Henry's reign lasted 56 years, the longest in English history except that of George III.

**HENRY IV.**, founder of the royalty of the house of Lancaster, supposed to have been born at Bolingbroke, Lincolnshire, April 4, 1366, died in Westminster, March 20, 1413. He was the eldest son of John of Gaunt, duke of Lancaster, fourth son of Edward III., and of Blanche, daughter and heiress of Henry Plantagenet, duke of Lancaster, great-grandson of Henry III. His first title was earl of Derby. At the age of 15 he married Mary Bohun, daughter of the earl of Hereford, who was descended from Edward I. In his youth Henry delighted in tournaments and adventures. In 1390 he went to the assistance of the Teutonic knights, serving in Prussia and Lithuania. He then went to Barbary. Returning to England for a season, he set out on a journey to Palestine in July, 1392. He travelled by the way of Dantzic, Königsberg, Vienna, Friuli, and Venice, sailing from the last named place for Rhodes, whence he returned to England in 1393, visiting on the way Venice, Milan, Piedmont, Savoy, and France. Richard II. made him duke of Hereford in 1397. In 1398 he brought an accusation of traitorous designs against the duke of Norfolk, who denied it, and appealed to the trial by battle. The arrangements for fighting were all completed, when the king put an end to the contest, banishing both parties, Norfolk for life, and Hereford for ten years. Subsequently Hereford's term of exile was reduced to six years; but when, on his father's death, he became duke of Lancaster, Richard banished him for life, and seized his immense

possessions. Lancaster resolved to return home, ostensibly to assert his claim to his property, but with the intention of obtaining the crown. This course was advised by his friends. He landed at Ravenspur, July 4, 1399, with a small force, the king being absent on an expedition in Ireland, and declared that his only object was to establish his right to his hereditary possessions; but he became immediately the chief of the opposition that had been created by Richard's follies and crimes, and was joined by persons of all classes, from the Percies to the humblest commoners. Success followed his movements; and when Richard returned he was unable to resist, and became Lancaster's prisoner, resigning the crown, which parliament conferred upon the duke, who thus became Henry IV. (Sept. 30, 1399). The only person who objected was the bishop of Carlisle. The new king affected to trace his right to the crown to his descent from Edmund of Lancaster, who was said to have been the elder brother of Edward I., but to have lost his inheritance from some personal deformity. This claim was not valid, and Henry had only such right as came from conquest and parliamentary election. This defect in his title led him to court the clergy, who were now troubled by the Lollards; and though his father had been the greatest patron and supporter of Wycliffe, Henry became the persecutor of the reformers. The statute *de heretico comburendo* (for the burning of heretics) was adopted in 1401, and it was not allowed to remain a dead letter. Henry's reign was mostly passed amid conspiracies and civil and foreign war, and he spared few of his enemies. He found the Welsh his constant foes, and was more than once attacked by the Scots. The Percies broke with him in 1403, though they had been the chief instruments in his elevation; and the battle of Shrewsbury was fought in July, 1403, and Henry Percy, called Hotspur, defeated and slain. Other attempts were made to depose him, but, though not without great difficulty, the king triumphed over his enemies, Glendower in Wales alone proving unconquerable, though much reduced. An English vessel took the ship on board of which Prince James, heir apparent of the Scotch crown, was going to France, and the prince remained a captive for many years. The feeling between France and England during this reign was extremely bitter, because Richard, who had espoused for his second wife a daughter of the French king, was popular in the former country. Henry became unpopular shortly after his elevation to the throne, though as a subject he had been the favorite of all classes. His first wife died in 1394, leaving four sons, who were among the most eminent men of that age, and two daughters. His second wife was Joanna of Navarre, widow of the duke of Brittany, whom he married in 1403, and by whom he had no issue.

**HENRY V.**, son of the preceding, and second king of the Lancaster branch of the Plantage-

nets, born, it is supposed, in Monmouth, Aug. 9, 1388, died at Vincennes, France, Aug. 31, 1422. But little is known of his childhood. On his father's banishment Henry was seized by Richard II., who took him with the expedition to Ireland, and knighted him. When Richard returned to England, to meet the youth's father, he placed him in the castle of Trim. His father caused him to be liberated and brought to London; and he was created prince of Wales, Oct. 15, 1399. He took part in the proceedings against the insurgent Welsh in 1401, while he was still a boy. He was then appointed to the command of the royal forces in Wales, and was made lieutenant of Wales in 1403. He had a prominent part in the battle of Shrewsbury. On March 11, 1405, he defeated the rebels at Grosmont. The constant rebellion that prevailed in England prevented the king from sending much assistance to his son, and he was thrown upon his own resources, which tended to the development of his character and prowess; and the speaker of the house of commons in 1406 bore testimony to his good qualities as a son and as a man. At the close of 1407 he commanded an expedition that was sent into Scotland, and after some successes made a truce with the Scotch. The house of commons thanked him for his conduct, at the instance of his father. His immediate connection with Wales is believed to have ceased in 1409. He was made warden of the cinque ports and constable of Dover the same year, and captain of Calais in 1410. The king gave him his house of Coldharbor, in London, which accounts for the prince's connection with the city. Councils were there held, at which the prince presided, as he did when they were held at other places. The stories respecting his irregularities, loose life, and association with highwaymen rest upon very insufficient evidence. The prince seems to have been in theory and action above the average morality of his time. The popular idea of him is taken from Shakespeare, whose "Prince Hal" is not the historical Henry of Monmouth, but almost as ideal a character as Hamlet himself. Henry V. was proclaimed March 21, 1413, the day after his father's death. His accession caused great rejoicings. Parliament voluntarily tendered the oath of fealty and allegiance, an act without precedent. He behaved with magnanimity toward the enemies and rivals of his house, particularly in the instance of the earl of March, who was the legitimate heir to the crown. His legislation is not open to the same praise. He continued the persecution of the Lollards; he was attached to Catholicism both from conviction and from supposed interest; and he sent representatives to the council of Constance to help to heal the schism in the church. He determined to renew the claim of the English sovereigns to the crown of France, though it was far less strong in his person than it was in that of Edward III.; and his determination is attributed to the advice of the clergy, who wished

to draw off the attention of the people from church questions, and to save the church's patrimony, the seizure of which had been called for by the house of commons. He first claimed the entire kingdom of France when negotiating an alliance for a marriage with Catharine, daughter of Charles VI.; and when that claim was scouted, the English envoys, waiving it without prejudice to their principal's rights, "demanded the sovereignty of the duchies of Normandy and Touraine, the earldom of Anjou, the duchy of Brittany, the earldom of Flanders, with all other parts of the duchy of Aquitaine, the territories which had been ceded to Edward III. by the treaty of Bretigny, and the land between the Somme and Gravelines; to be held by Henry and his heirs, without any claim of superiority on the part of Charles or his successors. To these demands were added the cession of Provence, and payment of the arrears of the ransom of King John, amounting to 1,600,000 crowns. It was also intimated that the marriage with Catharine could not take place unless a firm peace were also established with France, and that 2,000,000 crowns would be expected as her dower." These monstrous terms were rejected by the French, who however offered to make great concessions. The English parliament strongly supported the king, and the guilt of one of the most unjust wars ever waged lies rather upon the nation than upon its sovereign. Parliament commenced the system of loans for the support of this war. French ambassadors were sent to England to labor for peace, but without success. A powerful force was assembled at Southampton; and a conspiracy was there detected, which was the first act in the contest between the houses of York and Lancaster. The earl of Cambridge, a grandson of Edward III., and the husband of the sister of the earl of March, was at the head of the plot, which had for its object the restoration of the crown to the legitimate line of Clarence. Cambridge and others suffered for their conduct. The expedition sailed from Southampton, Aug. 11, 1415, and reached France in two days. Harfleur was taken, Sept. 22, after a siege of five weeks. Henry challenged the dauphin to a personal conflict, to decide the issue of the war, but his proposition was not accepted. Resolving to return to England by the way of Calais, Henry left Harfleur with a small army, his forces having suffered from sickness, and on Oct. 25 encountered a great French army at Agincourt, which he totally defeated. In a moment of panic, he caused his prisoners to be massacred. He returned to England Nov. 17. The English rejoiced much over the victory, but they found the war very burdensome, and it was not vigorously prosecuted. Sigismund, emperor of Germany, sought to mediate, and visited both France and England; but failing, he joined the latter. Little was done in 1416. In 1417 Henry invaded France again, and met with considerable suc-

cess. The French vainly sought peace. The Scots invaded England, and were beaten. Lord Cobham was captured in Wales, and executed as a traitor and a heretic. Rouen was besieged, and, after a long and terrible defence, was taken Jan. 19, 1419. The duke of Brittany, following the example of the duke of Burgundy, joined Henry. An interview between the French and English authorities having produced no effect, the war was renewed, victory remaining with Henry. The murder of the duke of Burgundy by partisans of the dauphin caused the French king to denounce his own son, and to resolve that Henry should be made regent of France. At the end of November, 1419, an arrangement was made that Charles VI. should remain king while he lived, but that, because of his insanity, Henry should become regent, and, marrying the princess Catharine, should succeed him on his death. An armistice was concluded, from which the dauphin and his party were excluded. The two kingdoms were to be united, and a treaty was made at Troyes, May 21, 1420. The same day Henry and Catharine were affianced, and their marriage took place June 2. A large part of France continued faithful to the dauphin, and he was aided by the Scots, but the successes of the English continued. Henry returned to England, where Catharine was crowned, Feb. 24, 1421. He made a journey to the north, during which he received news of the battle of Beaugé, in which the French and Scots defeated and killed his brother Clarence. Making his brother Bedford regent, he returned to France in the summer, where his usual good fortune in war awaited him; but nothing could overcome the stubborn resistance of the loyal portion of the French nation. Henry had planned a crusade when he was seized with a fatal illness, the exact nature of which is unknown. "Memorials of Henry the Fifth, King of England," edited by Charles Augustus Cole, of the public record office, were published in London in 1858 by the authority of the lords commissioners of the treasury, under the direction of the master of the rolls. "A History of Henry V.," by G. M. Towle, was published in New York in 1866.

**HENRY VI.**, son of the preceding and of Catharine of France, and last monarch of the Lancastrian dynasty, born in Windsor, Dec. 6, 1421, believed to have been killed in the tower in May, 1471. His reign is reckoned as having begun Sept. 1, 1422, the day after his father's death, when he was only nine months old. Parliament declared him king of France and England, and lord of Ireland, and created his father's eldest brother, the duke of Bedford, protector, defender, and chief counsellor of the kingdom and church, and provided that whenever the duke of Bedford was absent, his father's younger brother, the duke of Gloucester, should act in his place. The care of his person and education was confided to the earl of Warwick and to Bishop (afterward Cardinal)

Beaufort. Charles VI. of France having died soon afterward (October, 1422), Henry was also proclaimed king of France in all those parts of that country which were in the possession of the English, while Charles VII. was crowned by the French the same year at Poitiers. A long struggle ensued between the supporters of Henry and those of Charles, in which the English had the advantage until Joan of Arc turned the scale. Henry was crowned at London in 1429 and at Paris in 1431, the protectorate then ending. During his minority there had been much contention between Cardinal Beaufort and the duke of Gloucester, and the king's coronation was a triumph of the former, who then gave to the government a strong ecclesiastical tendency, which was offensive both to the people and to the aristocracy. It was found that Henry had inherited none of the martial qualities of his father. The Beaufort party arranged a match between him and Margaret of Anjou, daughter of René of Provence. The marriage, which took place April 22, 1445, was unpopular in England, both on account of Margaret's relationship to the French king, and because, in return for her hand, Maine and Anjou were surrendered to her father, who claimed them by right of inheritance. A truce which had been negotiated with France was prolonged upon terms considered disadvantageous to England. In 1447 both Beaufort and Gloucester died, and the earl of Suffolk became the most powerful person in the kingdom; he was first created marquis, then duke, and received other high offices and preferences. But as through him both the marriage and the truce had been negotiated, he was greatly disliked. The ill will with which he was regarded was aggravated by disasters suffered in France when hostilities were renewed. Finally his enemies procured his banishment from England, pursued him after he had left it, and had him murdered (1450). His death did not allay the popular dissatisfaction, which rendered Jack Cade's insurrection temporarily successful. Meanwhile the English continued to lose ground in France. In 1451 they had lost all their French possessions except Calais. Popular attention began to be directed toward Richard, duke of York, as the rightful heir to the throne. He was descended from Lionel, duke of Clarence, third son of Edward III., while Henry himself was descended from John, duke of Lancaster, Edward III.'s fourth son. Henry's weakness, and the general unpopularity of the government, encouraged York, who was much loved because of his bravery, mildness, and good conduct both in public and private life, to put forward his claims. His immense possessions gave him vast influence. His wife was a Neville, and he had the support of the ablest members of that family, the earls of Salisbury and Warwick, father and son. So long as no offspring followed from the marriage of Henry and Margaret, it was believed

that York would peaceably succeed to the throne on the king's death. But in 1453 Margaret gave birth to a son whose legitimacy was doubted; and about the same time the king became imbecile. The Yorkists seized the government, overthrowing Somerset, who had succeeded to Suffolk; and the duke was made protector by parliament. On recovering his health, Henry restored Somerset to office, whereupon York levied an army, and demanded reform in the government. The war of the roses then began. The first battle of St. Albans was fought May 22, 1455, and the Yorkists or party of the white rose were victorious. The administration passed into York's hands, and he was king in fact, but Henry's authority was restored in 1456. A partisan quarrel in 1459 renewed the war; and in 1460 the Lancastrians were defeated by Warwick, and the king was captured, at Northampton. York now demanded the throne, and parliament decided that he should succeed to it on Henry's death, and the duke in the mean time administer the government. The queen raised an army in opposition to this arrangement, with which she won the victory of Wakefield, Dec. 30, 1460, in which York was slain. The second battle of St. Albans, Feb. 17, 1461, restored Henry to the hands of his friends; but the victory of Towton, won by Edward, duke of York, now Edward IV., March 29, 1461, compelled him to fly, with his wife and son, to Scotland. Margaret, through foreign assistance, renewed the war in 1463, but was defeated in 1464, and Henry was captured in 1465. He was imprisoned in the tower till 1470, when Warwick restored him to the throne after his quarrel with Edward IV. On the return of Edward, Henry again became a prisoner, and died about May 21, 1471.

**HENRY VII.**, founder of the Tudor dynasty of English kings, born at Pembroke castle, in South Wales, July 26, 1456, died at Richmond, April 21, 1509. On the death of Henry V., his widow, Catharine of France, married Owen ap Tudor, a Welsh gentleman of ancient lineage, but of moderate fortune. Of the four children born of this marriage, the eldest was Edmund Tudor, who was created earl of Richmond by Henry VI., his half brother; and Richmond in 1455 married Margaret Beaufort. John of Gaunt, duke of Lancaster, fourth son of Edward III., had married for his third wife Catharine Swynford, who had long been his mistress. None of their offspring were born in wedlock, but he obtained the legitimization of them all by a papal bull, a charter from Richard II., and an act of parliament. John Beaufort, duke of Somerset, grandson of John of Gaunt and Catharine Swynford, married Margaret, widow of Sir Oliver St. John, *née* Beauchamp, and their only child was Margaret Beaufort, who was married to the earl of Richmond in 1455, and became countess dowager Nov. 1, 1456, three months after the birth of her son. For some years Henry of Richmond resided at

Pembroke castle; even after that place had been given to the Herberts, the chief of whom had charge of him. He was attainted soon after the crown passed to the house of York. His education was conducted by his mother, a woman of piety and learning; and he grew up a thoughtful and serious boy, much inclined to religion. When the house of Lancaster was restored in 1470, Richmond was placed in Eton college, where he was seen by Henry VI., who predicted that he would be king. The next year saw the return of Edward IV., and the death of Henry VI. and his only son, when Richmond became chief of the Lancastrian party. By letters patent from Richard II. in 1397, granted to the duke of Lancaster, the Beauforts were to be "admitted to all honors and dignities," which placed them in the line of succession to the crown; but when Henry IV. ratified the act of Richard II., he added, after the words "all honors and dignities," the words "except to the royal dignity." Thus the Beauforts were not from the first excluded from claims to the throne, and Henry of Richmond had plausible ground for asserting that he was the lineal heir of John of Gaunt, and head of the house of Lancaster. Henry was sent to Pembroke castle after the triumph of the Yorkists, and going to Tenby, sailed thence to France. Landing in Brittany, he was seized by the duke of that country, who held him a prisoner many years, refusing to surrender him to Edward IV. In 1484, when the usurpation of Richard III. had caused much discontent in England, Henry was recognized as chief of all parties opposed to the government, and a marriage was arranged between him and Elizabeth, eldest daughter of Edward IV. The duke of Brittany finally liberated him, and with a small force he sailed for England. He was unsuccessful, his fleet dispersed, and his party in England was crushed for the time by Richard. After a variety of romantic adventures, he raised a larger force, sailed from Harfleur in the beginning of August, 1485, and landed at Milford Haven. The victory of Bosworth (Aug. 22) and the death of Richard III. made him king. He was crowned at Westminster Oct. 30. Parliament settled the succession on his heirs. He married the princess Elizabeth in January, 1486, but her coronation did not take place until the close of 1487. Henry's reign was much disturbed by pretenders and plots. The first pretender was Lambert Simnel, who claimed to be the earl of Warwick. The true earl was a prisoner, and the pretender was exposed; but an army was raised, which at Stoke (June 16, 1487) disputed the day with the royal forces, and placed the Tudor cause in great peril. Victory at length declared for Henry, and the Yorkists lost all their leaders on the field. The king, with good-natured contempt, made Simnel a turnspit. A more formidable competitor was Perkin Warbeck, who claimed to be Richard, duke of York, second son of Edward IV.; and the assistance he received from Burgundy,

France, Scotland, and Ireland alarmed Henry. He detected a conspiracy among the nobility, and put the leaders to death, including Sir William Stanley, to whom he owed the victory of Bosworth and the throne. A Cornish rebellion, caused by taxation, was put down at Blackheath, June 22, 1497. To revive this rebellion, Perkin went to Cornwall, but failed, and fell into the king's hands. Henry had him set in the stocks, and forced him to admit that he was an impostor, he reading the confession which he had written with his own hand to the people assembled in Cheapside. He was then confined in the tower, and, after an attempt to escape, was hanged at Tyburn in 1499. Warwick, who had shared in the attempt, and had been the object of a third plot, was beheaded, a deed as foul as any that has been attributed to Richard III. Henry's motive was to satisfy Ferdinand of Aragon, who would not give his daughter Catharine to the prince of Wales while any Yorkist prince remained on earth. The son in behalf of whom this act was committed died in 1502. Henry became very avaricious in his last years, and by the revival of old laws and other means amassed £1,800,000, according to some accounts, which are perhaps exaggerated. He extorted money from his subjects under pretence of making war on France, which they demanded, but which he knew better than to undertake. He sold pardons, and drove a trade in offices of the court and the church. The two most noted instruments of his avarice were Empson and Dudley. In the 11th year of his reign the statute for the security of the subject obeying and aiding a king *de facto* was passed, which was made necessary by the judicial slaughter that had occurred among the aristocracy while the contest between the houses of York and Lancaster distracted England. Seven years earlier was passed the statute of fines, which was but a copy of that of Richard III., and probably reenacted only to give validity to that monarch's laws. The clergy were not friendly to Henry, and in each case of a pretender a priest was concerned. Yet he followed the policy of the house of Lancaster, causing at least two Lollards to be burned, and severely persecuting many others. He sought the reform of the church, and in his reign we find the first indications of that course which, in his successor's time, ended in the English reformation. Henry encouraged commerce and patronized voyages of discovery. His foreign policy was judicious; and by marrying his eldest daughter to James IV. of Scotland, he furthered the ultimate union of the two kingdoms. Worn out with anxiety and care, he died before the end of his 53d year.

**HENRY VIII.**, second king of England of the Tudor dynasty, and second son of the preceding king and Elizabeth of York, born at Greenwich palace, June 28, 1491, ascended the throne April 22, 1509, died Jan. 28, 1547. His father intended that he should become the

head of the English church, and was educating him for the office of archbishop of Canterbury, when the death of his elder brother, Arthur, made him heir apparent, April 2, 1502. Arthur had married Catharine of Aragon, daughter of Ferdinand and Isabella, receiving with her 200,000 crowns, one half of which was paid down; and on his death her parents desired that she might be sent home, and the money refunded. Henry VII. objected, and proposed that Catharine should marry the new prince of Wales, who was five years her junior; and she was betrothed to him, June 25, 1503. Two years later the prince read and signed a protest against this contract, in presence of his father's councillors, declaring that he did not mean to fulfil it. This was the work of his father, who wished to marry Juana, widow of Philip I. of Castile, and elder sister of Catharine. Henry VII. probably altered the date of the protest at a later period, so as to disguise its object. The prince of Wales was at that time attached to Catharine, and a dispensation had been granted by the pope as early as 1504, allowing them to marry, on the ground that the marriage with Prince Arthur had not been consummated. The king, who was always conscientious when ill, appears at times to have had some scruples on the subject of the marriage, and would have restored the princess to her parents, but that he could not bear to part with her portion. He died, and in less than two months Henry VIII. and Catharine were married. This hasty marriage was made, in the first instance, at the king's desire, but it was probably urged on by most of the statesmen around him because of their anxiety to establish the succession. The wars of the roses in the preceding century had made an indelible impression on the English mind, the effect of which was visible throughout the entire history of England during the existence of the house of Tudor, and to which must be attributed much of their vicious conduct. Should Henry VIII. die without an heir, there would ensue an immediate contest for the crown between the houses of York and Tudor, both represented by women; the former by the countess of Salisbury, a daughter of the last duke of Clarence, brother of Edward IV., and the latter by the daughters of Henry VII. Archbishop Warham opposed the marriage, on the ground of their relationship. Bishop Fox argued in its favor, though it was under his direction that the king when prince of Wales had protested against it. The privy council recommended the marriage. It was solemnized at Greenwich, June 7, 1509, and they were crowned June 24. Few monarchs have been more popular than was Henry at his accession. He was the heir of both branches of the old royal house, his father representing that of Lancaster, and his mother that of York. His person was eminently handsome, his mind had been highly cultivated, and he was fond of martial pleasures. He gave up

Empson and Dudley, the obnoxious ministers of the late king, to vengeance, together with their instruments. He returned fines that had been unjustly or oppressively exacted. Much was hoped and expected of him, and not altogether in vain. Though addicted to pleasure, he was not unmindful of business, and paid special attention to foreign affairs. His manners were pleasing, yet he evinced at an early period not a little of that obstinacy which became his chief trait in later life. He is often spoken of as a lavish prince, but Wolsey said that he was the most avaricious man in the world. Had he died within 20 years from his accession, he would have been the most popular monarch in English history. His foreign connections began early. In 1510 he received the golden rose from Pope Julius II., who wished to obtain his aid to expel the French from Italy; but at first he was disposed to be moderate, and to pursue substantially the policy of his father. He made a treaty with France, and then entered into engagements with his father-in-law, guaranteeing his Spanish dominions against the French, and sent an ambassador to Rome to promote a pacification. Gradually he was drawn into the war on the side of the pope and Ferdinand, and English forces were sent to their assistance. Late in 1511 a league was formed against France by the pope, the emperor, Aragon, and Venice. Henry led a large army into France in 1513, after his fleet had been checked and the French had threatened the English coast. Maximilian I., emperor of Germany, served under him as a volunteer. Great things were expected from this invasion, but were not realized. The French were beaten in the battle of the spurs (at Guinegate), an unimportant skirmish, remarkable only because Bayard was then captured; and the English took Thérouanne and Tournay. Henry then returned home with most of his forces. Louis XII., hoping to intimidate Henry, had called the duke of Suffolk, one of the nephews of Edward IV., to France, whereupon Henry caused Suffolk's brother to be put to death, after he had long been detained a prisoner. While the king was in France, James IV. of Scotland led a great army into England, which was totally defeated at Flodden by the earl of Surrey, Sept. 9, 1513, and the Scottish king slain. Being deserted by his allies, Henry made peace with Louis XII., who married his sister, Mary Tudor; but the French king soon died, and Mary married Charles Brandon, duke of Suffolk. Wolsey, whose career had commenced in the preceding reign, was now high in favor with the king, and his course on many occasions gave much offence to the nobility. The successes of Francis I. in Italy alarmed Europe, and the German emperor sought to engage Henry to act against France by holding out hopes of being made his successor; and Francis, in retaliation, formed plans for an invasion of England in support of Suffolk's claim to the

throne. This pretender was an object of terror to the English government until he was slain at the battle of Pavia. The successes of the Turks continuing to alarm the western nations, Henry listened to the pope's plans for a crusade. On the death of Maximilian I. Henry thought of becoming a competitor for the imperial crown, but soon discovered that he had no chance of success. The election of Charles of Spain to the imperial throne caused Henry and Francis to become friendly, and in 1520 a meeting was arranged between them. Before it could be held, Charles V. visited England, and there gained the influence of Wolsey, by affecting to favor his aspirations to the papedom. Francis and Henry then met near Ardres, on territory belonging to the latter, though in France. The meeting was so magnificent that the place of it was known as the field of the cloth of gold. Henry visited the emperor at Gravelines, where Charles completed his conquest of Wolsey by conferring Castilian sees upon him. War breaking out between Charles and Francis, Henry was induced by Wolsey to favor the former, and to enter into an offensive alliance with him. In 1521 Henry received from Leo X. the title of defender of the faith, for having written a book against Luther and his doctrines. The same year occurred the execution of the duke of Buckingham, one of the greatest nobles of the realm, and descended in the female line from Edward III. His death was attributed to Wolsey, but it was due to the jealous rage of Henry, who could not bear about him any one who had, or could pretend to have, claims to the succession in the event of his dying without issue. The death of Leo X. and the elevation of Adrian VI. endangered the alliance between Charles V. and Henry, because of Wolsey's disappointment; but the emperor visited England, soothed the cardinal, and prevailed upon the king to declare war against France. An English army, commanded by Surrey, invaded France, but did nothing beyond burning and pillaging a few places of little note. Francis I. again called forth the pretender Suffolk, and threatened England with invasion; and these threats, and the alarm they caused, show that the party of York was still formidable in that country, a fact that palliates many of the king's acts. Henry was a party to the conspiracy of the constable de Bourbon against Francis in 1523; and from this conspiracy he expected to become as powerful in France as Henry V. had been. But the failure of the plot ruined Bourbon, while an English army, commanded by Brandon, duke of Suffolk, performed as little in France as had been done by that of Surrey. The death of Adrian VI. in 1523 excited anew the hopes of Wolsey, but Charles V. threw his influence into the scale of Cardinal de' Medici, who became Clement VII. This disappointment determined Wolsey to withdraw his master from the imperial alliance; but not until after the battle of Pavia was he able to accomplish his

purpose. Henry was at first disposed to prosecute the war more vigorously than ever against France, and Bourbon showed that he could obtain the crown of that country; but Wolsey's policy prevailed, much aided by the emperor's conduct, as he evinced a disposition hostile to English aggrandizement. A treaty of peace was made with France in August, 1525, on terms advantageous to England. In 1527 Henry and Francis formed an alliance for the expulsion of the imperialists from Italy, and the deliverance of the pope, who was the emperor's prisoner. Henry renounced all claims to the French throne, and Francis agreed to pay 50,000 crowns annually to Henry and his successors. Wolsey made a magnificent journey to France, which the public associated with the thought of Henry's divorce, with a view to his marriage with a French princess; and from this time, the spring of 1527, the question of divorce becomes the leading incident of Henry's reign. His marriage with Catharine had not been productive of heirs. During the first nine years of their union, the queen had thrice miscarried, two sons died immediately after birth, and a third son was still-born. The only child that lived was the princess Mary, born in 1516. Henry, who was superstitious even to fanaticism, was much impressed by these repeated misfortunes, and believed they were punishments for having married his brother's wife. The idea of a divorce had perhaps been maturing in his mind for years, when accident gave it sudden prominence. The marriage of the princess Mary with a French prince being spoken of as probable, the legitimacy of the princess was questioned by the French envoy, the bishop of Tarbes. This the king asserted in council, but it has been doubted whether the bishop ever raised any such question. At this time the pope was suffering from the attack of the imperialists, and soon became a prisoner of the emperor, and Wolsey determined to procure a divorce, in the hope of being able to commit Henry thoroughly to the cause of the ancient church, which was beginning to feel the attacks of the reformers. Apart from the theological reasons which deterred the pope from granting a divorce, he had to dread the resentment of the emperor, who was Catharine's nephew. Wolsey aimed at a reformation of manners in England, and he hated the emperor because of his repeated disappointments respecting the papacy; and in both the ends he proposed to effect, the moral reformation and the divorce, he had a good right to count upon the pope's assistance, as matters stood in 1527. But it was impossible that the pope should continue to be the open enemy of the emperor; and unless he should so continue, his aid in the divorce question could not be counted upon. The alliance with the emperor was popular in England, he being ruler of Flanders, with which country England had a great and profitable commerce. The emperor himself was at that time popular in Eng-

land: with the reformers, because he was at war with the pope; with the conservatives, because they knew his position necessarily made him the champion of the old order of things, though circumstances had for the time made him their apparent enemy; and generally, because he was the foe of France, England's old rival. Wolsey triumphed over all these obstacles, by convincing Henry that by a change of foreign policy he could cause the pope to grant the divorce he so much desired; and in his correspondence with the English agent at Rome, he declared that the king would disregard the wishes of his subjects and the private interests of his realm, to attach himself cordially and constantly to the holy see, provided the pope should prove his friend in the matter he had so much at heart. That Henry was in part governed by religious feeling, and also by considerations growing out of the subject of the succession, cannot reasonably be doubted; but his attachment to Anne Boleyn, which began some years before the open agitation of the divorce question, was the real occasion of his wish to put away his wife, Anne being resolute in her determination not to be his mistress. Wolsey was opposed to the proposed marriage with Anne, and the king, without his minister's knowledge, sent his secretary to Rome, with a private proposition that a dispensation should be granted, allowing him to take a second wife, the former marriage to stand with no definite sentence passed upon it; or, if that were impossible, leaving the pope to proceed after his own ideas, the main object to be kept always in view. Wolsey's plan was that the pope should extend his (Wolsey's) legatine authority so far as to grant him full power to act as English vicegerent so long as Rome should be held by the emperor's forces. Soon, however, the public and private agents acted together, and the pope was urgently desired to do that which Henry asked. For years he played a double game, though warned by Wolsey and others of the evil that must follow to Rome from his failure to favor Henry. In 1528 Cardinal Campeggio was appointed to proceed to England, to hear the cause in conjunction with Wolsey; but he purposely delayed his journey, and had instructions not to decide the cause. He endeavored to persuade the king to give up his wish, and failing, sought to induce Catharine to take the vows of chastity, and to retire from the contest; but that lady, who was singularly tenacious of her rights, would consent only on condition that the king should take the same vows. Henry, now convinced that only bold measures would answer, avowed his intention to make Anne Boleyn his wife, and installed her in Greenwich palace. He sent a relative of the lady to Rome, to announce that his request must be granted, menacing that, if he failed with the pope, the whole matter should be laid before parliament. The emperor sought to intimidate the king; but Henry summoned a meeting of

nobles, merchants, and others, at London, before whom he placed the reasons of his conduct, and appealed to the patriotism of his subjects, with success. The imperial threats and intrigues proved very injurious to the queen's cause. The legatine court was prevented by trickery from acting until May, 1529, and then Catharine appealed to Rome, to which Henry was summoned. Against this Wolsey protested, declaring that if Henry should go to the court of Rome, it would be with such a force as should be formidable to the pope and all Italy. A parliament was immediately called, and power passed into the hands of new men, though of the old aristocracy, and Wolsey's enemies, and opposed to the rule of the church, yet not reformers in every case. At that time there were three parties in the country: the English party, in whose hands was power, and who were determined upon a secular revolt; the papal party, the chief member of which was Sir Thomas More, now chancellor; and the doctrinal Protestants, who were disliked by both the others. Wolsey gave up the seals Oct. 17, 1529, and parliament met Nov. 3. The fact that the opening speech was made by More, an extreme Catholic, standing at the king's right hand, shows that Henry had even then no wish to break with Rome. Wolsey was coarsely reflected on by the chancellor. Parliament was left to pursue its own course, and it proceeded to denounce the clergy in a formal "act of accusation," or petition, which contained the germ of the English reformation. Henry submitted this to the bishops, who replied at length, but ineffectually, as the commons passed several laws respecting the powers and privileges of the clerical order; and the lords concurred, though the clergy formed a majority of the upper house, which shows that the pressure was great from without. The divorce question continued under discussion, and the pope issued two inhibitions, threatening Henry with spiritual censures if he should proceed. The king thought at one time of giving way, and most of the council agreed with him; but Thomas Cromwell induced him to persevere. Henry hoped the conduct of parliament would intimidate the papal court. The right of the pope to grant that dispensation under which the marriage of Henry and Catharine had taken place was called in question, the object being to transfer the matter to a broader court, and to obtain in some way, as through an appeal to a council, a decision against the marriage. This is said to have been suggested by Cramer, who made himself very prominent in obtaining the opinions of universities and learned men on the subject, and who belonged to the embassy of the earl of Wiltshire, sent to the emperor at Bologna in 1530. This embassy failed to move Charles. The pope still affected impartiality, and allowed free expression of opinion on the marriage in Italy; but his sole object was delay, and Spanish influence was exerted in the queen's

behalf. In Catholic countries, the sentiments of learned men and other authorities on the dispensing power were about equally divided. The Protestants, including Luther, were generally hostile to Henry. In France and England Henry's cause triumphed, because all the influence of both governments was used in its behalf. The entire proceedings were scandalous. Wolsey had been prosecuted under the statute of provisors, and had died in disgrace; and it was determined to proceed against the higher clergy, but less in the spirit of justice (for the whole nation shared in their guilt) than to obtain an opportunity to strip them of some of their property, and to lessen their power. Convocation met in 1531, and consented to pay a fine of £118,000. In the preamble to their subsidy bill the clergy were compelled to acknowledge Henry as "protector and only supreme head of the church." They were then pardoned. The divorce question was first brought before parliament in 1531, when the opinions of the universities were communicated to it. The house of peers sent a remonstrating letter to the pope, warning him of what would follow if a divorce should not be granted. Catharine was asked if she would withdraw her appeal to Rome, and on her firm refusal she was removed from the court. In 1532 parliament proceeded in the work of clerical reform, taking its first step toward a breach with Rome by the abolition of annates, which originated with the clergy, who, to preserve their own power at home, were ready to go any length against Rome, even while persecuting Protestants most intolerantly. Parliament was more moderate, and passed the act conditionally. From this time dates "the Anglican schism," the convocation praying to the king, "May it please your highness to ordain in this present parliament that the obedience of your highness and of the people be withdrawn from the see of Rome;" that is, if the pope should insist upon the payment of annates. But this did not prevent parliament from limiting the legislative power of the convocation, in spite of the clergy's opposition. Meantime the nun of Kent and other fanatics were inciting the people to opposition to the government, and a powerful party hostile to change was forming itself. Sir Thomas More resigned the chancellorship; and Archbishop Warham, after protesting against the doings of parliament, died. An offensive and defensive alliance between Francis and Henry was formed in 1532; the former agreed to send 15,000 troops to England, should the emperor invade that country; and he assisted Henry in various ways. Scotland gave England much trouble at this time. The English court visited that of France at Boulogne, and Francis made great promises of support, and advised Henry to marry Anne Boleyn on his return to England. New efforts were made to move the pope, but though he often affected to favor the king, and made some suggestions implying a desire to gratify

him, he could not be prevailed upon to do anything. At length Henry married Anne Boleyn, Jan. 25, 1533, according to the generally received account, though it was believed that a secret marriage had taken place in the preceding November. A papal brief soon appeared, declaring Henry and Anne excommunicated, unless they should avoid all intercourse pending the decision of the divorce, the marriage being kept secret. Parliament met, and passed the act of appeals (April 12), directed against the papal authority, and intended to bear against Catharine's appeal to Rome. This took the matter before the convocation, and that body, on Cranmer's application, decided that Pope Julius II., in granting a license for the marriage of Henry and Catharine, had exceeded his authority, and that the marriage was therefore *ab initio* void. Cranmer then demanded the king's permission to proceed with the case, which being granted, he opened his court at Dunstable, and summoned Catharine to appear. She refused, and was pronounced contumacious, and the trial proceeded. Judgment was rendered May 23, 1533, the marriage being declared null and void from the beginning. Nine days later the coronation of Anne took place, and it was announced to Catharine that she should no longer be called queen, but princess dowager. There was much discontent, and the emperor, whom Henry in vain sought to appease, believed there would be an insurrection, and urged Catharine not to carry out her design of flying to Spain with her daughter. On May 12 Henry was summoned to appear at Rome, but he appealed to a general council. News of the divorce threw the pope into a rage, yet he contented himself at the time with a conditional excommunication, declaring Cranmer's judgment illegal, and giving Henry more than two months for repentance and restitution. Henry stood firm, but Francis failed to support him, and he had to look to the German Protestants for sympathy; and he sent an envoy to the elector of Saxony, with no effect. The princess Elizabeth was born Sept. 7, 1533. Conspiracies against the king were formed, implicating both Catharine and her daughter Mary; and the throne was in much danger from the ambition of some parties and the fanaticism of others. Government acted vigorously, and it was determined to form a Protestant league. Parliament met in January, 1534, and took a variety of measures to increase the separation of Rome and England, under Cromwell's lead. The papal authority was conditionally abolished in England. An act of succession was passed, settling the crown upon the children of Henry and Anne. At length the pope gave sentence, deciding against Henry, declaring him excommunicate, and freeing his subjects from allegiance. The emperor was to enforce the sentence, and invade England within four months; and preparations to that end were at once begun. Francis showed himself friendly to Henry, and a meeting be-

tween them was prevented only by the latter's fear that a rebellion might break out during his absence. A French fleet guarded the channel through the summer. Henry's conduct was very energetic. Convocation declared that the pope had no more authority in England than any other bishop; convicted conspirators were executed; military preparations were made; the oaths of allegiance under the statute of succession were taken; and More and Fisher were imprisoned, and ultimately executed, for refusing to admit the king's supremacy. The act of supremacy was passed, making Henry the head of the church, which act has been described as "the epitome of all the measures which had been passed against the encroachments of the spiritual powers within and without the realm," and as being "at once the symbol of the independence of England, and the declaration that thenceforth the civil magistrate was supreme within the English dominions over church as well as state." A new and sweeping treason act was passed. The first fruits were transferred to the crown. The new pope, Paul III., who as Cardinal Farnese had been on Henry's side, showed a desire for reconciliation, and the French king labored in the same direction; but the hour for England's divorce from Rome had come, and all negotiation was now useless. The execution of Fisher and More created a great sensation among Catholics. The pope issued a bull of interdict and deposition against the king. The union of the Protestants was now more earnestly sought than before, Henry aiming at the formation of a grand league. The visitation of the monasteries commenced in 1535, and the first suppression took place the next year. Catharine died at the beginning of 1536, and the fall of Anne Boleyn occurred four months later, when Henry married Jane Seymour. On Anne's death new overtures came from Rome for a reconciliation, which failed principally through the indiscretion of Reginald Pole. The pilgrimage of grace occurred in 1536, being a popular outbreak, principally due to the suppression of the monasteries and to the social changes that were going on. The dispute was settled by compromise, the government yielding to some of the demands of the insurgents. A second outbreak was put down by force, and many persons were executed. Edward, prince of Wales, was born Oct. 12, 1537, and Queen Jane died 12 days later. During 1538 there were conspiracies against the crown, for which many persons suffered, at the head of whom stood the marquis of Exeter, a grandson of Edward IV. The final dissolution of the monasteries took place in 1539, the same year that the six articles were adopted, forming the new church in England, and embracing the real presence, communion in both kinds not necessary to salvation, forbidding the marriage of priests, upholding vows of chastity, declaring that private masses should be continued, and providing for

the continuance of auricular confession. This was followed by a persecution of the reformers. At the beginning of 1540 Henry married Anne of Cleves, a marriage that had been negotiated by Cromwell, with a view to uniting the Protestants of England and Germany; but the lady's unprepossessing appearance so disgusted the king that he soon procured a divorce, and in a few months Cromwell was sent to the scaffold. Henry took for his fifth wife Catharine Howard, niece of the duke of Norfolk, who was soon attainted and executed for adultery. He married a sixth time (1543), taking Catharine Parr, widow of Lord Latimer, who survived him. The countess of Salisbury, last of the Plantagenets, was executed in 1541. A war broke out between England and Scotland, in which the latter met with nothing but disgrace. England and the empire drew together again, and war was made by both with France. The emperor made peace with France in violation of his faith to England; but peace between England and France was not restored till 1546. In the mean time Henry continued to persecute both Catholics and reformers, and many persons suffered death. Internal reform, however, also went on, and among other changes worship was performed in English. Extreme men on both sides were offended by the king's course, who sought to trim between them. An act of parliament vested the properties of all hospitals, colleges, and chantries in the crown, but this was to prevent the resumption of such properties after the dissolution of the monasteries, and not as preliminary to confiscation. Toward the close of Henry's reign the conservatives obtained the ascendancy in his councils, and persecuted Protestants with considerable zeal, though Henry, in his very last speech to parliament (December, 1545), spoke as favorably of toleration as any statesman of that age could speak of it. Some of the worst deeds of his reign occurred at this time. Anne Askew was racked and burned, Latimer was arrested, and an attempt was made against the queen. Henry's interference put a stop to the last of these doings, and he was on the point of going as far forward in his work as Elizabeth afterward went, when his reign came to an end. The danger to which Protestantism was exposed in 1546, through the course of the emperor, alarmed him, and he suggested to the Germans an offensive and defensive league, to be called "the league Christian," of which he should be the head. He was ready to settle all minor differences with the Germans on religion, and to present a solid front to Rome. Home changes were to be made, the chief of which was the change of the mass into the modern communion. The Germans did not respond well to his offers, and were overthrown by the emperor. Henry was now very ill, being unable either to stand or to walk, and he prepared to settle the government that should exist during his son's minority. The Catholic party was then con-

spiring to get possession of all power, headed by the earl of Surrey, who was accused of treason, condemned, and executed a few days before Henry's death; and his father, the duke of Norfolk, was attainted by parliament, which met Jan. 14, 1547, and is supposed to have escaped the scaffold only because of the king's death, which happened at 1 o'clock on the morning of the 28th. As Henry's end approached he signified his wish to see Cranmer, who did not arrive until the king had become speechless. The archbishop spoke to him, and, asking him to give him some token that he put his faith in God through Jesus Christ, the king wrung his hand hard, and died. His will, which provided that daily masses should "be said perpetually while the world shall endure," at an altar to be erected near his tomb and that of Queen Jane, had been completed four weeks before his decease. He bequeathed the crown to his son and his issue, and, failing them, to such issue as he might have of his queen Catharine (Parr), or any other lawful wife whom he might marry. Failing such issue, it was to descend to Mary and her heirs, and then to Elizabeth, and her heirs, provided they married not without the consent of their brother, or of the council appointed for his guardianship. Finally, and passing over the Scottish line, it was to go to the children of his sister Mary's two daughters. The government selected for Edward's minority was composed of men from both parties. Henry's reign has often been called a tyranny, but more than once he had to yield to the bold expression of the popular will. He was allowed to do as he pleased with the aristocracy, and he never encountered opposition when he glutted the scaffold with the noblest of victims. His reign was the seedtime of modern English parties, and its history has been written in a partisan spirit which has obscured it. James Anthony Froude is his ablest apologist. A collection of the papers of Henry VIII. was commenced by J. S. Brewer in 1862, of which seven volumes had been published in 1873.

## II. FRANCE.

**HENRY I.**, the third French king of the Capetian dynasty, born about 1011, died Aug. 4, 1060. As early as 1027 he was associated in the government by Robert, his father, whom he succeeded in 1031, notwithstanding the rebellion raised against him by his stepmother Constance. This he quelled through the assistance of Robert the Devil, duke of Normandy. Henry's weakness encouraged his vassals to rebel, and more than once he had to take the field against them; and toward the end of his reign he was even embroiled in a war with his former ally, the duke of Normandy. The hostilities were soon terminated by a treaty of peace, but were the beginning of the ill feeling which lasted so long between the kings of France and the English descendants of the dukes of Normandy. During his reign, France

was afflicted by a dreadful famine and by many private wars. The church attempted to allay the latter curse, by enforcing agreements known as the "peace of God" and "truce of God;" but Henry declined to abide by them. By Anna, daughter of Yaroslav, grand duke of Russia, he had Philip, who was his successor, and Hugh, who became count of Vermandois.

**HENRY II.**, tenth king of the Valois family, born in St. Germain-en-Laye, March 31, 1519, died in Paris, July 10, 1559. The only surviving son of Francis I. by his queen Claude of France, he succeeded his father, March 31, 1547, adhering to whose policy, he engaged abroad in the great struggle to destroy the ascendancy of the house of Austria, while he persecuted the Protestants at home. Being entirely under the control of his mistress, Diana of Poitiers, who acted in concert with the great constable Montmorency and the brothers Guise, he had many of the Protestants arrested, tried, and burned at the stake in Paris, Lyons, Angers, Blois, and Bordeaux. By his edicts of Châteaubriant (1552) and Éconen (1553) the punishment of death was decreed for attendance at secret religious meetings. In 1557 ecclesiastics, under the title of inquisitors, were introduced into the parliaments to sit as judges in all cases against heretics. Finally, in 1559, two members of the parliament of Paris, Du Faur de Pibrac and Anne du Bourg, having been bold enough to advocate in his presence the liberty of conscience, were incarcerated, and Du Bourg was publicly hanged and burned. These bloody measures were the forerunners of religious wars. Henry's foreign policy was partially successful. The English, who were then in alliance with the emperor Charles V., were desirous of securing the union of Scotland by the marriage of young Edward VI. with Mary Stuart; French troops were sent to Scotland, and Mary was brought to France and affianced to the dauphin Francis. Meanwhile Boulogne was besieged, and England gave it up in 1550, for one third of the sum which had been stipulated for its surrender. In Italy, Henry protected Ottavio Farnese, duke of Parma, against the imperial troops; and in 1552 he became the ally of Maurice of Saxony and the other Protestant princes who were struggling to throw off the yoke of Charles V., and soon after seized the episcopal cities of Metz, Toul, and Verdun. Charles, having concluded the treaty of Passau with his German opponents, tried to reconquer those cities, and in 1553 made a fruitless attack upon Metz, which was defended by François de Guise, and avenged his defeat by pillaging Picardy, but was once more defeated at Renty in 1554. The French at the same time were successful in Italy, where Brissac conquered Savoy and Piedmont. Charles having abdicated in favor of his son Philip II., a five years' truce was signed at Vauxcelles in February, 1556. Henry II., however, soon renewed the war, but unsuccessfully; the duke

of Guise was foiled in his attempt against the kingdom of Naples by the superior ability of the duke of Alva, and the constable Montmorency was totally defeated near St. Quentin, in 1557, by Duke Philibert Emmanuel of Savoy. Had Philip II. improved the opportunity, Paris would have been taken; but his delay gave time to his rival to make preparations for defence; and Guise, being recalled from Italy, revenged the disgrace of Montmorency's defeat by the conquest of Calais in 1558, the only place that the English still possessed on French soil. But the Spanish troops under Egmont having won a new victory, Henry II., weary of war and yielding to the entreaties of his mistress, concluded, April 2, 1559, the disastrous peace of Cateau-Cambrésis. He kept Calais, Metz, Toul, and Verdun, but consented to restore all his conquests in Italy and the Netherlands, including nearly 200 strong places. Henry's daughter Elizabeth was to be married to Philip, and his sister Margaret to the duke of Savoy. During the celebration of the peace and the double marriage, Henry II. was mortally wounded in a tilt with the count de Montgomery, the captain of his guards, and his sceptre passed to his eldest son, Francis II., the husband of Mary, queen of Scots.

**HENRY III.**, the last king of the Valois family, born in Fontainebleau, Sept. 19, 1551, died Aug. 2, 1589. He was the third son of Henry II., and the favorite of his mother, Catharine de' Medici, and before his accession bore the title of duke of Anjou. Being placed at the head of the Catholic army in the reign of Charles IX., he won in 1569 the victories of Jarnac and Moncontour over the Protestants. He participated in the councils that brought about the St. Bartholomew massacre in 1572. His military reputation, aided by his mother's intrigues, procured his election to the throne of Poland in 1573; but his refined and effeminate habits were distasteful to the Poles, while he disliked their independent spirit and coarse manners. On hearing of the death of his brother Charles IX. in 1574, he secretly escaped and returned to France, passing through Vienna and Venice. His arrival was marked by the renewal of civil war. The Protestant party, being strengthened by their alliance with that party of Catholics known as the *politiques*, had taken up arms; but their German auxiliaries were defeated at Dormans, Oct. 11, 1575, by the duke of Guise; and the king, fearful of the growing popularity of that prince, hastened to conclude the peace of Beaulieu, in May, 1576, the terms of which were so favorable to the Protestants as to be considered a betrayal of the Catholic cause. This gave rise to the holy league, which, under pretence of protecting religion, aimed chiefly at furthering the ambitious designs of the house of Guise. Henry attempted to avert the danger by declaring himself chief of the league during the session of the states general which met at Blois in December, 1576; but the association clung faithfully to Guise as

their leader, and made use of their majority in the states to curtail the prerogatives of the king and force him into another war against the Protestants. After reluctantly carrying it on for a few months, he ended it by the treaty of Bergerac, Sept. 17, 1577, and tried by conciliatory measures to win over the most influential of the Catholics. This policy was of little avail; the so-called "lovers' war" broke out, which he succeeded in bringing to an early conclusion by the treaty of Fleix, Nov. 26, 1580. A momentary lull occurred; but the king became more and more unpopular by his unbounded licentiousness and prodigality. On the death of his younger brother, the duke of Alençon, by which the succession to the crown reverted to the Protestant Henry of Navarre, the spirit of the league rekindled; the association extended all over the provinces, and became more formidable than ever; the majority of the nation was indeed adverse to accepting as heir apparent a prince who was not a Catholic. Henry III., although not sharing this popular prejudice, was obliged to go to war with Henry of Navarre, and assembled four armies. By thus increasing its burdens he hoped to make the nation weary of the contest, while he exerted his ingenuity to make such combinations as would thwart the projects of the league. But his favorite Joyeuse was defeated by the king of Navarre at Coutras in 1587, and his own unpopularity increased, the league making him answerable for the reverses which befell the Catholic party. On all sides he was denounced as a traitor, and his deposition was publicly advocated. The duke of Guise was recalled to Paris by his adherents, and, notwithstanding repeated orders from the king, triumphantly entered the capital. Henry having summoned troops for his own defence, the Parisians raised a formidable rebellion; barricades were constructed, May 12, 1588; and the king barely escaped from his ambitious rival. He immediately convoked the states general at Blois, in the hope of finding support among them; but the majority was still against him; his life and crown were at stake; he resorted to violent means, and on Dec. 23, 1588, caused the duke of Guise to be murdered in his own apartment by his body guards, the "forty-five." This was a new incentive to the league. Henry, branded as an assassin, anathematized by the pope, deposed by decrees of the Sorbonne and the parliament, had no resource but to unite with Henry of Navarre, and they marched in concert against Paris, the principal seat of the league. During the siege of that city a Dominican monk, Jacques Clément, whose fanaticism had been encouraged by Guise's own sister, the duchess of Montpensier, presented himself at St. Cloud to the king as the bearer of an important letter, Aug. 1, 1589, and stabbed him with a knife, inflicting a wound of which he died on the following day. With Henry III. the Valois family became extinct.

**HENRY IV.**, the first French king of the house of Bourbon, born at the castle of Pau, Dec. 14, 1553, assassinated in Paris, May 14, 1610. The son of Antoine de Bourbon and Jeanne d'Albret, queen of Navarre, he was brought up by his mother in the Protestant religion, carefully educated, and inured to hardship. As early as 1569 she took him to the Protestant army before La Rochelle, and placed him under the control of Admiral Coligni. He was present at the battles of Jarnac and Moncontour, both disastrous to his party. He distinguished himself in the military operations in southern France, which were terminated by the peace or edict of St. Germain in 1570. The seeming reconciliation of the Protestant and Catholic parties was to be sealed by the marriage of young Henry with Margaret, the sister of King Charles IX.; it was agreed to in April, 1572, and notwithstanding the sudden and unexpected death of Jeanne of Navarre, which occurred in June under very suspicious circumstances, the ceremony was performed on Aug. 17, seven days before the massacre of St. Bartholomew. A number of eminent Huguenots had congregated in Paris to participate in the matrimonial festivities, and were slaughtered during the bloody 24th. Henry himself, a prisoner in the Louvre, saved his life by abjuring his faith. For nearly four years he was detained at court, strictly watched, dissembling his real sentiments under the cover of levity. In February, 1576, he escaped, took refuge first in Alençon, then crossed the Loire at the head of a number of his adherents, revoked his abjuration, took command of the Protestant troops, and successfully carried on hostilities against the Catholics, which brought about the peace of Beaulieu in May, 1576. The states general at Blois having issued coercive decrees against the Huguenots, Henry took up arms again, but peace was concluded at Bergerac, Sept. 17, 1577. On the breaking out of the "lovers' war" in 1580, of which he gave the signal, he inspired his adherents with confidence and ardor, and accomplished deeds of heroic valor at the siege of Cahors, which city he stormed after a tremendous fight of four days' duration. He thus gained a high position, not only among his own party, but in the eyes of his opponents. The death of his mother in 1572 had left him king of Navarre; and on the death of the duke of Alençon, or rather Anjou, youngest brother of Henry III., June 10, 1584, he became heir apparent to the French crown. He was then in his 31st year. As he was deserted by Henry III., proscribed by the Catholic party and the league as a heretic, and shortly after excommunicated by Pope Sixtus V., his cause seemed desperate; but though his troops scarcely numbered one tenth as many as the Catholic army, he soon took the field with his wonted courage. The victory of Coutras, Oct. 20, 1587, greatly bettered his fortunes, although it was followed by the defeat

of several auxiliary troops sent to him by the German princes. The *journée des barricades*, when Henry III. was compelled to leave his metropolis in the hands of the rebellious duke of Guise, brought about a reconciliation between the kings of France and Navarre, who united their forces to oppose the league, and in concert laid siege to the capital. The assassination of Henry III. greatly increased the difficulties of Henry of Navarre. He was at once deserted by the Catholic nobles who supported the cause of his predecessor, but who, notwithstanding their devotion to royalty, would not accept a Protestant king; the league at the same time raised against him his uncle, the cardinal de Bourbon, whom they proclaimed king under the title of Charles X.; and the nation itself evinced no partiality for Henry. He was obliged to raise the siege of Paris, was pursued through Normandy by the duke of Mayenne, and seemed to be in imminent danger, when he thwarted the hopes of his enemies by his heroic stand near the castle of Arques; notwithstanding their large superiority in numbers, they were obliged (Oct. 6, 1589) to beat a retreat, leaving from 1,000 to 1,200 men on the field. Henry, quickly returning to Paris, seized its suburbs, but could not take the city itself for want of artillery. Another and more decisive victory over Mayenne, that of Ivry, which he won March 14, 1590, once more opened before him the road to the capital, which he blockaded for several months, and had reduced to the last extremities, when it was relieved by the approach of a Spanish army under Alexander Farnese, duke of Parma. For two years longer the war was carried on with varied success, Henry being more than once worsted by his opponents, but, amid the most trying circumstances, showing such perseverance, ingenuity, and valor as to uphold the drooping spirits of his followers. A favorable change in his fortunes became apparent during the year 1593. Discord prevailed among his enemies; the ambitious designs of Philip II. of Spain, who openly manifested his desire of placing his daughter on the throne of France, inspired the French Catholics, and even the leaguers, with distrust and anger. A better feeling grew up among the people, who, being weary of so protracted a war, instinctively leaned toward the prince from whom alone peace could be expected. Everything showed him that the time had come for a decisive step; and he therefore abjured Protestantism at St. Denis in July, 1593, and was crowned at Chartres, Feb. 27, 1594. The majority of the nation at once sided with him. Paris surrendered March 22, and within a few months most of the Catholic governors of the provinces and cities also submitted. Mayenne still held Burgundy with the assistance of Spanish troops; but the high constable of Castile having been defeated at Fontaine-Française, June 5, 1595, negotiations were entered into, and the duke, swearing allegiance to Henry, kept the govern-

norship of the province. Picardy was meanwhile in the hands of Spain, against which war had been formally declared; the king led his army against Amiens, and, notwithstanding the presence of the Spanish army under the archduke Albert, forced that city to capitulate (1597), and the next year brought to submission the duke de Mercœur, who had heretofore acted as an independent sovereign in Brittany. France was now wholly under his control; he gave her peace at home by the celebrated edict of Nantes, April 13, 1598, and abroad by the treaty of Vervins with Spain, May 2. Henry now perseveringly pursued the policy of restoring order and prosperity to his kingdom, strengthening the royal authority, and placing France in a respectable position abroad. In this laborious task he was especially assisted by the duke de Sully. Agriculture, mining, commerce, and manufactures were encouraged; roads were opened and repaired; the army received a better organization, while strong fortresses were built along the N. and E. frontiers; the navy, which had been neglected, was improved, and attention was paid to the French colonies in America. In short, improvements were made in every branch of the public service. The ambitious aspirations of provincial governors were effectually checked; political conspiracies were severely punished; municipal franchises and immunities, that had been revived or extended during the civil wars, were curtailed; and obedience to the king became the order of the day. After the death of his celebrated mistress, Gabrielle d'Estrées, having procured the dissolution of his marriage with Margaret of Valois, December, 1599, Henry married Maria de' Medici, the niece of the grand duke of Tuscany, which secured his influence among the Italian princes. A short war with the duke of Savoy put him (1601) in possession of several valuable districts on the E. frontier. A formidable conspiracy having been plotted by the duke de Bouillon and the count d'Auvergne, in conjunction with Marshal Biron, who also maintained secret relations with Spain and Savoy, Henry had the latter, his old companion in arms, arrested, tried before the parliament, and beheaded, July 31, 1602. A few years later the count d'Auvergne, having engaged in new intrigues, was incarcerated in the Bastille; and the duke de Bouillon, the constant promoter of rebellions among the Protestants, was dispossessed of his principality of Sedan, and would have lost his life but for Queen Elizabeth's entreaties. His power being thus firmly established, Henry resumed the political designs of Francis I. and Henry II., concerted extensive schemes with Barnaveldt, the grand pensionary of Holland, formed alliances with German Protestant princes, and made preparations for a fresh war against the house of Austria. It is even said that he aimed at nothing short of an entire reorganization of Europe. However this may have been, he was on the eve of leaving Paris

to take command of the French army in the north, when, riding through the city, May 14, 1610, he was stabbed to the heart by the fanatic François Ravallac. His death was regarded as a national calamity. Henry's children, by his second wife, were his successor Louis XIII.; Gaston, duke of Orleans; Elizabeth, who married Philip IV. of Spain; Christine, who became duchess of Savoy; and Henrietta Maria, the wife of Charles I. of England. César, his natural son by Gabrielle d'Estrées, was the founder of the house of Vendôme, and grandfather of the celebrated duke who distinguished himself under Louis XIV.—The high capacities of Henry IV., as well as his shortcomings and "amiable faults," have always been well known; but it is only in recent years that his ready wit and charming style as a writer have come to be fully appreciated, through the publication of his letters (9 vols. 4to) by M. Berger de Xivrey in the *Documents inédits sur l'histoire de France*. Motley's "Life and Death of John of Barneveld" (London, 1874) throws much light on Henry's last diplomatic transactions, and displays the occasional frivolity of his motives in his most important enterprises. See also *Henri IV.*, by M. H. de Lescure (Paris, 1874).

### III. GERMANY.

**HENRY I.**, king of Germany, surnamed the Fowler or Falconer (*der Finkler or Vogler*), the first of the line of Saxon sovereigns of Germany, born in 876, died in 936. He was the son of Otho the Illustrious, duke of Saxony, on whose death he succeeded to the dukedoms of Saxony and Thuringia. His father had been elected in 911 to the sovereignty of Germany, but had caused Conrad, duke of the Franks, to be elevated in his stead. This sovereign undertook to deprive Duke Henry of part of his inherited estates, but the latter fought his enemy at Eresburg (modern Stadtberge), and compelled him to acknowledge all the ducal rights of Saxony and Thuringia. Conrad discovered the great qualities of his opponent, and, having been mortally wounded in an expedition against the Hungarians, designated Henry as his successor, and sent messengers to make known his choice. The envoys, it is said, found the duke in the Hartz mountains, with a falcon upon his wrist, and this was the origin of his surname. Henry's election was formally declared in 919, by the nobles of Franconia and Saxony. The dukes of Swabia and Bavaria refused their homage, but were speedily brought to submission. Henry also conquered Lorraine, which had hesitated to accept him. He erected the fief into a duchy, giving his daughter in marriage to Duke Gisbert; and having thus consolidated the sovereignty of Germany, he turned all his attention to arresting the Slavic and Hungarian inroads. In 924 the Hungarians advanced into the very heart of Saxony. Their leader was captured, and in exchange for him Henry

obtained a truce of nine years. He made the most of the truce by organizing his army, building castles, fortifying cities, and reducing Brandenburg, together with the tribes on the Eider and the Elbe, and extending his rule to Prague. From this period dates the fealty of the Bohemian princes to Germany (929). On the expiration of the truce war with the Hungarians was renewed, and Henry gained a complete and decisive victory on the banks of the Saale (933), which for the time relieved Germany from all danger of invasion. In 934 he defeated the Danes, who were ravaging the coasts of his northern provinces. Henry reigned nearly 18 years, and left his kingdom powerful and prosperous. The municipal privileges which he granted were the foundation of the Germanic corporations.

**HENRY II.**, *Saint*, surnamed the *Lame*, emperor of Germany, great-grandson of the preceding, born May 6, 972, died at Grone, near Göttingen, July 13, 1024. His surname of the *Lame* was derived from an accident which befell him at Pavia in 1004. He succeeded his father as duke of Bavaria in 995, was elected successor to Otho III. at Mentz, June 6, 1002, and marched immediately against Hermann of Swabia, his competitor, whom he defeated. After ravaging Swabia, Thuringia, Saxony, and Lorraine, he had himself crowned a second time at Aix-la-Chapelle; he married Cunegunda (Kunigunde), daughter of Sigfried, first count of Luxemburg, and had her crowned at Paderborn in 1003. In the following year he passed into Italy, defeated Arduin of Ivrea, who had assumed the title of Cæsar, and on May 15 was crowned in Pavia with the iron crown of the Lombard kings. Returning to Germany, he drove the Poles out of Bohemia in 1006, confirmed Stephen of Hungary in his new royal dignity in 1007, and in 1008 bestowed the duchy of Lorraine upon Godfrey, count of Ardennes. The continued ill success of his arms against Boleslas of Poland inspired him in 1011 with the resolution to embrace a monastic life; but his counsellors dissuaded him from his purpose, and he soon afterward concluded a peace with Poland and secured the frontiers of Bohemia. At this time Cunegunda, being publicly accused of adultery, underwent the ordeal of walking on red-hot ploughshares. In 1013 Henry defeated Arduin a second time, and having restored Pope Benedict VIII., he and Cunegunda received at his hands the imperial crown at Rome, Feb. 14, 1014. Historians accuse him of having on this occasion promised fealty to the pope, thereby sowing the seeds of future dissensions between church and state. Having pacified Lombardy, Henry returned to Germany, and on his way assumed the monastic habit in the convent of St. Vannes at Verdun, and vowed obedience to the abbot. But the latter forthwith commanded him to resume his imperial state and attend to the government of the empire. He was defeated anew by the Poles in 1015, and

the war with them continued till 1018. Henry was about retiring to the cloister, when at the solicitation of the pope in 1021 he returned to Italy to repel the Saracens. In 1022 he presided at the council of Seligenstadt, and in 1023, at an interview with the king of France near Sedan, he concluded an advantageous peace. He was buried in the cathedral of Bamberg founded by himself, and with him ended the imperial Saxon line. He founded many monasteries and schools, which became centres of learning. He was canonized by Eugenius III. in 1152, and his feast is celebrated on July 14. Cunegunda was also canonized in 1201. Henry's life, written probably by Adebald, bishop of Utrecht, was inserted with the annotations of Basnage in the *The-saurus Monumentorum Ecclesiasticorum* of Canisius (Antwerp, 1725), and is reproduced in the *Acta Sanctorum* for July.

**HENRY III.**, emperor of Germany, of the Franconian line, surnamed the Black, the Bearded, the Old, and the Pious, born in 1017, died in 1056. He was the son and successor of the emperor Conrad II., having been elected during his father's life, and ascended the throne in 1039. He repeatedly and successfully interfered in the affairs of Hungary, and a portion of that country (from the Kahlenberg to the Leitha) was definitively united with Austria. Three claimants at this time were contesting the papal tiara. Henry summoned a council at Sutri in 1046, set them all aside, and created a German bishop of Bamberg (Suidger) pope, under the title of Clement II. He subsequently gave three successive German popes to Rome, reserving to himself a thorough control of the spiritual administration. He held the temporal princes at the same time in subjection, transforming the German empire into a monarchy of which the elected sovereign was absolute ruler. He promoted education, and encouraged art and science. His first wife was a daughter of Canute, king of Denmark and England.

**HENRY IV.**, emperor of Germany, son of the preceding, born in 1050, died in Liège, Aug. 7, 1106. He was about six years old when his father died, and the regency was intrusted to his mother, Agnes of Aquitaine; but her authority was overthrown by the nobles, and she retired to Rome, while Henry was taken to Cologne by the archbishop Hanno. Shortly afterward he became the pupil and ward of Archbishop Adalbert of Bremen, from whom he imbibed a feeling of hostility against the temporal lords, especially those of Saxon descent, which embittered his whole reign. At 15 he was declared of age, and in the following year (1066) was removed by the nobles from the immediate control of Adalbert. The counsel and instructions of the archbishop, however, were never forgotten, and Henry soon manifested a hatred of the Saxons by acts of oppression and violence. He had espoused Bertha, the daughter of an Italian prince of Susa, and now sought

to be divorced from her. The pope manifested opposition, and Henry, after vainly resorting to unworthy means for the accomplishment of his wishes, at length became reconciled to his young wife, whose noble conduct subsequently won and retained his affection. Meanwhile the exasperated nobles of Saxony rose against the emperor, who was driven from several strongholds in succession, and finally wandered three days in the Hartz without food. Under the guidance of a mountaineer he escaped to the Rhine, assembled an army, defeated the Saxons, and desolated their country with fire and sword. Other princes of the empire now interfered, and the Saxon nobles, after public humiliation upon their knees, were admitted to mercy, though many of them were retained as prisoners, and their fiefs made over to other vassals. Henry rebuilt his Saxon fortresses, and by his arrogance and extortion planted anew the seeds of revolt. Meanwhile he was suddenly commanded by Pope Gregory VII. (Hildebrand) to appear at Rome to answer for crimes laid to his charge, on penalty of excommunication. Henry's indignation vented itself for the moment in a missive addressed to the "false monk Hildebrand," informing him of his deposition by the German prelates (Worms, 1076), and of his excommunication by judgment of the same assembly. The pope immediately issued sentence of excommunication. Henry soon learned the necessity of submission. Deserted and threatened by the majority of the German princes, he hastened to Italy, accompanied by his wife and a single attendant, and humbled himself before the pope in the most penitential manner. Clad in a shirt of hair, and barefooted, he was compelled, it is said, to pass three whole days in an outer court of the castle of Canossa, in midwinter, awaiting Gregory's permission to appear before him. On the fourth day he was admitted and received absolution. With this, after finding adherents among the Lombards, his courage and resentment alike revived. He began a war with the sword and with the pen, which for 30 years he sustained with the greatest skill and determination, and in which for the most part he maintained the ascendancy. Such were the opening scenes of the long and violent contest concerning investitures—a conflict between state and church which was destined to rage for half a century, and which, subsequently resumed, was protracted till 1268. During Henry's absence the German princes had deposed him, and elected Rudolph of Swabia, in a diet at Forchheim (March, 1077); but there were yet cities and bishoprics in Germany which remained faithful, and Rudolph was forced to retire from Swabia, which duchy, together with the hand of his daughter Agnes, Henry bestowed upon a bold adherent, Count Frederick of Buren, who soon built his castle on the summit of Mt. Staufen, and founded the race of Hohenstaufen. The war raged fiercely meanwhile in the fairest regions of Germany. The pope, who was

not sorry to find the rival emperors consuming their strength against each other, is supposed to have fostered the quarrel for his own purposes. At length, influenced by the Saxons, he sent the crown to Rudolph, and again excommunicated Henry. The latter, in turn, again declared the pope deposed, and caused an antipope, Clement III., to be elected. At this period (1079) fortune appeared to favor Henry; but in the following year he lost a great battle near Gera. In the action, however, Rudolph was slain by Godfrey of Bouillon, the hero of the first crusade. The fall of Rudolph, although his army was victorious, was considered a judgment of God, and the effect was to enlist an immense increase of numbers in the service of Henry, who now marched upon Rome, and besieged it with short intervals during three years. Gregory retreated into the castle of Sant' Angelo, and Henry contented himself with a coronation by his own pope, Clement (1084). Robert Guiscard, the Norman duke of Calabria, at length approached from lower Italy, and Henry retired, leaving Rome to be plundered by the Normans, and Gregory to be rescued by them from his own people, who had laid siege to the castle. Hermann of Luxemburg succeeded Rudolph in the rival emperorship, and Victor succeeded Gregory in the rival papacy (1085); but neither could withstand the power of Henry. Hermann soon abdicated, and his successor, Egbert of Thuringia, having been assassinated, the Saxons submitted. Henry's eldest son, Conrad, whom he had named king of the Romans, was now gained over by the papal party. He was deposed, and died in 1101. His defection was followed by that of his brother Henry, who, in view of the renewal of the papal ban against his father by the popes who had in turn succeeded Victor, resolved to support the church. He pretended a reconciliation, however, and the emperor, having been treacherously seized and carried prisoner to Ingelheim, was compelled by the prince to resign his throne. Henry escaped, and sought refuge at Liège, where he died.

**HENRY V.**, emperor of Germany, surnamed the Young, second son of the preceding, born in 1081, died in Utrecht, May 23, 1125. His filial ingratitude and treachery are noticed in the account of Henry IV., whom he succeeded in 1106. Notwithstanding his revolt against his father, he acted from the outset of his reign according to the principles of the late emperor, and in defiance of the pope he claimed the right of investiture. He espoused Matilda, daughter of Henry I. of England, and was enabled by her dowry to go to Italy with great magnificence and a strong military force, to be crowned by the pope. The pontiff, Paschal II., had made propositions of compromise in regard to the dispute concerning investitures, and the subject was to be adjusted in solemn assembly in the church of St. Peter; where, however, an angry discussion among the bishops was followed by the seizure and imprisonment of the pope

and cardinals. Henry's army, encamped around the church, was attacked by the enraged Romans, and in a furious battle the emperor's life was with difficulty saved by Count Otho of Milan, at the expense of his own. The Romans were driven into the city, and after Henry had ravaged the surrounding country, the pope purchased his own liberty and the safety of the city by consenting solemnly to the imperial right of investiture, declaring at the same time that Henry should not be excommunicated. The latter clause was incorporated in the treaty, and the emperor was crowned in St. Peter's, April 13, 1111. But scarcely had he taken his departure, when Paschal denounced the treaty as having been extorted by force. The dispute, thus renewed, was protracted with great animosity for ten years. Henry was excommunicated by the successors of Paschal, and defeated in northern Germany, where the princes refused obedience. In Saxony also the emperor lost all authority. In 1116 he led a second expedition against Rome, created an antipope, Gregory VIII., but at length saw the necessity of abandoning his claim, and subscribed the famous concordat of Worms (1122), by which he surrendered the investiture with ring and crozier as tokens of spiritual jurisdiction, and agreed to permit the free choice of the German bishops, whose election, however, was to take place in presence of the emperor or of his plenipotentiary. It was also agreed that in doubtful elections, or in electoral disagreements, the decision should lie with the emperor, whose imperial authority, in connection with the temporal possessions of the churchmen, was at the same time solemnly acknowledged. The concordat, virtually a compromise, was received throughout Europe with great joy, and the remainder of Henry's reign was passed in peace with the church; but dissensions prevailed throughout his dominions. He formed plans for strengthening the imperial power, and began a war with France, but was cut off suddenly by a contagious disease. With him ended the race of Salian or Franconian princes. His hereditary possessions fell to the sons of his sister Agnes, Frederick and Conrad of Hohenstaufen; and the imperial crown was conferred upon Lothaire of Saxony.

**HENRY VI.**, surnamed the Cruel, emperor of Germany, son and successor of Frederick I. (Barbarossa), born in 1165, died in Sicily, Sept. 28, 1197. He had been crowned king by the Lombards in 1185, and was also during his father's lifetime named successor to the imperial throne. In 1186 he married the Norman heiress, Constance of Naples and Sicily. On the death of Frederick in Cilicia (1190), Henry, who had been invested with the government during his father's absence, succeeded without opposition. But the return from England of Henry the Lion of Saxony, who had been temporarily exiled by Frederick, provoked new wars, which were terminated by the marriage of the son of the duke with Agnes, prin-

cess palatine, cousin to Henry. In 1192 Richard Cœur de Lion was arrested while going through Germany in disguise, and with his ransom Henry fitted out an expedition to Italy. Naples surrendered, and he was crowned at Palermo in October, 1194; but his cruelty to the Italian nobles who had rebelled, and his extortion, rendered him so odious that his sudden death is generally attributed to poison. Constance has been accused of the murder. At the time of his death he was preparing for an expedition against the Greek empire, preliminary to a new crusade.

**HENRY VII.**, of Luxemburg, emperor of Germany, born in 1262, died at Buonconvento, near Siena, Aug. 24, 1313. He was elected emperor in 1308, after an interregnum of four months which followed the death of Albert I. After punishing the murderers of his predecessor, and after the marriage of his son John with the heiress of Bohemia, he went to Italy, which was distracted by the wars of the Guelphs and Ghibellines; and having compelled the Milanese to consent to his coronation with the iron crown of Lombardy, he reduced the whole of northern Italy, and continued his march to Rome, of which King Robert of Naples held military possession. After the reduction of that city, and the imperial coronation by cardinals (the pope, Clement V., having transferred the holy see to Avignon in 1309), Henry placed Robert under the ban of the empire, and was about to march against Naples when he died suddenly, of poison, it was affirmed, administered in the eucharist.

**HENRY, Caleb Sprague**, an American author, born in Rutland, Mass., Aug. 2, 1804. He graduated at Dartmouth college in 1825, and, after a theological course at Andover and New Haven, settled in 1828 as a Congregationalist minister at Greenfield, Mass. In 1831 ill health obliged him to suspend his ministry, and he spent two years at Cambridge in the study of philosophy. In 1833 he was settled in Hartford, Conn. In 1834 he published a pamphlet on the "Principles and Prospects of the Friends of Peace." About this time he also established a journal called the "American Advocate of Peace," which after the first year became the organ of the American peace society. In 1835 he removed to New York, where he took orders in the Protestant Episcopal church. Soon afterward he was appointed professor of intellectual and moral philosophy in Bristol college, Pa. In 1837 he returned to New York, and in conjunction with Dr. Hawks founded the "New York Review." In 1839 he became professor of philosophy and history in the New York university. He published in 1845 a translation of the abbé Bautain's "Epitome of the History of Philosophy," with a continuation from the time of Reid down to the date of its publication. He has also published "Cousin's Psychology," being a translation of Cousin's lectures on Locke's "Essay on the Human Un-

derstanding," with notes and additional pieces (Hartford, 1834; 4th ed., revised and enlarged, 1856). In 1847 he became rector of St. Clement's church, New York. On account of failing health he resigned this post in 1850, and his professorship in 1852. In 1870 he took charge of St. Michael's church, Litchfield, Conn., where he continued for four years, when he removed to Stamford, where he now resides (1874). Dr. Henry has published, besides the works above mentioned, "Compendium of Christian Antiquities" (8vo, 1837); "Moral and Philosophical Essays" (1839); "Guizot's General History of Civilization, with Notes;" "Household Liturgy;" Taylor's "Manual of Ancient and Modern History," revised, with a chapter on the history of the United States (New York, 1845); "Dr. Oldham at Greystones, and his Talk there" (1860; 3d ed., 1872); "Considerations on some of the Elements and Conditions of Social Welfare and Human Progress," and "About Men and Things: Papers from my Library Table Drawer" (1873); and numerous addresses and pamphlets.

**HENRY, Joseph**, an American physicist, born in Albany, N. Y., Dec. 17, 1797, died in Washington, D. C., May 13, 1878. After a course of study in the Albany academy, in 1826 he was appointed professor of mathematics in that institution. In 1827 he began a series of experiments in electricity, and in 1828 published an account of various modifications of electro-magnetic apparatus. He was the first to prove by actual experiment that in the transmission of electricity for great distances the power of the battery must be proportioned to the length of the conductor. He was also the first actually to magnetize a piece of iron at a distance, and invented the first machine moved by the agency of electro-magnetism. (See ELECTRO-MAGNETISM.) In March, 1829, he exhibited to the Albany institute electro-magnets which possessed magnetic power superior to that of any before known, and subsequently he constructed others on the same plan, one of which, now in the cabinet of the college at Princeton, N. J., will sustain 3,600 pounds, with a battery occupying about a cubic foot of space. In 1831, in some experiments at the Albany academy, he transmitted signals by means of the electro-magnet through a wire more than a mile long, causing a bell to sound at the further end of the wire. An account of these experiments and of his electro-magnetic machine was published in Silliman's "American Journal of Science" in 1831, vol. xix., in which Prof. Henry pointed out the applicability of the facts demonstrated by his experiments to the instantaneous conveyance of intelligence between distant points by means of a magnetic telegraph, several years before such a telegraph was brought into practical operation by Prof. Morse. In 1832 he was appointed professor of natural philosophy in the college of New Jersey at Princeton, where he continued his experiments and researches.

In his first course of lectures in that institution in 1833 he mentioned the project of the electro-magnetic telegraph, and demonstrated that the electro-magnet might be used to produce mechanical effects at a distance. In February, 1837, he went to Europe, and in April of that year visited Prof. Wheatstone of King's college, London, to whom he explained his discoveries and his method of producing great mechanical effects at a distance, such as the ringing of church bells 100 miles off, by means of the electro-magnet. In 1846, on the organization of the Smithsonian institution at Washington, Prof. Henry was appointed its secretary, a post which he held till his death, and which gave him the principal direction of the institution. His discoveries in physics are numerous, some of the most important of which are described in various scientific articles in this work. He was the author of "Contributions to Electricity and Magnetism" (4to, Philadelphia, 1839), and many papers in the "American Philosophical Transactions," in Silliman's "Journal," in the "Journal of the Franklin Institute," and in other scientific periodicals.

**HENRY, Matthew**, an English Biblical commentator, son of Philip Henry, born at Broad Oak, Flintshire, Oct. 18, 1662, died in Nantwich, June 22, 1714. He studied law for some time, but preferred the ministry, succeeded as a preacher, and was soon invited to Chester, where, being ordained in 1687, he drew around him a large congregation, to which he ministered for 25 years. During this period he more than once went through the entire Bible in a course of expository lectures, which he continued at Hackney, whither he removed in 1712. He thus gradually completed his celebrated "Exposition" of the Bible. The first collective edition was published in 1710 (5 vols. fol., London), and it has been many times reprinted. Henry's other works include "Life and Death of Rev. Philip Henry" (1698); "Method of Prayer" (1710); "Treatise on Baptism;" "Communicant's Companion" (1731). A collection of his miscellaneous works, in one volume, appeared in London in 1830. See "Life of Matthew Henry," by W. Tong (1716), and also by Williams prefixed to the "Exposition" (3 vols., London, 1828).

**HENRY, Patrick**, an American orator and statesman, born at Studley, Hanover co., Va., May 29, 1736, died at Red Hill, Charlotte co., June 6, 1799. His father, John Henry, was a native of Aberdeen, Scotland, and a nephew of Robertson the historian. His mother was first married to Col. John Syme, and afterward to John Henry, who was colonel of a regiment, county surveyor, presiding magistrate, and a man of liberal education and conspicuous loyalty. A few years after the birth of the boy, Col. John Henry removed from Studley to Mount Brilliant in the same county, where the childhood and early youth of the future orator were passed. He was sent first to an "old field school," where at that period tuition was

chiefly confined to the English and primary departments, with perhaps a smattering of the classics. Under his father, who taught a grammar school in his own house, he acquired a competent English education, and some acquaintance with Latin and mathematics. But hunting and angling early grew to be passions with him; he would desert his books at any moment to seek the forest with his gun, or the neighboring streams with his fishing rod. At the age of 14 he heard the celebrated Presbyterian preacher Samuel Davies, whose eloquence produced a powerful effect upon the boy and opened a new world for him. Henry spoke of him throughout life in terms of unbounded admiration, and declared that any success which he himself had achieved was due in a large measure to the great orator of the Presbyterian church. About this time his father became embarrassed, and required assistance from his sons. Patrick was accordingly placed behind the counter of a country merchant, and the year after, at the age of 16, his father set him up in business with his elder brother William. The future orator possessed none of the traits which secure success in trade. He was indolent, careless, slovenly in his dress, and awkward in manners, but humorous and attractive in conversation; and his fondness for social pleasures was rather an obstacle than an advantage. William Henry was even less energetic than his brother, and, after a year's experience, abandoned the business. After this Patrick became still more indolent. His social and sporting propensities grew upon him. The hunter's horn and the cry of the hounds often drew him away; and he expended on the violin and the flute the energies which should have been given to his business. At other times he gratified the dry humor which characterized him by exciting debates among the country people who hung around the store. He would relate stories, real or fictitious, and derive his own amusement from the emotions exhibited by the simple auditors. If to these idle pursuits be added the fact that he could not refuse any one credit, the result of the mercantile venture may without difficulty be understood. In two or three years the store was closed, and Patrick Henry was insolvent. He had just married Miss Shelton, the daughter of a respectable farmer. With the assistance of his father and father-in-law he began farming upon a small scale, but in two years abandoned it in despair, and selling his scant property turned again to merchandise. But experience and misfortune had taught him nothing. The violin, the flute, his old pastime of telling stories and watching the expression of his auditors, were cultivated with renewed ardor. He studied geography, read translations of Latin and Greek authors, Livy being his favorite, and, when weary of books, shut up his store, and went hunting or fishing. The former result duly followed. He again became bankrupt, and began to study law. At the age of

24, after only six weeks' study, he presented himself before the judges, who granted him a license with hesitation, and only after a promise to study further before commencing practice. It is said that at this time he was unable to draw a declaration, or perform the simplest duties of his profession. He could obtain no practice, and the distress of his family was extreme. He was living with his father-in-law, who then kept the tavern at Hanover Court House, and Henry assisted him in the business, filling the place of Mr. Shelton in the tavern when he was compelled to be absent. Otherwise he was as idle as ever. But events were rapidly hastening toward the commencement of the great political struggle in which he was to bear so glorious a part. His first appearance in public, as in every great movement of his career, was on the side of popular rights. At the age of 27 he was retained, for want of a better advocate, in what seemed a desperate struggle—the celebrated "parsons' cause," the history of which was briefly as follows. In 1755, a year of great drought, and serious public embarrassment from the expenses of the French war, the house of burgesses had enacted that all debts due in tobacco, then a species of currency, should be paid either in kind or in money, at the rate of 16s. 8d. for the 100 lbs. of tobacco, or 2d. per pound. The law was universal in its application, and was to remain in force for ten months. Its effect was to reduce all fees and salaries to a moderate amount in money, and it bore especially upon the clergy of the established church. They were entitled by law to 16,000 lbs. of tobacco per annum each, and the act deprived them of about 66 per cent. of their due. There was much dissatisfaction, but no resistance. When, however, in 1758, a similar law was passed, an acrimonious controversy arose between the planters and the clergy. The latter appealed finally to the king in council, and the act was declared void. Suits were immediately instituted by the clergy in the different counties to recover the amount of loss which they had suffered by the "twopenny act." The county of Hanover was selected as the theatre of the struggle, the decision in one case being regarded as a fair test of the question. The court, on demurrer, decided in favor of the plaintiff, the Rev. John Maury; and the case now stood upon a common writ of inquiry of damages. The contest was considered at an end, and Patrick Henry seems to have been employed by the defendants merely as a matter of form. They had calculated without the popular feeling against the clergy, who were hated by a great part of the people. A large crowd assembled to witness the trial of the question of damages. On the bench sat more than twenty of the clergy, among them many of the most learned men in the colony. Their case was lucidly and calmly stated by Peter Lyons, a distinguished counsellor of the time; and Patrick Henry rose to reply. The array before him was terrifying to

a youthful and inexperienced man, and the presence of his father in the chair of the presiding magistrate did not lessen the embarrassment of his position. His exordium was awkward and confused. He visibly faltered. The crowd, whose sympathies were all on the side which he represented, hung their heads and gave up the contest. The clergy smiled and exchanged glances of triumph. The father of the speaker almost sank back in his seat. But a change suddenly took place in the demeanor of every one. All eyes were drawn to the youthful orator. His confusion had passed away; his form rose erect; and the "mysterious and almost supernatural transformation of appearance" which his contemporaries spoke of passed over him. Those who heard the unknown young man in this his first speech said that he "made their blood run cold and their hair to rise on end." Under his terrible invective the clergy disappeared hastily from the bench; and the jury, after retiring for an instant, brought in a verdict of one penny damages. A motion was made by Mr. Lyons for a new trial, but it was overruled; and Patrick Henry, thenceforth the "man of the people," was caught up by the crowd, drawn out of the court house, and borne on the shoulders of the multitude. Thus, at a single step, Henry rose to the first rank among the Virginia orators of the time. His success in the parsons' cause brought him profit as well as fame. He no longer suffered from want of business, and seems to have addressed himself to the prosecution of his profession with industry and energy. The law was not, however, destined to monopolize his genius. He entered the house of burgesses in the spring of 1765, at the moment when England consummated her long series of oppressions upon the American colonies by the passage of the stamp act. The bill received the royal sanction in March of that year, and in May it came up for discussion before the burgesses. The character of that body was anomalous—its action difficult to predict. It had opposed consistently and with stubbornness all encroachments of the home government from the earliest times; it had repeatedly denied the right of the English parliament to lay imposts upon the American colonies, and had systematically contended that taxation and representation were inseparable. But peculiar elements and considerations entered into the struggle about to take place. An open rupture with England was extremely repugnant to the dominant party in the house. The great majority of the burgesses were opulent planters of the tide-water region, attached to the mother country by a thousand ties. They regarded Magna Charta, the established church, and the common law as a part of their inheritance; and a dissolution of the ties which bound them to Great Britain seemed a relinquishment of the part which they had in these great institutions. Thus socially and politically the ruling classes in Virginia were opposed to extreme measures,

and in the house which assembled in the spring of 1765 they were represented by their most powerful names. These gentlemen held back, hesitated, and advocated renewed protests and petitions. It was in the midst of this general indecision and doubt that Patrick Henry startled the assembly by his celebrated resolutions. He was almost unknown to the members, and the first sentiment of the richly clad planters was scorn and indignation at the presumption of the slovenly and awkward youth, in leather knee breeches and a homespun coat, who ventured to assume the post of leader in an assemblage so august and at a moment so critical. His resolutions, which he had hastily written on the leaf of a law book, contained none of the old formal and submissive phrases. They suggested no new petition or protest. They declared that the house of burgesses and the executive had "the exclusive right and power to lay taxes and imposts upon the inhabitants of this colony;" and that, consequently, the stamp act, and all other acts of parliament affecting the rights of the American colonies, were unconstitutional and void. The best patriots received the resolutions with a tempest of opposition. They were declared extreme, impolitic, and dangerous. "Many threats were uttered," says Henry, "and much abuse cast on me by the parties for submission." Thomas Jefferson, who heard the debate, says that it was "most bloody." But the nerve and resolution of the young burgess were as great as his eloquence. In the midst of the debate he thundered: "Cæsar had his Brutus, Charles the First his Cromwell, and George the Third"—"Treason!" cried the speaker, "Treason, treason!" echoed from every part of the house—"may profit by their example! If this be treason, make the most of it!" The resolutions, in spite of a bitter opposition, were carried, the last by a majority of one. The young man had thus achieved at the age of 29 the reputation of being the greatest orator and political thinker of a land abounding with public speakers and statesmen. He had suddenly become a "power in the state;" and the sceptre, departing from the hands of the wealthy planters, was wielded by the county court lawyer. The mouthpiece of resistance, the authoritative representative of the masses as distinguished from the aristocracy, and soon to be the advocate of revolution, Patrick Henry thenceforth occupied a post of strength from which his enemies were unable to drive him. From the pursuits of his profession, to which he returned, he was soon again recalled to the stage of public events. The stamp act had been repealed, but the policy of laying burdens upon the colonies had not been abandoned. In 1767 the act levying duties upon tea, glass, paper, and other articles, threw the country into renewed ferment. In the spring session of 1769 the leading advocates of resistance in the house of burgesses, of whom Patrick Henry, Thomas Jefferson, and the

Lees were the most active and determined, offered a series of resolutions which caused the dissolution of the body by Lord Botetourt. Henry and his friends immediately assembled at the old Raleigh tavern in Williamsburg, and drew up articles of association against the use of British merchandise, which were generally signed by the burgesses. Here terminated for a time the struggle, and Henry returned to his profession, though he continued a member of the burgesses. In this year he was admitted to the bar of the general court, where his appearance was respectable, but not distinguished. He was not a good "case lawyer," from defective study; but in jury trials, where his wonderful powers of oratory could be brought to bear upon the passions of men, he excelled all his contemporaries. For four years Henry continued to occupy a seat in the house of burgesses, and to practise his profession. Then the struggle between Great Britain and the colonies commenced in earnest. It was plain that both sides were greatly embittered, and there is evidence that Patrick Henry, Thomas Jefferson, and other advocates of uncompromising resistance desired to take advantage of the public sentiment and precipitate the rupture. Early in the session of 1773, Henry, Jefferson, the two Lees, and Dabney Carr met in the Raleigh tavern and originated that great machine, the "committee of correspondence, for the dissemination of intelligence between the colonies." The burgesses promptly acted upon the suggestion, and were as promptly dissolved by Lord Dunmore, who had succeeded Botetourt. They were all reelected by the people, and resumed their seats in the spring of 1774. Massachusetts had already made her courageous stand against parliament. The tea of the East India company had been thrown overboard in Boston harbor, and a collision between England and the colonies was now in the highest degree probable. The most determined patriots were therefore summoned to the public councils in Virginia. The Boston port bill, closing Boston harbor on June 1, speedily arrived. The leaders of the burgesses again met in secret consultation, and the result was a resolution that the 1st of June should be set apart as "a day of fasting, humiliation, and prayer" throughout the province. The burgesses passed the resolution, and Dunmore duly dissolved them. They retired to the Raleigh tavern as before (May, 1774); but public feeling was too deeply aroused to content itself with protests or "articles of association." The meeting resulted in two resolves of the utmost importance. The first was that the different counties should be recommended to elect deputies to assemble at Williamsburg, Aug. 1, to consult for the good of the colony. The second was that the committee of correspondence should propose immediately to all the colonies a general congress, to meet annually and deliberate upon the common welfare; "the first recommendation of a general congress,"

says Irving, "by any public assembly." The deputies accordingly assembled on Aug. 1, subscribed a new and more thorough non-importation agreement, and appointed delegates to a general congress, to meet at Philadelphia in September. Among these delegates was Patrick Henry, and his voice was the first to break the silence of the august assembly. His fame had preceded him. He was recognized and greeted as the great champion of constitutional liberty—the man who, more than any other, had aroused public sentiment in, and directed the councils of, the great province of Virginia. His extraordinary eloquence astonished all listeners. It was "Shakespeare and Garrick combined." When he took his seat, there was no longer a doubt in any mind that he was the greatest orator of America, and one of the greatest of any land or age. A petition to the king, and an address and memorial to the inhabitants of Great Britain, were the chief results of the congress, which adjourned in October. Henry returned home with his brother delegates, and, when asked who was "the greatest man in congress," replied that Mr. Rutledge of South Carolina was the greatest orator, but Col. George Washington the greatest man—an instance of his powers of penetrating into the depths of human character. With the spring of the next year, 1775, all things advanced rapidly toward the dividing line between peace and war. In March the second convention met in Richmond, and here again Henry assumed a position very far in advance of his associates. He rose and moved that the militia should be organized, and the "colony be immediately put in a state of defence." The resolutions met with strong opposition, as had been the case with his stamp act resolutions ten years before in the house of burgesses. The leading and greatest patriots warmly opposed them as precipitate and ill advised. Henry's speech in reply was one of extraordinary eloquence and power. With the vision of a prophet almost, he exclaimed: "There is no retreat but in submission and slavery. Our chains are forged! Their clanking may be heard on the plains of Boston. . . . The next gale that sweeps from the north will bring to our ears the clash of resounding arms. . . . I know not what course others may take; but as for me—give me liberty or give me death!" The resolutions were passed without a dissenting voice, and the convention rose. Ere long arrived the news of the battles of Lexington and Concord. The contest was not to be long delayed on the soil of Virginia. In compliance with general orders from England, Lord Dunmore had on the night of April 20 removed clandestinely from the magazine in Williamsburg all the powder of the colony. The alarm spread rapidly throughout the province, and the people flew to arms. Seven hundred men assembled at Fredericksburg, but, receiving an assurance that the powder would be restored, were disbanded. Patrick Henry

saw the favorable moment thus about to pass. He determined to act boldly. Summoning the militia of Hanover, he placed himself at their head, despatched a troop to arrest the king's receiver general, and marched upon Williamsburg. Lord Dunmore's agent met him on the way, and paid £330 for the powder; and on his return home Henry found himself and his friends denounced in a public proclamation as "deluded" arousers of sedition. But the whole province, indeed all the land, was equally deluded. The defiance had been given by Henry; the authority of the king, in the person of his representative, menaced with an armed force. There was no choice thenceforth but between submission and open resistance. In June Lord Dunmore fled with his family from Williamsburg on board a man-of-war, and in July a convention met at Richmond which organized a committee of safety, consisting of 11 gentlemen, endowed with almost dictatorial powers. Two regiments were directed to be immediately raised, and Patrick Henry was elected colonel of the first and commander of all forces to be enrolled; William Woodford, colonel of the second. Lord Dunmore at this time was ravaging the shores of the Chesapeake and threatening Norfolk, and the committee of safety were compelled to act promptly. They detached Col. Woodford at the head of the greater portion of the forces against the enemy, and the result was the battle of Great Bridge, in which the raw Virginia recruits drove back the best trained English grenadiers and gained a victory, sending Dunmore back to his ships. The action of the committee in passing over Henry was violently inveighed against by his friends, and the venerable Edmund Pendleton, the president, was especially assailed. The censure seems to have been wholly unjust. The right of the committee to assign a separate command to Col. Woodford was formally stated in Henry's commission, and Woodford's military experience determined the action of the committee in selecting him for this critical undertaking. The ardent feelings of Henry and his disappointment doubtless betrayed him into resigning his commission, which he speedily did, though between Pendleton and himself there was never any quarrel. He was a delegate to the convention which met in May, 1776, and instructed the Virginia deputies to the general congress to propose to that body to "declare the united colonies free and independent states." In the same year he was elected the first republican governor of Virginia, and from this time his career was rather that of the statesman and minister of public affairs, than the ardent, imposing, almost dazzling orator of revolution. He filled the office of governor by successive reelections till 1779, when he was no longer eligible. During this trying period he was eminently serviceable in sustaining public spirit and seconding the efforts of the great leaders of the revolution.

He returned to the legislative body, where he served throughout the war, at the termination of which he was again elected governor, and served until the autumn of 1786, when he resigned. In 1788 he was a member of the convention to ratify the federal constitution, an instrument whose adoption he opposed with all the strength and eloquence of his youth. Although this opposition afterward abated in a measure, he always remained fearful that the final result would be the destruction of the rights of the states. In 1794 he retired from the bar, and removed to his estate of Red Hill in Charlotte. In 1795 Washington appointed him secretary of state, in place of Edmund Randolph, who had resigned; but Henry declined the appointment, as he did that of envoy to France afterward offered him by Mr. Adams, and that of governor offered him in 1796. In March, 1799, yielding to the request of Washington and other distinguished persons, and desirous of doing his part to avert what he feared would be the disastrous results of the "resolutions of '98" just passed by the Virginia house, he ran for the state senate in his district. The great orator had only to indicate his wishes to fill any public position, and was easily elected; but he never took his seat. The speech at Charlotte Court House was his last, and it is said to have been worthy of his fame. He died less than three months afterward.—Patrick Henry was undoubtedly one of the most extraordinary men of an extraordinary epoch. In the house of burgesses he bore away the palm from Edmund Pendleton, Richard Henry Lee, George Mason, and the most powerful men of the time. In the general congress, the men of the north acknowledged that Henry was the greatest orator whom they had ever heard. Of this conspicuous endowment there are countless proofs, anecdotes, and traditions; and it is established beyond a rational doubt that Henry possessed a natural genius for moving men such as has rarely been bestowed upon humanity. Jefferson said that he seemed to him to speak "as Homer wrote." Undoubtedly a large part of his wonderful success was due to his moral courage. To that mysterious eloquence which swayed and took captive all minds, he united a nerve and resolution which when thoroughly aroused were indomitable. There was a hard stubborn fibre in his moral organization which resisted all attacks, and defied whatever attempted to move him. As a mere logician, apart from the advocate, Henry had no conspicuous talent. He was not a great lawyer, and his name remains connected with no large measures of policy under the new order of things, like that of Jefferson. He lives and will always live as the mouthpiece of the revolution, the voice which uttered most boldly and clearly the principles of human freedom. He was a man of the revolution, the representative of a convulsed epoch and an indignant people; the words which he uttered

were those which trembled upon the lips of millions. In person Henry was rather striking than prepossessing. Nearly six feet, spare, rawboned, and slightly stooping in the shoulders, he gave no indication of the majesty and grace which characterized his appearance when his genius was aroused. His complexion was sallow; his countenance grave, thoughtful, stern in repose, and marked with the lines of deep and painful reflection. His brows were habitually contracted, and communicated to his features an air of forbidding sternness and severity. The mouth, with closely compressed lips, and deep furrows at the corners, was set in an expression of unyielding resolution. When he spoke, however, a wonderful change passed over him. His person rose erect, his head, instead of stooping, was held proudly aloft, and the whole man seemed to undergo a transformation. The power which he possessed of expressing feeling by a simple movement of feature was extraordinary. The stern face would relax and grow soft, pensive, and gentle; or a withering rage would burn in the fiery eyes; or eyes, mouth, and voice would convey to the listener emotions of the tenderest pathos. In private life he was kindly, good-humored, and agreeable. He possessed a dry humor which was very attractive. He indulged in none of the vices of high living then prevalent; temperate, frugal, rarely drinking anything but water, he presented a strong contrast to his contemporaries. His reading was not extensive, but serious and solid. Livy was his favorite historian; but his reading was chiefly confined to the Bible. He was a devout Christian, and when governor printed and circulated at his own expense Soame Jenyn's "View of Christianity" and Butler's "Analogy." Sherlock's sermons he read every Sunday evening to his family, after which all joined in sacred music, while he accompanied them upon the violin. All the accounts of his personal bearing represent it as simple, plain, and cordial. There was an honest good feeling in his manner which induced the commonest persons to approach him with confidence. By this class he was almost idolized; and throughout his career he retained their unbounded admiration, attachment, and respect.—The life of Patrick Henry has been written by William Wirt (8vo, 1817), and by A. H. Everett, in Sparks's "American Biography."

**HENRY, Philip**, an English nonconformist divine, born in Whitehall, London, Aug. 24, 1631, died June 24, 1696. He was educated at Westminster school and at Christchurch, Oxford, was ordained to the ministry at Worthenbury, Flintshire, in 1657, was one of the clergymen who left the church of England in 1662 in consequence of the act of uniformity, and lived in seclusion till in 1687 he was permitted again to preach by the declaration of King James in favor of liberty of conscience. From that time he held public religious services near his residence at Broad Oak, and also

preached frequently elsewhere. His biography, by his son Matthew Henry (London, 1698), has passed through many editions.

**HENRY, Robert**, a Scottish historian, born in the parish of St. Ninian's, Stirlingshire, Feb. 18, 1718, died near Edinburgh, Nov. 24, 1790. He was educated at the university of Edinburgh, and was afterward master of the grammar school of Annan till in 1746 he was licensed as a preacher. He was pastor of a Presbyterian congregation at Carlisle from 1748 to 1760, at Berwick-upon-Tweed from 1760 to 1768, and afterward in Edinburgh. His principal work is a "History of Great Britain" (6 vols., Edinburgh and London, 1771-'93). It extended to the death of Henry VIII., and was continued to the accession of James I. by J. P. Andrews (London, 1794).

**HENRY, William**, an English chemist, born in Manchester, Dec. 12, 1775, died Sept. 2, 1836. He studied under Dr. Black of Edinburgh. Though he practised in Manchester as a physician, he gave particular attention to chemistry. In 1803 he published the law "that water takes up of gas condensed by one, two, or more additional atmospheres, a quantity which would be equal to twice, thrice, &c., the volume absorbed under the common pressure of the atmosphere." His "Elements of Experimental Chemistry" (2 vols., London, 1810) reached its 11th edition in 1829.

**HENRY THE HERMIT**, or **Henry of Lausanne**, founder of the sect of the Henricians, born probably in Italy, died at Clairvaux, France, in 1149. He lived at first as an anchorite, but about 1113 abandoned his hermitage, and travelled through northern Italy, preaching his peculiar views. It is said that he rejected a great part of the Scriptures, baptized only adults, denied the real presence, suppressed the mass, declared churches and altars useless, and forbade the use of the cross as a symbol of worship, and prayers for the dead. He was tall and poorly clad, wore a hair shirt, shaved his beard, and walked barefoot. He was eloquent and earnest, and gained many disciples, having a reputation for piety and devotion. Driven by persecution, he crossed the Alps to Lausanne, and his reputation spread throughout France. He was invited to Le Mans, but first sent two disciples, and then followed them. He there excited a great opposition of the people to the priests, and the archbishop Hildebert interposed, forbidding him to preach, and ordering him to leave the diocese. Henry then went to Poitou, Languedoc, and Guienne, and made many disciples at Poitiers and Bordeaux. Driven still by persecution, he went to Dauphiny, where he met Peter de Bruys, whom he acknowledged as his master. His doctrines were so widely adopted, that Pope Eugenius III. in 1147 sent Cardinal Alberic, bishop of Ostia, to combat this heresy, accompanied by Geoffroy, bishop of Chartres, and St. Bernard, and asked the interference of temporal princes, especially of

the king of France and the duke of Savoy. Peter de Bruys was arrested and burned at the stake, but Henry escaped to Toulouse, and continued to spread his doctrines in Gascony and the adjacent countries. Bernard spoke against him, but without persuading the people, who cherished Henry and his doctrines. He was cited several times before the legate, but, admonished by the fate of Peter de Bruys, fled from city to city. He was taken at length, carried before the bishop of Toulouse, and finally before the council of Rheims in 1148, and convicted. Eugenius III. would not allow him to be burned, but condemned him to prison, where he soon died. His followers made common cause with the Vaudois and Albigenses.

**HENRY THE LION**, duke of Saxony and Bavaria, born in 1129, died in Brunswick in 1195. His father, Henry the Haughty, had been outlawed and despoiled of his possessions for refusing to acknowledge the election of the emperor Conrad III. He died soon after, leaving his son, 10 years of age, to whom (as the Saxons had never succumbed to the decision of Conrad respecting their late duke) Saxony was speedily restored. In the diet at Frankfurt (1147) Henry formally demanded restitution of all his possessions, Bavaria having been bestowed upon Leopold, margrave of Austria. Conrad refused, and a war ensued, the results of which in the main were favorable to Henry. Frederick Barbarossa meanwhile succeeded Conrad (1152), and one of his first acts was to restore to Henry the Bavarian duchy. Henry's dominions, including part of modern Pomerania, now extended from the Baltic and North sea to the Alps. He was the head of the house of Guelph, and in all respects the most considerable of the German princes. He triumphed over a confederacy of church potentates who conspired against him in his own dominions; and in 1168 he espoused Matilda (or Maud) of England, sister of Richard Cœur de Lion. Under him Lübeck, which had been founded a few years before, was built up into a powerful city. Hamburg, which had been destroyed by the Wends, was rebuilt; Munich was founded; and improvements were everywhere encouraged in education and industry. But Henry had become unpopular with neighboring princes and bishops, who threatened to arrest his growing importance. He attacked them, devastated Thuringia, reconquered Bremen, and, having restored tranquillity along his frontiers, made a pilgrimage to the Holy Land (1172). Feeling now sufficiently powerful to decline service in the imperial expeditions in Italy, he withdrew his forces at a critical moment; and the immediate consequence was the overthrow of the emperor at Legnano (1176). On Frederick's return from Italy, after the peace of Venice (1177), he summoned the duke to appear before him in a diet at Worms. The summons, thrice repeated, was unheeded, and the contumacious prince was declared deposed and under the ban of the empire. His

fiefs were parcelled out among other princes, who marched in league to take possession. Henry beat them off, but the arrival of the emperor with overwhelming forces compelled him to retire to Lübeck, and at length into Holstein. He was forced soon after to humble himself at the feet of Frederick (1181), who banished him for three years to England, where he became the father of a son from whom the British Hanoverian sovereigns trace their descent. He was meanwhile reinstated in his hereditary possessions of Brunswick and Lüneburg, and at the end of the three years re-crossed the channel to take personal possession. In consequence of asserted violation by the imperial authorities of his hereditary dominions, he undertook a war (1189) for their absolute recovery. Frederick died in 1190; when, after making peace and entering into a family alliance with Henry VI., by the marriage of his son with Agnes, cousin of the emperor, Henry at length found repose.

**HENRY THE NAVIGATOR**, a Portuguese prince, born March 4, 1394, died at Sagres, Nov. 13, 1460. He was the fourth son of King John I. of Portugal and Philippa, daughter of John of Gaunt, duke of Lancaster. While still a youth he displayed his courage in war with the Moors of Barbary, and was knighted for his bravery in the expedition which achieved the conquest of Ceuta in 1415. On his return from this expedition he fixed his residence at Sagres in Algarve, near Cape St. Vincent, and occupied himself with sending out vessels to cruise against the Moors and to harass the coast of Africa, where he made three campaigns. He was distinguished for learning, particularly for mathematical and geographical knowledge, and founded at Sagres an observatory and a school where young noblemen were instructed in the sciences connected with navigation. The first use of the compass in European navigation, and in part the invention of the astrolabe, are ascribed to him. His studies and inquiries led him to the conclusion that the coast of Africa did not end, as was then commonly supposed, at Cape Nun, and that great and valuable discoveries might be made by tracing its line to the southward into the unknown and dreaded torrid zone. The first expedition he sent for this purpose consisted of two vessels commanded by João Gonçalves Zarco and Tristram Vaz, who set out to pass Cape Nun, but were driven off the coast by storms, and accidentally discovered the little island of Porto Santo near Madeira. In the next year (1419) the same captains discovered and subsequently colonized Madeira. Prince Henry during the next 12 years sent vessel after vessel down the coast of Africa, some of which passed Cape Nun and reached Cape Bojador, 300 m. further south. But that cape, from the failure of repeated attempts to double it, was now popularly considered the limit of the habitable world, and there began to be much complaint in Portugal at the ex-

pense and hazard of these fruitless expeditions. But the prince persevered, and at length Gil Eannez, whom he sent out in 1433, succeeded in passing Cape Bojador, an achievement that created great excitement at the time, and which forms an era in the history of maritime discovery. The Azores had been visited shortly before. From 1434 to 1441 Prince Henry was chiefly occupied with the domestic affairs of Portugal, which were involved in much confusion. In 1441 the pope, at the request of Prince Henry, granted to the Portuguese crown all that it could conquer from Cape Bojador to the Indies. The discoveries of the Portuguese had by this time been extended to the mouth of a river nearly 200 m. S. of Cape Bojador. In 1445 the prince sent a vessel under command of Diniz Dyaz or Diniz Fernandez, who sailed down the coast till he reached Cape Verd; the longest advance at one effort that had yet been made by Europeans in African navigation. By this time the popular feeling had changed with regard to these voyages, many of which brought not only honor and fame but profitable returns in gold and slaves, and numbers of enterprising men were ready to engage in them. In 1447 a fleet of 14 vessels was fitted out at Lagos, and the command given by Prince Henry to Lançarote, and sent to the African coast, but without any greater result than extending the limit of discovery to the river Gambia. Several other expeditions in the same direction were subsequently sent out by the Portuguese government, under the advice and control of Prince Henry, one of which just before his death reached Sierra Leone. The Portuguese historian Faria y Sousa, in his *Asia Portuguesa* (Lisbon, 1666), thus sums up the character of Prince Henry: "He was bulky and strong; his complexion red and white; his hair coarse and shaggy. His aspect produced fear in those who were not accustomed to him; not in those who were, for, even in the strongest current of his vexation at anything, his courtesy always prevailed over his anger. He was patient in labor, bold and valorous in war, versed in arts and letters; a skilful fencer; in the mathematics superior to all men of his time; generous in the extreme, and zealous in the extreme for the increase of the faith. No bad habit was known in him. He did not marry, nor was it known that he ever violated the purity of continency."

**HENRYSON, Robert**, a Scottish poet of the 15th century. Of the particulars of his life and the time of his death little or nothing is known. Dunbar, in his "Lament" (1508), speaks of "gude Mr. Robert Henryson" as among the departed poets. He seems to have been chief schoolmaster at Dunfermline, and was not unlikely an ecclesiastic, and perhaps a Benedictine monk. One account identifies him with Henryson of Fordell, father of James Henryson, who perished in the battle of Flodden. His principal work is his collection of

"Fables," 13 in number, which was edited by Dr. Irving in 1832. Among his other writings are the tale of "Orpheus Kyng, and how he geid to Hewyn and Hel to seik his Quene" (Edinburgh, 1508); "Testament of Cresseid" (1593), a poem which was suggested by and was a sequel to Chaucer's "Troilus and Cresseid," in connection with which it generally appears; "Robin and Makyne," printed in Percy's "Reliques;" and several smaller poems, printed in different works.

**HENSEL. I. Wilhelm**, a German painter, born at Trebbin, Prussia, July 6, 1794, died in Berlin, Nov. 26, 1861. He studied five years in Italy, and on his return to Berlin in 1828 became professor at the academy of fine arts. He died from injuries received while assisting a stranger who was thrown out of an omnibus. One of his best pictures is "Christ before Pilate." **II. Fanny**, a German pianist, wife of the preceding, born in Hamburg, Nov. 14, 1805, died in Berlin, May 14, 1847. She was the sister of Mendelssohn, and wrote in imitation of his style small compositions for the piano, and a few songs. She possessed a fine musical organization. Mendelssohn was devoted to her, and never rallied from the effect of her death.—Her sisters **LUISE** and **WILHELMINE** wrote poetry which was collectively published by Kletke (Berlin, 1857).

**HENSELT, Adolph**, a German pianist, born at Schwabach, Bavaria, May 12, 1814. He first studied the violin, but abandoned it for the piano. At the age of 17 he attracted the attention of the king of Bavaria, through whose aid he was enabled to go to Weimar and place himself under the instruction of Hummel. From Weimar he went to Vienna in 1832, to study counterpoint under Sechter. He practised at the piano 10 hours a day, and soon injured his health by excess of work. For change of air he went to Berlin in 1836, and from thence to Dresden and St. Petersburg, where he was made pianist to the empress. Here he continued to reside, making in 20 years only one journey, which extended to London and the principal capitals of Europe. He holds the first rank among pianists, though his timidity has hindered him from playing much in public. He has not composed much, nor are his works of a high merit. The most important is a concerto in F minor for piano and orchestra, a composition of much technical difficulty.

**HENSHAW, John Prentiss Kewley**, an American bishop, born at Middletown, Conn., June 13, 1792, died at Frederick, Md., July 20, 1852. He entered Middlebury college, Vermont, when he was 12 years old, and graduated in 1808. Though educated a Congregationalist, he was led to become an Episcopalian, was baptized when on a visit to his native place, and became a lay reader in Middlebury, and later in Marblehead, Mass. He was ordained deacon in 1813, and priest in 1816. He served for several years in St. Ann's church, Brooklyn, N. Y., and in 1817 was called to Balti-

more, where he was rector of St. Peter's church for 26 years. Being elected bishop of Rhode Island, he was consecrated Aug. 11, 1843, and became also rector of Grace church, Providence. In the summer of 1852 he was requested to perform episcopal duties in Maryland, during the absence of Bishop Whittingham on account of ill health. While actively engaged in this work he was stricken with apoplexy. His publications include "Theology for the People" (1840); "Memoir of Bishop R. C. Moore" (1842); "Inquiry concerning the Second Advent" (1842); and "Lectures on the Terms Priest, Altar, Sacrifice, as used in the Prayer Book" (1843).

**HENSLEY, Eliza**. See FERDINAND (AUGUSTUS FRANÇOIS ANTHONY).

**HENTZ, Caroline Lee**, an American authoress, born at Lancaster, Mass., in 1800, died at Mariana, Fla., Feb. 11, 1856. She was the daughter of Gen. John Whiting, and married in 1825 Mr. N. M. Hentz, who was afterward appointed professor at Chapel Hill college, N. C. At Covington, Ky., whither they removed from Chapel Hill, she wrote "De Lara, or the Moorish Bride," a play which obtained a prize of \$500. She lived successively in Cincinnati, Florence, Ala., Tuscaloosa, Tuskegee, and Columbus, Ga. Her writings include "Aunt Patty's Scrap Book" (1846); "The Mob Cap" (1848); "Linda, or the Young Pilot of the Belle Creole" (1850); "Rena, or the Snowbird" (1851); "Marcus Marland, or the Long Moss Spring" (1852); "Eoline, or Magnolia Vale" (1852); "Wild Jack" (1853); "Helen and Arthur, or Miss Thusa's Spinning Wheel" (1853); "The Planter's Northern Bride" (1854); and "Ernest Linwood" (1856).

**HENZEY, Léon Alexandre**, a French archaeologist, born in Rouen in 1831. He studied at the normal school in Paris and at the French school in Athens, and became professor of history and archaeology at the school of fine arts. He published, as the result of his personal researches, *Le Mont Olympe et l'Acarnanie* (1860); and Napoleon III. having sent him to Macedonia and adjoining regions, he published with M. Daumet, *Mission archéologique de Macédoine: fouilles et recherches exécutées dans cette contrée et dans les parties adjacentes de la Thrace, de la Thessalie, de l'Illyrie et de l'Épire* in 1861 (1864 et seq.). In 1872 he published *Un palais grec en Macédoine*, narrating his discovery at Palatitza.

**HEPATICA**, a genus of plants of the order *ranunculacea*, so closely allied to *anemone* that some botanists place it as a section of that genus. The common name is liver-leaf, and it is sometimes incorrectly called liverwort, a name that should be restricted to a family of cryptogamous plants. The botanical name and its popular one both have reference to a fancied resemblance in shape between the leaves of the plant and the liver. The old herbalists, who believed in the doctrine of signatures, assumed that each medicinal plant indicated in

some manner the disease it would cure or the portion of the body it would affect, and hepatica was at one time used for liver complaints; but it is nearly destitute of active properties, being at most a demulcent. The hepaticas are stemless perennials, with numerous radical, heart-shaped, three-lobed, thick, persistent leaves, from among which there rise in early spring numerous hairy scapes, each bearing a single flower; the flowers are without petals, the colored calyx appearing like a corolla, and the three-leaved involucre is so close to the flower as to appear like a calyx; the sepals in the wild state are six to nine, blue, purple, or even white; stamens and pistils numerous. The commonest species, *H. triloba*, is widely distributed in the cooler portions of both hemispheres; *H. acutiloba* has the lobes of the leaves pointed, while in the other they are very obtuse and rounded, and may be only a variety of the preceding; it is found from Vermont to

*Hepatica triloba*.

Wisconsin. Both species grow in rich woods among the fallen leaves, and lift up their bright flowers soon after the snow has gone. The single-flowered *H. triloba*, with several double varieties, with flowers of various shades of red, blue, purple, and crimson, as well as white-flowered ones, are in cultivation in Europe. In this country they do not succeed, exposed to the heats of our long summers, unless in a moist rich soil. The double varieties are increased by division. A species or a marked variety, *H. angulosa*, has recently been brought into cultivation from Transylvania; it is much larger than ours, the flowers being sometimes two inches across.

**HEPHESTION**, a Macedonian, the friend and companion of Alexander the Great, with whom he had been brought up. When, at the commencement of his Asiatic expedition, Alexander visited the site of Troy, Hephæstion accompanied him. He was frequently intrusted with

commands of great importance, and for his services was rewarded with a golden crown on his arrival at Susa, and received in marriage Drypetis, the daughter of Darius and sister of Statira. From Susa he accompanied Alexander to Ecbatana, where he died of fever after an illness of seven days (325 or 324 B. C.). Alexander's grief was excessive. His body was transported to Babylon, where a magnificent pyre and monument were erected; and orders were issued for a general mourning throughout the empire, and divine honors to the deceased hero.

**HEPHÆSTUS.** See VULCAN.

**HEPTARCHY.** See ENGLAND, vol. vi., p. 607.

**HEPWORTH, George Hughes**, an American clergyman, born in Boston, Feb. 4, 1833. He graduated at the theological school of Harvard university in 1855, and was called to the Unitarian church in Nantucket, where he remained two years. In 1858 he removed to Boston and became pastor of the church of the Unity. In December, 1862, he was appointed chaplain of the 47th regiment of Massachusetts volunteers, and in 1863 served on the staff of Gen. Banks in Louisiana. In 1870 he accepted the pastorate of the church of the Messiah, New York, but resigned it in 1872, in consequence of a change of religious belief in the direction of Trinitarianism. He afterward organized and is now (1874) pastor of the "Church of the Disciples" in New York. He has published "Whip, Hoe, and Sword" (Boston, 1864), and "Rocks and Shoals" (1870).

**HERA.** See JUNO.

**HERACLEA**, the name of several ancient Greek cities, the most important of which were: **I.** A city of Magna Græcia, in Lucania, near the Tarentine gulf, founded by a colony of Thurians and Tarentines about 432 B. C. It was the place for the general assembly of the Italiote Greeks, until Alexander, king of Epirus, transferred it to Thurii. Heraclea was the scene of the first conflict between Pyrrhus and the Romans, the consul Lævinus being defeated there in 280. In 278 an advantageous treaty was made with Rome, which was maintained as long as the republic lasted, and Heraclea was flourishing in the time of Cicero. Its site is now marked by heaps of rubbish, where many coins and bronzes have been discovered; and near there were discovered in 1732 the celebrated *tabule Heracleenses*, now in the national museum at Naples. These are fragments of two bronze tables, containing on one side Greek inscriptions with reference to certain fields sacred to Bacchus and Minerva, and on the other side a Latin inscription relating to the municipal regulations of Heraclea, which is in fact a copy of the more general *lex Julia municipalis* issued in 45 B. C. The Latin inscription was explained by Savigny in his *Zeitschrift für geschichtliche Rechtswissenschaft*, and both inscriptions were published and illustrated by Mazocchi in his *In Regii Herculanensis Musæi Tabulas Heracleenses Commentarii* (Naples, 1754-'5). **II.** A city of Sicily, on the

S. W. coast of the island, at the mouth of the river Halycus, said to have been founded by Minos, and hence surnamed Minoa. About 510 B. C. Euryleon came to Sicily with the Spartan prince Dorieus to reclaim the territory of Hercules, and, escaping from the defeat of Dorieus, subdued Heraclea, which probably received its name from him. It rose rapidly in prosperity, but was destroyed by the Carthaginians, and was for many years an insignificant place, subject to the Carthaginians or to Agathocles. It revolted in 307, but was soon subdued. It was taken by Pyrrhus, and in 260 by Hanno, and made a rendezvous for the Carthaginian fleet, which there suffered a great defeat from Regulus and Manlius. It was alternately held by the Romans and Carthaginians, and held out against Marcellus even after the fall of Syracuse. **III.** A city of Bithynia, surnamed Pontica (now *Eregli* or *Erekli*), on the S. shore of the Euxine. It had two good harbors, the smaller made artificially. It was founded by a colony of Megarians and Bœotians, and rose to supremacy over the neighboring regions. During the reign of Dionysius, one of its tyrants, in the time of Alexander the Great, it reached great prosperity. It suffered from the kings of Bithynia and from the Galatians, and in the war of the Romans against Mithridates it was partly destroyed by Aurelius Cotta. (See *EREGLI*.)

**HERACLES.** See *HERCULES*.

**HERACLIDÆ.** See *GREECE*, vol. viii., p. 187.

**HERACLITUS**, a Greek philosopher who flourished at the close of the 6th century B. C. He was a native of Ephesus, and from his gloomy disposition was styled the "weeping philosopher." In his youth he travelled extensively, and on his return to Ephesus was offered the chief magistracy of the city, but declined it because of the bad morals of the Ephesians, and employed himself in playing at dice near the temple of Diana, declaring even that to be a more profitable occupation than attempting to govern his fellow citizens. Afterward he became a confirmed recluse, retiring for a time to the mountains, and living on herbs. His philosophical creed was embodied in a work commonly entitled *Περὶ Φύσεως*, "On Nature." The most remarkable tenets of this creed were that, by the operation of a light ethereal fluid, constantly active, self-changing, and all-transforming, which he denominated fire, all things in the universe, animate and inanimate, material and immaterial, were created and shaped, and that acquiescence in the decrees of the supreme law was the great duty of man. His style was so obscure that the Greeks surnamed him "the unintelligible." He was regarded in antiquity as the antipodes of Democritus, the "laughing philosopher." The fragments of his treatise were published by Schleiermacher in Wolf and Buttmann's *Museum der Alterthumswissenschaft*, and by Ferdinand Lassalle in his *Die Philosophie Herakleitos' des Dunkeln von Ephesos* (2 vols., Berlin, 1858).

**HERACLIUS**, a Roman emperor of the East, born in Cappadocia about A. D. 575, died early in 641. He was the son of Heraclius, exarch of Africa, and first appeared in a public capacity in 610, when his father sent him with a fleet to besiege Constantinople, and dethrone the tyrant Phocas. This enterprise he accomplished, and was himself chosen to fill the vacant throne. At the accession of Heraclius, the empire was in a deplorable condition. The barbarians of the north were laying waste its European provinces, while the Persians, under Chosroes II., were overrunning and ravaging those of the east. The first object of the new emperor was to protect his European dominions and to make provision for their future security. The king of the Avars having withdrawn from before Constantinople, after treacherously slaying or taking captive immense numbers of citizens who had come out to witness an interview between him and Heraclius, the latter allotted that part of Illyricum bordering on the Adriatic and the Danube, which had been depopulated, to the Serbs and Croats, in order that they might serve as a barrier to his N. W. frontier. Then, turning his attention eastward, as soon as he considered his army sufficiently disciplined to take the field, he placed himself at its head, and sailing from the Bosphorus in 622, landed in Cilicia, and encamped on the plain of Issus, where he defeated a large Persian force. From Cilicia he fought his way into Pontus, and afterward returned to Constantinople. In the following spring he landed at Trapezus (Trebizond) with another army, whence, marching through the regions of the Caucasus, he penetrated into Media, forming alliances and destroying the temples of the Magi as he proceeded. This campaign was closed by a second brilliant victory over the Persians commanded by Chosroes in person. In 625 he invaded Mesopotamia, and returning through Cilicia, gained a third great victory over the Persians on the river Sarus, where he slew with his own hand a gigantic barbarian whom all feared to encounter. The last campaign of this war was by far the most glorious. Constantinople was besieged by a great host of Persians and Avars, but instead of going to its relief Heraclius marched into the very heart of the Persian empire, overthrew the enemy in a great battle near Nineveh in December, 627, took Dastagerd, the favorite residence of Chosroes, and plundered the royal palaces in the vicinity of untold treasure. In 628, Chosroes having been put to death by his son Siroes, the latter acceded to a treaty which closed the war and restored to Heraclius the provinces wrested from his predecessor. But at Edessa, as he was returning from the war, an ambassador from Mohammed summoned him to embrace the faith of the prophet. Heraclius made a treaty of amity with the Arabian potentate; but in a little time a war broke out between the Arabs and the eastern emperor, in which Syria, Palestine, and Egypt were wrested from

the latter. Heraclius took no part personally in this contest, but spent his latter days in luxurious ease in Constantinople.

**HERALDRY**, the art or science of blazoning or describing in appropriate technical terms coats of arms, badges, and other heraldic and armorial insignia. The use of distinctive devices, both national and personal, is very ancient. The eagle was the emblem of Persia and of imperial Rome, the ox of Egypt, the owl of Athens; and the dragon has served as the national symbol of China and Japan from the most remote times. The warriors of Greece bore distinguishing symbols on their shields, and at Rome the families of those who had held a curule office had the right to display waxen images of their ancestors as a mark of hereditary distinction. But heraldry, in the present acceptance of the term, is a comparatively modern invention, and cannot be traced as a system to a time earlier than the close of the 12th century. It is generally admitted to have had its origin in the necessity, in battles and in tournaments, of using some device to distinguish persons concealed by their armor. It was gradually elaborated during the crusades in the time of Richard I., and it was probably systematized to some extent by the Germans; but to the French is due the credit of perfecting it and reducing it to a strict system, and the technical nomenclature invented by them was adopted with slight modifications by other nations. By the end of the 13th century heraldry had become bound by strict rules and terms, and from this time onward arms were displayed on coins, monumental brasses, and tombs, and in architectural decorations, and were borne on shields, banners, and military surcoats. From their use on garments is derived the phrase "coat of arms."—The rules of heraldry, as now practised, are comparatively modern, and differ somewhat in different countries. The general principles however are the same, and as it will be impossible to enter into minor details, this article will be confined to English heraldry. According to early authorities arms are divisible into ten classes, but these may be reduced to three: arms of states, of communities, and of persons and families. Arms of states are those assumed by sovereign princes or by governments as distinguishing badges for their respective kingdoms, empires, or states. Arms of communities include those of ecclesiastical, lay, and municipal corporations. Arms of persons and families are insignia borne by individuals and families, generally by right of inheritance or of grant. All these classes of arms follow the same general heraldic rules, and are displayed on a shield or escutcheon. There is no prescribed form for the shield, which has differed in different ages and among different nations, but the shape usually adopted is that in the accompanying plate. The shields of maids and widows are in the form of a lozenge. The face of the shield, on which the arms are blazoned, is technically called the

field. To facilitate description, heralds divide this into nine parts (see plate), viz.: A, the dexter chief; B, middle chief; C, sinister chief; D, honor point; E, fess point; F, nombril or navel point; G, dexter base; H, middle base; and I, sinister base. The shield is always described with reference to the position of the bearer, which brings the dexter or right side opposite the left hand of the observer. Fields are diversified by tinctures, lines of division, and charges. Tinctures are composed of metals, colors, and furs. Metals are or (gold) and argent (silver). Colors are gules (red), azure (blue), sable (black), vert (green), and purple (purple). The furs are ermine, vair, and potent. Ermine is a field argent with spots or tails sable. When this is reversed, a field sable with spots argent, it is termed ermines. Erminoise is a field or with spots sable, and pean a field sable with spots or. Vair (Lat. *varius*), supposed to represent the skin of the squirrel, is expressed by several rows of little shields or bells, alternately argent and azure, the base of the argent ones against the base of the azure. In counter vair the bells of the same tincture are placed base against base and point against point, or counterplaced, as it is technically called. Potent, though classed as a fur, signifies a crutch or gibbet (Fr. *potence*). The crutches, argent and azure, are placed as in the plate. In potent counter potent the crutches are counterplaced. If the colors used in vair and potent are other than argent and azure, they must be specified; if not, it is unnecessary. In drawings and engravings the tinctures are designated by dots and lines. Thus or is known by the shield being filled with dots, argent by a plain shield, gules by vertical lines, azure by horizontal lines, &c. This invention is attributed to both the French heraldist De la Columbière and the Italian Silvestro di Petrasancta. The earliest example in England of this method of indication is found on some of the seals attached to the death warrant of Charles I.—The field being often of a combination of colors, it is variously divided by lines. When the division is into two equal parts by a vertical line, it is said to be parted or party per pale; by a horizontal line, per fess; by a dexter diagonal line, per bend; by a sinister diagonal line, per bend sinister; by a vertical and a horizontal line crossing at right angles, per cross or quartered; by diagonal lines crossing, per saltier; by two lines starting from the sides in the dexter and sinister bases and meeting in an angle in the fess point, per chevron; and by vertical, horizontal, and diagonal lines into eight equal parts, gironny. When a shield is quartered, the several quarters are numbered, the dexter upper quarter being called the first, the sinister upper the second, the dexter base the third, and the sinister base the fourth. If one or more of these divisions is subdivided into quarters, it is said to be quarterly quartered, and the quarter thus quartered is called a grand quarter. A shield divided into any

number of parts by lines drawn through it at right angles to each other is said to be quarterly of the number; thus, if divided into eight parts by three vertical lines crossed by one horizontal, it is said to be quarterly of eight. All of these divisions are multiplied by the use of a variety of lines, the principal of which are called engrailed, invected, wavy, embattled, nebuly, raguly, indented, dancette, and dovetailed.

Partition Lines.

When any of these lines are used in the division of a shield instead of straight lines, it must be described, as party per pale wavy, party per fess indented, &c. The term parted or party may be omitted as superfluous, it being understood in phrases like the preceding.—A charge is any emblem or figure borne in a field, and the field thus blazoned is said to be charged. Charges are divided into honorable ordinaries, subordinaries, and common charges. The honorable ordinaries, which are the principal charges in heraldry, are nine, viz.: the chief, pale, bend, bend sinister, fess, bar, chevron, cross, and saltier, the most of which have diminutives. The chief occupies the upper one third of the shield, determined by a horizontal line. Its diminutive is the fillet, one fourth its width and occupying its lower edge. The pale is formed by two parallel vertical lines drawn from the middle chief to the middle base, and occupying one third of the field. It has two diminutives, the pallet of one half its width and the endorsee of one fourth its width, which frequently accompany the pale. The bend is formed by two diagonal lines drawn from the dexter chief to the sinister base, and is one fifth the width of the field. Its diminutives are the bendlet or garter of one half its width, the cost or cotise of one fourth its width, and the riband of one eighth its width and coupé or cut off at the ends. The bend sinister is like the bend, but is drawn from the sinister chief to the dexter base. Its diminutives are the scarpe of one half its width, and the baton of one fourth its width and coupé at the ends. The baton and the riband are generally considered to indicate illegitimacy. The fess is formed by two parallel horizontal lines drawn through the middle of the field and occupying one third of it. The bar is similar to the fess, but occupies only one fifth of the field, and differs from it in that it is not confined to the middle, but may be placed in any part of the field; there may be also several bars in a field. Its diminutives are the barrulet of one half its width, and the closet of one fourth its width. The latter is never borne single. The chevron is a figure formed of two bars drawn from the dexter and sinister bases and meeting in an angle in the fess point. Its diminutives are

the chevronel of one half its width, and the couple-close of one fourth its width. The latter is borne in couples, generally one on each side of the chevron. The cross is a combination of the pale and the fess. This is the Greek cross, which is the only one included in honorable ordinaries. All variations of it are common charges. The saltier is a combination of the bend and the bend sinister. All of the honorable ordinaries may be engrailed, wavy, indented, &c., and may themselves be charged or borne between charges.—The subordinaries are the bordure or border, orle, inescutcheon, quarter, canton, gyron, billet, paile or pall, pile, flanch or flaque, lozenge, mascle, rustre, fusil, and fret. The bordure is a stripe surrounding the shield, and is one fifth the width of the field. It passes over all the ordinaries except a chief, a quarter, and a canton. When divided into squares of alternate metal and color, it is said to be compony or gobony; when into two rows of squares, counter-compony; when into three or more rows, chequy. The bordure is often used to distinguish different branches of a family, and the bordure wavy is now the general mark to denote illegitimacy. The orle is one half the width of the bordure, and is borne within the shield and not extending to its edge. The inescutcheon is a small escutcheon borne within the shield. The quarter is a square occupying the upper dexter quarter of the field. The canton is like the quarter but smaller, and occupies the dexter chief; if placed in the sinister chief, it must be described as a canton sinister. The gyron is formed by intersecting the quarter by a diagonal line bendwise. The billet is an oblong rectangular figure twice as long as broad. The pall is a figure like the letter Y, representing the pall of an archbishop. The pile is a wedge-like figure issuing, unless otherwise specified, from the middle chief, and extending to the nombril point or lower. Flanches, which are always borne in pairs, are formed by curved lines drawn from the upper angles to the respective base points. The lozenge is a figure of four equal sides, the upper and lower angles of which are acute and the others obtuse. The mascle is a lozenge perforated so as to make it only a narrow border. The rustre is a lozenge with a circular perforation. The fusil is an elongated lozenge. The fret is formed by the interlacing of a figure like a saltier with a mascle.—A distinct group of charges are called roundles and guttæ or gouttes, both of which may be of different tinctures. The roundle is circular, the goutte is round at the bottom and pointed at the top. Roundles of or are called bezants, of argent plates, of gules torteaux, of azure hurtes, of sable pellets or ogresses, of vert pommes, of purple golpes. A roundle Barry wavy of six, argent and azure, is called a fountain. Gouttes of or are called d'or, of argent d'eau, of gules de sang, of azure de larmes, of sable de poix, of vert d'olive.—Charges and tinctures may be varied so as to

cover the entire field. When the field is divided into an even number of partitions palewise, it is said to be paly, the number being always specified, as paly of six, paly of eight, &c. When divided bendwise it is called bendy, and when barwise barry. If there are more than eight bars, it is said to be barruly. Paly-bendy is when the field is divided by lines in the direction of the pale and bend; barry-bendy, in the direction of the bar and bend. Gyronny, lozengy, fusilly, and chequy indicate that the field is divided by lines in the direction of the sides of these several figures. The pales, gyrons, checks, &c., thus formed, are varied with different tinctures. A shield is said to be fretty when the field is covered with narrow bars in the direction of the bend and bend sinister, and interlaced.—Common charges are every device on a shield other than the ordinaries and subordinaries. These include beasts, birds, fishes, shells, reptiles, insects, the human figure, imaginary beings, celestial bodies, trees, plants, and flowers, and miscellaneous inanimate objects. The principal beasts in heraldry are the lion, bear, tiger, leopard, bull, boar, wolf, antelope, stag, goat, fox, badger, talbot or hound, horse, beaver, and squirrel. The lion is one of the most noble and most frequent of charges, and previous to the 13th century constituted almost the sole armorial device. He is represented in many attitudes, as sejant, passant, rampant, &c., and may be of a metal, fur, or color. He is said to be guardant when his head is affronté or full-faced, and regardant when his head is turned toward the sinister side. All charges must be represented as moving toward the dexter side of the field, unless otherwise specified; if moving toward the sinister side, they must be described as contourné. Beasts of prey are said to be armed of a tincture when their teeth, talons, or claws are of that tincture. When the tongue is shown, they are said to be langued of that tincture; animals with hoofs tinctured are unguled of that tincture, and stags and other docile animals, whose horns are colored, are attired of that tincture. When the heads or other parts of beasts are borne as charges, if cut off smooth they are said to be coupé; if with a jagged edge, erased. The principal birds used as charges are the eagle, falcon, swan, gamecock, chough, pelican, heron, popinjay or parrot, crow, goose, sheldrake, ostrich, raven, owl, dove, peacock, and bat. The eagle, as the noblest of birds, is one of the most honorable of charges. It is generally represented as displayed, but sometimes as rising or close. The double-headed eagle, adopted by the Russian, German, and Austrian emperors as the successors of the Roman emperors, is supposed to have symbolized the union of the eastern and western empires. A pelican sitting on her nest feeding her young is called "in her piety," and a peacock with tail displayed "in his pride." Of fish, the dolphin is the most common charge; in France its use was formerly

restricted to the dauphin. Other fish used are the lucie or pike, roach, salmon, sturgeon, eel, trout, and herring. Of shells, only the escallop and whelk are found among charges; the former dates from the crusades. The reptiles and insects most commonly used are the serpent, tortoise, scorpion, bee, butterfly, and grasshopper. The human figure often occurs in charges, either whole or in parts, naked or vested. The parts used are heads, arms, legs, &c., and these may be either coupé or erased. Of imaginary beings, the griffin, dragon, unicorn, cockatrice, wyvern, triton, and mermaid are common. The celestial bodies, trees, plants, and flowers of many kinds, and many miscellaneous objects, such as helmets, swords, arrows, horseshoes, and buckles, are also used as charges. The numerous variations of the Greek cross are usually ranked as common charges. According to Guillim, there are 39 varieties, to Leigh 46, to Edmondson 109, to Robson 222, and to Berry 385. For some of the principal ones see the plate.—Charges are blazoned either on the field or on an ordinary or other charge. When on the latter, they are said to be in fess, in pale, in cross, in orle, &c. Sometimes an ordinary is placed over a charge, when the latter is said to be debruised by the former. When represented of its natural color, a charge is called proper. It is considered false heraldry to put metal on metal or color on color; but this rule does not hold when a field consists of two tinctures, as of metal and color. In such a case a charge placed on it is sometimes countercharged, which implies that the field and the charge are of the same tinctures, but reversed, so that metal may be on color and color on metal. A charge is said to be over all when it is placed on top of all other charges. A series of nine emblems called differences or marks of cadency are used to distinguish the several sons in a family and the subordinate branches of each house. The eldest son bears in his arms the label, the second the crescent, the third the mullet, the fourth the martlet, the fifth the annulet, the sixth the fleur-de-lys, the seventh the rose, the eighth the cross moline, the ninth the double quatrefoil. In England none but the label is used to distinguish younger sons of the royal family, it being varied by additional pendants and by charges. When marks of cadency are used to distinguish subordinate branches of each house, they are charged with the same. For instance, the first son of the second house bears a crescent charged with a label, the second son of the second house a crescent charged with a crescent, &c.—Marshalling of arms is the orderly arrangement of a number of coats of arms within one shield, by impaling or quartering. A married man has the right to impale his wife's paternal arms, by placing them on the sinister side of his own shield. The joining of one half of his own coat with one half of his wife's in the same shield is called

dimidiation, but this has now fallen into disuse. If the wife is an heiress, her arms may be borne on an escutcheon over his own, called an *escutcheon of pretence*. A widow impales her father's and her husband's arms in a lozenge; but if an heiress, she may bear her father's arms in an *escutcheon of pretence* over her husband's. Where several coats of arms have been acquired by intermarriages of ancestors with heiresses, they are quartered in one shield. According to some authorities, only eight quarterings should be admitted in a family *escutcheon*; others admit sixteen, but more than 100 shields have sometimes been quartered in one field.—Besides the devices borne on the shield, a coat of arms has often a number of exterior ornaments, viz.: the crown or coronet, helmet, mantlings, wreath, crest, scroll and motto, and supporters. The crown or coronet is borne above the shield by those privileged to bear it. (See *CORONET*.) Helmets are of four kinds. Those of kings and princes of the blood royal are of gold, full faced, with the *beauvoir* divided by six projecting bars and lined with crimson; of nobles, steel with five gold bars, and inclining to a profile; of knights and baronets, steel with visor open and without bars, and full faced; and of esquires and gentlemen, steel with visor closed, and in profile. The mantling or lambrequin is a kind of scrollwork, flowing from the helmet. The wreath is formed of the two principal colors of the arms, and surrounds the top of the helmet like a fillet. Out of it rises the crest (Lat. *crista*, a comb), the uppermost device of a coat of arms. The crest is almost as ancient as devices upon shields, and was worn on the helmet by those of high rank or of noted valor as a means of distinguishing them in battle, from which it was sometimes called a *cognizance*. Unless stated to be on a *chapeau* or coronet, it is always on a wreath. No crest is allowed to a female. The scroll and motto are placed beneath the shield. Supporters are figures standing on the scroll on each side of the shield which they seem to support.—The offices of heraldry are performed by heralds, whose chief duties consist in the blazoning of arms, the preservation of heraldic records and of pedigrees, and the conducting of public ceremonies, such as coronations, the creation of peers, marriages, funerals, &c. In England heralds are merged in a corporation called the college of arms or heralds' college, which was instituted by Richard III. in 1483. At the head of the college is the earl marshal of England, a dignity which has been hereditary since 1672 in the family of Howard, dukes of Norfolk. The royal commands are directed to him, and under his care are prepared the programmes for public ceremonies. Under him are three kings-at-arms, styled Garter, Clarenceux, and Norroy. Their subordinates are six heralds, called respectively Chester, Lancaster, Richmond, York, Windsor, and Somerset, and four pursuivants, portcullis, rouge-dragon, blue-

mantle, and rouge-croix. The Bath king-at-arms, attached to the order of the Bath, is not a member of the college of heralds. In Scotland the principal heraldic official is the Lyon king-at-arms, who holds the position by commission under the great seal. He has six subordinate heralds, styled Rothesay, Marchmont, Albany, Ross, Snowdon, and Islay, and six pursuivants, Kintyre, Dingwall, Carrick, Ormond, Unicorn, and Bute. The chief officer for Ireland is the Ulster king-at-arms, who is appointed by the crown. He has two heralds, Cork and Dublin, and two pursuivants, Athlone and St. Patrick.—The following are a few of the principal works on heraldry: Guillim, "Display of Heraldry" (London, 1610); Dugdale, "The Ancient Usage in bearing Arms" (London, 1682); Nisbet, "System of Heraldry" (Edinburgh, 1722); Berry, "Complete Body of Heraldry" (2 vols. folio, London, 1780), and "Encyclopædia Heraldica" (3 vols., 1828); Robson, "British Heraldry" (London, 1830); Von Biedenfeld, *Die Heraldik*, &c. (4to, Weimar, 1846); Burke, "General Armory of Great Britain and Ireland" (London, 1847); Saladini, *Teatro araldico* (8 vols. 4to, Milan, 1841); Grandmaison, *Dictionnaire héraldique* (8vo, Paris, 1852); De Magny, *La science du blason* (8vo, Paris, 1858-'60); Piferrer, *Nobiliario de los reinos y señoríos de España, ilustrado con un diccionario de heráldica* (6 vols. 8vo, Madrid, 1857-'60); Bouton, *Nouveau traité du blason* (Paris, 1862); and Boutell, "English Heraldry" (London, 1867). But the most important heraldic work of modern times is Siebmacher's *Grosses und allgemeines Wappenbuch*, begun by Von Hefner and continued by Grenser and others (Nuremberg); it is to consist of 160 parts, of which 113 had been published up to 1874.

**HERAPATH, William**, an English chemist, born in Bristol, May 26, 1796, died there, Feb. 6, 1868. His father was a brewer, and William succeeded to the business. From the study of chemistry in its application to brewing he turned his attention to that of the science in general. His first paper, "On the Specific Gravity of the Metallic Oxides," was published in the "Philosophical Magazine." He was one of the founders of the London chemical society, and was elected in 1828 professor of chemistry in the Bristol medical school. He retired from the business of brewing in 1830, and in connection with his professorship was employed in making chemical analyses. He was eminent in toxicology.

**HERAT**, or *Herat*, a city of Afghanistan, on the Heri, 360 m. W. of Cabool, and 190 m. S. E. of Meshed; pop. about 50,000. It is situated in a plain 2,500 ft. above the level of the sea, and is strongly fortified. The streets are ill built, narrow, and dirty. The principal public edifices are the citadel, mosques, bazaars, caravansaries, baths, and the palace of the khan. It is divided by four bazaars, which run from four gates, and one of which is 1,300

yards long and roofed with arched brickwork. The staple articles of commerce are saffron and asafetida, and the manufactures include carpets, cloaks, caps, shoes, saddlery, harness, sables, and dressed sheep skins. Herat is a place of great military and commercial importance, being the N. W. "gate of India," and the point where the shawls, chintzes, muslins, indigo, &c., of India and Afghanistan are exchanged for the products of China, Russia, Turkey, and Persia.—At the close of the 18th century Herat belonged to the dominions of Zemaun Shah, the sovereign of Afghanistan. But there were two rival families in the state—that of the king, of the Suddosi tribe, and that of Futteh Khan and his 20 brothers, of whom Dost Mohammed was one of the youngest. The family of Futteh Khan eventually triumphed over their rivals, and divided Afghanistan among themselves, except Herat, which remained in the hands of the brother

government and the dictatorial attitude of the Persian shah fomented discord, in consequence of which Yusuf was driven from power by Esa Khan, who usurped it. The Persians then besieged the town, and captured it, Oct. 26, 1856. This led to war between Persia and England, since the latter government looked upon the capture of Herat as a breach of the treaty of 1853. The Persians were defeated on several occasions, and compelled to sign a treaty at Teheran, April 14, 1857, by which the shah renounced all claims on Herat; but he installed Ahmed Khan as its ruler, who was recognized by the British government. Soon afterward this ruler captured Furreh, which the amir of Cabool quickly recaptured, and then laid siege to Herat. After holding out 10 months, the city was taken by storm, May 26, 1863. It has since been reannexed to the Afghan dominions. The struggle of Russia and Great Britain for the ascendancy in

central Asia has given to Herat an even greater political importance than it had before.

**HÉRAULT**, a S. department of France, in Languedoc, bordering on the Mediterranean, and on the departments of Gard, Aveyron, Tarn, and Aude; area, 2,393 sq. m.; pop. in 1872, 429,878. The surface is mountainous in the north, but in the south are plains, which slope to the sea. Between the mountains and the plains there runs from E. to W., through the entire length of the department, a band of stony earth which allows of no cultivation

The Citadel, Herat.

of Zemaun Shah. In 1837, under the viziership of Yar Mohammed, the Persians appeared before Herat and subjected it to one of the most memorable sieges in modern times, lasting from Nov. 22, 1837, to Sept. 9, 1838, which the town was able to resist in consequence of the exertions of Lieut. Pottinger of the Bombay artillery. In May, 1843, when Kamran, the chieftain of Herat, died, Yar Mohammed made himself master of the town, to the exclusion of Kamran's son. At his death in 1851 he transmitted his power to his son Mohammed Said, whose conduct became so unsatisfactory that, with the consent of the people and the military assistance of the shah of Persia, he was supplanted by Yusuf, a prince of the Suddosi family, who in 1855 captured Herat and proclaimed himself chief as the vassal of Persia. He acted under Russian and was opposed to English influence. The proposed expulsion of an agent of the English

but that of the olive and the vine. The principal river is the Hérault, which flows nearly S. through the department to the Mediterranean at Agde. There are several canals. The climate is dry and very warm, and, except near the marshes on the S. coast, healthy. Olives and grapes are the chief agricultural products. Excellent white and red wines are made. Brandies, cloths, woollens, silks, liqueurs, perfumes, paper, pottery, and candles are manufactured; there are mines of iron, copper, and coal, and marble quarries. It is divided into the arrondissements of Béziers, Lodève, Montpellier, and St. Pons. Capital, Montpellier.

**HÉRAULT DE SÈCHELLES, Marie Jean**, a French revolutionist, born in Paris in 1760, guillotined there, April 5, 1794. He was a lawyer, and was advocate general at the Châtelet. When the revolution broke out he embraced its principles with ardor, and distinguished himself by personal bravery at the siege of the Bastille. In

September, 1791, he was elected by the city of Paris to the legislative assembly, where he at once joined the extreme left. Having been returned to the convention by the department of Seine-et-Oise, he was chosen president of that body, Nov. 2, 1792. He was one of the commissioners sent to organize the department of Mont Blanc, and while absent from Paris on this mission signed a letter voting for the "condemnation" of the king, after the words "to death" had been stricken from it at the request of one of his colleagues, the abbé Grégoire. He joined Danton and Lacroix in demanding the trial of Henriot, and presided at the well known sitting of June 2, 1793, when he proclaimed the proscription of the Girondists. On June 10 he presented a report from the committee of public safety on the proposed constitution, which had been drawn up mainly by himself, but it was not accepted. He also presided at the great *fête* of Aug. 10, 1793. He was an uncompromising democrat, and as member of the committee of public safety proposed many measures of great severity. When sent on a mission to Alsace in September, 1793, he wrote: "I have planted guillotines on my route, and find that they have produced good effects." The consideration he enjoyed provoked the jealousy of Robespierre, and on a frivolous pretext he was imprisoned. On March 31, 1794, St. Just accused him in the convention of being a noble by birth and of having protected the *émigrés*. He was condemned to death with Danton, Desmoulins, and others, and met his fate with calmness. He was the author of many works, among which were *Visite à Buffon* (Paris, 1785), and *Théorie de l'ambition* (1802), written during his last imprisonment.

**HERBARIUM**, a collection of dried plants, formerly called a *hortus siccus*. In collecting specimens, the whole plant, including root, is taken if not over 15 in. high, if possible selecting those which present both flower and fruit. With larger plants such portions are taken as will accurately represent the whole; if the leaves vary in form, specimens of each kind should be included, as well as young shoots, buds, flowers, and fruit. The specimens are dried between sheets of bibulous paper, which are changed more or less frequently according to the climate and the character of the plants. When thoroughly dry, the flowers and soft parts are poisoned, to prevent their destruction by insects, by sprinkling them with an alcoholic solution of corrosive sublimate and keeping them between papers until this is dry. The specimens are finally mounted upon sheets of heavy white paper by gluing them down, or by fastening them by means of small straps of gummed paper; one species only is placed upon a sheet, but several small specimens of the same species in different stages, or from different localities, are put upon the same sheet. The name of the plant is written at the lower right-hand

corner, or a ticket containing it is pasted there. The species of each genus are placed together in a fold of heavy manila paper, upon the lower left-hand corner of which the name of the genus is written. The specimens in their genus covers are then placed in a cabinet or case with pigeonholes large enough to allow them to lie flat, which should close tightly to exclude dust and insects. The genera are gathered into families or orders, following whatever lineal arrangement may be preferred. The size of the paper is a matter of importance; great annoyance results from having it too small, and if needlessly large it increases the expense. Most American botanists adopt the size of  $11\frac{1}{2}$  by  $16\frac{1}{2}$  in.; the herbarium of Linnæus is on ordinary foolscap sheets. Among the celebrated collections of Europe are the Kew, the Linnæan, and the Banksian herbaria, the last at the British museum. The herbaria of the Paris museum, of Berlin, of St. Petersburg, and many others, are of great extent and value. In this country, the Gray herbarium at Harvard, the Torrey and Meisner herbaria at Columbia college, and that of the academy of natural sciences at Philadelphia, are the most important; and there are many smaller ones, including those of botanists who study in special departments, of great scientific interest.

**HERBART, Johann Friedrich**, a German philosopher, born in Oldenburg, May 4, 1776, died in Göttingen, Aug. 14, 1841. At an early age he acquired a knowledge of the philosophical systems of Wolf and Kant, and subsequently attended the lectures of Fichte at Jena. After teaching at Bern, where he was intimate with Pestalozzi, and wrote a treatise on his system of education, he went in 1802 to Göttingen, and in 1805 was appointed extraordinary professor. In 1809 he accepted the chair of philosophy at Königsberg, whence he was recalled in 1833 to Göttingen. His philosophy was a reaction against the reigning idealism, and partakes at once of the empiricism of Locke and Condillac, the monadism of Leibnitz, the criticism of Kant, and the mathematical idealism of Bardili. His principal works are: *Lehrbuch zur Einleitung in die Philosophie* (Königsberg, 1813; 4th ed., 1837); *Lehrbuch zur Psychologie* (1816; 3d ed., 1834); *Psychologie, als Wissenschaft neu gegründet auf Erfahrung, Metaphysik und Mathematik* (2 vols., 1824-'5); *Allgemeine Metaphysik nebst den Anfängen der philosophischen Naturlehre* (2 vols., 1828-'9); and the *Encyclopädie der Philosophie aus praktischen Gesichtspunkten* (Halle, 1831; 2d ed., 1841). His minor philosophical writings, with a biography by Hartenstein, were published at Leipsic (3 vols., 1841-'3); his complete works were edited by Hartenstein (12 vols., Leipsic, 1850-'52).

**HERBELOT, Barthélemy d'**, a French orientalist, born in Paris in December, 1625, died there, Dec. 8, 1695. He acquired a knowledge of Hebrew, Arabic, Syriac, Persian, and Turkish, twice visited Italy to obtain instruction from

the orientals who frequented Genoa, Leghorn, and Venice, and in the last years of his life he was professor of Syriac at the collège de France. He left several inedited works, of which the *Bibliothèque orientale, ou Dictionnaire universel, contenant tout ce qui fait connaître les peuples de l'Orient* (fol.), was published in Paris two years after his death.

**HERBERT, Edward**, Baron Herbert of Cherbury, an English philosopher, born at Montgomery, Wales, in 1581, died in London, Aug. 20, 1648. He was married at 15, completed his education at Oxford, and in 1600 went to London. In 1608 he visited France. In 1610 he joined the English auxiliaries in the Netherlands under the command of Maurice of Nassau, prince of Orange, and served in the siege of Jülich. In 1614, under the same commander, he served in a second campaign against the Spaniards. He distinguished himself in these wars by great intrepidity. He then went to Italy, where the duke of Savoy intrusted him with the guidance of 4,000 Languedoc Protestants into Piedmont. In 1618 he was appointed by King James ambassador extraordinary to France, to renew the alliance between France and England. Very sensitive on all points of honor, he was involved in many duels, and especially offended the duke de Luynes, a favorite of the king, at whose instigation he was recalled to England. On the death of De Luynes (1621) he was sent again to France, and while there published his first work, *Tractatus de Veritate* (Paris, 1624). In 1625 he returned to England, and was created baron of Castle Island in the peerage of Ireland, and from this time devoted himself entirely to the duties of his station and to literature. In 1631 he was elevated to the English peerage, under the title of Baron Herbert of Cherbury. He was opposed to Bacon and Hobbes, and taught that human knowledge is derived from a *rationalis instinctus* or instinct of the reason, and that by the action of outward objects upon the mind certain *communes notiones* or universal principles are educed. He believed that religion rests upon innate ideas, man's own consciousness being the standard by which revealed religion should be tested. In the disturbances in the reign of Charles I. he sided first with the parliament, and afterward with the king. Among his works are the following, all of which appeared after his death: *De Religione Gentilium, Errorumque apud eos Causis; Ex-peditio (Buckinghami Ducis) in Ream Insulam*; and the "Life and Reign of King Henry VIII." His autobiography was printed by Horace Walpole in 1764.—See *Lord Herbert de Cherbury*, by Charles de Rémusat (Paris, 1874).

**HERBERT, George**, an English poet, fifth brother of the preceding, born at Montgomery castle, Wales, April 3, 1593, died at Bemerton, England, in February, 1632. He was educated at Westminster and at Trinity college, Cambridge, elected fellow of the college in 1615, and in 1619 public orator, which in

those days was a great honor. King James, whose favor he had gained by an elegant letter to him in Latin, presented him with a sinecure office worth £120 a year. The death of two of his most powerful friends, the duke of Richmond and the marquis of Hamilton, soon followed by that of the king, induced him to take holy orders, and he was made by Bishop Williams prebendary of Leighton Bromswold, or Layton Ecclesia, in 1626. In 1630 Charles I. presented him with the living of Bemerton, near Salisbury, and here he remained till his death. As a pastor he was most exemplary and zealous, and he was generally known as "holy George Herbert." His verses are quaint and full of imagery, with many beautiful thoughts and holy precepts. They are of the same school as those of Quarles and Donne. Herbert was the intimate friend of Sir Henry Wotton, Dr. Donne, and Lord Bacon. His principal works are: "The Temple, Sacred Poems and Private Ejaculations" (Cambridge, 1633); "Outlandish Proverbs, Sentences, &c." (London, 1640); "Quadrupartit Devotions" (1647); "The Priest to the Temple, or the Character of a Country Parson" (1652); and "Remains," prose writings (1652). His life was written by Izaak Walton.

**HERBERT, Henry William**, an American author, born in London, April 7, 1807, died by his own hand in New York, May 17, 1858. He was a son of the Hon. and Rev. William Herbert, dean of Manchester, and graduated at Caius college, Cambridge, in 1828. He came to New York in 1831, and until 1839 was teacher of Greek in a private school. During this time he began to write for the public, and from 1833 to 1836 was editor of the "American Monthly Magazine," at one time in connection with C. F. Hoffman. In 1834 he published his first historical novel, "The Brothers, a Tale of the Fronde," followed by "Cromwell" (1837), "Marmaduke Wyvil" (1843), "The Roman Traitor" (1848), "The Miller of Martigny," "Guarica, or the Carib Bride," "Sherwood Forest, or Wager of Battle" (1855), and others. His historical works were "The Captains of the Greek Republics," "The Captains of the Roman Republic," "Henry VIII. and his Six Wives," and "The Royal Maries of Mediæval History." Some of these enjoyed in their time great popularity. For several years previous to his death Mr. Herbert resided near Newark, N. J. He made versions of several French romances, of Weiss's "Protestant Refugees" (New York, 1854), of the "Prometheus" and "Agamemnon" of Æschylus, and of poetry from French and Italian authors. His most celebrated and characteristic works, however, were on sporting, published under the pseudonyme of Frank Forester, namely: "The Field Sports of the United States and British Provinces" (1849); "Frank Forester and his Friends" (London, 1849); "The Fish and Fishing of the United States," &c. (New York, 1850); "Young Sportsman's

Complete Manual;" "The Horse and Horsemanship of the United States and British Provinces of North America" (2 vols. 4to, 1857); and "American Game." Mr. Herbert also edited various works, and was a versatile contributor to literary magazines and journals. As a writer on field sports he was the first in America to give prominence to a department of literature which has of late years become both copious and popular.

**HERBERT, John Rogers**, an English painter, born in Maldon, Essex, Jan. 23, 1810. He became a student in the royal academy while a boy, and before the age of 24 had acquired considerable reputation. About 1839 he became a convert to the Roman Catholic church. He was employed on the decoration of the new houses of parliament, and among his frescoes there are nine subjects taken from the Old Testament in illustration of justice on earth and its development in law and judgment. Since the death of his son in 1856, a young painter of great promise, his subjects have been almost entirely religious. He was elected associate of the royal academy in 1841 and academician in 1846.

**HERBERT, Sir Thomas**, an English traveller, born in York about 1606, died there in 1682. He studied at Oxford and Cambridge, and in 1626 accompanied Sir Dodmore Cotton on his embassy to Persia. He returned to England at the end of four years, after having visited Persia, northern Africa, and the East Indies, and in 1634 published "Some Yeares Travels into Africa and the Great Asia, especially the Territories of the Persian Monarchy." In the civil war Herbert took the side of the parliament, was one of the commissioners of Hali-fax, and was sent by parliament among the deputies to Newcastle to receive the king from the Scotch. Charles was so won by his kind and courteous behavior that, though he was a Presbyterian, he retained him to the last, after his other attendants had been dismissed. Herbert, for his services to the king, was rewarded by Charles II. with the title of baronet. Together with some others, he wrote the *Threnodia Carolina*, an account of the last two years of the life of Charles I. (1678 and 1813).

**HERBERT, William**, third earl of Pembroke, an English poet, born at Wilton, Wiltshire, April 8, 1580, died in London, April 10, 1630. He was chancellor of the university of Oxford, a knight of the garter, for some time governor

of Portsmouth and lord chamberlain of the royal household, a contributor to the Bodleian library of valuable Greek MSS., and gave his name to Pembroke college, Oxford. He wrote poems of little merit, and some of a licentious character, but great interest is attached to his name on account of the supposition that he was the W. H. of Shakespeare's sonnets. Hallam, in his "Literature of Europe," favors this belief. Herbert, whose character is drawn by Clarendon in his "History of the Rebellion," was learned, noble, gallant, and licentious.

**HERBIVORA** (plant-eaters), an order of mammals, ungulate or hoofed, having molar teeth for grinding, and no clavicles. Owen divides them into: 1. Artiodactyls, or even-toed, with 19 dorso-lumbar vertebræ, and horns, if any, in pairs; including ruminants, two-toed, which chew the cud, as the cow, sheep, and camel; and omnivores, four-toed, like the hog. 2. Perissodactyls, odd-toed, one, three, or five, with more than 19 dorso-lumbar vertebræ, and horns, when any, never in pairs; including the solid-ungulates or solid-hoofed, one-toed, like the horse, ass, and hipparion; multungulates, three or five-toed, like the tapir, rhinoceros, and palæotherium; and proboscidea, like the elephant and mastodon, with five toes, a proboscis, and tusks in one or both jaws. They form one of the three orders of the eighth class, or mammals, in Prof. Agassiz's classification, the other two being marsupials and carnivora; of course, thus including rodents, many edentates, bats, and monkeys. This extension of the term is likely to introduce confusion into the generally followed classifications.

**HERCULANEUM**, an ancient city of Campania, Italy, situated at the N. W. base of Mt. Vesuvius, about 5 m. S. E. of Naples, and entirely

Herculaneum.

overwhelmed by an eruption of Vesuvius in A. D. 79. Its foundation was ascribed to Hercules, and Ovid called it *Herculeæ urbs*. It is said by Strabo to have been occupied in turn

by Oscans, Pelasgians, Tyrrhenians, and Samnites, but its history is obscure, and it was never of great importance. The inscriptions show that under the Romans it had the rights of a *municipium*, and that it was governed with its own laws by demarchs and archons. Strabo describes it as situated on a projecting headland, and Sisenna as built on elevated ground between two rivers, and surrounded by low walls. Its healthy situation rendered it a place of resort for wealthy Romans, who built magnificent villas in the city and its suburbs. It suffered severely from an earthquake in A. D. 63, and Seneca said then that what remained was not safe. In August, 79, Vesuvius threw out for eight days and nights torrents of mud, filling the city to the roofs of the houses, and afterward showers of ashes and currents of lava, forming a deposit varying from 70 to 112 ft. in depth. A second settlement formed near the site of the buried city met with a similar fate in 472. Thereafter even the situation of Herculaneum was forgotten. It was not mentioned except in a few works of the 15th, 16th, and 17th centuries, and was supposed to be buried under the modern site of Torre del Greco. The discovery of the real site was due to the sinking of a well at Resina in 1709, which brought to light some fragments of mosaic and statues. For the history of the excavations, see POMPEII.

**HERCULES** (Gr. *Ἡρακλῆς*), the most renowned of the mythical heroes of antiquity, son of Jupiter by Alcmena, the granddaughter of Perseus. He was destined by Jupiter to occupy the throne of Perseus, but by the contrivance of Juno was superseded by Eurystheus, the grandson of that hero. His name originally was Alcides or Alcæus; it was changed to Hercules by the Delphic oracle, which ordered him to live at Tiryns and serve Eurystheus 12 years. When Jupiter saw that Juno had accomplished the disinheritance of Hercules, he made her promise that Hercules should become immortal on the completion of 12 great works for Eurystheus. There is some difference in the accounts of these labors, but the most common enumeration is the following: 1. The fight with the Nemean lion. The valley of Nemea between Cleonæ and Phlius was infested by a monstrous lion. Hercules blocked up one of the entrances to the den, entered it by the other, strangled the lion, and brought the carcass to Eurystheus. 2. The fight with the Lernaean hydra. In the district of Lernæ, near Argos, dwelt a huge hydra having nine heads, the middle one immortal. Hercules, having roused the hydra from its lair, cut off its heads, but in place of every head cut off two new ones sprang up. With the assistance of his servant Iolaus, he burned the mortal heads, and buried the immortal one under a rock. 3. The capture of the Arcadian stag. This animal had golden horns and brazen feet, and was of surpassing swiftness. Hercules was ordered to bring it alive to Mycenæ. For a whole year

he pursued it in vain. At length, weary of pursuing, the hero wounded it with an arrow, caught it, and carried it to Mycenæ. 4. The hunt of the Erymanthian boar. This boar had descended from Mt. Erymanthus into Psophis, and Hercules was ordered to bring him alive to Eurystheus. He chased the brute through the deep snow till, having tired him down, he caught him in a net. 5. The cleansing of the Augean stables. Augeas, king of Elis, had a herd of 3,000 oxen, whose stalls had not been cleansed for 30 years. Eurystheus commanded Hercules to clean them in one day. He accomplished it by turning the rivers Alpheus and Peneus through the stables. 6. The destruction of the Stymphalian birds, an innumerable swarm of voracious creatures, with claws, wings, and beaks of brass, that used their feathers as arrows and fed upon human flesh. They had taken refuge in a lake near Stymphalus, whence Hercules startled them with a rattle, and killed them with his arrows as they attempted to fly away. 7. The capture of the Cretan bull. This bull was a sacrificial gift from Neptune to Minos; but as Minos neglected to sacrifice him, Neptune caused the bull to go mad, and to make great havoc in Crete. Hercules was commanded to catch him, and bring him to Mycenæ. He did so, but then set the animal free to the great terror of Greece. 8. The abduction of the mares of Diomedes, a Thracian prince who fed them with human flesh. Eurystheus sent Hercules to bring them to him. Hercules had conducted them to the seacoast, when he was overtaken and attacked. He vanquished the Thracians, slew Diomedes, and cast his body to the mares, which became tame after eating the flesh of their master. Hercules then embarked with them, and brought them to Eurystheus. 9. The seizure of the girdle of Hippolyte, queen of the Amazons, which she had received from Mars. Hercules set sail from the Peloponnesus, and landed at Themiscyra, where he was hospitably entertained by Hippolyte, who promised him the girdle. But the malignity of Juno rousing the Amazons against him, he, deeming the queen a party to the conspiracy, slew her, possessed himself of her girdle, and arrived with it in safety at Mycenæ. 10. The capture of the oxen of Geryones, a monster who lived in the island of Erythia, and who had a herd of red oxen which fed with those of Helios, and were guarded by the giant Eurytion and the two-headed dog Orthrus. Erythia was in the ocean far to the west, and in his journey to it Hercules erected the pillars of Calpe and Abyla, hence called the pillars of Hercules. He killed Orthrus, Eurytion, and Geryones, and, after overcoming the efforts of gods and men to deprive him of them, brought the oxen to Eurystheus. 11. The getting of the golden apples of the Hesperides. These apples had been presented by Terra to Juno, by whom they had been intrusted to the keeping of the Hesperides and the dragon Ladon, in some

remote region of the west. Hercules, with the aid of Atlas, obtained the apples, which on his return he gave to Eurystheus. 12. The seizure of Cerberus, the dog that guarded the entrance to Hades. On arriving in Hades, Hercules asked permission of Pluto to take Cerberus, and the god yielded his assent, provided he could do so without having recourse to arms. Seizing Cerberus, Hercules bore him to the upper world, showed him to Eurystheus, and immediately carried the monster back to Hades.—In the original legends, Hercules figures as a mighty chieftain, who subdues Troy, and wages successful war against Argos and Lacedæmon; who dethrones princes, and gives away kingdoms and sceptres. The worship of Hercules prevailed especially among the Dorians; and the sacrifices offered to him were chiefly bulls, boars, rams, and lambs. He was also worshipped at Rome, and, under various names, in many other parts of the ancient world. In works of art he is represented in all the various stages of life; but whether he appears as a child, a hero, or a celestial, his character is always that of supernatural strength and energy. He is most frequently represented clothed in a lion's skin and carrying a club.

**HERCULES' CLUB**, a trivial name for three widely different plants: 1. *Xanthoxylum clava-Herculis*, a large West Indian tree of the same genus with our prickly ash; its smaller branches, thickly covered with short, straight, persistent prickles, are often made into walking canes. 2. A remarkable variety of the common gourd, *lagenaria vulgaris*, the fruit of which often exceeds 5 ft. in length; its greatest diameter is 4 or 5 in., and it is quite small near the stem. 3. *Aralia spinosa*, a large native shrub with an exceedingly prickly stem, also called angelica tree, and frequently cultivated on account of the tropical character of its foliage.

**HERCYNIA SILVA**, the ancient name of a forest of Germany, covering a mountain range whose position and extent are very differently described by various writers. It probably comprised the whole mountain system of central Europe, extending from the sources of the Danube to Transylvania, and thus including the Hartz, which seems to have retained a trace of the ancient name. The term Hercynian Forest was afterward restricted to the ranges which connect the Thuringian Forest with the Carpathians.

**HERDER, Johann Gottfried von**, a German author, born at Mohrungen, Aug. 25, 1744, died in Weimar, Dec. 18, 1803. He was the son of a schoolmaster and chorister, and became the amanuensis of a clergyman named Trescho, under whom he made wonderful progress in study and various reading. At the age of 18 his philosophical and literary erudition gained him the friendship of a Russian physician, who sent him to Königsberg, whence he was to go to St. Petersburg as a lecturer on surgery. But he renounced his intended profession after wit-

nessing a single operation, and devoted himself to theology. In 1765 he became a preacher at Riga, where the fervor and power of his discourses quickly made him an object of general enthusiasm. His *Fragmente über die neuere deutsche Literatur* (1767), and his *Kritische Wälder* (1769), were manifestoes against the artificial spirit and literature of his age, as compared with the grander inspirations of the early Orient and of ancient Greece. In 1769 he resigned his pastorate in order to travel in Germany, France, and Italy. At Strasburg he was intimately associated with Goethe. In 1771 he was called as court preacher to Bückeburg, and in 1776 was appointed court preacher and member of the consistory at Weimar. By his *Älteste Urkunde des menschlichen Geschlechts* (1774) he had already given a new impulse to theology by seeking poetic sentiments in religious traditions, and by tracing in the primitive world the sublime instincts of human nature and the foreshadowings of human destiny. At Weimar he passed the remainder of his life, in association with the leading minds in that most brilliant period of German literature, and occupied with constant labors in theology, poetry, and history. As a theologian he coöperated with Lessing in opposing the despotism of the letter and of dogmas, and brought the instincts of piety and of poetic fancy, illustrated by a wide erudition, rather than the dialectics of the schools, to bear upon the questions of religion. This tendency appears in his *Geist der Ebräischen Poesie* (Dessau, 1782; translated into English by Dr. James Marsh, 2 vols., Burlington, 1833), in which he treats the Hebrew writings as productions at once of primitive poetry and of religious inspiration. He translated many legends and songs from Arabian, Indian, Italian, Spanish, and ancient German poets, among which were the Spanish romances of the Cid. His most important work is the unfinished *Ideen zur Philosophie der Geschichte der Menschheit* (4 vols., Riga, 1784-'91; translated into English by T. Churchill, under the title of "Outlines of a Philosophy of the History of Man," 4to, London, 1800, and 2 vols. 8vo, 1803), which is one of the principal and standard treatises on the subject. He traces the course of humanity as of an individual placed on the earth by an unseen hand, changing its forms and objects as it passes from country to country and from age to age, protesting everywhere against the finite world which enchains it, seeking the triumph of the infinite, the victory of the soul, tending in spite of détours and through a series of revolutions to civilization, and preparing for the blossoming of life in another world. His numerous writings have been collected in 43 vols. (Stuttgart, 1806-'20), and in other editions, including one of his select works by H. Kurtz in 4 vols. (1871). A monument, with the inscription *Licht, Liebe, Leben*, was erected to his memory by Grand Duke Charles Augustus at Weimar in 1818. His biography was written

by his son E. G. von Herder (6 vols., Erlangen, 1846-'7). N. L. Frothingham has translated some of his poems into English. A complete edition of his works was published in 1872, under the patronage of the Prussian government.

**HEREDITAMENTS**, in law, whatever may be inherited. Hereditaments are corporeal, embracing lands and tenements of every description, and incorporeal, of which ten classes are usually enumerated: advowsons, tithes, commons, ways, offices, dignities, franchises, corodies or pensions, annuities, and rents. The first, second, and sixth do not exist in the United States, and the fifth is never the subject of inheritance here; but there are many easements that may be inheritable in connection with corporeal hereditaments to which they are appendant or appurtenant. In England there are also heirlooms which pass with the

realty to the heir, such as the family pictures, and by custom the furniture of the mansion house; but heirlooms are scarcely known to the law of America.

**HEREFORD**, a city and parliamentary and municipal borough of England, capital of Herefordshire, on the N. bank of the Wye, here crossed by a bridge of six arches, 136 m. by railway W. N. W. of London; pop. in 1871, 18,335. The principal building is the cathedral, refounded in 1079, of early Norman architecture, cruciform, with a frontage of 325 ft. and a breadth of 110 ft. The west front fell in 1786, and was rebuilt in an incongruous style, but the rest of the building has recently been restored in the best manner. It has many fine monuments, some as old as the 11th century, a chapter house, Lady chapel, cloisters, and a library containing valuable manuscripts,

Hereford Cathedral.

among them Wycliffe's Bible. Hereford is noted for its ancient charities, among which are 11 hospitals, or almshouses, which distribute money and bread. The manufactures are not important; they consist of gloves, once the staple industry, hats, flannels, leather, and cutlery. Iron works have been established since the opening of the railway to the coal district. Six fairs are held annually, the October fair being the largest in England for cattle and cheese. A musical festival is given triennially, in the cathedral, by the united choirs of Hereford, Worcester, and Gloucester. Hereford retains several of its ancient privileges.

**HEREFORDSHIRE**, an inland county of England, on the E. border of Wales, almost circular in shape; area, 835 sq. m.; pop. in 1871, 125,364. Its surface is diversified by hill and dale. It belongs wholly to the basin of the Severn, and has a gentle slope S. to that river,

into which flow its streams the Lugg, Teme, Dore, Monnow, Arrow, Frome, and Wye, the last traversing the whole width of the county and famous for its beautiful scenery. Canals connect the towns of Hereford and Leominster with the Severn, and railways connect Hereford with Shrewsbury, Worcester, Abergavenny, and Brecon. The geological formation is old red sandstone, excepting in detached localities, where it is limestone. Iron ore, red and yellow ochres, pipe clay, and fullers' earth are found. Some medicinal and petrifying springs exist. This county is entirely agricultural, and formerly bore the name of "the garden of England." The soil is a deep, heavy, red loam, resting on clay or gravel, and very fertile. Wheat, barley, fruit, hops, and oak bark are the principal productions. The Hereford breed of cattle is famous for gentleness, beauty of appearance, and aptitude to fatten.

**HERFORD**, a town of Prussia, in the province of Westphalia, on the Werra and Aa and the Minden and Cologne railway, 46 m. E. N. E. of Münster; pop. in 1871, 10,968. It has a Roman Catholic and four Protestant churches and a synagogue. The Münsterkirche, a vast Romanesque building of the 13th century, was formerly attached to the monastery founded in 789, to which the town owes its origin, and of which the abbess was a princess of the empire. There are also a gymnasium and a museum for art and antiquities. Tobacco, linen, carpets, and leather are manufactured. At Engers, 5 m. E., is the tomb of Wittekind the Saxon.

**HERING, Constantin**, an American physician, born at Oschatz, Saxony, Jan. 1, 1800. He studied medicine in Leipsic, Dresden, and elsewhere in Germany, and in 1826 received the degree of doctor of medicine, surgery, and obstetrics. Subsequently he was sent on a scientific expedition to Dutch Guiana. In 1834 he settled in Philadelphia, where he has since for the most part resided. He has been connected with several medical reviews and journals of the homœopathic school, and is the author of a number of works devoted to the therapeutical reform commenced by Hahnemann, including "Rise and Progress of Homœopathy" (Philadelphia, 1834), which has been translated into several languages; "The Domestic Physician" (6th ed., Philadelphia, 1858); "American Drug Provings" (vol. i., Leipsic, 1853), &c. He has given much attention to cures for the bites of venomous reptiles and mad dogs. In 1874 he was preparing for publication a collection of his medical essays.

**HERIOT, George**, a Scottish goldsmith, the founder of Heriot's hospital, born in June, 1563, died in London, Feb. 12, 1624. As goldsmith to James I., he acquired a large fortune, and, having no direct heirs, bequeathed about £24,000 to the magistrates and clergy of Edinburgh, for the founding of a hospital there for the "maintenance, relief, bringing up, and education of poor and fatherless boys, free-men's sons of the city."

**HERISAU**, a town of Switzerland, capital of the half canton of Appenzell Outer Rhodes, 7 m. N. W. of Appenzell, on the right bank of the Glatt, about 2,500 ft. above the sea; pop. in 1870, 9,736. It consists of two principal squares and four streets, with seven smaller ones opening into them, and contains a large and handsome church, with a tower supposed to have been built in the 7th century, a new and elegant town house, a poorhouse, arsenal, and casino. There are extensive manufactures of muslins, plain and embroidered, and of cottons and silks, tanneries, dye works, bleach fields, and paper mills. The environs are laid out in beautiful walks and gardens, and the surrounding heights are crowned by the old castles of Rosenberg, Rosenberg, and Schwänenberg, while the baths of Heinrichsbad are about a mile distant.—Herisau was originally called Herginis Au. The Romans made a settlement

here, and Christianity was introduced early in the 7th century. The nobles of Herisau established their jurisdiction here, which in 1390 fell under the abbey of St. Gall. The abbot taxed the people heavily and arbitrarily, and in 1463 they bought themselves free.

**HERKIMER**, a N. E. county of New York, intersected by the Mohawk river, and also drained by several mill streams; area, 1,745 sq. m.; pop. in 1870, 39,928. It has a hilly surface, in many places covered with a dense growth of timber, and containing limestone, building stone, lead, and gypsum. The soil is very fertile in the valleys, and even in some of the hilly districts. The Erie canal, the New York Central railroad, and the Adirondack railroad (in progress) traverse it. The chief productions in 1870 were 12,665 bushels of wheat, 128,953 of Indian corn, 551,179 of oats, 60,288 of barley, 41,806 of buckwheat, 367,805 of potatoes, 25,918 lbs. of wool, 444,910 of hops, 100,025 of flax, 1,212,051 of butter, 5,101,654 of cheese, and 157,839 tons of hay. There were 8,299 horses, 48,547 milch cows, 11,836 other cattle, 6,984 sheep, and 8,403 swine; 2 manufactories of agricultural implements, 72 of cheese, 24 of cheese boxes, 34 of carriages, 25 of clothing, 2 of cotton goods, 1 of firearms, 3 of hardware, 4 of malt, 1 of matches, 3 of printing paper, 1 of starch, 14 of tin, copper, and sheet-iron ware, 4 of woollen goods, 18 flour mills, 15 tanneries, 6 currying establishments, 5 planing mills, and 26 saw mills. Capital, Herkimer.

**HERKIMER, Nicholas**. See supplement.

**HERKOMER, Hubert**. See supplement.

**HERMANN**. See ARMINIUS.

**HERMANN, Johann Gottfried Jakob**, a German philologist, born in Leipsic, Nov. 28, 1772, died Dec. 31, 1848. After studying law and philology at Leipsic and Jena, he began to lecture on ancient literature at Leipsic in 1794, and in 1798 was appointed extraordinary professor of philosophy. From 1803 till his death he was professor of eloquence, and from 1809 also of poetry. He interested himself in the Greek society founded in 1799, and in 1834 assumed the direction of the school of philology. His services to the cause of classical learning were very important. His researches were original, and their results were presented in his lectures with great vigor and clearness. He was particularly noted for the new principles which he developed in reference to the classical metres and the Greek grammar. His principal works in regard to the metres were: *De Metris Græcorum et Romanorum Poetarum* (Leipsic, 1796); *Handbuch der Metrik* (1798); *Elementa Doctrinæ Metricæ* (1816); *Epitome Doctrinæ Metricæ* (1818; 2d ed., 1844); and *De Metris Pindari*, in Heyne's edition of Pindar (3 vols., 1817). The principles which he applied in the grammar of the Greek language may be found in his treatise *De Emendanda Ratione Græcæ Grammaticæ* (1801), and in his annotations of Vigier's *De Græcæ Dictionis*

*Idiotismis* (1802; 4th ed., 1834) and *Libri IV de Particula Æv* (1831). He also edited most of the plays of Euripides, the "Clouds" of Aristophanes, the "Trinummus" of Plautus, the "Poetics" of Aristotle, the hymns of Orpheus, and those ascribed to Homer, Bion, Moschus, and Æschylus, and completed the edition of Sophocles begun by Erfurdt. He discussed the significance of classical mythology in *De Mythologia Græcorum Antiquissima* (1807), and in *Briefe über Homer und Hesiodus*, written by him and Creuzer (Heidelberg, 1818). A collection of his essays was published under the title *Opuscula* (7 vols., 1827-'30).

**HERMANNSTADT** (Hung. *Nagy-Szeben*), a city of Transylvania, capital of the land of the Saxons, on the Zibin, 70 m. S. S. E. of Klausenburg; pop. in 1869, 18,998, of whom 69 per cent. were Germans. It consists of an upper and a lower town, and is surrounded by a wall

with five gates. The principal public edifices are the churches, the palace of Baron Brückenthal, a Lutheran and a Roman Catholic gymnasium, barracks, hospital, theatre, town hall, and government offices. The palace contains a picture gallery, a library, and a museum of Roman antiquities. The ramparts have been converted into fine promenades. There are considerable manufactures of linen and woollen, pottery, &c. Hermannstadt is the seat of the Lutheran chief consistory, and of a Greek bishop, the head of the Greek church of the Rouman nationality. It was founded in the 12th century by a German colony. In the course of the 15th and 16th centuries it was often besieged by the Turks, and was taken by them in 1536. At the beginning of the 17th century it was subjected to great calamities by Gabriel Batori. Several battles between the Austrians and the Hungarians under Bem were

Hermannstadt.

fought there at the beginning of 1849. In the early days of March the town was occupied by the Russians, but taken by Bem, March 11. A conflict between the Russians and Hungarians on July 20 resulted in the occupation of the town by the former on the following day, but on Aug. 4 Bem reconquered it. After the overthrow of the Hungarian revolution Hermannstadt was for a time the capital of Transylvania.

**HERMAPHRODITE** (Gr. Ἑρμῆς, Mercury, and Ἀφροδίτη, Venus), an animal or plant uniting in itself the sexual characters of the male and female. The name is derived from the fable of the union into one of the bodies of Hermaphroditus, son of Mercury and Venus, and the nymph Salmacis. There are two kinds of hermaphroditism, the spurious and the true; in the former there is only an appearance, from arrest or excess of development, of a union of opposite sexual characters; in the latter there is an actual coexistence in the same individual of more or less of both male and female organs. By far the largest number of cases of hermaphroditism, in man and the vertebrate

animals, belong to the first class. They are simply cases in which the individual is in reality exclusively male or female, but some of the accessory genital organs are so changed, either by excessive or deficient growth, or by change of position, as to resemble the corresponding parts in the opposite sex. In the second class of cases, where real male and female organs coexist upon the same individual, either one or the other set of organs is incomplete or imperfectly developed. According to the best authorities, no case has yet been known, in man or the higher animals, where the same individual presented simultaneously the complete male and female organizations. But true hermaphroditism is the normal type of sexual structure in almost all phanerogamic plants, the reproductive organs being either upon the same flower or upon different flowers on the same stock; and this condition is sometimes found as a monstrosity in dioecious plants. Perfect hermaphroditism exists also normally in many invertebrate animals, as, according to Siebold, in the *ctenophora* among *acalephæ*; the *cestodes* (tapeworms) and *trematodes* among

helminths; *planaria*; *hirudinei* (leeches) and *lumbricini* (earth worms) among annelids; some acephalous and cephalophorous mollusks; cirripeds among crustaceans; and the *tardigrada* among arachnoids. It does not exist in insects, unless as a monstrosity. In some of these, as in the *trematodes* and *planariae*, each individual may be self-impregnating, but generally the sexual act is accomplished by two individuals, respectively impregnating each other.

**HERMAS**, an ecclesiastical writer of the 1st century, author of the book *Pastor Hermæ*. He is thought by some to be the Hermas mentioned by St. Paul in Rom. xvi. 14. The Hermas of the epistle is a saint of the Roman calendar, whose feast is on May 9. The writer appears from intrinsic evidence to have been married and the father of a family. His book derives its title of "Shepherd" or Ποιμήν from the fact that the author in the second book introduces his guardian angel in the character of a shepherd. Irenæus cites the "Shepherd" under the title of "the Scripture;" Clement of Alexandria considers its revelations as divine; and Origen deems it an inspired book. It was very popular with Christians of the 2d and 3d centuries. Jerome accuses Hermas of foolishness in his commentary on Habakkuk; Tertullian designates his book as apocryphal. Duguet says it contains the germ of all heresies; and Mosheim calls its author an impostor. Of late years this book has been the subject of more editing and literary criticism than any other relic of the early church. It is supposed to have been originally written in Greek, but at present it exists entire only in a Latin version, which has been often published since the 16th century. It is inserted in Cotelier's *Patres Apostolici Evi* (Paris, 1672), and in French in Desprez's *Bible* (Paris, 1715). A Greek version discovered in Ethiopia, and translated into Latin by D'Abbadie, was published in Leipsic in 1860. In 1857 a new Latin version from a manuscript discovered in Rome was edited at Leipsic by Dressel, together with a Greek text brought from Mount Athos by Simonides and revised by Tischendorf. The latter considers this Greek text a retranslation from the Latin; and in Dressel's *Patres Apostolici* (Leipsic, 1866) is a Greek text discovered by Tischendorf himself in the Sinaitic codex, and containing book i. of the "Shepherd" and the first four chapters of book ii. This is also given in Hilgenfeld's *Novum Testamentum extra Canonem receptum* (Leipsic, 1866). An English translation of Hilgenfeld's *Pastor Hermæ* is found in the "Ante-Nicene Christian Library" (Edinburgh, 1867).—Another HERMAS or HERMES, mentioned by St. Paul in the same verse, is held by the Greeks to have been one of the 70 disciples, and afterward bishop of Dalmatia. His feast in the eastern church occurs on April 8.

**HERMES.** See MERCURY.

**HERMES, Georg**, a German theologian, born at Dreyerwalde, Westphalia, April 22, 1775,

died in Bonn, May 26, 1831. He studied theology at the university of Münster, and in 1798 became teacher in the gymnasium of that city, and in 1807 professor of positive divinity at the university. Having closely studied Kant's philosophy, he occupied himself in refuting the doctrines of that philosopher so far as they were inconsistent with the Roman Catholic faith. When the Prussian government established the university of Bonn, Hermes in 1820 was appointed to the chair of Catholic theology. Here he began to found a speculative philosophic and dogmatic school in the church itself, delivering lectures aiming at an alliance between Protestants and Catholics, insisting that the difference between their views was not so great as is popularly supposed. He attempted to base the *Dogmatik* or positive theology of the Catholic church on speculative philosophy, founding a doctrine known as *Hermesianism*, and drew around him great numbers of followers. The philosophico-dogmatic method which Hermes advocated, as propounded in an "Introduction to the Catholic Christian Theology," insisted that the truth of Christian revelation and of the Catholic church should first be tested by reason, and that revelation should then be followed. *Hermesianism* was in fact a most ingenious effort to base the doctrines of the church on Kant's system of philosophy. It awoke powerful opposition, being condemned as heretical by a papal letter of Sept. 26, 1835. The *Hermesians* defended their orthodoxy vigorously; Braun, Achterfeld, Rosenbaum, and others appealing to the pope, but in vain.

**HERMES TRISMEGISTUS**, a mythical person, the reputed author of a great variety of works that were probably written by Egyptian Neo-Platonists. The Egyptian god Thoth (the intellect) was identified by the Greeks with Hermes (Mercury) as early as the time of Plato. In the conflict between Neo-Platonism and Christianity, the former sought to give a profounder and more spiritual meaning to the pagan philosophy, by combining the wisdom of the Egyptians and the Greeks, and representing it as a very ancient divine revelation. They therefore ascribed the authorship of the highest attainments of the human mind to Thoth or the Egyptian Hermes, regarded him as the source of all knowledge and inventions, the embodied Logos, thrice greatest (τρίς μέγιστος), from whose thoughts Pythagoras and Plato had derived their ideas, and whose works contained the sum total of human and divine wisdom. Clement of Alexandria mentions the contents of 42 books of Hermes which were extant in his time. Of those which now remain, some seem to have proceeded from the school of Philo, and others are much later and not unaffected by Christianity; some are written in a sober philosophical spirit, and others abound in fantastic astrological and thaumaturgical speculations. The most important is the *Pæmander*, a dialogue on nature, the creation, the Deity, the soul, knowledge, and similar topics,

and interesting as showing the extent to which the combination of Platonic, Christian, oriental, and Jewish notions was carried. It was published in Greek and Latin by Bargius (Paris, 1554), and by Rossett (Cologne, 1630). See Baumgarten-Crusius, *De Librorum Hermetico-rum Origine atque Indole* (Jena, 1827).

**HERMIT.** See **ANCHORET**.

**HERMITAGE WINE.** See **FRANCE, WINES OF.**  
**HERMON,** a mountain, or rather a range of heights, on the northern border of Palestine, often spoken of in the Bible, forming the S. W. part of the Anti-Libanus. (See **ANTI-LIBANUS**.) The Psalms speak of the "dew of Hermon;" and travellers tell us that this is so abundant that their tents are wet with it, as if by a steady rain. Moses applies to this range the names both of Hermon and Sion, mentioning also its Emoritic name Senir, and the Sidonian Sirion.

**HERMOPOLIS MAGNA,** a city of ancient Egypt, on the left bank of the Nile, lat. 27° 45' N. It was the capital under the Greek rulers of a nome on the borders of Middle and Upper Egypt, and is sometimes classed in one and sometimes in the other division. It was a place of great opulence, ranking second to Thebes alone, and was famous for the worship of Typhon and of Thoth. Its name was derived from the latter divinity, who was supposed to correspond to the Greek Hermes. A little S. of it was the castle of Hermopolis, where vessels from the upper country paid toll. At the base of the Libyan hills, W. of the city, was the necropolis, where numerous mummies have been found. The Ptolemies erected many magnificent structures in Hermopolis, but there are now few remains. A part of the portico of the temple of Thoth was standing during the present century, but being of calcareous stone it was burned by the Turks for lime. The village of Ashmoonein or Eshmoon now occupies the southern extremity of the mounds on the site of Hermopolis. The principal occupation of the inhabitants, who number about 4,000, is excavating the mounds for nitre.

**HERMOSILLO,** an inland town of Mexico, in the state of Sonora, lat. 29° 20' N., and lon. 110° 40' W., 40 m. S. W. of Ures; pop. about 14,000, about 3,000 of whom are Yaqui Indians. It is situated in a sandy valley near the base of an isolated mountain, not far from the confluence of the Sonora and Horecasitas rivers. The streets are regular, and the houses built mostly of adobe, though a great many are of stone. The only public buildings are two churches and the mint, to which latter is attached an assay office. The climate is exceedingly hot, but the people are generally healthy. Mining was once extensively carried on, but the chief industry is now agriculture, wheat being the great staple production. Numerous flour mills in the town and vicinity form a striking feature of the place. The vine thrives well, and large quantities of brandy are manufactured. Hermosillo was formerly the seat

of the presidio of Pitic, and up to 1800 a military station. After the discovery of gold mines in Sonora the population grew rapidly, and Hermosillo is still the most important commercial entrepot of this part of the republic. Its port is Guaymas, about 100 m. S., on the gulf of California.

**HERNANDO,** a W. county of Florida, bordering on the gulf of Mexico, and bounded N. and E. by the Withlacoochee river; area, 1,980 sq. m.; pop. in 1870, 2,938, of whom 854 were colored. The surface is low and level, and mostly occupied by pine forests and swamps; the soil is sandy. The chief productions in 1870 were 41,354 bushels of Indian corn, 16,680 of sweet potatoes, 182 bales of cotton, 23 hogsheads of sugar, 6,356 gallons of molasses, and 34,682 lbs. of rice. There were 427 horses, 2,894 milch cows, 10,993 other cattle, and 5,711 swine. Capital, Brooksville.

**HERNDON, William Lewis,** an American naval officer, born in Fredericksburg, Va., Oct. 25, 1818, lost at sea, Sept. 12, 1857. He entered the navy at the age of 15, served in the Mexican war, and was engaged for three years in the national observatory at Washington. In 1851-'2 he explored the Amazon river under the direction of the United States government. The route selected by him was from Lima across the Cordillera eastward as far as Tarma, and thence N. to Tingo Maria on the Huallaga, whence by canoe he reached the great stream. During a portion of the journey he was accompanied by Lieut. Lardner Gibbon. A narrative of the expedition is contained in "Exploration of the Valley of the River Amazon," with maps and plates (2 vols., Washington, 1853-'4), the first part of which is by Herndon, and the second by Gibbon. In 1857 he was commander of the steamer Central America, which left Havana for New York on Sept. 8, having on board 474 passengers and a crew of 105, and about \$2,000,000 of gold. During a violent gale from the northeast and a heavy sea, on Sept. 11, she sprung a leak, and sank on the evening of Sept. 12, near the outer edge of the Gulf stream, in lat. 31° 44' N. All the women and children on board were put in the boats and saved, with a few men. Herndon and 426 others sank with the vessel.

**HERNIA,** or **Rupture,** the protrusion of any organ outside of its natural enclosing cavity, but, in common language, limited to the escape of the abdominal viscera. Until about the 18th century this disease was neglected by the profession, and its treatment was principally in the hands of itinerant quacks; but since then it has received the attention of the most eminent surgeons of all countries. According to the seat of the protrusion, the principal kinds of hernia are: the inguinal, which comes out at the abdominal rings, following the course of the spermatic cord in the male and of the round ligament in the female respectively into the scrotum and the greater labia; the femoral or crural, passing beneath Poupart's ligament, and

forming a tumor on the inner and upper part of the thigh; umbilical, in which the protrusion takes place at the navel or fetal opening of the umbilical cord; ventral, at the openings in the *linea alba* or *lineæ semilunares*; diaphragmatic, in which the abdominal organs pass into the cavity of the chest through some natural or abnormal opening in the diaphragm. All the abdominal viscera, except the duodenum, pancreas, and kidneys, may form part of the contents of a hernial tumor; but the floating portions of the small intestines (*jejunum* and *ileum*), the omentum, and the arch of the colon, are their most frequent constituents. Hernia rarely protrudes on the posterior and lateral portions of the abdomen, which are protected by thick muscles and firm unperforated aponeuroses, and where the organs are large and but little movable; the anterior abdominal wall, on the contrary, is thin, extensible, having weak points in the inguinal rings and canals, and freely floating organs always pressing upon its yielding tissues. A hernia is said to be reducible when the protruding organ may be returned into the abdomen; irreducible when it is not thus returnable; and strangulated when, owing to its unusually close constriction, the circulation of blood in its vessels, or the natural passage of the intestinal contents, is arrested. The sac of a hernia is a pouch of the reflected or parietal layer of the peritoneum, which is pushed forward in proportion to the escape of the viscera; external to this are the layers of fasciæ, muscles, and cellular tissue, varying in thickness according to the situation of the tumor. When we consider the yielding nature of the abdominal walls, their liability to pressure from muscular action, and the weak points inviting protrusion of the viscera, it is not surprising that hernia is so common; it has been estimated that in the male sex at least one in five is affected by it. The exciting causes are such as suddenly or violently compress the organs by action of the abdominal muscles, such as great bodily exertion, the lifting of heavy weights, violent vomiting, coughing, and sneezing; long continued efforts in parturition, defecation, or micturition; habitual compression by corsets, belts, bandages, and heavy hip-supported clothing; falls, improper gymnastic exercises and feats of strength, severe blows and contusions. A simple hernia, easily reducible and kept so by a proper truss, is rather an annoying infirmity than a positive disease, and is often susceptible of a radical cure.—The treatment of reducible hernia is to return it to the abdomen by a process called the *taxis*, and to retain it in place by a properly constructed and well fitting truss. Great care is necessary in the preparation of the truss; it should fit exactly, the springs should have the right bearings and pressure, and the pads the proper shape and consistency. Hernia may be rendered irreducible by adhesions of the sac to its contents, and of the latter to each other, or by enlargement of the contained

omentum from fatty deposition; the treatment is merely palliative, except in rare and favorable cases. Strangulated hernia may be produced by a sudden protrusion through a narrow aperture after violent exertion, by swelling or spasmodic action about the neck of the sac, distention of the intestine by flatus or fæces, and swelling and congestion of the omentum and mesentery; the stricture is generally at the neck of the sac. The indications of treatment are to reduce the hernial contents by the taxis, if possible, with the assistance of relaxation of the muscles by position, by bleeding, hot baths, narcotics, tobacco enemata, cold applications, and antimonial prostration, or, in modern times, by the inhalation of sulphuric ether and chloroform; if these fail, the sac must be cautiously opened, the stricture divided by the knife, and the hernia returned. Strangulated hernia is always a dangerous affection, and frequently fatal either in itself or from the effects of inflammation. Umbilical hernia, most common in new-born children, is treated on similar principles, by the reduction of the contents, and their retention by a special bandage. Diaphragmatic hernia, whether from congenital deficiency or accidental rupture of this partition, when strangulated, is difficult of diagnosis, and beyond the reach of operative surgery.

**HERNICI**, an ancient people of central Italy, often mentioned in the early history of Rome. They were of the Sabine race, and inhabited the Apennines of Latium between Lacus Fucinus (now Lake Celano) and the Trerus (Sacco), a tributary of the Liris (Garigliano). Their name is supposed to have signified "mountaineers." Their nearest neighbors were the Marsi, Æqui, and Volsci, whom they equalled in bravery, and like whom they obstinately resisted the growing power of Rome. In 486 B. C., however, they became the allies of the Romans, and 180 years later they were finally subdued by them. Anagnia (Anagni) was the chief town in their territory.

**HERNÖSAND**. See WESTER NÖRELAND.

**HERO**. See HEERON.

**HERO**, in Greek mythology, a priestess of Venus at Sestos, beloved by Leander, a native of Abydos. Leander used to swim across the Hellespont nightly to visit his mistress; but one tempestuous night he was drowned, and in the morning the billows cast his body on the shore. When Hero beheld it she threw herself into the sea.

**HEROD**, surnamed the Great, king of the Jews, son of Antipater, a noble Idumæan, born in Ascalon, Judea, about 72 B. C., died in 4. When in 47 Julius Cæsar appointed his father procurator of Judea, the young Herod obtained the government of Galilee, and quickly vanquished the hordes of robbers which then infested the province. Alarming the ruling men at Jerusalem by his popularity, he was summoned before the sanhedrim on complaints of having put Jewish citizens to death without

trial. On the appointed day he appeared before the tribunal, gorgeously clad in purple, and surrounded by armed men; and though his acquittal was pronounced, he departed secretly to Syria, and was appointed governor of Cœle-Syria in 46. After the death of Cæsar he favored Brutus and Cassius, and received the command of the army in Syria. He was equally successful in winning the support of Mark Antony, who entertained him at Rome in 40, and obtained from the senate a decree appointing him king of Judea. After the battle of Actium (31) and the death of Antony, he was confirmed in his kingdom by Augustus, whose favor he enjoyed during his reign. He had entered upon his government by besieging Jerusalem, and he hesitated at no crime or cruelty to establish his sovereignty. Hyrcanus, whom he feared as a competitor, was put to death on a charge of treason; his own wife Mariamne, to whom he was passionately attached, was executed (29); and her execution was followed by that of her two sons, and of her nearest relatives, and several of his principal counsellors. Yet his administration was vigorous and splendid, and for 30 years Judea was undisturbed by war, though its forces aided the Romans in Arabia and on the Bosphorus. He erected a marble temple at Paneas in honor of Augustus, restored the city of Samaria under the name of Sebaste, transformed a small town on the coast into the magnificent city of Cæsarea, erected temples and theatres, and an amphitheatre without the walls of Jerusalem, in which the Roman combats with wild beasts and gladiators were exhibited, sought to conciliate his subjects by many acts of munificence and liberality, and began to rebuild the temple of Jerusalem. In 18 he visited Rome, and was received with the greatest distinction by Augustus. The latter part of his reign was harassed by conspiracies and intrigues, and in his last illness, while a fearful disease was consuming his stomach and intestines, he ordered the execution of his son Antipas. To this illness is also referred the murder of the children in Bethlehem, an event recorded by the evangelist (Matt. ii. 16), but passed unnoticed by Josephus. His death occurred in the year which is generally considered by critics the year of the birth of Christ. Josephus is the principal authority for the events of his reign, which, notwithstanding its barbarities, restored to Jerusalem much of its earlier magnificence. He had ten wives, and partitioned his kingdom between three of his sons, Archelaus, Philip, and Herod Antipas.

**HEROD AGRIPPA I.**, king of Judea and Chalcis, son of Aristobulus, and grandson of Herod the Great, born in the year 10 B. C., died A. D. 44. He was a favorite of his grandfather, who after the death of his father sent him to Rome, where he was educated. Caligula gave him the tetrarchy of Judea with the title of king (37). For services rendered, the emperor Claudius, after the banishment of Herod Anti-

pas, gave him all the provinces of ancient Judea and the kingdom of Chalcis, so that he became of a sudden one of the greatest princes of the East. A part of his history is written in the Acts of the Apostles (xii.). He governed much to the satisfaction of the Jews, and, probably from a desire of pleasing the fanatical party, put to death the apostle James, and shut up Peter in prison. At Cæsarea, while he was giving games in honor of Claudius, the inhabitants of Tyre and Sidon waited on him, desiring peace. Arrayed in royal apparel, he sat on his throne and made an oration to them, and they glorified him as a god. He willingly received the impious flattery, but soon died miserably after a reign of seven years.

**HEROD AGRIPPA II.**, a Jewish prince, son of the preceding, born about A. D. 27, died in 100. When his father died he was residing at the court of the emperor Claudius, who, instead of bestowing on him the dominions to which he was heir, detained him for four years at Rome. In 48 he received the small principality of Chalcis, to which additions were subsequently made. In 60 he went with his sister Berenice to Cæsarea to salute Festus on his accession to the government of Judea, and St. Paul, a prisoner there, stated his case before him. Before the rebellion of the Jews from the Romans, he sought to reconcile them, and during the war he sided with the Romans. After the capture and destruction of Jerusalem he retired with Berenice to Rome.

**HEROD ANTIPAS**, the son of Herod the Great and Malthace, a Samaritan, born in Jerusalem. His father gave the main parts of his kingdom to Archelaus, another son, and assigned to Antipas the tetrarchy of Galilee and Peræa. He first married the daughter of Aretas, king of Arabia Petræa, and afterward Herodias, the wife of his half brother Herod Philip, then living. This involved him in a war with Aretas, who invaded his territory, and was also the first step toward the indulgence of the passion which resulted in the imprisonment and beheading of John the Baptist. He built the city of Tiberias, and adorned and fortified many other places in his province. Having gone to Rome to solicit the title of king, he was banished to Gaul (A. D. 39) by Caligula, on suspicion of being concerned in the conspiracy of Sejanus, and died in Spain. It was before this Herod, who had come to Jerusalem to celebrate the passover, that Pilate sent Jesus, as a native of his tetrarchy (Luke xxiii.).

**HERODES ATTICUS.** See ATTICUS.

**HERODIAN**, a Greek writer on Roman history, supposed to have lived between A. D. 170 and 240. Nothing is known of his life, except that he resided for a long time in Italy. His work is entitled *Τῆς μετὰ Μάρκον Βασιλείας Ἰστοριῶν Βιβλία οκτώ*, and contains the history of the reigns between A. D. 180 and 238. His style is formed on that of Thucydides, and though his chronology and geography are sometimes inaccurate, his narrative is generally

clear and impartial. The best editions are those of Irmisch (5 vols., 1789-1805), F. A. Wolf (1792), and Bekker (1826).

**HERODOTUS**, a Greek historian, styled the father of history, born in Halicarnassus, Asia Minor, about 484 B. C., died probably in Thurii, Italy, about 420. The statement of Suidas that he belonged to an illustrious family is confirmed by the indications of wealth furnished by his high education and abundant means for frequent and distant travel. Suidas states further that he was exiled from Halicarnassus by Lygdamis, grandson of Artemisia, and that he took up his residence at Samos. He returned, however, to Halicarnassus about 455, and took part in the political movements which ended in the expulsion of the tyrant. He removed soon after to Athens. He visited Babylon, Ardericca near Susa, the remoter parts of Egypt, Cyrene, Colchis, Scythia, Thrace, Zante, Dodona, and Magna Græcia, thus ranging over a space more than 1,700 m. from E. to W. and 1,600 m. from N. to S. Within these limits his knowledge of scenery, cities, temples, manners and customs, and various wonders, is generally so minute and full that it could have been acquired only by a leisurely examination. In Egypt, for instance, he visited the great capitals Memphis and Heliopolis, the smaller towns, Sais, Bubastis, Buto, Papremis, Chemmis, Crocodilopolis, and Elephantiné, the labyrinth, Lake Mœris, the line of the canal from the Arabian gulf to the Nile, the borders toward the desert of Sinai, and the whole region of the Delta. It is related on uncertain authority that in 446 the Athenian assembly decreed a reward to him for his history, which he had read publicly; that he made known his work by recitation not only at Athens but in other cities, travelling from place to place as a sort of prose rhapsodist; and that at the recital of it before the collected Greeks at the great Olympian festival the young Thucydides was moved to tears. Herodotus while at Athens was at least acquainted with Thucydides, Sophocles, and some of the other intellectual lights that distinguished the age of Pericles, and it was doubtless from association with them in the centre of literary Hellas that he received the impulse to that wonderful elaboration of his work which he carried on for many years after his departure. Herodotus went about 440 to Thurii, a colony newly founded by the Athenians near the site of the former Sybaris, where he is said to have passed the remainder of his life. Suidas's statement that Herodotus lived for a while in Samos, and composed there some portions of his work, is quite probable; and from several passages in the work it appears that he left Thurii several times and went out on short voyages. At Thurii he is supposed to have applied himself only to the perfection of his history, retouching the narrative and interweaving parenthetical passages and accounts of later events. The abruptness of its close and occasional traces of incomplete-

ness indicate that, notwithstanding he had been constantly improving it, it was not entirely finished at his death. Many critics believe that he composed also the separate treatise on Assyrian history, to which he twice refers in his general history, but which has not been preserved. The time and place of his death are not altogether certain, his life being prolonged according to some to 394, and Pella and Athens, instead of Thurii, being made his abode in his latest years.—It is a question whether there were Greek histories in the century before Herodotus. Niebuhr absolutely denies the existence of any such works. What is more certain is, that before the work of Herodotus was written, there was no writing in Greece which could properly be called historical. Herodotus is habitually minute in referring to his authorities, but the only Greek with whose works he seems to have been familiar is Hecateus, who, however, can lay no claim to the title of a historian. The main subject of Herodotus's history is the Persian war of invasion, the contest which began with the expedition of Mardonius and terminated with the discomfiture of Xerxes. Yet he not only relates as an introduction the growth of the Persian empire and the previous hostilities between Greece and Persia, but takes every opportunity of diverging from his principal subject in order to introduce his various historical, geographical, and antiquarian knowledge. Thus he interweaves accounts of Cræsus and of the Lydian kingdom, of the Babylonians and Assyrians, of the Egyptians, of the Greek colonies of northern Africa and the native Libyan races, of the Scythians and Hyperboreans, apropos of whom he gives an episode on universal geography. For the later and more important portion of his history, abundant living testimony was easily accessible to him, besides which there were in most of the countries monumental records of antiquity, and oral traditions even in Scythia and Libya. Thus in Greece more or less accurate lists of the kings, priests, and victors at the games were preserved in cities and sanctuaries, and dedicatory inscriptions on offerings in the temples; the Babylonians had sculptured documents, many of which have recently been discovered, tracing their history back for more than 2,000 years; the monuments of the Egyptians reached to a still earlier date; and in Persia there were not only memorials on pillars, tombs, and palaces, but more copious writings on parchment preserved in the archives of the empire. Herodotus was evidently unable to read or speak the Egyptian language, and was therefore dependent on his interpreters. In Egypt the priests took advantage of his ignorance to magnify the antiquity of their nation, to conceal from him their dark period of subjection under the invading shepherd kings, and to modify other inglorious portions of their history. In Babylon he probably obtained but little of his information from the Chaldean priestly caste, who possessed the most

exact and extensive knowledge; and though his accounts are correct in outline, they lack the fullness and precision of the narrative of the priest Berosus, who wrote more than a century later. Being born and bred in a Greek city subject to Persia, he doubtless came frequently into contact with Persian soldiers and officials, and he seems to have had access also to some of the most important documents in the royal archives, perhaps by means of Greek transcripts. His Persian history is, therefore, based in the main on authentic national records, diversified especially in the earlier part by circumstances and adventures from romantic chroniclers. Thus for the most important portions of his work Herodotus had more or less trustworthy monumental records; and his diligence, honesty, and impartiality in employing the materials that were open to him, have been generally admitted. His chief defect as a historian is an undue love of the marvellous; but he is truthful and accurate whenever he speaks from his own observation. The skill with which he has interwoven his episodes, and the prevailing idea of a divine Nemesis which he constantly presents, gives to his history the unity essential to a work of art. The peculiarity of his theory of divine retribution is, that he regards mere greatness and good fortune, apart from any impiety or arrogance, as provoking the envy of the gods. This theory was the great moral which he had drawn from his survey of mundane events; and perhaps the chief attraction of his main theme, and the principle which guided him in his choice of episodes, was that he might present signal illustrations of greatness laid low, of monarchs and patriots who gradually rose to the pinnacle of glory and prosperity only to experience a most calamitous reverse. The simple beauty of his style, the grandeur of his historical combinations, the amiability of his temper, and the entertainment which his narrative furnishes, have never been questioned, and he is esteemed by scholars the earliest and best of romantic historians.—The best editions are those of Schweighäuser (6 vols., Strasburg and Paris, 1806; reprinted in London, 1818), Gaisford (4 vols., Oxford, 1824), Bähr (4 vols., Leipsic, 1830-'35; new ed., 1855-'61), Abrecht (2d ed., Leipsic, 1869), Stein (3d ed., Berlin, 1870), and H. G. Woods (London, 1873). The best English translation is that of the Rev. G. Rawlinson, assisted by Sir Henry Rawlinson and Sir J. G. Wilkinson (4 vols., London, 1858-'60), with copious notes and appendices embodying the chief historical and ethnographical illustrations that have been obtained in the progress of cuneiform and hieroglyphical discovery. See also Bädinger, *Zur ägyptischen Forschung Herodots* (Vienna, 1873).

**HEROLD, Louis Joseph Ferdinand**, a French composer, born in Paris, Jan. 28, 1791, died at Ternes, near Paris, Jan. 18, 1833. He studied with Mehul, Adam, and Cherubini, and having procured the means for travel by a successful

competition for the prizes of the conservatory, passed five years in Italy. On his return to Paris in 1817 he wrote a number of works for the Opéra Comique, which were successful in their day, but are now mostly forgotten. *Zampa*, produced in 1831, placed him in the first rank of French composers. Incessant labor undermined his health, and after the production of the *Pré aux Clercs* and *La médecine sans médecin*, which were received with great favor, he died in the zenith of his fame. His later works are frequently performed, especially *Zampa*.

**HERON**, a wading bird of the family *ardeideæ*, and the old genus *ardea* (Linn.), including also the bitterns and egrets, treated under their own names. The bill is much longer than the head, rather slender, sharp, and straight, with an emargination at the tip; the wings are long, the first quill nearly as long as the second and third, which are equal and longest; the tail short and even, of 12 stiffened feathers; tarsi long and slender, transversely scaled in front; tibiae lengthened, bare for the lower third or half; outer toe longer than the inner, and united at the base to the middle one; hind toe long, on a level with the others; claws moderate, curved, and acute, the inner edge of the middle one pectinated. The body is rather compressed; the neck is very long, well feathered, and, by a beautiful arrangement in the cervical vertebrae, capable of being turned so that the head may be placed almost at a right angle with it; the bill is a formidable weapon. Herons are found in most parts of the world, migrating to the warmer regions as winter comes on; they are generally seen alone, standing in swamps, pools, and shallow rivers, waiting for their prey, with the long neck drawn down between the shoulders;

European Heron (*Ardea cinerea*).

but no sooner does a reptile or a fish appear than the bill is darted forth and the animal immediately swallowed. They do not seize fish with their feet; the serrated middle claw is for removing from the bill the sticky down which adheres to it after cleansing the

plumage.—The common heron of Europe (*A. cinerea*, Linn.), celebrated in old times as the bird which afforded the principal sport in falconry, is of a bluish ash color, with a black crest on the hind head, and the fore part of the neck white with black dots; the shoulder

Louisiana Heron (*Ardea Ludoviciana*).

of the wings and the primaries black; a naked space around the eyes. Its food consists of fish, frogs, aquatic insects and mollusks, mice, moles, and similar small animals. The nest is generally on a high tree in the vicinity of a river. The flight is sometimes very high, and is performed with the legs hanging behind, and the head and neck resting on the back. It makes at times a harsh and loud scream; when taken young, it becomes so far domesticated as to associate with domestic fowl; though a royal bird in respect to game, its flesh is unfit for food. It is distributed over most parts of the old world; among some eastern nations the crests of the males are highly esteemed as ornaments.—The purple heron of Europe (*A. purpurea*, Linn.) is very handsome, with the elegant shape of a heron and the rufous and purplish tints of the bitterns.—The Louisiana heron (*A. Ludoviciana*, Wils.; *demiegretta*, Baird) is about 27 in. long, with an extent of wings of 3 ft.; the bill is very slender; the head with a long crest, the feathers, with those of the neck and upper back, lanceolate; like the egrets, it has the feathers of the lower back plumose and lengthened; the color above is slaty blue on the head, neck, and exposed upper parts; lower back, rump, under parts, and middle line of throat, white; occiput and back of neck purplish; bill brownish black above and at tip; the female is like the male. From its beauty of form and plumage and grace of motion, Audubon calls this heron the "lady of the waters;" it is found on the coast of the southern Atlantic and gulf states, never far inland; it keeps in company and sometimes breeds in the same

places with egrets and other herons; it is not very shy, and its flight is irregular and swifter than that of any other species. The nests are generally within a few feet of the ground, on low bushes, and very close to each other, made of small dried sticks crossed in various ways, flat, and each containing three eggs; these are about  $1\frac{1}{2}$  by  $1\frac{1}{2}$  in., nearly elliptical, of a pale greenish blue, thin, and smooth; the period of incubation is 21 days; as of most herons, the flesh of the young, before they leave the nest, is considered good eating.—The snowy heron (*A. candidissima*, Gmel.; genus *garzetta*, Bonap.) is about 23 in. long, with an extent of wings of 38 in.; the head is ornamented with a full occipital crest of feathers with hair-like webs, and similar plumes on the lower part of the throat; dorsal plumes reaching to the end of the tail. The color is pure white; the bill black, yellow at base; legs black. It is found on the coast of the middle and southern states, and across the continent to California; it is a constant resident in Florida and Louisiana, and is occasionally seen as far north as Massachusetts. They breed in large communities with other herons and with grakles, in a similar manner to the preceding species; the mangroves of Florida are favorite places for their nests; the eggs are three, about  $1\frac{1}{2}$  by  $1\frac{1}{2}$  in., broadly elliptical, and pale bluish green; both sexes incubate, and the young in Florida leave their nest about the middle of May, and a month or two later further north; both eggs and young are destroyed by crows and turkey buzzards. They resort to the borders of salt marshes, and feed on shrimps, small fish, crustaceans, snails, lizards, frogs, and aquatic insects; in the pursuit of their prey they run

Great Blue Heron (*Ardea herodias*).

quickly through the shallows, throwing up their wings in a rapid and graceful manner; when wounded they defend themselves with the bill with great courage.—The great blue heron (*A. herodias*, Linn.), generally called blue crane, is 4 ft. long to end of tail, with an extent of wings

of 6 ft., and the bill  $5\frac{1}{2}$  in. with a gape of  $7\frac{1}{4}$ . The color above is bluish ash, with the edges of wings and tibiae rufous; neck cinnamon brown, head black, frontal patch white; below black, with broad white streaks on the belly; lower tail coverts white, middle line of throat the same with black and rufous streaks; bill greenish above, dusky yellow at the base; the quills black, and the tail bluish slate. There is considerable variation in size and plumage, according to age and habitat. It is found throughout the United States and the West Indies, but most abundantly in the low lands bordering on the Atlantic coast. It is one of the hardiest of the family, bearing the cold of a New England winter; it is exceedingly difficult to approach, from the acuteness of its hearing and vision, except in close woods; it feeds at all hours of the day, and even in clear nights. It begins to breed from the beginning of March to the middle of June, according to

Great White Heron (*Ardea occidentalis*).

latitude; during the love season they associate in pairs, being rather solitary at all other times; several pairs sometimes form a community, in swamps, pine barrens, and localities several miles from water, but especially in the vicinity of rice fields, and in the tops of cypress trees. The eggs, three in number, are  $2\frac{1}{2}$  by  $1\frac{1}{2}$  in., of a dull bluish white; the male and female sit alternately, feeding each other, and are remarkably affectionate to the young; the flesh of the young is tolerably good. Its food consists of fish, reptiles, birds, small quadrupeds, and large insects; it strikes its prey through the body, as near the head as possible, killing often by beating it against the ground; it is exceedingly voracious. This bird is capable of inflicting severe wounds with its bill, the more dangerous that it generally aims at the eyes; it has been seen to chase the fish hawk, and force it to yield up its prey. The flight is high, majestic, and long sustained. The weight of a full-grown bird is from 6 to 8 lbs.; the intes-

tine is about 9 ft. long, not thicker than a swan's quill.—The great white heron (*A. occidentalis*, Aud.) is more than 4 ft. long, with an extent of wings of nearly 7; the bill 6 in.; the weight about 7 lbs. The color is pure white; the lengthened occipital feathers do not form a crest. It is found in southern Florida and in Cuba. This is the largest of the herons, and has the purest white plumage. It is very shy, breeding among the keys on the Florida coast, to which it resorts year after year; two nests are rarely seen near each other, though nests of other species are often on the same bush; it begins to lay about the 1st of February. It lays three eggs,  $2\frac{3}{4}$  by  $1\frac{3}{8}$  in., thick-shelled, of a plain light bluish green; both sexes incubate, for about 30 days. It is more solitary than the preceding species, except on the feeding grounds; the walk is majestic, and the flight firm and regular; the sand bars and flats on which they feed are often far from their roosting places, and are rarely left until the water reaches as high as their body; the position, when roosting, is generally on one foot. There is a great enmity between this and the preceding species, and the former will pursue, kill, and swallow the young of the latter whenever an opportunity offers, even though other favorite food be in abundance.—The blue heron (*A. cærulea*, Linn.; genus *florida*, Baird) is 22 in. long, with an extent of wings of 33; the bill is about 3 in., and the weight 9 oz. The bill is blue, slender, and very sharp; the prevailing tint of the bird is slate blue, with the head and neck bluish purple; legs black; the young are white, sometimes spotted with blue. The top of the head is moderately crested, and the scapulars greatly elongated. It is found in the southern Atlantic states and about the gulf of Mexico, and has been seen in New York; it associates with the white and Louisiana herons, roosting in the evergreens of the keys; it is very shy, and its flight is swifter than that of any except the *A. ludoviciana*. The eggs are  $1\frac{1}{4}$  by  $1\frac{1}{4}$  in., of the same color as those of the snowy heron.—The green heron has been alluded to under BITTERN. The sun herons of the warmer parts of South America belong to the genus *eurypyga* (Illiger), characterized by a long, slender, straight bill, bent and emarginated at the tip; long and ample wings; long, broad, and slightly rounded tail. The best known species (*E. helias*, Pall.) is about as large as a small grouse, with a long, thin neck, spreading tail, and comparatively short legs; the plumage is varied with bands and lines of brown, fulvous red, gray, and black, resembling the distribution of colors on some of the larger moths; it feeds on small fry and aquatic insects. It is called "little peacock" in Cayenne; its habits resemble those of the snipes more than of the herons. (See NIGHT HERON.)

**HERON**, or **Hero** (Gr. Ἡρώ), a philosopher and mathematician of Alexandria, who flourished in the latter part of the 3d century B. C. He was the inventor of several ingenious ma-

chines, among which are the fountain called by his name, in which a jet of water is kept playing by means of condensed air; a steam engine, on the principle of what is called Barker's mill, in which the boiler is caused to revolve round a vertical axis by jets of steam issuing from lateral holes in the arms with which it is provided; and a double forcing pump, used for a fire engine. Heron wrote several works on mechanical and scientific subjects, of which only fragments remain; the most valuable is his *Πνευματικά*, or treatise on pneumatics, the best edition of which is that published at Paris in 1693, in the *Veterum Mathematicorum Opera*.

**HEROPHILUS**, a Greek anatomist, born at Chalcedon in Bithynia, flourished about 300 B. C. He lived at Alexandria, where he acquired great reputation both as a teacher and practitioner. He is generally thought to have been the first who actually studied and taught anatomy from the dissection of human bodies; and he no doubt practised this method to a far greater extent than had previously been done. His investigations in human anatomy were marked by so much originality and exactness, that a large number of the anatomical names now in use date from him. He first distinguished the nerves from the tendons, with which they had previously been confounded, and showed that they originate from the brain. He recognized the principal membranes of the brain and the eyeballs, and gave them their names of arachnoid, retina, &c. The confluence of the great longitudinal and lateral sinuses of the brain is still called the *torcular Herophili*; and the first division of the small intestine retains the designation, duodenum, which he gave to it. He is also said to have examined to some extent the internal organs, for the purpose of investigating the nature and cause of the disease which produced death; thus laying the foundation of the science of pathological anatomy, the study of which was recommenced by Morgagni, 2,000 years later. The original works of Herophilus have long been lost, with the exception of a few fragments, and are now known mainly through quotations by Galen and others.

**HEROSTRATUS**. See **EROSTRATUS**.

**HERPETOLOGY** (Gr. *ἑρπετών*, reptile or creeping thing, and *λόγος*, discourse), the branch of zoölogy which treats of the structure and classification of reptiles. The present article will be confined to the last division, the first being more properly noticed under **REPTILES**. The Egyptian and other ancient authors knew well the distinctions between the four reptilian orders, generally called tortoises, lizards, serpents, and frogs; Aristotle described them as terrestrial, red-blooded animals, laying eggs, and with four or no feet, mentioning tortoises, frogs, crocodiles, lizards, and serpents, and indicating the first three as amphibians. Pliny, four centuries later, divided reptiles into terrestrial, aquatic, and aerial, but he has mostly

copied Aristotle, adding a great variety of fabulous stories whose influence has extended in the popular mind even to the present time. Gesner, in the 16th century, devoted a considerable part of his writings to the natural history of this class, illustrated with wood engravings, and conveniently arranged in alphabetical order. Aldrovandus, toward the end of the same century, wrote two books on serpents and lizards, compiling chiefly from the Greek and Arabian authors, and collected much information from the synonymy of reptiles, their symbolic history, and their uses in medicine. Ray published in London, in 1693, a synopsis of serpents, in which the manner of respiration, the size and color of the eggs, and similar characters, are made the basis of an unnatural classification.—Linnæus divided the class of reptiles into orders, genera, and species in his *Systema Naturæ*; calling them, however, *amphibia*, and characterizing them by the three principal marks of naked or scaly body, teeth sharp and without molars, and no fins with rays; he made two orders, serpents (without limbs) and reptiles (with limbs). In his third class, as given in Gmelin's edition of 1788, the order reptiles are those breathing by lungs, with four limbs, and a simple male sexual organ; serpents; on the other hand, have a rounded body without distinct neck, moving by its undulations, with dilatable and non-consolidated jaws, and without limbs, fins, or external ears. In the first order were four genera, the tortoise, dragon, lizard, and frog; and in the second, *crotalus*, *boa*, *coluber*, *anguis*, *amphisbæna*, and *cæcilia*, most of these genera being subdivided into numerous species. Laurenti, in 1768, published a synopsis of reptiles, very remarkable for the time. Leaving tortoises out of the class, he gives their characters as follows: cold-blooded animals, without hair or mammae, with lungs acting without diaphragm and almost without the aid of the ribs (swallowing air into them), torpid in winter, devouring their prey without chewing, and digesting it very slowly, able to exist for months without food, and renewing their youth by changing their skins. Lacépède, in 1788-'9, in a work continuing that of Buffon, entitled *Histoire naturelle des quadrupèdes ovipares et des serpents*, divided reptiles into four classes—tailed and tailless oviparous quadrupeds, biped reptiles, and serpents; the first containing the tortoises and saurians, the second the frogs and toads, the third and fourth being sufficiently characterized by the names; he made only 292 species. Alexandre Brongniart, in 1799, taking into consideration not only the external characters but those presented by the mode of generation and development, divided reptiles into the four orders of chelonians, saurians, ophidians, and batrachians. In 1800 Duméril introduced into the first volume of his *Leçons d'anatomie comparée* a classification adopting the names of Brongniart, and separating the batrachians as a distinct order. Daudin,

in 1802-'4, published a general treatise on reptiles, at the end of the eighth and last volume of which is a *résumé* in which he divides the class into four orders, like Brongniart. Opper, a Bavarian naturalist, published at Munich in 1811 a small quarto volume on the orders, families, and genera of reptiles, in which he adopts a mode of arrangement borrowed principally from Duméril. Latreille, in his *Histoire naturelle des reptiles* (1802), followed the classification of Lacépède with some slight modifications; in 1825, in his *Familles du règne animal*, adopting most of the divisions and some of the names of contemporary herpetologists, he makes two classes, reptiles and amphibians. Cuvier, in his *Tableau élémentaire de l'histoire naturelle des animaux*, in 1798, divided reptiles, with Lacépède, into oviparous quadrupeds, serpents, and bipeds, giving, however, some new views on their division into orders, correcting errors in generic characters, and advocating a classification founded on organization. In 1817, in his *Règne animal*, and in the second edition in 1829, Cuvier published a new arrangement, based on internal as well as external structure, and following chiefly the method of Duméril, for many years professor of this branch in the museum of natural history at Paris. He makes four orders, of which the chelonians, saurians, and ophidians have a heart with two auricles, and the batrachians with a single auricle, the first two with limbs, the third without them; in the chelonians the jaws are toothless and corneous; in the saurians the jaws are furnished with teeth, and the limbs with five or four toes to each, including the crocodilians, lacerians, iguanians, geckotians, chameleoniens, and scincoids; in the ophidians the skin is either scaly as in *anguis* and the true serpents, or naked as in *cæcilia*; in the batrachians the tail may be absent or long, the feet four or two, and the lungs with or without coexistent branchiae. De Blainville, in 1822, established two classes for reptiles (*ostéozoaires*), reptiles proper (*squammifères ornithoïdes*), and ichthyoid amphibians. Dr. J. E. Gray, in 1825, published a synopsis of the reptiles and amphibians of North America; in the first class he makes five orders: 1, emydo-saurians or *loricata*; 2, saurians; 3, saurophidians, such as the skinks and chalcidians; 4, ophidians or serpents, divided into the venomous and non-venomous groups; and 5, chelonians. The amphibians he makes a class by themselves, placing among them all batrachians, in the four orders of *anoura*, *urodela*, sirens, and *apoda* or pseudophidians (*cæcilia*). This very natural system is founded largely on that of Opper. In 1831 the same author published, in vol. ix. of Griffith's edition of Cuvier's "Animal Kingdom," a second synopsis with short descriptions; he divides reptiles, exclusive of amphibians, into two sections: *cataphracta*, or shielded reptiles, and *squamata*, or scaly reptiles. In this, and in subsequent modifications of it in the "Cata-

logues" of the British museum, he borrows largely from Wagler (noticed below) and contemporary writers. Oken, in his "Physiophilosophy" (Ray society, 1847), gives a classification, elaborated between the years 1802 and 1826, in which he places reptiles in his second province of *sarcozoa*, fourth circle of fleshy animals, and eleventh class of *myozoa* or *rhinozoa*; the first of the above class terms relating to the fact that typical or true muscles, of a red color, and provided with tendons, are first found in reptiles, and the last to the equally important fact that, in the genetic development of the organs of sense, the nose in reptiles, first in the animal series, opens into the mouth, permitting the passage of air to the respiratory organs. This classification proceeds from the lowest reptiles (tailed batrachians) to the highest (crocodiles). Carus, in his "Comparative Anatomy," French translation (1828 and 1834), places reptiles in his third circle, *céphalozoaires*, and fifth class, *céphalo-gastrozoaires*; with orders: I., *branchiata* (siren and proteus), having relations to fishes; II., *pulmonata*, the true representatives of the class, with the suborders batrachians, ophidians, saurians, and chelonians—some (ichthyosaurus and triton) approaching fishes, others (dragons) the birds, others (amphisbæna) even the worms, and others still (the tortoises) the mammalia; III., *alata*, related to birds, including the fossil pterodactyl. Much of this and subsequent classifications is borrowed from Oken. Fitzinger, in 1826, published at Vienna his *Neue Classification der Reptilien*, rich in anatomical and physiological research; he adopts the classification of Brongniart modified by Opper, with much of the nomenclature of Merrem. The class is divided into two orders, *monopnoea* and *dipnoa*, according as the respiration is pulmonary only or pulmonary and branchial, the first corresponding to reptiles proper, and the last to batrachians. In a table he gives some interesting affinities between reptiles and the higher and lower vertebrates; the pterodactyls, through the dragons and anolis, have some analogies with the mammal bats; the gavials and large fossil saurians connect the lizards with the cetacean dolphins; some chelonians seem to connect reptiles with the mammal monotremata, and others (like the imbricated tortoise) with birds of the penguin family; in the same way the descent to fishes is made by the cæcilians and the sirens. The method of Ritgen, published in the volume for 1828 of the *Nova Acta Academiae Naturæ Curiosorum*, is based upon correct principles, but the author has attempted to unite too many distinctive characters under one head, and has in this way originated a most sesquipedalian and ill-sounding nomenclature. Wagler, in 1830, published at Munich his "Natural System of Amphibia," based essentially on their organization. He established eight orders in the class, as follows: 1, the *testudines*; 2, the crocodilians; 3, the lizards; 4, the serpents; 5, the *anguis* (blind-

worm, &c.); 6, *cæcilia*; 7, *ranæ* (frogs and salamanders); and 8, *ichthyodes* (sirens, menobranchs, &c.), from their fish-like forms. He includes 248 genera. In chronological order would come here the classification of Duméril and Bibron, whose work, *Erpétologie générale, ou histoire naturelle complète des reptiles* (10 vols. 8vo, 1835-'50), is the most extensive ever published on this subject; though more recent observers have introduced some changes, their classification may be considered as representing, on the whole, the actual state of herpetology. When their work was commenced, in 1835, the materials at their command numbered about 850 species, which number they largely increased. They divide reptiles into the four orders of chelonians or tortoises, saurians or lizards, ophidians or serpents, and batrachians or frogs and salamanders. McLeay, in the *Horæ Entomologicæ* (1819-'21), divides the animal kingdom into five great circles, each containing five smaller ones; the five groups of the class reptiles he considers to stand in the following natural order: 1, the chelonians; 2, emydosaurians, or crocodiles; 3, saurians; 4, dipod or two-footed serpents; and 5, apod or true serpents—the extremities of the column seeming to meet in the *chelodina longicollis* (Gray), and the whole forming a group distinguished from birds by being cold-blooded, and from amphibia by having two auricles to the heart, by undergoing no metamorphosis, and by a different method of generation. One great defect of this classification is, that it leaves entirely out of view the fossil enaliosaurian reptiles. Swainson, in his "Natural History of the Monocardian Animals" (Lardner's "Cyclopædia," vol. ii., 1839), like McLeay, makes a distinct class of the amphibia, and divides reptiles into five orders: 1, emydosaurians, or crocodiles; 2, chelonians; 3, enaliosaurians (*ichthyosaurus*, &c.); 4, ophidians; and 5, saurians. Strauss-Durckheim, in his *Traité d'anatomie comparative* (1843), divides his third class, or reptiles, into the three orders of saurians, ophidians, and batrachians, making a separate and fourth class of the chelonians, with the single order of *testudinata*. Stannius, in the second volume of the second edition of his "Manual of Comparative Anatomy" (Berlin, 1854-'6), in the class 17, *reptilia*, makes two subclasses, *dipnoa* and *monopnoa*. Milne-Edwards, in his *Cours élémentaire d'histoire naturelle* (1855), divides the vertebrata or *ostéozoaires* into two sub-branches; in 1, the *allantoidia*, he places with mammals and birds the class of reptiles, with the orders *chelonina*, *sauria*, and *ophidia*; and in 2, *anallantoidia*, with fishes, he places the batrachians, with the orders *anura*, *urodela*, *perennibranchia*, and *cæcilia*.—There are several German systems of classification, which deserve notice in regard to reptiles. Von Baer, in 1826-'8, in his vertebrate or doubly symmetrical type, rises from osseous fishes to amphibia, in which lungs are formed, the branchial fringes remaining in the

sirens and disappearing in the *urodela* and *anura*; thence to reptiles, which acquire an allantois, but have no umbilical cord, nor wings, nor air sacs, the last two being characteristic of birds. Van Beneden, in his *Anatomie comparée* (Brussels, about 1855), makes reptiles and batrachians the third and fourth classes in his *hypocotyledones* or hypovitellicans (*vertebrata*), in which the vitellus enters the body from the ventral side; the reptiles he divides into *crocodili*, *chelonii*, *ophidii*, *saurii*, *pterodactyli*, *simosauri*, *plesiosauri*, and *ichthyosauri*; and the batrachians into *labyrinthodontes*, *peromelia*, *anura*, *urodela*, and *lepidosirenica*. Vogt, in his *Zoologische Briefe* (1851), bases his classification on the contrast between the embryo and the yolk, and makes the reptiles and amphibia the third and fourth classes in the *vertebrata*, or animals with the yolk ventral; in reptiles he includes the orders *ophidia*, *sauria*, *pterodactylia*, *hydrosauria*, and *chelonina*; and in amphibia the orders *lepidota*, *apoda*, *cavdata*, and *anura*. These classifications are important, as showing the tendency of modern zoölogy to combine embryological with external and structural characters, in establishing the natural divisions among animals; for full details and interesting remarks on these and other systems, the reader is referred to the "Essay on Classification" in Prof. Agassiz's "Contributions to the Natural History of the United States," vol. i.—T. Rymer Jones, in the article "Reptilia," in the "Cyclopædia of Anatomy and Physiology," vol. iv., gives the following classification, considering the batrachians as a separate class: Order I., *chelonina*; II., *sauria*; and III., *ophidia*. Van der Hoeven, in his "Handbook of Zoölogy" (English translation, 1858), thinks De Blainville went too far in elevating the batrachians into a class, and goes back toward the old fourfold division, adding however two orders. He divides reptiles into two sections: *diplopnœa* or *psiloderma*, breathing by lungs or gills and with smooth skin; and *haplopnœa*, breathing by lungs only, and with a scaly skin. Owen, in the "Anatomy of Vertebrates" (vol. i., 1866), makes the following subclasses in the reptilian division of the *hæmatoecrya* or cold-blooded animals, which include also the fishes: subclass 5, with orders *ichthyopterygia*, *ichthyosaurs*; *sauropsitygia*, *plesiosaurs*; *anomodontia*, like *dicynodon* and *rhyrachosaurus* (all of the above extinct); *chelonina*, tortoises and turtles; *lacertilia*, lizards, &c.; *ophidia*, serpents; *crocodilia*; *dinosauria*, iguanodon, &c.; and *pterosauria*, pterodactyl, &c. (the last two also extinct). Prof. T. H. Huxley, in the "Introduction to the Classification of Animals" (London, 1869, really dating back to 1864), calls the second "province" of vertebrates *sauropsida*, comprising reptiles and birds, the close affinity between the two being shown by such reptilian birds or bird-like reptiles as *archæopteryx*. (See *ARCHÆOPTERYX*.) The reptiles are the second class of the province, there being four

living and five fossil orders: 1, *crocodilia*; 2, *lacertilia*, as lizards, blindworms, and chameleons; 3, *ophidia*, or snakes; 4, *chelonía*, turtles and tortoises; and the following fossil: 5, *ichthyosauria*; 6, *plesiosauria*; 7, *dicynodontia*; 8, *pterosauria*; 9, *dinosauria*. Prof. Nicholson, in his "Text Book of Zoology" (London, 1872), adopts the same classification, simply adopting Owen's names for the fifth, sixth, and seventh orders of Huxley.—First in the order of American classifications of native reptiles is that of Harlan, given in the "Journal of the Philadelphia Academy of Natural Sciences" (vols. v. and vi., 1826). He adopts Brongniart's four orders, dividing them as follows: 1, *batrachia*, divided into three sections according to the mode of respiration; the first has the branchial openings persistent, as in *amphiuma* and *menopoma*, the second with persistent branchiæ, like *siren* and *menobranchus*, and the third with deciduous branchiæ, breathing by lungs in the adult state (salamanders, frogs, and toads); 2, *ophidia*, with six North American genera; 3, *sauria*, with six genera; and 4, *chelonía*, with three families of land, fresh-water, and sea tortoises, with two, three, and two genera respectively. Dr. J. E. Holbrook, in his "North American Herpetology" (5 vols. 4to, 1842), adopts the four orders of *chelonía*, *sauria*, *ophidia*, and *batrachia*; in the *chelonía*, *sauria*, and tailless *batrachia*, he follows essentially the arrangement of Duméril and Bibron; in *ophidia* he prefers Cuvier's classification; and in the tailed *batrachia*, a system partly from Cuvier and partly from Fitzinger. His work is very valuable to the American student, both for its lucid descriptions and excellent illustrations. Messrs. Baird and Girard have published in the "Reports of the Smithsonian Institution" (1853) a catalogue of North American serpents, of the families *crotalida*, *colubrida*, *boïda*, and *typhlopida*; of 35 genera they make 22 new, and of 119 species 54 new. Mr. Baird has published a revision of the North American tailed *batrachia*, with new genera and species, in the "Journal of the Academy of Natural Sciences" (vol. i., 2d series, 1850), adopting the two groups of Duméril and Bibron, *atretondera* and *trematodera*. In the same journal, vol. iii., 1858, is a paper by Dr. E. Hallowell on the caduceibranchiate *batrachians*. Mr. J. Le Conte, in the "Proceedings of the Academy of Natural Sciences" (vol. vii., 1854), gives a catalogue of the American *testudinata*, which he divides into three families, corresponding to sea, fresh-water, and land tortoises. Other catalogues of American reptiles, more or less extensive, are scattered through the scientific journals. De Kay, in the "Natural History of New York" (1842), divides its reptiles into the orders: 1, *chelonía*, with family *chelonida*; 2, *sauria*, with families *scincida* and *agamida*; and 3, *ophidia*, with families *colubrida* and *crotalida*. The *amphibia* he divides into the families *ranida*, *salamandrida*, *sirenida*, and

*amphiumida*. Prof. Agassiz, in his "Essay on Classification" (1857), insists on the separation of the *amphibians* as a class from the reptiles, from the different manner in which their structural plan is carried out; the former breathe by lungs or gills, undergo metamorphosis, lay a large number of small eggs, and have a naked skin; the latter are covered with horny scales, lay few and comparatively large eggs, breathe by lungs, and undergo no marked transformation; these differences require special ways and means in framing their structure, which ought to rank them as distinct classes. Prof. Agassiz divides his fifth class, or *amphibians*, into three orders, *cæcilia*, *ichthyodi*, and *anura*; and the sixth and higher class, reptiles, into four orders, *serpentes*, *saurii*, *rhizodontes*, and *testudinata*. In part ii. of his first volume, above referred to, he divides the order *testudinata* into the suborders: 1, *chelonii* (Opp.), with two families, *chelonioïda* and *sphargidida*; 2, *amyda* (Opp.), with seven families, *trionychida*, *chelyoida*, *hydraspidida*, *chelydroida*, *cinosternoida*, *emydoida*, and *testudinina*. A large part of the first and all of the second volume is taken up in the consideration of the whole subject of North American *testudinata*, with numerous illustrations.—The above are the principal systems of herpetology, and are sufficient to show the progress of this branch of zoology, and its gradual approach toward a natural method of classification. Those who wish to pursue the subject into its details are referred to the list of authors in the work of Duméril and Bibron, and in the foot notes to the essay of Prof. Agassiz.

**HERRERA, Fernando de**, a Spanish poet, born in Seville in 1534, died in 1597. Although he was an ecclesiastic, many of his verses are amatory effusions addressed to a lady, said to have been the countess of Gelves, whom he celebrates under the names of Estella, Eliodora, and Aglaë. He was a friend of Cervantes and of the painter Pacheco. His best poems are mostly sonnets, odes, and elegies. An edition of his works was published at Seville in 1582. His principal prose works are *Relacion de la guerra de Chipre y suceso de la batalla de Lepanto* (Seville, 1572), and *Vida y muerte de Tomas Moro* (1592).

**HERRERA, I. Francisco de**, the elder, a Spanish painter, born in Seville in 1576, died in Madrid in 1656. He was a pupil of Luis Fernandez. By the boldness and spirit of his drawing and the clearness of his coloring he virtually founded a new school. His most noted picture is the "Last Judgment" in the church of St. Bernard in Seville. His "Holy Family" and "Outpouring of the Holy Spirit," in the church of St. Inez, and his frescoes in the cupola of St. Bonaventura, are also masterpieces. In his old age he went to Madrid, and painted in the cloister of la Merced Calzada several scenes from the life of San Ramon. He excelled in painting fairs and market scenes, and etched several plates from his own compositions. He

also engraved on bronze, and was accused of uttering base coin. **II. Francisco de**, the younger, youngest son of the preceding, also a painter, born in Seville in 1622, died in 1685. He studied first with his father and then at Rome, and excelled in pictures of still life, flowers, and fish, for the last of which the Italians called him *Il Spagnuolo dei pesci*. After his father's death he went to Seville and painted in the churches, but from jealousy of Murillo soon removed to Madrid, where he was appointed painter to the king and superintendent of the royal works. His best pictures are the great altarpiece of the barefooted Carmelites, representing St. Hermendildo; the "Assumption of the Virgin," in the convent of Nuestra Señora de Atocha; and "St. Anne teaching the Virgin to Read," in the convent of Corpus Christi.

**HERRERA Y TORDESILLAS, Antonio de**, a Spanish historian, born at Cuellar, in the province of Segovia, about 1549, died in Madrid, March 29, 1625. He early went to Italy, where he became secretary to Vespasiano Gonzaga, with whom he subsequently returned to Spain. His patron when dying recommended him to Philip II., who appointed him first historiographer of the Indies and one of the historiographers of Castile, titles which he preserved under Philip III. and Philip IV. His reputation rests on his *Historia general de los hechos de los Castellanos en las islas y tierra firme del mar Océano* (4 vols., Madrid, 1601-15). His other works, including *Historia general del mundo del tiempo del señor rey Don Felipe II. desde 1559 hasta su muerte* (3 vols., Madrid, 1601-12), and *Historia de Portugal y conquista de las islas de los Azores* (in 5 books, 1591), were, according to Ticknor, all written under the influence of contemporary passions.

**HERRICK, Robert**, an English poet, born in London, Aug. 20, 1591, died in October, 1634. He studied at Cambridge, and for many years after leaving the university seems to have pursued a gay and dissipated career in London. He then took orders, and in 1629 was presented by Charles I. to the vicarage of Dean Prior, near Totness, in Devonshire. His poems written at this time abound in lively descriptions of the charms of a country life, and his fancy revelled in amatory verses, after the fashion of the day, to imaginary beauties, for his small household comprised only himself and his old housemaid Prudence Baldwin. Some of these pieces also contain curious illustrations of country customs, manners, and prejudices. From this humble retreat the long parliament ejected him in 1648, and he returned to London, where he gladly resumed the society of such of his old associates as were living, but led a somewhat precarious existence. In 1647 and 1648 he published his "Noble Numbers" and "Hesperides, or Works Humane and Divine," which he dedicated to "the most illustrious and most hopeful Prince Charles." On this occasion, in consideration of the class

of readers who would peruse his works, he announced himself as "Robert Herrick, Esquire." At the restoration Charles II. reinstated him in his old living, where he passed the remainder of his days. Herrick was essentially a lyric poet, and the facility with which he wrote is recognized in the multitude of little pieces, amatory, Anacreontic, and pastoral, which his works contain. His frequent indelicacy is the gravest charge which has been brought against him. In that, however, he but followed the fashion of the cavalier poets, and there is much hearty gayety and natural tenderness in his works. His serious pieces are morally unexceptionable, but have generally less poetical merit. For nearly a century and a half after Herrick's death his works lay neglected. In 1810 a selection from the "Hesperides" was edited by Dr. Nott, and since then several excellent editions have been published in England and America, including one by Prof. Child (2 vols. 12mo, Boston, 1856). A new edition of his poetical works was published in London in 1859. Many of his shorter songs, such as "Cherry Ripe" and "Gather ye rose-buds while ye may," have been set to music.

**HERRING**, the general name of the family *clupeidæ* of the malacopterous or soft-rayed abdominal fishes. The family has been divided by Valenciennes, according to the position of the teeth, size of the ventrals, length of the anal, and projection of the lower jaw, into 16 genera, of which the best known and most important are *clupea* (the herring), *harengula* (the sprat), *rogenia* (the whitebait), *alosa* (the shad and pilchard or sardine), and *engraulis* (the anchovy). The last has been described under *ANCHOVY*, and, as the others will be noticed in their regular order, the herrings proper will alone be noticed here. The generic characters of *clupea* (Cuv.) are small premaxillary teeth, with very fine ones also on the maxillary and symphyseal portion of the lower jaw, larger teeth in a longitudinal band on the vomer and centre of tongue, and a few deciduous ones on the palate bones; body elongated and compressed, with rounded back, and sharp, keel-like abdominal edge; scales large, thin, and easily removed; a single dorsal fin, and eight branchiostegous rays; mouth large, and lower jaw the longer; the air bladder is very large, and the number of long and slender bones among the muscular fibres very great; the branchial openings are wide, and the gills remarkable for the length of their fringes, in consequence of which they live but a short time out of water; indeed they die so soon that "dead as a herring" is a common English saying. The herrings do not ascend rivers like the alewife and shad.—The common American species, or blue-back, sometimes erroneously called "English herring," is the *C. elongata* (Lesueur); it varies in length from 12 to 15 in.; the color above is deep blue, tinged with yellow, with silvery sides and lower parts; opercles brassy, and, like the sides, with me-

tallic reflections; irides silvery and pupils black. It is found on the coasts of New England, New Brunswick, and Nova Scotia; it is generally most abundant from March to May, but according to Mr. Perley is caught on the shores of New Brunswick during every month of the year, precluding the idea that it is migratory.

American Herring (*Clupea elongata*).

In spring it is often caught in seines and sweep nets to the amount of 100 barrels or more in a single night; it is eaten fresh, salted, and smoked; the young fish, called spirling, make excellent bait for cod. Until within the last 30 years this herring was very abundant on our coasts, frequenting the harbors of Cape Cod in myriads from March till June; since that time it has been comparatively rare; in Massachusetts bay great quantities were formerly caught by nets when following the light of a large torch in a swiftly rowed boat. The herring fishery seems to have been prosecuted by the pilgrims, and we read of the herring "wear" at Plymouth having been rented to three men for a term of three years. Dr. Storer considers the brit, *C. minima* (Peck), the young of this species. When this herring first made its appearance in Long Island sound in 1817, it was mistaken for the English herring, and it was gravely stated that it followed the British squadron thither in the attack upon

European Herring (*Clupea harengus*).

Stonington in 1814. Several other American species are described in Storer's "Synopsis of the Fishes of North America."—The common herring of Europe (*C. harengus*, Linn.) is from 10 to 13 in. long, having the back and the upper portion of the sides sky-blue, with a tinge of sea-green; belly and sides bright silvery; cheeks, gill covers, and irides tinged with gold.—The food of the herring appears to be chiefly minute crustaceans and worms, and sometimes its own fry and other small fish. It is the popular belief that the herrings retire in

winter to the arctic regions, whence they migrate in immense shoals in spring, summer, and autumn to the coasts of Europe, Asia, and America. Yarrell and other modern observers doubt this, and maintain that these fish merely come from deep water to the shores in their spawning season, making no very lengthened journeys, and by no means the migrations described by Pennant and the older naturalists; at any rate they are found on both the American and European coasts at all seasons, but sometimes disappear for years from certain localities, probably as their favorite food is abundant or scarce, and they have not been observed on their return northward. Wherever they come from, they appear in vast shoals, covering the surface of the sea for miles; they afford food for rapacious birds and aquatic animals, and supply material for one of the most important fisheries. They vary considerably in size in different latitudes and in limited localities, being generally largest and in best condition in the north; the time of spawning is various, as we have spring, summer, and autumn herrings. Notwithstanding the destruction of these fish by man and animals, their numbers do not diminish, a fact not astonishing when it is remembered that about 70,000 ova exist in each female, a large portion of which might be unfecundated or destroyed, and yet enough remain to stock the ocean. The regularity of their appearance and their immense numbers have made them the pursuit of man from the earliest times; the herring fishery of France dates back to the beginning of the 11th century, and that of Great Britain 300 years earlier, and both have proved excellent schools for seamen for the mercantile and naval service of these countries. It was prosecuted at a very early period also by the Dutch, who fished on the British coasts when the business was comparatively neglected by the English. Amsterdam became at one time a great centre of the trade, and the prosperity of Holland was largely due to it. Political economists in England, France, and Holland have always regarded this fishery as of the greatest national importance, in its influence on the marine service, and as a source of profitable industry at home and of extensive commerce abroad.—The herring fishery is surpassed only by the cod fishery in the value of its products. The quantity of cured herrings brought in by United States vessels, as reported by the bureau of statistics for the year ending June 30, 1873, was 75,770 cwt., valued at \$188,361, besides which large quantities are consumed fresh. Vessels, especially from Gloucester, Mass., visit the coasts of New Brunswick, Newfoundland, the Magdalen islands, and Labrador for herrings. The business is pursued in the spring and winter. An important fishery is during the winter along the coast of Maine and in the bay of Fundy, the herrings being preserved frozen, and sold in the markets of Portland, Boston, New York, and other cities.

The product of the Dominion of Canada, as returned by the commissioner of fisheries, for the year ending June 30, 1872, was 293,932 barrels of salted and 606,705 boxes of smoked herrings, valued at \$1,312,306; the product of Nova Scotia being valued at \$682,628, of New Brunswick at \$500,628, of Quebec at \$87,206, and of Ontario at \$41,844. The chief seats of the Newfoundland fishery are Labrador, the bay of Islands, Bonne bay, and St. George's bay on the W. coast, and Fortune bay on the S. coast. In the bay of Islands the herring fishery opens in September and continues throughout the winter. When the bay is frozen the fish are taken in nets through holes in the ice. The exports of herrings from Newfoundland in 1872 amounted to 140,873 barrels salted, and 6,898 fresh. Of the whole amount 53,780 barrels were from Labrador and 53,000 from the French shore. The Scotch herring fishery is pursued along the N. W. and E. coasts, the latter being the seat of the most productive fishery. The quantity cured in 1872 was 773,859 barrels, of which 751,524 were cured on shore, and 22,335 in vessels; 671,703 were cured gutted, and 102,156 ungutted. The number of vessels fitted out was 95 (making 136 voyages); tonnage, 2,976; number of men, 434. The number of boats employed in a selected week for each district was 8,252; fishermen, 29,378; whole number of employees, including curers, &c., 58,899. The fishery is pursued to some extent in the winter, but chiefly in the summer. Yarmouth is the headquarters of the English herring fishery, employing about 200 vessels and 2,000 men. The winter fishery which closed with January, 1872, was unusually productive, 240,000,000 fish, equivalent to about 600,000 cwt., being landed. The value of the herring fishery along the E. coast of Ireland in 1872 was about £250,000, the greater portion of which was obtained by Cornish, Scotch, and Manx boats. The highest number of boats that fished during the season was 394, of which 116 were Irish, 120 Cornish, 100 Scotch, and 58 Manx. The exports of herrings from the United Kingdom during that year amounted to 631,750 barrels, valued at \$891,634. When pickled and packed in barrels they are known in Great Britain as "white" herrings; salted and smoked, they are called "red" herrings. "Bloaters" are herrings slightly cured and smoked, and intended for immediate use. In France, in 1869, 222 vessels of 11,944 tons and 4,209 men were fitted out for the salt herring fishery, and 561 vessels of 14,782 tons and 6,941 men for the fresh herring fishery; 270,150 cwt. of salt and 132,140 of fresh fish were brought in. The Dutch fisheries, which once surpassed all others, have greatly declined, but the Dutch herrings still command the highest price in the continental markets. The product of the Norwegian fishery is about 1,000,000 barrels a year. In most of the northern countries of Europe large quantities are annually captured. For a detailed

account of the habits and fishery of the herring, the reader is referred to vol. xx. of the *Histoire naturelle des poissons*, by Cuvier and Valenciennes, by whom several other species are described.—The history of this fish is connected with many strange superstitions and beliefs; their sudden disappearance has in various places been attributed to fires on the shores, the discharge of cannon, and the action of steamboat wheels. (See FISHERIES.)

**HERRING, John Frederick**, an English painter, born in Surrey in 1795, died Sept. 22, 1865. His father was a London tradesman, an American by birth, and he himself was a stage coachman in early life. His ambition was to paint a race horse, and for 18 years he persevered, until he achieved reputation in this class of subjects. For 33 years he took the portraits of the winners of the Doncaster St. Leger, and painted an immense number of racers and racing scenes for eminent patrons of the turf. Afterward he executed scenes from the farmyard, in which, although the horse is still the prominent object, many other animals and a variety of fowls and birds are introduced. Many of these are extensively known through engravings, which have considerable popularity in the United States, where some of his best pictures have also been exhibited. Among his pictures are "The Roadside," "The Members of the Temperance Society," and "The Baron's Charger."

**HERRNHUT.** See MORAVIANS.

**HERSCHEL.** **I.** Sir William, an English astronomer, born in Hanover, Nov. 15, 1738, died at Slough, near Windsor, Aug. 23, 1822. His father, a musician, educated him to his own profession, and at the age of 14 placed him in the band of the Hanoverian foot guards. In 1757 he went to England to seek his fortune, and for some years he devoted himself to music for support. He is said to have been engaged in military bands and at concerts, but there is much confusion in the stories relating to this period of his life. He became organist at Halifax, and in 1766 at the Octagon chapel in Bath. In the latter place he first turned his attention to the study of astronomy, particularly to the construction of optical instruments. In 1774 he had made a large reflecting telescope. While at Bath he constructed 200 Newtonian telescopes of 7 ft. focus, 150 of 10 ft., and about 80 of 20 ft., and did far more than any one who had preceded him in uniting to the best advantage the magnifying and the illuminating power of the telescope. Either of these qualities may easily be strengthened, but at the expense of the other, and the exact proportion in which they must be united to render the greatest amount of light effective was a problem which required many careful experiments. With one telescope, magnifying 227 times, Herschel began a careful survey of all the stars, serially; and while examining the constellation of Gemini, he noticed (March 13, 1781) that one of them appeared unusually

large, and a second examination showed it to have changed its place. Finally he pronounced it a comet, and it was so published in the "Philosophical Transactions" (1781). This announcement drew the attention of astronomers to the supposed comet, and they began to endeavor to compute its course. The president Saron first pronounced it a planet, and then Lexell and Laplace, almost simultaneously, computed its elements, and found it to have an elliptical orbit, whose great axis was about 19 times greater than that of the earth, and the period of its revolution to be 84 years. Herschel had taken no part in the mathematical calculations, but on its being pronounced a planet, he proposed to name it the Georgium Sidus. It has often been called Herschel, but the name Uranus, applied to it by Bode, has been generally adopted. Herschel now turned his attention most carefully to this planet, determined the apparent diameter (about 4") for its mean distance from the earth, and discovered two of its satellites, revolving in a plane nearly perpendicular (at an angle of  $78^{\circ} 58'$ ) to its orbit, and contrary to the order of signs (that is, from east to west). He thought he had also detected four other satellites; but it is now generally believed that he mistook faint stars for satellites, and that Uranus has only four, two of which were discovered by Lassell, of England, in 1851. The discovery of Uranus attracted the attention of all Europe, and Herschel was made private astronomer to the king, with a salary of £400 and a house near Windsor, first at Datchet, and finally at Slough. With funds advanced by the king, Herschel constructed his celebrated 40-foot reflecting telescope, the metal speculum of which was 4 ft. in diameter,  $3\frac{1}{2}$  in. thick, and over 2,000 lbs. in weight. The plane mirror of the instrument was dispensed with, and the observer sat in a swinging chair with his back to the object observed, and facing the object end of the tube, in which the image, by an inclination of the speculum, was thrown to one side and observed through a single lens. He conjectured that with this instrument 18,000,000 stars might be seen in the milky way.—Though Herschel discovered an almost unprecedented number of new bodies in the planetary system, yet his glory is greatest in sidereal astronomy, of which he laid almost the foundations. His leading discoveries in this branch of the science were the following: I. The binary system of stars, and the orbits of several revolving stars. Double stars had been noticed even before the introduction of the telescope; but while Herschel was observing them to learn their annual parallax, he noticed a steadily progressive change in their position and distance; and in 1802, 23 years after he began his observations, he announced in the "Philosophical Transactions" his discovery that both stars were revolving round their common centre of gravity, and all his instances have been confirmed. II. He classified the nebulae, and advocated the

nebular hypothesis, since supposed to be disproved by the discoveries made with the great telescope of Lord Rosse, but now accepted as demonstrated by the results of spectroscopic analysis. He discovered that these nebulous spots cover at least  $\frac{1}{10}$  of the visible firmament, and in 1802 he indicated the positions of 2,500 nebulae or clusters of stars. He classified them as: 1, clusters of stars; 2, nebulae proper; 3, nebulous stars. III. The law of grouping the entire visible firmament. He "gauged" the heavens, by counting the whole number of stars visible in the field of his 20-foot reflector, and taking the average for each region. The result showed a remarkable and steady law of decrease, from the central zone of the milky way in opposite directions to the northern and southern poles. IV. The determination of the fact of the motion of our system, and the direction of that motion. It was already known that the stars were not fixed, but had a proper motion. Herschel, from the proper motions of about 20 stars, with great penetration, divined that our system was moving in the direction of  $\lambda$  Herculis, a point whose right ascension is  $270^{\circ}$ , and north declination  $25^{\circ}$ . Besides discovering the satellites of his own planet, Herschel discovered two new satellites of Saturn, now called, from their being next the ring, the first and second, and determined the rotation of the rings of the planet to be in 10 h. 32 m. He found also that the time of the rotation of the satellites of Jupiter was just equal to the period of their revolution about the planet. When his age made it advisable for him to discontinue his observations in the heavens, he turned his attention to the properties of heat and light. He also gave some valuable opinions concerning the spots on the sun, attributing them to occasional openings in the luminous coating, which seems to be always in motion.—Herschel contributed papers, sometimes several in a year, to the "Philosophical Transactions" from 1780 to 1815. He married in 1788 Mrs. Mary Pitt, a widow of considerable fortune, and had by her one son, John. II. **Caroline Lucretia**, sister of the preceding, born in Hanover, March 16, 1750, died there, Jan. 9, 1848. She lived in Hanover till her 22d year, when she went to England to join her brother at Bath. Here she turned her attention to astronomy, and gave him great assistance, not only taking the part of an amanuensis, but frequently performing alone the long and complicated calculations involved in the observations. For this she received a pension from George III. Meanwhile she took her own separate observations of the heavens, with a small Newtonian telescope which her brother had made for her. She devoted herself particularly to a search for comets, and between 1786 and 1805 discovered alone eight of these bodies, of five of which she was the first observer. Her contributions to science, most of them in her brother's works and under his name, are very valuable. She

took the original observations of several remarkable nebulae in her brother's catalogue, and computed the places of his 2,500 nebulae. In 1798 she published her "Catalogue of Stars taken from Mr. Flamsteed's Observations, contained in the second volume of the *Historia Coelestis*, and not inserted in the British Catalogue, with an index to point out every observation in that volume belonging to the stars of the British Catalogue; to which is added a collection of Errata that should be noticed in the same volume." This work was published at the expense of the royal society, and contained about 560 stars which had been omitted by the framers of the British catalogue. After her brother's death she returned to her native city. In 1828 she completed a catalogue of the nebulae and stars observed by her brother, for which she received a gold medal from the astronomical society of London, and was elected an honorary member of it. **III.** Sir John Frederick William, an English astronomer and physicist, son of Sir William Herschel, born at Slough, March 7, 1792, died at Collingwood, near Hawkhurst, May 11, 1871. At Cambridge, where he graduated in 1813, he was distinguished for his mathematical genius and his fondness for physical science. In 1820 he published his "Collection of Examples of the Application of the Calculus to Finite Differences." About 1825 he began his observations in sidereal astronomy, to which he chiefly devoted himself, partly in conjunction with Sir James South, and the results of his observations for eight years were communicated to the royal astronomical society in a series of catalogues, the first appearing in 1825, for which he received the gold medal. In 1830 he published important measurements of 1,236 stars, which he found with his 20-foot reflector. In 1830 he wrote for the "Encyclopædia Metropolitana" a treatise on "Sound," and for the same work in 1831 a treatise on the "Theory of Light." In Lardner's "Cyclopædia" he published a "Preliminary Discourse on the Study of Natural Philosophy," and a "Treatise on Astronomy." About the same time he wrote several experimental essays on different branches of chemistry, magnetism, and optics. His great enterprise was his expedition to the Cape of Good Hope, to take observations of the whole firmament of the southern hemisphere. Taking with him the same instruments (a 20-foot reflector with an 18½-inch aperture, and a 7-foot achromatic with a 5-inch aperture) which he had used in the northern hemisphere, that his results might be compared with his former ones, he arrived at the Cape, Jan. 15, 1834, and settled at Feldhuysen, about 6 m. from Table bay. He examined carefully and measured the double stars, clusters, and nebulae of the southern skies, and completed the wonderful "gauging of the heavens" which had been begun by his father. His observations lasted four years, and the entire expense was defrayed by him-

self, though an ample indemnity was offered him by government. During his absence, in 1836, the royal astronomical society again voted him their gold medal, and on his return honors were heaped upon him. The royal society proposed to make him their president, but he was unwilling to accept the office. In 1838, at the coronation of Queen Victoria, he was created a baronet. In 1839 he received the degree of D. C. L. from Oxford, and in 1842 he was elected lord rector of Marischal college, Aberdeen. In 1847 appeared in a large 4to volume his "Results of Astronomical Observations made during the Years 1834-'8 at the Cape of Good Hope, being the completion of a Telescopic Survey of the whole surface of the Visible Heavens, commenced in 1825." This work, one of the most considerable and valuable of our time, is divided into seven portions: 1, "Nebulae of the Southern Hemisphere;" 2, "The Double Stars of the Southern Hemisphere;" 3, "Astrometry, or the Numerical Expression of the Apparent Magnitudes of Stars;" 4, "The Distribution of Stars, and the Constitution of the Galaxy in the Southern Hemisphere;" 5, "Observations of Halley's Comet (as seen at the Cape toward the close of 1835), with Remarks on its Physical Condition and that of Comets in general;" 6, "Observations of the Satellites of Saturn;" 7, "Observations of Solar Spots." His residence at the Cape gave not only valuable additions to astronomy, but also to meteorology. He suggested the plan of taking simultaneous meteorological observations at different places on given days, and embodied his views on the plan in his "Instructions for Making and Registering Meteorological Observations at various Stations in Southern Africa" (1844). Before going to the Cape of Good Hope he added 800 nebulae to the catalogue of his father, and on his return published a catalogue of 2,049 nebulae of the southern hemisphere and their positions, 500 of which were before entirely unknown. He also added, while at the Cape, 1,081 double stars, and in measuring the angles of positions and the distances of the stars from each other, found that many of them have very rapid orbital motions. He made many interesting observations on the milky way. "This remarkable belt," he says, "examined through a powerful telescope, is found (wonderful to relate) to consist entirely of stars scattered by millions, like glittering dust, on the black ground of the general heavens." Again, he conjectures, from his ingenious combinations of photometric calculations, that if the stars in the great circle of the milky way, which he saw in his 20-foot reflecting telescope, were newly risen luminous cosmical bodies, it would require 2,000 years for a ray of their light to reach us. His observations on the brightness and the color of stars, on variable stars, on the sun's rays, on the atmospheric air, and on the Magellanic clouds, are all very valuable. Sir John Herschel did not

confine his attention to astronomy. He calculated the density of the atmosphere, and held that a perfect vacuum exists at the height of 80 or 90 miles above the earth, and also that three fourths of all the atmospheric air is within four miles of the earth's surface. The question concerning the absorption of light, which gave rise to much discussion, particularly in its connection with the undulatory theory, was very ably answered by Herschel in his paper on the "Absorption of Light by Colored Media." He made some important discoveries in photography, and produced from chemical compounds and the juices of plants the most beautiful chromatic effects. Sir John Herschel contributed to the "Manual of Scientific Inquiry" (1849 and 1851), and wrote "Outlines of Astronomy" (1850; 10th ed., 1869); "Essays, from the Edinburgh and Quarterly Reviews, with Addresses and other Pieces" (1857); "Physical Geography" (1861); and "Familiar Letters on Scientific Subjects" (1866). His son, Capt. John Herschel of the royal engineers, is now (1874) collecting his letters with a view to publication. During the year 1848 Herschel was president of the royal astronomical society. In 1850 he was appointed master of the mint, which office he held till 1855, when he resigned on account of ill health. In 1855 he became one of eight foreign associates of the French academy of science.

**HERSENT, Louis**, a French painter, born in Paris, March 10, 1777, died there, Oct. 2, 1860. He studied under Regnault, and at the age of 20 gained the second prize at the school of fine arts. He was one of the painters to the government, and received an honorary decoration from Louis XVIII., who bought his "Ruth and Boaz" and "Monks of St. Bernard." His "Abdication of Gustavus Vasa," considered his best work, was destroyed in the sacking of the Palais Royal in 1848. His "Louis XVI. giving Alms to the People," now in the museum at Versailles, was among his later works. Almost all his pictures have been engraved.

**HERSFELD**, a town of Prussia, in the province of Hesse-Nassau, 10 m. N. N. E. of Fulda, on the left bank of the Fulda; pop. in 1871, 6,434. It owes its origin to a Benedictine abbey which was founded in the 8th century. With its territory it was made an ecclesiastical principality in the 12th century, under the government of the abbots. At the peace of Westphalia (1648) it was secularized, and the town of Hersfeld remained the capital till 1821, when the principality became an administrative circle. The town until lately was walled, and protected with an ancient ditch; gardens are now laid out in place of these. The river is here crossed by two bridges. Among the noteworthy buildings are the ancient council house, the fine parish church with a lofty tower and a great bell, and the ruins of the convent church which was built in the beginning of the 12th

century, in the Byzantine style, on the site of the cathedral which had been burned. The ancient monastery itself, shut off from the town, has its own district, containing the ruins of the church and the surrounding gardens and orchards. The gymnasium was founded in 1570 by Abbot Michael. Hersfeld is the head of the cloth manufactures of the former electorate of Hesse, employing 2,000 hands, and has manufactories of mixed cotton goods, soap, and red and white leather, and numerous dye works and worsted mills.

**HERSTAL**, a town of Belgium, in the province and 3 m. N. E. of the city of Liège, on the left bank of the Meuse; pop. in 1866, 9,326. Various kinds of iron and steel ware, especially firearms, are manufactured in the town, which has also an establishment for the extraction of pyroligneous acid, a salt refinery, breweries, &c. In the neighborhood are many coal mines. Herstal was the home of Pepin the Fat, generally called Pepin of Héristal.

**HERTFORD**, a N. E. county of North Carolina, bordering on Virginia, bounded E. by Chowan and Nottoway rivers, and intersected by the Meherrin, which unites with the Nottoway to form the Chowan; area, 320 sq. m.; pop. in 1870, 9,273, of whom 4,952 were colored. It has a level surface, covered in part with pine and cedar woods, which furnish large quantities of timber, tar, and turpentine for exportation. The Chowan river is navigable by sloops along the border of the county. The chief productions in 1870 were 5,430 bushels of wheat, 189,079 of Indian corn, 13,857 of oats, 49,807 of sweet potatoes, and 235 bales of cotton. There were 915 horses, 1,174 milch cows, 2,708 other cattle, 2,259 sheep, and 11,398 swine; 1 saw mill, and 7 flour mills. Capital, Winton.

**HERTFORD**, a town and parliamentary borough of England, capital of Hertfordshire, on the river Lea, 18 m. N. of London; pop. in 1871, 7,164. It has eight churches, a Latin school, a mechanics' institute, a branch of the London Christ's hospital, a large distillery, and several large breweries. There is an active trade in coal, timber, and corn. In 678 a national ecclesiastical council was held here, and early in the 10th century Edward the Elder rebuilt the town and built the castle, which afterward was occasionally a royal residence.

**HERTFORDSHIRE**, or **Herts**, an inland county of England, bordering on Cambridgeshire, Essex, Middlesex, Buckinghamshire, and Bedfordshire; area, 611 sq. m.; pop. in 1871, 192,226. Its principal rivers are the Colne and Lea with their tributaries, affluents of the Thames, and some smaller streams flowing to the Ouse. Part of the New river, which supplies London with water, is within the shire, and is conducted by an aqueduct along the valley of the Lea. The Grand Junction canal passes through the county. It is also traversed by the London and Northwestern and Great Northern railways, while the Eastern Counties railway skirts the S. E. boundary. In the

northern part of the county are several ranges of chalk hills, which attain an elevation of 900 ft. above the sea. There are manufactories of straw goods, ribbons, paper, and malt, but the principal industry is agriculture, seven eighths of the county being arable land. In the S. W. part are extensive apple and cherry orchards. There are many Roman and other antiquities, of which the most prominent are St. Alban's abbey and the ruins of Berkhamstead castle, and Royston church and cave. Capital, Hertford.

**HERTHA**, *Ertha*, or *Nerthus*, the goddess of earth (Anglo-Saxon, *eorthe*, Ger. *Erde*), anciently worshipped by the Æstii, Lombards, Angles, and many other Teutonic tribes established near the lower Elbe, and in the regions of the Baltic. The Scandinavians called her *Jord*; according to them she was daughter of Annar and Night, sister of Dagur or Day by the mother's side, wife of Odin (thus identical with Frigga), and mother of Thor. This identification of the female principle, or of generation and fertility, with the earth, is found in all religions. The earth being the all-nourishing mother, it was naturally believed that Hertha sympathized with mankind, and the myth of the revival of spring gradually became for the vulgar a faith that she visited them in person at stated times. These visits took place, according to Tacitus, on a sacred island in the Baltic, where the chariot of Hertha was kept. When the goddess had descended from the throne of Odin, she was believed to take her seat in the chariot. Heifers were then harnessed to it, and she was drawn amid festivity over the land. During this procession all feuds were suspended. Finally the goddess, or rather her wagon, on returning to the holy grove, was washed in the sea by slaves, who immediately after were drowned. This appearance of Hertha was also practised in another form among certain German tribes, with whom it was usual on occasions of drought to send the most beautiful maiden of the village, entirely naked, at the head of a female procession over the fields.

**HERTZ**, *Hendrik*, a Danish poet, born in Copenhagen, Aug. 25, 1798. He is of Jewish parentage, but joined the Protestant church, and studied law. In 1826 he published anonymously his first comedy, *Herr Burckhard og hans Familie*, which was rapidly followed by others. *Gjenganger-Brevene*, a polemical poem (1830), attracted much attention on account of its severe criticism of the literature of the day. His tragedy *Scend Dyrings Huus* (1837) added greatly to his popularity by its patriotic character, and a lyrical drama entitled "King René's Daughter" carried his fame into Germany, France, and England, where his works have since been translated as soon as they appeared. Among his novels, *Stemninger og Tilstande* (1839), *Johannes Johnson* (1858), and *Eventyr og Fortællinger* (1862) are specially noteworthy.

**HERTZEN**, or *Herzen*, *Alexander*, a Russian author, born in Moscow, March 25, 1812, died in Paris, Jan. 21, 1870. He studied at the university of Moscow, where he and some of his associates were arrested in 1834 on account of their socialistic tendencies. He was detained in prison nearly a year, and for several years afterward he was exiled to Siberia. In 1839 he received a full pardon and a clerkship in the ministry of the interior, which he soon lost by his strictures on the government; but in view of his high connections and attainments he was treated considerably, and received the title of councillor of state with orders to reside at Novgorod. In 1842 he asked to be released from all connection with the government, and in the same year came forward as a writer under the *nom de plume* of Iskander. In 1845-'6 he published an elaborate work showing his sympathy with the younger Hegelian school of philosophy, and in 1847 appeared his first novel descriptive of Russian life. His father's death having put him in possession of a moderate fortune, he was enabled to leave Russia in 1847. After conferring with revolutionists in Italy, France, and Switzerland, he organized a systematic propaganda against Russian absolutism by establishing a publishing house in London for printing and circulating Russian translations of the writings of Louis Blanc, Mazzini, and kindred authors. In 1856 he founded in London the *Kolokol* ("The Bell"), a journal which attained a large clandestine circulation in Russia, and through which he paved the way for the emancipation of the serfs, for the abolition of corporal punishment in the army, for judiciary reforms, and for diminishing corruption among Russian officials. In 1865 he removed to Geneva, where he published the *Kolokol* in French (*La Cloche*), but could not sustain it. He spent the latter part of his life in Paris. The loftiness of his purpose and his integrity, as well as his commanding influence on Russian progress, were respected even by his adversaries; and his claims to literary distinction rest upon a variety of writings, comprising novels and books of travel, published in Russian, German, and French, these languages having been equally familiar to him. His principal works are: *Erinnerungen aus meinem Leben* (3 vols., 1854; English translation, 2 vols., London, 1855); *Russland's sociale Zustände* (1854); *Memoiren der Fürstin Daschkow* (2 vols., 1857); "The Polar Star" (in Russian, 7 vols., London, 1857-'67; 8th vol., Geneva, 1868); *Mémoires de l'impératrice Catherine, écrits par elle-même* (London, 1859); "For Five Years, 1855-'60" (in Russian, London, 1860); *Biloe i Dumi* (3 vols., London, 1861; 4th vol., Geneva, 1867); and "Posthumous Writings" (in Russian, Geneva, 1870).—His confiscated Russian estates were restored in 1874 to his only surviving brother, in virtue of an amnesty granted on occasion of the marriage of the grand duchess Maria with the duke of Edinburgh.

**HERULI**, or *Eruli*, a German tribe, which in the latter part of the 3d century appeared on the shores of the Euxine, having joined the Goths in their invasion of the Danubian provinces of the Roman empire. They were afterward conquered by the Ostrogoths, followed Attila on his march to Gaul (451), and after his death, uniting with other German tribes, destroyed the western empire under their leader Odoacer, who assumed the title of king of Italy (476), but finally succumbed to the Ostrogoths under Theodoric (493). Another kingdom of the Heruli, founded in the central part of modern Hungary, was destroyed by the Lombards. Part of them then removed to the south of the Danube, and the others emigrated to the shores of the Baltic.

**HERVÉ**, a French composer, whose real name is Florimond Ronger, born at Houdain, near Arras, in 1825. His *Don Quichotte* (1847) was the first opera bouffe introduced on the French stage, and subsequently, as a protégé of M. de Morny, he became connected with theatres, where he continued to produce similar entertainments, paving the way for Offenbach, who soon eclipsed Hervé at the Bouffes-Parisiens (1855), the latter disappearing for several years from the stage. Since 1865, however, when he became leader of the orchestra at the Eldorado, he has been sharply competing with Offenbach. Among his later productions are *L'œil crevé* (1867), *Chilperic* (1868), *Le petit Faust*, and *Les Turcs* (1869).

**HERVEY**, James, an English author, born at Hardington, near Northampton, Feb. 26, 1713, died Dec. 25, 1758. He graduated at Oxford, took orders, and at the age of 22 was appointed curate to his father, on whose death in 1750 he succeeded to his two livings at Weston Favell and Collingtree. He was noted for his benevolence, and was well skilled in Hebrew, Greek, and Latin. In 1746-'7 he published his "Meditations and Contemplations," which have been widely read and admired. In 1753 he published "Remarks on Lord Bolingbroke's Letters on History;" in 1755, "Theron and Aspasia," a work on the Calvinistic theory of redemption. He also published letters to Wesley and to Lady Frances Shirley, and edited, with a preface, Burnham's "Pious Memorials," and Jenks's "Devotions." His works, with a memoir (7 vols. 8vo, London, 1797), have passed through numerous editions.

**HERVEY**, John, Baron Hervey of Ickworth, an English politician, born Oct. 15, 1696, died Aug. 5, 1743. He was the eldest son of John Hervey, first earl of Bristol of that name. He studied at Cambridge, and was appointed in 1716 gentleman of the bedchamber to the prince of Wales. He was looked upon as the most accomplished man of his time, and by his talents, literary tastes, and family connections was an important auxiliary to Sir Robert Walpole. In 1730 he was appointed vice chamberlain and privy councillor, and in 1733 raised to the peerage. He lost much in-

fluence on the death of the queen in 1737, but entered the cabinet, and received in 1740 the privy seal, which he lost on the fall of Walpole. He was an epileptic, and his life was protracted only by great watchfulness. Pope, in the prologue to the satires, attacked him under the name of Sporus. His most important work is the "Memoirs of the Court of George II. and Queen Caroline," edited by J. W. Croker (2 vols. 8vo, 1848; new ed., 1854).

**HERVEY**, Thomas Kibble, an English poet, born in Manchester, Feb. 14, 1799, died in Kentish Town, Feb. 17, 1859. He studied at Cambridge and at Oxford, but did not take a degree. Then he attempted the study of law, but soon abandoned it to follow his taste for literature. In 1824 he published "Australia and other Poems," the title piece being an elaboration of a prize poem. This volume, with additions, was reissued in 1829 as "The Poetical Sketch Book." In 1830 he published anonymously "The Devil's Progress," a satire. For 20 years he was a leading writer for the "Athenæum," of which he was sole editor from 1846 to 1854. His other publications were: "Illustrations of Modern Sculpture" (vol. i., 1832, never completed); "The Book of Christmas" (1836); and "England's Helicon in the Nineteenth Century" (1841).—His wife, ELEONORA LOUISA (MONTAGUE), born in Liverpool in 1811, is distinguished as a writer of dramatic and other poems, tales, fairy legends, &c.

**HERVEY DE SAINT DENYS**, Marie Jean Léon de, marquis, a French sinologue, born in Paris in 1823. He early applied himself to the study of Chinese, and became president of the ethnographical society. He translated several Spanish plays into French, and among his other works are *Recherches sur l'agriculture des Chinois* (1851), a translation of *Poésies de l'époque des Thang*, with an essay on Chinese poetry (1862), and several other important translations published in 1874.

**HERWEGH**, Georg, a German poet, born in Stuttgart, May 31, 1817, died in Baden-Baden, April 7, 1875. He studied theology at Tübingen, but devoted himself to literature, and in 1841 published in Switzerland *Gedichte eines Lebendigen*, a collection of political poems, which passed through seven editions in two years (9th ed., 1871). He was expelled from Prussia on account of a letter which he addressed to the king, and also from Zürich, but found an asylum in Basel, where he completed the 2d volume of his *Gedichte* (1844), in a decidedly revolutionary tone. Subsequently residing in Paris, he put himself, soon after the revolution of 1848, at the head of a legion of French and German laborers, crossed the Rhine intending to revolutionize Germany, and appeared in Baden in April, but was defeated at Dossenbach by the Würtemberg troops, and fled with his wife to Switzerland. He afterward translated several of Shakespeare's plays.

**HERZ**, Henriette, a leader of Berlin society, born in that city, Sept. 5, 1764, died there, Oct.

22, 1847. She was a daughter of Dr. Lemos, a physician of Portuguese-Jewish origin, and was barely 16 when she married Dr. Markus Herz, an elderly and wealthy gentleman. Through her extraordinary beauty and intelligence she acquired great social influence. Schleiermacher was her most intimate friend, and conspicuous among her many other associates were William and Alexander von Humboldt. After the death of her husband in 1803 she continued to exercise the same commanding and beneficent influence in society, but her means were reduced, and in 1808 she was obliged for some time to accept the hospitality of friends in Rügen. On her mother's death in 1817 she embraced Christianity, and during the rest of her life, mostly spent in Berlin, she kept up her relations with distinguished people, with whom she maintained an active correspondence, but late in life she destroyed most of her letters.—See *Henriette Herz, ihr Leben und ihre Erinnerungen*, by Fürst (Berlin, 1850), and *Briefe des jungen Börne an Henriette Herz* (Leipzig, 1861). Börne lived for a considerable time in her house.

**HERZEGOVINA**, or *Hersek*, a province of European Turkey, forming the S. W. part of the vilayet of Bosnia, bounded N. by Turkish Croatia, W. by Dalmatia, S. by Montenegro and the gulf of Cattaro, and E. by Bosnia proper; area, 6,420 sq. m.; pop. about 290,000, of whom 180,000 belong to the Greek church, 48,000 are Catholics, and 62,000 Mohammedans, many of whom are renegades. They are chiefly of the Slavic race, and speak a Slavic dialect kindred to that of Dalmatia and Croatia. The province is covered by a branch of the Dinaric Alps, and slopes toward the Adriatic. It is traversed by the Narenta and its tributaries, which flow into the Adriatic. The products are tobacco of a very fine quality, rice, millet, and grapes. The most notable manufactures are hydromel or mead, a favorite popular beverage, and sword blades.—The province formerly belonged to the kingdom of Croatia, and was often called the country of Chulm, and by the Venetians the duchy of St. Saba, in honor of that saint. Annexed to Bosnia in the early part of the 14th century, it was wrested from it by the emperor Frederick III. (about 1450), who disposed of it in favor of Stefan Hranitch and his descendants, as an independent duchy. Hence the name of Herzegovina, the title of *Herzog* (duke) having been borne by its princes before the Ottoman conquest, which took place in 1467 under Mohammed II. After various contests, the Turks were confirmed in its possession by the treaty of Carlovitz (Jan. 26, 1699), excepting the former capital, the fortified town of Castelnovo, in the gulf of Cattaro, and a small territory which had been held by the Venetians since 1682, and which now forms part of Dalmatia. Capital, Mostar.

**HERZEN.** See **HERTZEN**.

**HESIOD** (Gr. *Hēsiódos*), one of the earliest Greek poets, of whose life nothing is known ex-

cept that he dwelt at Ascra, on Mt. Helicon, whither his father had removed from Cyme, on the Æolic coast of Asia Minor. The most general opinion of the ancients assigned Homer and Hesiod to the same period, which Herodotus fixes at about 850 B. C.; the higher antiquity of Hesiod is maintained by Ephorus of Cyme. K. O. Müller opposes the common opinion that the epic language was first formed in Asia Minor, whence it was borrowed and transferred to other subjects by Hesiod. He supposes this poetical dialect had already come into use in the mother country before the Ionic colonies were founded, and that the phrases, epithets, and proverbial expressions common to the two schools of poetry were derived from a common and more ancient source. The Hesiodic and Homeric poetry resemble each other only in dialect and form, and are completely unlike in their genius and subjects. E. Curtius says "that with Hesiod life on earth appears utterly stripped of the joyous brilliancy which the Homeric poems spread out over it; that with him it is a sunken and fallen state, a school of adversity through which man has to pass in the exercise of virtue, under the observation and support of beatified spirits. In a form of expression perfectly cognate to the Delphic sayings, the poems united under the name of Hesiod give circumstantial precepts for the different classes of human society, for knights and for peasants, and concerning both private and public life." The logographers related numerous stories of Hesiod, of his descent from Orpheus, his gift of prophecy, and his contest with Homer, which show that an early connection was conceived to have existed between the priests and bards of Thrace and Bœotia, out of which grew the elements of his poetry. The Hesiodic poetry flourished chiefly in Bœotia, Phocis, and Eubœa, and the eminence of Hesiod caused a great variety of works to be attributed to him. The "Works and Days" (*Ἔργα καὶ ἡμέραι*), the only poem which his countrymen considered genuine, is perhaps the most ancient specimen of didactic poetry, and consists of ethical, political, and minute economical precepts. It is in a homely and unimaginative style, but is impressed throughout with a lofty and solemn feeling, founded on the idea that the gods have ordained justice among men, have made labor the only road to prosperity, and have so ordered the year that every work has its appointed season, the sign of which may be discerned. The "Theogony" is an attempt to form the Greek legends concerning the gods into a complete and harmonious picture of their origin and powers, and into a sort of religious code. Beginning with Chaos, out of which rose first the Earth and Eros (love), the fairest of the immortal divinities, it completes the formation of the world, and relates the genealogies and wars of the gods and heroes, and the triumph of Zeus and the Olympians over the Titans. The Greeks considered it

high authority in theological matters, and philosophers sought by various interpretations to make it harmonize with their own theories. Another poem attributed to Hesiod was the "Heroines" (*Hoiai*), giving accounts of the women who by their connection with the gods had become the mothers of the most illustrious heroes, and containing a description of the shield of Hercules, which is all of it that is still extant. Several other Hesiodic poems are mentioned by the ancients. The best complete edition is that of Götting (8vo, Gotha and Erfurt, 1843); and the scholia on him of the Neo-Platonist Proclus, and others, are contained in Gaisford's *Poeta Græci Minores*, vol. iii. The "Works and Days" was translated into English by George Chapman (London, 1618). A poetical translation was made by C. A. Elton (London, 1810), and a prose version by the Rev. J. Banks, in Bohn's "Classical Library" (London, 1856). See also *Hesiodi Scutum Herculis*, edited by Van Lennep (Amsterdam, 1854); *Theogonia*, by Gerhard (Berlin, 1856); Flach, *Die Hesiodische Theogonia*, with *Prolegomena* (1873); and an English edition by James Davies (Edinburgh, 1873).

**HESPERIDES**, in Grecian mythology, the guardians of the golden apples which Terra gave to Juno as a wedding gift. Sometimes they are called the daughters of Erebus and Night, sometimes of Atlas and Hesperis, sometimes of Jupiter and Themis. Some traditions make them three, others four, and others seven. They were commonly set down at four—Ægle, Erythia, Hestia, and Arethusa. Their gardens were originally placed in the remote west, about Libya and Mt. Atlas, but later mythologists placed them in Cyrenaica, and some even in the extreme north, among the Hyperboreans. Their duty was to guard the apples which Juno had committed to their care, but Hercules obtained them by the assistance of Atlas.

**HESPERORNIS**. See supplement.

**HESSE, Karl Adolph Heinrich**, a German artist, born in Dresden in 1769, died at Wilhelmsdorf, near Vienna, July 3, 1849. He had much reputation as a painter of horses. His most famous work is the large painting, "The March of the Cossacks of the Ural through Bohemia," exhibited in 1799. He published *Studienblätter für Pferdeliebhaber*, the plates for which were etched by himself (1807), *Pferdewerke* (in 12 parts, 1807), and *Pferdeköpfe* (horses' heads), lithographed in natural size (Vienna, 1825).

**HESSE. I. Karl Ernst Christoph**, a German engraver, born in Darmstadt in 1755, died July 25, 1828. He first made himself known by some plates after pictures by Rembrandt in the gallery at Düsseldorf, and subsequently engraved a large portion of the gallery for a pictorial work. In 1782 he was appointed engraver to the court at Munich, and in 1806 he became professor at the academy of arts there.

**II. Peter von**, a painter, eldest son of the preceding, born in Düsseldorf, July 29, 1792, died

April 5, 1871. In 1813-'15 he participated in the most considerable actions against the French, and made sketches on the spot. These he afterward embodied in a series of battle pieces, of which the "Battle of Arcis-sur-Aube," the "Capture of a French Village by Cossacks," the "Bivouac of Austrian Troops," and the "Battle of Leipsic," are good specimens. He has been called the Horace Vernet of Germany. **III. Heinrich von**, a historical painter, brother of the preceding, born in Düsseldorf, April 19, 1798, died March 29, 1863. He prepared the cartoons for the decoration of the church of All Saints in Munich, in which the progress of Christianity is unfolded. He also painted for the basilica of St. Boniface in the same city 64 compositions in fresco, with figures of colossal size, illustrating the life of that saint.

**HESSE** (Ger. *Hessen*). **I. Or Hessia**, a territory of Germany, inhabited in the time of the Roman empire by the Catti, an old Germanic tribe. Germanicus is said to have destroyed their principal town, Mattium, which stood on the site of the present villages of Grossmaden and Kleinmaden, near Gudensberg. Under the early German emperors Hesse was governed by counts. The principal of these were the counts of Gudensberg of the name of Geiso. By the marriage of the heiress of the last count of Gudensberg, Geiso IV., with the landgrave Louis I. of Thuringia, this prince became sovereign of Hesse (about 1130). Till about the middle of the 13th century the history of Hesse was identical with that of Thuringia; but the landgrave Henry Raspe dying without issue in 1247, his niece Sophia, the daughter of the landgrave Louis the Pious and the wife of Henry, duke of Brabant, claimed Hesse as well as Thuringia; and after a war of succession with her cousin, the margrave Henry the Illustrious of Misnia, she was put in possession of Hesse by treaty in 1263. Sophia's son, Henry I. the Child, became the progenitor of the dynasty of Hesse, and took up his residence at Cassel. Philip I. the Magnanimous, who succeeded his father William in his sovereignty of the whole country in 1509, and who was the first to introduce the reformation, divided his dominions among his four sons (1567). The eldest, William IV., obtained one half, including the capital Cassel; Louis IV. one fourth, comprising Marburg; Philip II. one eighth, with Rheinfels; and George I. also one eighth, with Darmstadt. But Philip II. dying in 1583, and Louis IV. in 1604, without children, there remained only the two main branches of Hesse-Cassel and Hesse-Darmstadt, the former of which ceased to be a reigning family in 1866, when its territory was annexed to Prussia. It will become extinct with the death of the last elector of Hesse-Cassel. (See HESSE-CASSEL.) Among the side branches of the Hessian dynasty are the landgraves of Hesse-Philippsthal and Hesse-Philippsthal-Barchfeld. **II. Former-**

ly **Hesse-Darmstadt**, a German grand duchy, consisting of two large portions separated by a long strip of land extending from E. to W., which belongs to the Prussian province of Hesse-Nassau. The N. portion is bounded on all sides by Prussia; the S. portion is bounded N. by Prussia, E. by Bavaria, S. by Baden, S. W. by Rhenish Bavaria, and W. by Prussia; area, 2,964 sq. m.; pop. in 1871, 852,894, of whom 585,399 were Protestants, 238,080 Roman Catholics, and 25,373 were Jews. Hesse is divided into the provinces of Upper Hesse, Starkenburg, and Rhenish Hesse. The principal mountains are the Odenwald in the southern portion and the Vogelsgebirge in the northern. The Vogelsgebirge is a volcanic mass, occupying with its branches about 400 sq. m. The country is also traversed by branches of the Taunus, Westerwald, &c. The chief rivers are the Rhine, Main, Nahe, Nidda, and Lahn. Hesse is one of the best cultivated agricultural countries in Germany. Offenbach, near Frankfort, is the chief manufacturing town. Mentz is the great emporium for the corn, wine, and transit trade. Darmstadt is the capital. The grand duchy possesses many railways and excellent public roads. It occupies the sixth rank in the German empire, has three votes in the federal council, and sends eight deputies to the German Reichstag. The troops of the grand duchy constituted in 1874 a separate division of the 11th army corps. The government is a constitutional monarchy. The grand duke, who bears the title of *Grossherzog von Hessen und bei Rhein*, is assisted by a council of state and a cabinet, which in 1874 consisted of the premier or president (who is at the same time minister of the grand ducal household and of foreign affairs), of the ministers of the interior, of justice, and of finance. The legislature is composed of two chambers. The annual receipts, according to the budget of 1873-'5, amount to \$4,500,000; the expenditures to \$4,250,000. The public debt was contracted almost exclusively for the construction of railways, and amounted in 1872 to about \$5,500,000. There are numerous educational institutions, the chief of which is the university of Giessen.—The line of Hesse-Darmstadt was founded in 1567 by George I., youngest son of Philip the Magnanimous. The war of succession with Hesse-Cassel which broke out under the reign of his successor, Louis V. the Faithful, continued to rage during that of his son George II. (1626-'61), but was brought to a close in 1647 by the cession of Marburg and other contested localities in exchange for Giessen and other territory. During the French revolution much territory was lost, which was more than regained by the treaty of Lunéville in 1801. Louis X. (born 1753, died 1830) joined the confederation of the Rhine, adopting as grand duke the name of Louis I., obtained from Napoleon still further accessions of territory, caused his troops to act against Austria in 1809 and in concert with

the French in 1813, but joined the allies after the battle of Leipsic, on condition of being left in possession of his newly acquired territory. In 1815 he joined the German confederation, and made large cessions on the right bank of the Rhine to Prussia and other states, but obtained valuable possessions on the left bank of that river, including Mentz and Bingen. In 1828 he joined the Prussian customs union, by which he gave the first impulse to the formation of a more general union, which culminated eventually in the Zollverein. Soon after the accession of Louis II., political riots followed the French revolution of 1830, which were quelled by the army. The revolution of 1848 extorted from the grand duke the concession of the trial by jury. He appointed his son as coregent, March 5, 1848. He died June 16, and his son, the present grand duke Louis III. (born June 9, 1806), succeeded him. In March, 1866, the landgraviate of Hesse-Homburg, the reigning dynasty being extinct, was united with Hesse-Darmstadt. In June of the same year Hesse-Darmstadt joined Austria and the majority of the federal diet in the war against Prussia. In September it concluded a separate peace with Prussia, in which it engaged to pay an indemnification of \$1,200,000 to Prussia, and to cede the former landgraviate of Hesse-Homburg, and a small portion of its other territory, in exchange for which it received a few places which formerly belonged to Hesse-Cassel and Nassau. It also joined the North German confederation for that part of its territory which is situated north of the river Main. A special military convention with Prussia, by which the army of Hesse became a part of the army of the North German confederation, was concluded in April, 1867. In 1870 Hesse-Darmstadt, like the other states of South Germany, joined Prussia in the war against France, and in November it entered the German empire, then forming, for its entire territory. In 1871 the unpopular prime minister Dalwigk was dismissed. The history of Hesse-Darmstadt has been written by Walther (1841) and Steiner (5 vols., 1833-'4).

**HESSE, Adolph Friedrich**, a German organist, born in Breslau, Aug. 30, 1809, died there, Aug. 5, 1863. His father was an organ builder, and the son acquired at the factory a knowledge of the instrument, and when but nine years of age excited astonishment by his precocity as an organist. In 1827 he was appointed assistant organist at the church of St. Elizabeth. In 1828 and 1829 he made a concert tour through Germany, forming the acquaintance of Spohr and Rink, from the latter of whom he received valuable counsels. In 1831 he became first organist of the church of St. Bernardin. In 1844 he went to Paris for the inauguration of the great organ of St. Eustache. His reputation was that of one of the first organists of Europe. His compositions are about 80 in number, including six symphonies, an oratorio, five overtures, and many

compositions for the organ, severe in style but of great merit.

**HESSÉ. I. Nicolas Auguste**, a French painter, born in Paris in 1795, died in 1869. He studied under Baron Gros and in Rome, having gained the grand prize in 1868, acquired celebrity by his religious paintings, and succeeded Delacroix in 1863 in the academy of fine arts. His best works are in various churches. **II. Alexandre Jean Baptiste**, a French painter, nephew of the preceding, born in Paris in 1806. He became known in 1833 by his picture executed at Venice representing the funeral honors paid to Titian, and in 1867 he succeeded Ingres in the institute. His "Adoption of Godfrey of Bouillon by the Emperor Alexander Comnenus" (1842) is at Versailles, and one of his best pictures, the "Triumph of Pisani" (1847), is in the Luxembourg. His mural paintings for the chapel of St. Francis of Sales in the Paris church of St. Sulpice are esteemed.

**HESSÉ - CASSEL** (Ger. *Kurhessen*, Electoral Hesse), a former German electorate, incorporated with Prussia in 1866. At the time when it ceased to be an independent state it had an area of 3,701 sq. m., and a population, according to the census of 1864, of 745,063. The principal towns were Cassel, Marburg, Fulda, Hanau, Hersfeld, Schmalkalden, and Rinteln. Hesse-Cassel was the elder branch of the Hesse dynasty, and was founded by the eldest son of Philip the Magnanimous, the landgrave William IV., surnamed the Wise (1567 to 1592). His grandson, William V., took part on the Protestant side in the thirty years' war, and his widow after the restoration of peace obtained the greater part of Schaumburg and other territory. William VII. was succeeded in 1670 by his brother Charles, while another brother, Philip, founded the branch of Hesse-Philippsthal. Charles's eldest son became, by his marriage with Ulrike Eleonore, king of Sweden in 1720. In 1730 he assumed the government of his native country as Frederick I., and was succeeded in 1751 by his brother William VIII., who fought in the seven years' war on the side of Prussia. His son, the notorious Frederick II., became a convert to the church of Rome, and between 1776 and 1784 received over £3,000,000 by hiring his soldiers to the English government to fight against the Americans in the war of independence. He died in 1785, and was succeeded by his son William IX., who after 1803, when he was raised to the rank of an elector, reigned under the name of William I. Although recognized by Napoleon as one of the neutral princes in 1806, he was expelled from his possessions after the battle of Jena, and Hesse-Cassel was incorporated with the kingdom of Westphalia. On his return to power in 1813, he restored the old order of things. He is identified with the rise of the Rothschilds, and was the father of the Austrian general Haynau, by his mistress Frau von Lindenthal. He was not popular with his subjects. On his death in 1821 he

was succeeded by his son, the elector William II., whose relations with his subjects became seriously complicated by his connection with the obnoxious countess of Reichenbach. Riots broke out in 1830. The countess left Cassel, and on Jan. 9, 1831, the elector promulgated the long promised liberal constitution. On the return of the countess fresh disturbances arose, which incensed the elector to such an extent that he also left Cassel. On his death in 1847 he was succeeded by his son, who had officiated as regent after his departure from Cassel, and who assumed the sovereignty under the name of Frederick William I. (born Aug. 20, 1802). Yielding in 1848 to the revolutionary demand for political reforms, but retracing his steps after the reaction had set in, he gave great dissatisfaction to the people, especially in 1850, when the unpopular minister Hassenpflug came into power as premier, and Haynau, a nephew of the Austrian general, as minister of war. So great became the excitement that the elector fled, and Hassenpflug saw no other means of saving the crown than by invoking the aid of the other German powers. By their interference quiet was restored, and by their negotiation a new constitution was promulgated in 1852, which met with much opposition on account of its illiberality. After protracted agitations on the subject, a proposal in favor of the reestablishment of the old constitution was presented to the electors by a vote of the second chamber in November, 1859. During the war excitement in 1859, the chambers unanimously voted to join the Austrians against Napoleon III. On May 30, 1860, the government, in accordance with a resolution of the federal diet and with the wishes expressed by the first chamber, promulgated the constitution of 1852, with the amendments adopted in 1857 and with a new electoral law. The new second chamber protested against the constitutionality of the new electoral law and the validity of the new constitution, and on June 21, 1862, the federal diet, on motion of Prussia and Austria, enjoined upon the government of Hesse-Cassel the reintroduction of the liberal constitution of 1831 and the old electoral law of 1849. The government of Hesse-Cassel at first seemed disposed to refuse; but when Prussia mobilized an army corps, it submitted. Still the quarrels between the government and the legislature continued without interruption. At the outbreak of the war of 1866, the government of Hesse-Cassel sided with Austria, while the diet demanded that the electorate should remain neutral. Immediately after the declaration of war, in June, the Prussians took possession of the country; and when the elector refused to join the new confederation proposed by Prussia, he was taken as a prisoner to Stettin. A decree of Aug. 17 incorporated the electorate of Hesse-Cassel with the dominions of Prussia. In September, 1868, the ex-electror sent a memorial to all the courts of Europe, in which he protested against the forcible an-

nexation of his state to Prussia, but without effect. In 1873 the elector formally agreed to the cession of his territory to Prussia, and also renounced his right to the revenues of the electorate, the Prussian government granting him as compensation 2,000,000 thalers annually. —Histories of Hesse-Cassel have been written by Rommel (10 vols., 1828-'58), Wippermann (1850), and Röth (1855). (See HESSE, and HESSE-NASSAU.)

**HESSE-DARMSTADT.** See HESSE, II.

**HESSE-HOMBURG**, a former German landgraviate, consisting of the province of Homburg, which was surrounded by the territory of Nassau, Hesse-Darmstadt, Hesse-Cassel, and Frankfort, and of the more populous province of Meisenheim, which lay between Rhenish Prussia, the Bavarian Palatinate, and the Oldenburg principality of Birkenfeld; total area, 106 sq. m.; pop. in 1864, 27,374, of whom 3,000 were Roman Catholics, about 200 Jews, and the rest Protestants. The little state was known abroad chiefly for the gambling tables at the watering place of Homburg, the capital. It belonged formerly to Hesse-Darmstadt, and became an independent territory in 1596, when it was allotted to Frederick I. by his father George I. In 1815 Meisenheim was added to its territory. In 1830 disturbances broke out consequent upon the French revolution. In 1835 the landgrave joined the Zollverein. A liberal constitution was promulgated in 1848, but withdrawn in 1852. The last landgrave, Ferdinand, died on March 24, 1866, when the country reverted to Hesse-Darmstadt.

**HESSE-NASSAU**, a province of Prussia, consisting of the former electorate of Hesse-Cassel, the former duchy of Nassau, and the former free city of Frankfort, all of which were annexed to Prussia in 1866, and a few small districts which were ceded by Bavaria and the grand duchy of Hesse. It is bounded by the provinces of the Rhine, Westphalia, Hanover, and Saxony, by Waldeck, Brunswick, the Thuringian states, the grand duchy of Hesse, and Bavaria; area, 6,021 sq. m.; pop. in 1871, 1,400,370, of whom 491,933 were Protestants, 371,736 Roman Catholics, and 36,390 Jews. It is divided into the districts of Cassel and Wiesbaden. The chief towns are Frankfort, Cassel, Marburg, Fulda, and Wiesbaden. The principal rivers are the Main, with its affluent the Kinzig, the Rhine, on the western and southern frontiers, with the Lahn, and the Weser with the Fulda. The surface is mainly mountainous, the chief mountains being the Spessart, Rhön, Westerwald, Taunus, and offshoots of the Vogelgebirge, but it nowhere exceeds a height of 3,000 ft. Prominent among the productions are wine and wood; agriculture and cattle raising are extensively carried on. Among the manufactures, those of cloth, jewelry, iron, and pottery are the most flourishing. The province is noted for the large number of its watering places, the best known of which are Ems, Soden, Wies-

baden, Schlangenbad, and Schwalbach. The province was formed in December, 1868. (See HESSE-CASSEL, NASSAU, and FRANKFORT.)

**HESSIAN FLY**, a small gnat or midge, of the order *diptera*, family *cecidomyiada* or gall gnats, and genus *cecidomyia* (Latr.). It was called Hessian fly from the supposition that it was brought to this country in some straw by the Hessian troops during the revolutionary war; it was scientifically described in 1817 by Mr. Say as *cecidomyia destructor*. The body is about one tenth of an inch long, and the expanse of wings one quarter of an inch or more; the head, antennæ, thorax, and feet are black; the hind body is tawny, marked with black on each ring, and with fine grayish hairs; the wings are blackish, tawny at the narrow base, fringed with short hairs, and rounded at the tip; the legs pale red or brownish; the egg tube rose-colored. The antennæ are long, with bead-like swellings most distinct in the male, surrounded by whorls of short hairs, with 15 to 18 joints, globular in the male, oblong oval in the female; the proboscis is short, without piercing bristles; eyes kidney-shaped; legs long and slender, with the first joint of the feet short; and the wings with few veins. This insect, so destructive in some seasons in the fields of wheat, barley, and rye, generally matures two broods in the course of a year, appearing in spring and autumn, earliest in the southern states; the transformations of some are retarded in various ways, so that their life from the egg to the perfect insect may be a year or more, rendering the continuance of the species in after years more sure. The eggs, about  $\frac{1}{10}$  of an inch long, translucent, and pale red, are placed in the longitudinal creases of the leaves of both winter and spring wheat very soon after the plants are above the ground, to the number of 20, 30, or more on a leaf; if the weather be warm, they are hatched in four or five days, and the larvæ, small footless maggots, tapering at each end, and of a pale red, crawl down the leaf and fix themselves between it and the main stalk, just below the surface of the ground, there remaining head downward till their transformations are completed, nourished by the juices of the plant, which they obtain by suction. Two or three larvæ thus placed will cause the plant to wither and die. In about six weeks they attain their full size,  $\frac{3}{16}$  of an inch long, when the skin gradually hardens and becomes of a bright chestnut color, about the 1st of December in the autumn brood, and in June or July in the spring brood. In the beginning of this, the pupa state, they look

Hessian Fly (*Cecidomyia destructor*), enlarged.

like flax seed; in two or three weeks the insect within becomes detached from the leathery skin, and lies loosely in it, a motionless grub; within this it gradually advances toward the winged state about the end of April or beginning of May, according to the warmth of the weather. When mature, it breaks through this case, enveloped in a delicate skin, which soon splits on the back, setting the perfect insect at liberty. Many of those laid by the spring brood are left in the stubble, and remain unchanged until the following spring; some, however, do not get so low on the stalk as to be out of the way of the sickle, and thus with the straw may be transported long distances, and might have been brought in the flax-seed state across the Atlantic from Europe. The perfect insects, though small, are active and fly considerable distances in search of fields of grain. The insect supposed to be the Hessian fly, which Miss Morris found laying its eggs in the seeds of wheat instead of on the leaves, she afterward ascertained to be another species, which she called *C. culmicola*. This destructive insect was first observed in 1776 on Staten island, near the place of debarkation of the Hessian troops under the command of Sir William Howe; thence it spread to Long Island, southern New York, and Connecticut, proceeding inland at the rate of about 20 miles a year; it was seen at Saratoga, 170 miles from Staten island, in 1789, and west of the Alleghanies in 1797; so great was the destruction, that the cultivation of wheat was abandoned in many places. Burning the stubble in wheat, rye, and barley fields, afterward ploughing and harrowing the land, appears to be the best method of getting rid of this insect; steeping the grain, rolling it in plaster or lime, or other methods of securing a rapid and vigorous growth, sowing the fields with wood ashes and feeding off the crop by cattle in the autumn, are useful accessory means. Various minute parasitic insects, of the hymenopterous order, similar in their habits to the ichneumon flies, destroy a very large proportion of every generation of the Hessian fly, preying upon their eggs, larvæ, and pupæ. The insect which commits such depredations on the wheat crops of Great Britain, *C. tritici* (Kirby), will be described under WHEAT FLY. For details on the history, habits, and transformations of the Hessian fly, the reader is referred to "Insects Injurious to Vegetation," by Dr. T. M. Harris.

**HESYCHIUS.** **I. Saint**, an Egyptian bishop, born about the middle of the 3d century, died in Alexandria in 311. He published an edition of the New Testament mentioned by St. Jerome, as well as a revised edition of the Septuagint, both of which were in general use throughout Egypt and the neighboring countries. He suffered martyrdom in the persecution begun by Diocletian, shortly before its termination. **II. Of Alexandria**, a Greek lexicographer, born in Alexandria about 350. His personal history is unknown. He left a lexicon

considered to be of inestimable value. Some critics say that this work is based on a lexicon composed in the 1st century by Pamphilus of Alexandria, and abridged later by Diogenianus. One manuscript of the work exists in St. Mark's library at Venice; and according to Kopitar (*Hesychii Glossographi Discipulus Russus*, Vienna, 1839), inedited manuscripts of St. Cyril of Alexandria in several European libraries reproduce the work of Hesychius. The first edition was that of Musurus (Venice, 1514); the best is that of Johann Alberti and David Ruhnken (Leyden, 1746-1766; reedited by Schmidt, 4 vols. 4to, Jena, 1857-'64). **III. Of Jerusalem**, a Greek ecclesiastical writer, born in Jerusalem, died in Constantinople about 434. He was educated in his native city, and ordained priest in Constantinople, where he spent the remainder of his life. His principal works are: *In Leviticum Libri VII* (Latin, Basel, 1527; Paris, 1581; the Greek text is lost); *Στιχηρόν* (or *Κεφάλαια*) *τῶν ἰδ' Προφητῶν καὶ Ἑσάτων* (Augsburg, 1602); *Ἡ Ἐναγγελικὴ Συμφωνία* (in Combefis's *Græco-Latinæ Patrum Bibliothecæ Novum Auctarium*, Paris, 1648). His complete works are published in vol. xciii. of Migne's *Patrologie grecque*. Among his lost works is a church history. **IV. Of Miletus**, called the Illustrious, a Greek historian, born at Miletus in Ionia about 470, died about 530. Very little is known of his life. His only existing work is one on celebrated teachers, *Περὶ τῶν ἐν Παιδείᾳ λαμπραντῶν* (Antwerp, 1572, with a translation by Hadrianus Junius). Meursius in his *Hesychii Opuscula* (Leyden, 1613; Leipzig, 1820) published a fragment, *Πάτρια Κωνσταντινουπόλεως*, believed to be the 6th book of a universal history from Belus to the end of the reign of Anastasius I., 518. Photius and Suidas mention this work with praise.

**HETEROCERCAL.** All palæozoic and most mesozoic fishes had a vertebrated tail, the vertebræ extending to its extremity, instead of stopping short at its commencement as in almost all existing fishes. As the vertebral column extended into the upper lobe of the tail, the two lobes were unequal, sometimes very much so; hence such were called by Agassiz heterocercal or uneven-tailed fishes, while those of the ordinary form, the even-tailed, were called homocercal. The placoids (sclachians or sharks) and the ganoids (sturgeons and gar pike), both the extinct and living species, had heterocercal tails; while ordinary fishes (ctenoids and cycloids), from the oölite to the present time, have the lobes of the tail nearly or quite equal. This has been regarded as a mark of the sauroïd character of the early fishes; with other peculiarities, it indicates the high position of

1. Heterocercal (Shark).  
2. Homocercal (Salmon).

these ancient but seemingly prophetic types, and is among the facts that are difficult to explain on the Darwinian theory of development.

**HETEROPODA.** See NUCLEOBANCHIATES.

**HETEROPTERA.** See HEMIPTERA.

**HETMAN.** See ATTAMAN.

**HEUGLIN, Theodor von**, baron, a German traveller, born at Hirschlanden, Württemberg, March 20, 1824, died Nov. 5, 1876. He studied natural history and pharmacy, travelled through Europe, and went in 1850 to Egypt, and explored Arabia Petræa and the shores of the Red sea. Having been appointed in 1852 secretary to Dr. Reitz, Austrian consul at Khartoom, he accompanied him to Abyssinia. Reitz having died, Von Henglin succeeded him as consul, and continued his explorations in the region of the White Nile. In 1856 he visited Greece and the shores of Asia Minor, and in 1860 he took charge of an expedition in search of the traveller Edward Vogel. After searching in the Galla country and parts of Abyssinia, he returned to Khartoom in July, 1862. Early in 1863 he set out with Steudner to re-explore the course of the White Nile. In 1865 he returned to Europe. In 1870-'71 he explored Spitzbergen and Nova Zembla, and in 1875 returned to Africa and entered the khedive's service. His works include *Reisen in Nordostafrika* (Gotha, 1857); *Reise nach Abessinien und den Gall. ländern* (Jena, 1868); *Ornithologie Nordostafrikas* (Cassel, 1863 *et seq.*); *Reise in das Gebiet der westlichen Zuflüsse des Weissen Nil* (Leipsic, 1869); and *Reisen nach dem Nordpolarmeer* (3 vols., 1872-'4).

**HEVELIUS** (HEWEL, or HEWELKE), **Johannes**, a Polish astronomer, born in Dantzie, Jan. 28, 1611, died there, Jan. 28, 1688. He was of noble birth, studied at Leyden, applied himself to improving optical instruments, and established in his house a private press from which most of his works were issued. He was chosen councillor in 1651. In 1641 he constructed an observatory, called Stellaburgum, which he provided with instruments chiefly of his own manufacture. In 1679 he was visited by Halley, whom the royal society of London had requested to examine his observations. In that year his observatory was burned down, with his library and many of his manuscripts. He soon rebuilt it, and continued his astronomical pursuits till his death. As an observer he ranked next to Flamsteed among the astronomers of his age. His works include *Selenographia* (1647), *Cometographia* (1668), *Machina Cœlestis* (1673-'9), *Firmamentum Sobiescianum* (1690), and *Prodromus Astronomiæ* (1691).

**HEVES. I.** A central county of Hungary, bordering on the counties of Gömör, Borsod, Szabolcs, Békés, Csongrád, and Pesth; area, 2,546 sq. m.; pop. in 1869, 332,613, of whom the great majority were Magyars. It is watered by the Theiss, Zagyva, Eriau, and Tarna. Its chief products are wine, corn, and tobacco; and it has a considerable manufacturing industry and a brisk trade. Capital, Erlau.

**II.** A town of the preceding county, 55 m. E. N. E. of Pesth; pop. in 1869, 5,703. The inhabitants produce wine, corn, and tobacco.

**HEWES, Joseph**, one of the signers of the Declaration of Independence, born at Kingston, N. J., in 1730, died in Philadelphia, Nov. 10, 1779. He was educated at Princeton college, and went to Philadelphia to engage in mercantile business. About 1760 he removed to North Carolina, and settled in Edenton, and in 1774 was sent as a delegate to the general congress at Philadelphia. Soon after taking his seat he was appointed on a committee to "state the rights of the colonies in general, the several instances in which those rights are violated or infringed, and the means most proper to be pursued for obtaining a restoration of them," and aided in the preparation of its report. The congress adjourned in October, and a new one met in the succeeding May, of which Mr. Hewes was again chosen a member, and served on many important committees during 1775-'6. In 1777 he declined a reelection, but resumed his seat in July, 1779.

**HEYDEN, Jan van der**, a Dutch painter, born at Gorkum about 1637, died in Amsterdam in 1712. His best works represent the most picturesque views and public buildings of Amsterdam and other cities of the Netherlands, Germany, and England. He was a master of chiaroscuro and perspective, and his paintings were generally embellished with figures by Adrian van der Velde and by Lingelbach. The finish of his productions was remarkable. He was director of fire-extinguishing companies, and in 1690 published an illustrated work on his improvements in fire engines.

**HEYLIN, Peter**, an English theologian, born in Burford, Oxfordshire, in 1600, died in London, May 8, 1662. He was educated at Oxford, read lectures on history and geography, was made D.D., and in 1629 was nominated, at the request of Laud, one of the chaplains in ordinary to the king. He was a zealous royalist, and in the time of the rebellion his property was confiscated by the parliament, and he himself was obliged to fly to Oxford, where he edited the journal called *Mercurius Aulicus* till 1645. On the restoration he was appointed sub-dean of Westminster by Charles II. His writings comprise about 37 works, chiefly on church history and polemics. Some of them passed through several editions, and his "Ecclesia Restaurata, History of the Reformation of the Church of England," with his life by his son-in-law John Barnard, D.D., was reprinted in 1849 (2 vols. 8vo, Cambridge).

**HEYNE, Christian Gottlob**, a German philologist, born in Chemnitz, Saxony, Sept. 25, 1729, died in Göttingen, July 14, 1812. He studied philology and the classics at Leipsic, and afterward obtained at Dresden a situation as under secretary in the library of the minister Brühl, where he became intimate with Winckelmann, then a young, poor student like himself. In 1763 he was appointed to fill the chair of elo-

quence and poetry in the university of Göttingen, and he remained connected with that institution till his death. He published his views on the manner of studying the ancient authors in his edition of the *Apollodori Bibliotheca* (4 vols., Göttingen, 1782), and in several essays, which appeared in the "Transactions of the University of Göttingen." He was made chief librarian of the library of Göttingen, perpetual secretary of the royal society, and foreign member of the institute of France. Both as a teacher and writer he powerfully contributed toward the dissemination of a profound and philosophical knowledge of antiquity. He published editions of Tibullus (Leipsic, 1755), Epicetetus (1756), Virgil (4 vols., 1767-'75), Pindar (2 vols., Göttingen, 1773-'4), the Iliad (8 vols., Leipsic, 1802), Diodorus Siculus, and other classic authors. His life has been written by his son-in-law Heeren.

**HEYSE. I. Karl Wilhelm Ludwig**, a German philologist, born in Oldenburg, Oct. 15, 1797, died in Berlin, Nov. 25, 1855. He was for eight years a teacher in the family of Mendelssohn-Bartholdy, and subsequently was a professor at the university of Berlin. He prepared new editions of popular German grammars and dictionaries by his father, Johann Christian August (1764-1829), and published several similar works. His most valuable contribution to philology was edited after his death by Steindthal under the title of *System der Sprachwissenschaft* (Berlin, 1856). **II. Johann Ludwig Paul**, a German author, son of the preceding, born in Berlin, March 15, 1830. He studied in Berlin, Bonn, and Italy, and in 1854 became a permanent resident of Munich, at the request of the king Maximilian II. He married in the same year a daughter of the art historian Kugler. Numerous collections of his novels in verse and prose have appeared, and some of them have been translated into English. A fifth edition of his *Neue Novellen* was published in 1874. One of his finest poems is *Thekla* (Stuttgart, 1858), and his best known plays are *Franziska von Rimini* (Berlin, 1850), *Die Sabinerinnen* (1859), and *Ludwig der Bayer* (1866), contained in his *Dramatische Dichtungen* (6 vols., 1870). His latest and best novel is *Die Kinder der Welt* (1873).

**HEYWARD, Thomas**, one of the signers of the Declaration of Independence, born in St. Luke's, S. C., in 1746, died in March, 1809. After completing his classical and legal studies in London, he returned home, and began the practice of the law. He was a member of congress in 1775-'6, was appointed judge in 1778, and the next year was reelected to congress. In 1780 he was made a prisoner in Charleston, where he had commanded a body of militia, and was sent to St. Augustine. He continued in public life as a judge till 1798.

**HEYWOOD**, a town of Lancashire, England, on a branch of the Manchester and Leeds railway, 8 m. N. of Manchester; pop. in 1871, 21,248. It has extensive and flourishing manu-

factories of cotton; there are also machine and boiler works, iron foundries, and paper mills.

**HEYWOOD, John**, an English humorist, born probably at North Mims, near St. Albans, in the early part of the 16th century, died in Mechlin in 1565. He was educated at Oxford, and became a favorite of Henry VIII. and subsequently of Queen Mary. He is the author of a number of humorous "interludes," the best known of which, perhaps, is "The Four P's," and of a burlesque allegory called "The Spider and the Fly." From his "Six Centuries of Epigrams," he has been called the epigrammist. A new edition of his "Proverbs," by Julian Sharman, was published in London in 1874.

**HEYWOOD, Thomas**, an English dramatist, born in Lincolnshire in the latter half of the 16th century, died about 1650. He was educated at Cambridge, and was an actor as well as a writer. He wrote the whole or the greater part of 220 plays, of which but 23 survive. Some of them, such as "A Woman Killed with Kindness" and "The Four London Prentices," are not inferior to the productions of Massinger, Ford, and others of his contemporaries. Charles Lamb calls him "a sort of prose Shakespeare." The first complete edition of his dramatic works was published in 1874 (6 vols., London).

**HEZEKIAH**, king of Judah, succeeded his father Ahaz about 727 B. C., when he was 25 years old, died about 698. Following the injunctions of the prophet Isaiah, on his accession he took measures to break up the idolatrous customs into which the people had fallen during the life of his father, and to repair the losses and defeats they had suffered. Early in his reign the Assyrians invaded the neighboring kingdom of Israel, and carried away the ten tribes to provinces beyond the Tigris; but notwithstanding the power and threats of the conquerors, Hezekiah refused to acknowledge subjection to Assyria, or to pay the tribute which had been imposed and paid during the reign of his father. In consequence of this, the Assyrian king Sennacherib invaded his kingdom; but after various exploits his army met with a sudden destruction, and the survivors precipitately retreated. About this time he was seized by a dangerous illness, the unexpected recovery from which he celebrated in a poetical "writing" preserved in the book of Isaiah (xxxviii.). A messenger having been sent by the king of Babylon to compliment him on his restoration to health, the king of Judah displayed before him his accumulated treasures; and for this he was informed by Isaiah that from Babylon, and not from Assyria, would come the ruin and captivity of Judah. He ended his reign in peace.

**HIACOOMES**, the first Indian convert to Christianity in New England, born about 1610, died in Martha's Vineyard about 1690. He was converted under the preaching of the missionary Thomas Mayhew, and having been taught to read, he began in 1653 to preach to his

brethren in Martha's Vineyard. He succeeded in making a number of converts among them, notwithstanding the menaces directed against him by the Indian priests. In August, 1670, an Indian church was formed at Martha's Vineyard, and Hiacoomes became its pastor.

**HIBBARD, Freeborn Garretson**, an American clergyman, born in New Rochelle, N. Y., Feb. 22, 1811. At the age of 18 he entered the ministry of the Methodist Episcopal church in the New York conference, and continued in this work, chiefly in western New York, from 1830 to 1860, when he was elected editor of the "Northern Christian Advocate" at Auburn. In 1864 he resumed the active pastorate. Dr. Hibbard's principal works are: "Baptism, its Import, Mode, Efficacy, and relative Order" (New York, 1841); "Geography and History of Palestine" (1845); "The Psalms, chronologically arranged, with Historical Introductions, and a General Introduction to the whole Book" (1852); and "The Religion of Childhood, or Children in their Relation to Native Depravity, to the Atonement, to the Family, and to the Church" (1864). He has also edited "The Works of the Rev. Leonidas L. Hamline, D. D." (1872).

**HIBERNATION** (Lat. *hibernare*, to stay in winter quarters), generally understood as the condition of lethargy, in which many animals pass the cold season. The sources of their daily food being at this time cut off, they sink into a deep sleep, in which nutriment is unnecessary, and so remain until the warm weather of spring; a remarkable provision for the preservation of animals which would otherwise perish from cold and hunger. Among the animals in which this state has been noticed are the bat, hedgehog, dormouse, hamster, marmot, and other rodents; chelonians, saurians, ophidians, and batrachians; and some fishes (like the eel), mollusks, and insects. The phenomena of hibernation, however, are not confined to the winter season, and are not necessarily connected with a low degree of external temperature; the bats, in the summer time, present these phenomena regularly every 24 hours; the tenrec, a nocturnal insectivorous mammal, though living in the torrid zone, according to Cuvier, passes three of the hottest months of the year in a state of lethargy. The influence of cold in producing this state is due only to its tendency to cause sleep, and if carried too far, instead of inducing the physiological condition of hibernation, leads to the pathological one of torpor, and even death. According to Marshall Hall ("Cyclopædia of Anatomy and Physiology," article "Hibernation"), the quantity of respiration is inversely as the degree of irritability of the muscular fibre, the former being measured by the amount of oxygen inspired, and the latter by that of the galvanic force necessary to demonstrate its existence. Birds have a high respiration and a low muscular irritability; reptiles, on the contrary, have a high degree of irritability and a

low respiration. This is true also of the progressive development of animals from the immature to the perfect state, in which the change is from a lower to a higher respiration, and from a higher to a lower muscular irritability. In sleep, and especially in the profound sleep of hibernation, the respiration is diminished and the irritability increased. Sleep and hibernation are similar periodical phenomena, differing only in degree, and the latter is extraordinary only because less familiar than the former; the ordinary sleep of the hedgehog and dormouse, and of the bat in summer, is a diurnal hibernation, ceasing daily at the call of hunger, and accompanied by a diminution of respiration and animal heat; and this sleep may pass into true hibernation as the blood becomes more venous in the brain, and the muscular fibres of the heart acquire increased irritability. In perfect hibernation the process of sanguification is nearly or entirely arrested; the bat takes no food, and passes no excretions from the intestines or kidneys; but the dormouse awakes daily, and the hedgehog every two or three days, in a temperature of 40° to 45° F., and they take food and pass excretions, and subside again into their lethargy. Respiration is also very nearly or entirely suspended in perfect hibernation, as has been experimentally proved by the absence of all external respiratory acts, by the unchanged condition of the surrounding air, by the diminution of the animal heat to that of the atmosphere, and by the capability of supporting the entire privation of air or the action of carbonic acid and other irrespirable gases. The circulation, though very slow, is continuous, and the heart beats regularly; the blood, from the absence of respiration, is entirely venous, but the increased muscular irritability of the left ventricle of the heart permits it to contract under the slight and usually insufficient stimulus of a non-oxygenated blood; it is the exaltation of this single vital property which preserves life and renders hibernation possible, forming the only exception to the general rule of the circulation in animals which possess a double heart; the slow circulation of a venous blood keeps up a state of lethargy induced by a diminished respiration. Sensation and volition are quiescent, as the brain and its sensory ganglia are asleep, but the true spinal or excito-motory system is awake and its energies are unimpaired, as is shown by the facility with which respiration is excited by touching or irritating the animal; muscular motility is also unimpaired in this state; the action of the heart has been found to continue about ten hours in an animal in the state of hibernation, in which the brain had been removed and the spinal marrow destroyed, while in the same animal in a natural state it ceases after two hours. With such an irritable condition of the heart, the introduction into it of an arterial or oxygenated blood from respiration would soon cause death from over stimulation; and as trifling causes are sufficient

to excite the respiratory act, hibernating animals adopt various means of securing themselves from disturbance; bats retire to the recesses of gloomy caverns, where they hang suspended by the claws of the hind feet, head downward; the hedgehog and the dormouse roll themselves into a ball; tortoises burrow in the earth, frogs and eels plunge under the mud, and snakes twist themselves together in natural or artificial crevices and holes in the ground. The call of hunger and the warmth of returning spring arouse all these from their winter retreats, the irritability gradually diminishing as the respiration becomes active. Extreme cold will rouse a hibernating animal from its lethargy and speedily kill it; hence many animals congregate in carefully prepared nests, and others, like the snakes, entwine themselves for mutual protection from cold. The state of hibernation, or that in which the stimulus of venous blood is sufficient to continue the heart's action, finds a parallel in some cases of disease accompanied by lethargy, in which revival has occurred after supposed suspended animation, and in others in which actual death has been delayed for days after the apparent cessation of respiration and circulation; the causes of this condition, which might throw much light on the kinds and phenomena of death, have not been fully investigated in the human subject. The torpor produced by extreme cold, though sleep be always induced, is very different from true hibernation; the former is attended with diminished sensation and rigidity of the muscles, and if prolonged ends in arrest of the circulation and death; the latter, in which sensation and motility are unimpaired, has for its object the preservation of life; the hibernating bat or dormouse is aroused from its sleep by too great cold, and is destroyed by it like any other animal. Most animals lay up a store of fat under the skin, which is slowly absorbed during hibernation; in the frogs, and probably in many reptiles, the adipose accumulation takes place within the abdominal cavity in the folds of the peritoneum, for a similar purpose. The phenomena of insect hibernation are very interesting in all stages of growth; many pass the winter in this condition, both above and beneath the surface of the ground; eggs and chrysalids have been known to withstand a temperature several degrees below the freezing point of water. It is well known that many species of fish may become stiff from cold and yet not perish, but actual congelation is fatal; in the so-called frozen fishes which have revived in warm water, there must have been a low degree of vital action in the organs of circulation. In batrachians the necessary respiration may be effected entirely through the skin, in the hibernating state. The lower animals generally seem to possess a remarkable power of resisting cold, and may be reduced to a condition of apparent death, without the irritability of hibernation, and yet not identical with the torpidity usually produced by cold.

#### HIBERNIA. See IRELAND.

**HIBISCUS**, the rose mallow, a genus of *malvaceæ*, the mallow family, which differs from the common representatives of that family in having its fruit a pod, which is five-celled, and at maturity splits through the five valves without leaving a central axis. The flowers, which are large and showy, have the general structure peculiar to the order, as in the single hollyhock; immediately beneath the calyx is an involucre of numerous narrow bracts. The genus includes about 150 species of herbs, shrubs, and even trees, and is more abundant in tropical than temperate climates. The name is an ancient one of obscure meaning. The most common native species along the Atlantic coast is *H. Moscheutos*, the swamp rose mallow, which is often very abundant in brackish marshes and along rivers far beyond the reach of salt water; it is also found inland in the vicinity of salt springs. As it grows

*Hibiscus Moscheutos.*

from 4 to 7 ft. high, and has numerous pink (rarely white) blossoms 5 or 6 in. across, it is one of the most noticeable of midsummer flowers. The three-lobed leaves are downy and soft to the touch. This is an herbaceous species, sometimes cultivated in gardens, and by nurserymen under the name of *H. palustris*. Like other plants of the family, this has a strong fibrous inner bark, and about ten years ago there was an attempt at speculating in the seeds and plants at high prices under the name of American jute. It was asserted that it could be profitably cultivated for its fibre, which was said to be as valuable as jute; but it has not yet found a place among the fibres of commerce. *H. grandiflorus*, with flowers a foot wide, *H. militaris*, with halberd-shaped leaves, and *H. coccineus*, with large bright scarlet flowers, are among the tall-growing native species found in the southern states. *H. trionum*, the bladder-ketmia or flower-of-

an-hour, a smaller European species, has sulphur-yellow flowers with a blackish eye, and was formerly cultivated in gardens, where it became naturalized and now remains as a weed. *H. esculentus* is cultivated for its edible pods. (See OKRA.) The best known of the shrubby species is *H. Syriacus*, which was introduced into cultivation from the Levant over two centuries ago. It is known in gardens and nursery catalogues as the shrubby althæa, the old name for it being *althæa frutex*; it is also called rose of Sharon, a name that appears to be peculiar to this country. If left to itself, this will form a tall unshapely shrub 10 ft. or more high, with long swaying branches; it is usually kept closely pruned, and when cut back severely produces a profusion of flowers, which are like those of the hollyhock, but smaller; there are double varieties, which, as well as the single, range in color from white to deep purple. As it blooms late in summer,

Rose of Sharon (*Hibiscus Syriacus*).

will grow in almost any soil, and presents such a great variety in its flowers, it is justly regarded as one of the most valuable ornamental shrubs. There is a variety with its leaves distinctly margined with white, but it does not flower freely. Two woody species are found in Florida: *H. Floridanus*, 4 or 5 ft. high, and *H. tiliaceus*, a large tree. Some of the greenhouse species are very showy, the most common of which is *H. rosa Sinensis*, the rose of China; it is from the East Indies, where its brilliant scarlet flowers are used to black shoes; there are white, purple, rose-colored, and other varieties of it.

**HICCOUGH**, a spasmodic contraction of the diaphragm, producing a shock in the thoracic and abdominal cavities, and accompanied by a convulsive inspiration in which the column of air is arrested by the sudden closing of the glottis, and by a loud and well known clucking

sound. Authors are not agreed as to the origin of this act, but the movement is undoubtedly of a purely reflex character; though the spasmodic action be in the diaphragm, its point of departure may be in the abdominal organs or in the nervous centres. In ordinary cases it comes and goes spontaneously, and is a matter of no consequence beyond a slight inconvenience under certain circumstances; but it may be preceded by gastric symptoms, pain, and eructations, be accompanied by labored respiration, and be so persistent and severe as to require active treatment. It is often seen in children and in adults who have eaten or drunk immoderately or hastily, after long fasting, in diseases of the stomach, intestines, and liver, and in nervous persons troubled with flatulence; it becomes an important diagnostic sign in peritonitis, strangulated hernia, and other intestinal obstructions; it is not uncommon in intermittent fevers, and is a grave symptom in typhoid and gangrenous affections accompanied by other spasmodic phenomena. In nervous persons it may be brought on by any excitement, and generally disappears with its cause; if not, a few swallows of cold or acidulated water, cold sprinkling, or vivid emotion of any kind, will put an end to it in a few moments. Obstinate cases are on record, which required cold shower baths, ice externally and internally, narcotics, and revulsives to the epigastrium. When intermittent, it yields to quinine; if symptomatic, the nature of the disease will indicate its treatment.

**HICKES, George**, an English author, born at Newsham, Yorkshire, June 20, 1642, died Dec. 15, 1715. He studied at Oxford, and in 1664 was chosen fellow of Lincoln college. In 1675 he became rector of St. Ebbe, and in 1676 chaplain to the duke of Lauderdale, with whom he went the following year to Edinburgh. In 1682 he was made one of the king's chaplains, and in 1683 dean of Worcester. He was a violent Jacobite, refused to take the oath to William III. in 1689, and was deprived of all his benefices. He protested vehemently, by placard affixed to the door of Worcester church, and retired to London, where he remained for several years in concealment. In 1693 he was sent with a list of the nonjuring clergy to the exiled king at St. Germain, and in 1694 was consecrated suffragan bishop of Thetford by Archbishop Sancroft. His principal works are: *Institutiones Grammaticæ Anglo-Saxonicæ* (4to, 1689); *Antiquæ Litteraturæ Septentrionalis Thesaurus* (3 vols. fol., Oxford, 1703-'5); "The Christian Priesthood, and the Dignity of the Episcopal Order" (London, 1711; new ed., 3 vols., Oxford, 1847); *Bibliotheca Scriptorum Ecclesiæ Anglicanæ* (1709); and "Sermons" (2 vols., 1713).

**HICKMAN. I.** A W. central county of Tennessee, drained by Duck and Piney rivers; area, 550 sq. m.; pop. in 1870, 9,856, of whom 1,471 were colored. The surface is uneven,

and the soil rich and well watered. Iron ore is abundant. The chief productions in 1870 were 41,536 bushels of wheat, 514,554 of Indian corn, 34,202 of oats, 43,150 of peas and beans, 17,364 of Irish and 15,226 of sweet potatoes, 121,556 lbs. of butter, and 755 bales of cotton. There were 2,374 horses, 1,790 mules and asses, 2,600 milch cows, 4,438 other cattle, 6,927 sheep, and 23,793 swine; 1 manufactory of cotton goods, 2 flour mills, 5 tanneries, and 3 saw mills. Capital, Centreville.

**II.** A S. W. county of Kentucky, touching Tennessee on the S. E., separated from Missouri by the Mississippi river, and drained by several small streams; area, 220 sq. m.; pop. in 1870, 8,453, of whom 1,635 were colored. The surface is gently undulating, and the soil consists of rich mould with a substratum of sand. The Mobile and Ohio railroad passes through it. The chief productions in 1870 were 48,190 bushels of wheat, 350,860 of Indian corn, 570,287 lbs. of tobacco, 10,416 of wool, 53,650 of butter, and 308 bales of cotton. There were 1,385 horses, 858 mules and asses, 3,871 cattle, 5,010 sheep, and 13,948 swine. Capital, Clinton.

**HICKOK, Laurens Perseus**, an American metaphysician, born in Danbury, Conn., Dec. 29, 1798. He graduated at Union college in 1820, devoted himself to theology, was licensed as a preacher in 1822, and was pastor successively at Newtown, Kent, and Litchfield, till in 1836 he was elected professor of theology in the Western Reserve college, Ohio, where he remained eight years. In 1844 he became professor in the Auburn theological seminary, and in 1852 removed to Schenectady, N. Y., to become professor of mental and moral science and vice president of Union college. He became president of the college March 1, 1866, and resigned July 20, 1868, when he removed to Amherst, Mass., where he now (1874) resides. He has published "Rational Psychology" (8vo, Auburn, 1848); "Moral Science" (Schenectady, 1853); "Empirical Psychology, or the Human Mind as given in Consciousness" (1854); "Rational Cosmology" (New York, 1858); "Creator and Creation, or the Knowledge in the Reason of God and His Works" (Boston, 1872); and "Humanity Immortal, or Man Tried, Fallen, and Redeemed" (1872). He is now (1874) preparing for publication a work entitled "Rational Logic, or True Logic must Strike Root in Reason."

**HICKORY** (*carya*, Nuttall), the common name of several species of timber trees, with large compound leaves, having from 5 to 15, but usually not more than 11 leaflets. The hickories belong to the natural order of *juglandaceæ*, which comprise but two other genera besides this and the walnuts. The flowers of the hickory are of two kinds: sterile, which are borne in compound catkins, each principal catkin having two opposite branches, the stamens from four to eight in each flower; and fertile, which are solitary or else in small groups

at the ends of the branches. The fruit is a large roundish nut, the husk of which opens partially or wholly of itself by four seams. The genus *carya* is exclusively American, and is distinguished from *juglans*, the walnuts, by several characters, the most noticeable of which is the splitting of the husk; this in the walnut dries up on the nut. There are nine or ten species, all of them remarkable for stateliness and general beauty. In the autumnal scenery the foliage of the hickories contributes a pleasing share, each species possessing its own peculiar hues and tints. As an ornamental tree the hickory can be recommended, but on account of the difficulty of transplanting it is seldom planted; it is best to plant the nuts where the trees are to stand, in spring, they having been kept buried all winter; two or three nuts are planted near together, and if all grow, all but one are removed. The hickory seldom survives when taken from the woods, as its roots are large, few in number, and easily killed. Attempts to graft the hickory are rarely successful; it has been accomplished by setting the graft just below the surface of the ground; the French nurserymen are said to succeed by herbaceous grafting, *i. e.*, the scion and stock are both of unripe wood. On account of the density and tenacity of the wood of the hickories, it has a wide application in the arts, and its uses are too many to enumerate; that furnished by the different species is so much alike that it is difficult to distinguish them; it is liable to the attacks of insects, and decays rapidly when exposed. As a fuel it excels all other northern woods; it makes a hard charcoal, and the ashes are very rich in potash. The fruit of the species vary much in size and form, and it is often impossible to distinguish them by one character alone. The bitter-nut hickory (*C. amara*, Nutt.) is the most graceful and remarkable for its finely cut foliage. It raises a noble columnar top to the height of 60 or 70 ft., enlarging upward, and broadest at 40 or 50. Its recent shoots are of an orange green, smooth and dotted with orange. Its fruit, however, is intensely bitter. It is the least valuable species. The pig-nut hickory

1. Pig Nut.

2. Bitter Nut

(*C. porcina*, Nutt.) is also a large tree, with a close bark and very tough and valuable wood; its sprouts are used as withes; the wood is preferred by many artisans to that of any other species; it is especially useful for axe helvies and wagon axles. Its fruit is variable in size

and form, and is abundant, but of a disagreeable taste. The small-fruited hickory (*C. microcarpa*, Nutt.) grows in the moist woodlands of New York and southward, and its trunk rises to the height of 60 or 80 ft.; its fruit is small, but eatable. The mocker-nut hickory

Hickory.—1. Shell Bark. 2. Mockernut.

(*C. tomentosa*, Nutt.) is a fine stately tree of slow growth, with an erect trunk, forming at the summit a graceful pyramidal head of a few moderate-sized branches. The large round buds readily distinguish it from the next species. It is sometimes called white-heart hickory, although the wood in the old trees does

Mockernut (*Carya tomentosa*).

not differ in color from that of the other kinds. The nut varies greatly in the thickness of the shell and in form; one variety is called the square nut; the kernel is sweet, but is very difficult to extract, a fact which is supposed to have given the name mocker-nut.

The variety *maxima* (Nutt.) bears "fruit as large as an apple," with a very thick husk. The shell-bark or shag-bark hickory (*C. alba*, Nutt.) is easily distinguishable by its shaggy bark, its excellent fruit, and its rather small, ovate leaf buds. The shag-bark is a stately tree, rising to about 60 to 80 ft. Its branches are irregular and scattered; but when growing singly in open space, the tree attains much beauty and gracefulness. The delicious flavor of its fruit is not surpassed by any foreign nut. The nuts vary greatly; some individual trees have nuts with astonishingly thin shells, and were it not for the difficulty of grafting these might be propagated. Large quantities of the nuts, brought from districts where the species grows best, are readily disposed of in the markets. In the woods of Pennsylvania and westward to Illinois and Kentucky, the western shell-bark hickory (*C. sulcata*, Nutt.) is found, having nuts twice as large as the preceding, with a strong point at each end; the kernel is sweet, but of inferior flavor to that. The pecan hickory (*C. oliviformis*, Nutt.) is a more western and southern species. (See PECAN.) The nutmeg-fruited hickory (*C. myristiciformis*, Nutt.) is a rare and local species found in South Carolina, the fruit of which is very small, smooth, and brown, streaked with white, and strongly resembling a nutmeg; the kernel is of small size and little value.

**HICKORY**, a S. W. county of Missouri, intersected by the Pomme de Terre river, a tributary of the Osage; area, 408 sq. m.; pop. in 1870, 6,452, of whom 90 were colored. It has a moderately uneven surface, covered in some places by a good growth of timber, and a rich soil. The chief productions in 1870 were 43,696 bushels of wheat, 271,582 of Indian corn, 65,573 of oats, 16,715 of potatoes, 42,164 lbs. of tobacco, 105,040 of butter, and 3,292 tons of hay. There were 3,543 horses, 2,569 milch cows, 5,387 other cattle, 8,280 sheep, and 11,970 swine. Capital, Hermitage.

**HICKS, Elias**, an American preacher of the society of Friends, born in Hempstead, N. Y., March 19, 1748, died in Jericho, N. Y., Feb. 27, 1830. While a youth he manifested a talent for public speaking, and at the age of 27 was a well known preacher. For many years he labored zealously in advancing the generally accepted doctrines of the Friends; but having as he believed discovered errors in these tenets, he put forth views of his own which he defended with energy and ability. To advance these views he travelled extensively in the United States and in the British provinces, attracting large congregations by his oratory. The result was a schism in the body of Friends; those adhering to the old doctrines being specially termed orthodox, while the followers of Hicks were called after him Hicksites. (See FRIENDS.) He preserved his intellectual vigor till late in life, visiting when 80 years of age New Jersey, Pennsylvania, Maryland, Ohio, Indiana, and the north-

ern and western parts of New York. His theological writings were principally in an epistolary form.—See "Elias Hicks, Journal of his Life and Labors" (Philadelphia, 1828), and his "Sermons" (1828).

**HICKS, George E.** See supplement.

**HICKS, Thomas**, an American painter, born in Newtown, Bucks co., Pa., Oct. 18, 1823. He attempted portrait painting in his 15th year, and in 1838, after copying the casts in the Pennsylvania academy of fine arts, entered the schools of the national academy of design in New York, in which he exhibited "The Death of Abel" in 1841. For several years he painted portraits and compositions, and in 1845 went to Europe. He passed three years in Italy, chiefly at Rome, afterward studied under Couture in Paris, where he remained about a year, and after a brief residence in England returned to New York in 1849. He has since devoted himself principally to portrait painting, but has occasionally produced landscapes and figure pieces. Among his portraits are those of Dr. Kane in the cabin of the *Advance*, Longfellow, Margaret Fuller, Henry Ward Beecher, Edwin Booth as Iago, and a large picture of the "Contemporaneous Authors of America." In 1865 he published a eulogy on Thomas Crawford.

**HIDALGO**, a word applied in Spain to every noble man or woman, but strictly the title of the lowest order of nobility, constituting the *hidalgua*. Some writers derive the word from *hijo del Goto*, the son of a Goth, such descent being held in Spain to imply greater purity of blood than when intermixed; others from *hijo de alguno*, son of somebody. *Hidalgos* are divided into *hidalgos de naturaleza*, deriving their privileges from their ancestors, and *hidalgos de privilegio*, who have purchased their rank, or obtained it by court favor instead of descent, and are in this respect on an equality with simple *caballeros* and *escuderos*, or knights and squires. A *hidalgo de bragueta* was one supposed to possess the privileges of nobility from being the father of seven sons without an intervening daughter; and a *hidalgo de gotero* was one who enjoyed the rights of nobility in one place alone. The privileges of the *hidalgos* were abolished by the introduction of the constitutional system. In Portugal the word *fidalgua* embraces all the nobility under the common denomination of *fidalgos*.

**HIDALGO**, a S. W. county of Texas, separated from Mexico by the Rio Grande, which is navigable all along the border; area, 3,200 sq. m.; pop. in 1870, 2,387, of whom 41 were colored. About half of it is sandy and fit only for pasture; the other half is productive with irrigation, and will yield two crops a year. The principal trees are the live oak, mezquite, and ebony elm, which attain but a small size; the ash and willow grow in the valley of the Rio Grande. Stock raising is the chief industry. There is a salt lake, known as Sal del Rey, from which large quantities of

salt of superior quality are taken to northern Mexico. The chief productions in 1870 were 7,380 bushels of Indian corn and 117 bales of cotton. There were 3,459 horses, 4,496 milch cows, 13,645 other cattle, 11,270 sheep, and 555 swine. Capital, Edinburgh.

**HIDALGO Y COSTILLA, Don Miguel**, a Mexican revolutionist, born in South America in the latter part of the 18th century, shot at Chihuahua, Mexico, July 27, 1811. He was a priest, and in early life was noted for the conscientious fulfillment of his ecclesiastical functions. He is said to have introduced the silkworm into Mexico, and did much to promote the culture of the vine. The policy of the Spanish government being to discourage all manufactures or agriculture which could interfere with the revenue, the vines planted by Hidalgo were destroyed. This drove him to rebellion. Possessing much influence among the Indians, he formed the plan of a general insurrection, which was to take place Nov. 1, 1810; but the plot having been disclosed by one of the conspirators, some of his party were arrested, and he was obliged to precipitate his movements. In September, having been joined by three officers of the garrison of Guanajuato, he raised the standard of revolt. His eloquence had a remarkable effect on the multitude who heard him, and when after his oration he unfurled a rude copy of the picture of Our Lady of Guadalupe, the patroness of Mexico, the war assumed the character of a crusade. On Sept. 29, with an army of 20,000 men, mostly Indians, he captured Guanajuato, on which occasion the greatest outrages were committed, and \$5,000,000 plundered. He took Valladolid and several small places, and soon after was proclaimed generalissimo of the Mexican army, and advanced against Mexico; but, having been excommunicated by the archbishop, the disorders and desertions consequent upon this measure, as well as the total want of ammunition, compelled him to retreat. He was defeated at Aculco by Calleja on Nov. 7, driven soon after from Guanajuato with great slaughter, and totally routed at the bridge of Calderon, Jan. 17, 1811. Leaving the remnant of his forces at Saltillo under the command of Rayon, Hidalgo set out for the United States to obtain arms and military aid; but he was betrayed on the way into the hands of the Spaniards by one of his associates, Elizondo, March 21, carried to Chihuahua, degraded from the priesthood, and shot. After his death he was regarded as a saint by the people, and within a few years the place of his execution was shown as a holy spot.

**HIDDENITE.** See supplement.

**HIDES.** See LEATHER.

**HIERAPOLIS** (sacred city). **I.** An ancient city of Phrygia, between the rivers Lycus and Mæander, celebrated for its warm springs and its cave Plutonium, from which arose a mephitic vapor which was said to be poisonous to all but the priests of Cybele. It was the seat of

a Christian church in the time of St. Paul, who mentions it in his epistle to the Colossians (iv. 13). Its ruins, with stalactites and incrustations formed by its warm springs, are found at an unoccupied place called Bambuk-Kalesi. It was the birthplace of Epictetus the philosopher. **II.** An ancient city of Syria, between Antioch and Carrhæ in Mesopotamia, called Bambyce by the early natives, one of the chief seats of the worship of Astarte or Ashtoreth, and a great emporium under the Seleucidæ.

**HIERO, or Hieron** (Gr. *Ἱέρων*). **I.** Tyrant of Syracuse, succeeded his brother Gelon about 478 B. C., died in Catana in 467. After having made peace with his brother Polyzelus and Theron of Agrigentum, with whom he had been at variance, he turned his attention to foreign conquest. In Sicily he made himself master of Naxos and Catana, whose inhabitants he transferred to Leontini, while he repopled those cities with colonists of Dorian origin. In Italy he prevented the destruction of Locri by threatening its enemy Anaxilas with war, and subsequently effected the expulsion of the tyrant Micythus from Rhegium. But the most glorious event of his reign was his great victory over the Etruscan fleet near Cumæ, in 474. He was a liberal patron of poets and philosophers. His triumphs at the Olympian and Pythian games are celebrated in the odes of Pindar. **II.** King of Syracuse, son of Hierocles, born about 307 B. C., died about 216. He was appointed commander after the departure of Pyrrhus in 275, and in consequence of a great victory over the Mamertines was raised to the throne by the suffrages of his fellow citizens in 270. His great object appears to have been the expulsion of the Mamertines from Sicily; and when the Romans took them under their protection, Hiero allied himself with the Carthaginians, who had just arrived in Sicily with a powerful force in 264. The combined armies of the Carthaginians and Syracusans then proceeded to lay siege to Messana; but Hiero, having been attacked and defeated by Appius Claudius, the Roman consul, was panic-struck, and retreated precipitately to Syracuse. Soon after this disaster, seeing his territory laid waste by the Romans, and many of his cities in their possession, he deemed it prudent to abandon the Carthaginian alliance, and concluded a treaty with the Romans (263), by which he secured to himself the whole S. E. and E. of Sicily as far as Tauromenium. From this period till his death, nearly half a century, Hiero remained the steady friend of the Romans, and when he visited Rome was received with the highest honors. In 241 his treaty with them was changed into a perpetual alliance, and in the beginning of the second Punic war he fitted out a fleet to coöperate with that of Sempronius, and offered to clothe and feed the Roman forces in Sicily at his own expense. After the battles of Lake Thrasymentus and Cannæ he sent troops and liberal

supplies of corn and money to Rome, and a golden statue of Victory, which was set up in the capitol. His government was singularly wise and popular, and he built numerous magnificent temples, altars, and public works in Syracuse and Acra. Archimedes was his friend. He was succeeded by his grandson Hieronymus.

**HIEROGLYPHICS, or Hieroglyphs** (Gr. *ἱερός*, sacred, and *γλῦφειν*, to carve), picture writing, or figures representing animate beings or inanimate objects, and implying words or ideas. They have been found in all parts of the world, and seem to be employed by all peoples in certain stages of civilization. Though some highly cultured nations have failed to abandon their hieroglyphical systems of writing, yet generally hieroglyphs are gradually superseded by alphabets. Every attempt at fixing the memory of an event by indicating the objects and persons concerned in it by means of rude images belongs in a measure to the class of hieroglyphs. The rude inscriptions found on walls and monuments of the ruins of Rome, Pompeii, and other ancient cities, generally represent only the scribbling of idle persons. Examples of this are found even in the ruined temples and sepulchres of Egypt, and in the tombs at Jerusalem. They have received the name of *graffiti*. A large majority of them were doubtless written with the *stilus* or *graphium* of iron or bone. The drawings are chiefly grotesque, and the writing generally gives quotations from well known poets, or simply names of visitors, gladiators, and public men. Some are mere lists of nouns and verbs, probably scribbled by school boys; others contain good wishes, prayers, and invocations; others again libels and obscenities. In spite of their general triviality, they are of great value to palæography, philology, and history, since they exhibit the every-day life of the ancients, and elucidate many obscure passages in the classics.—**Hieroglyphics**, or picture writing proper, are indications of something that the writer desired to commemorate, while ignorant of or not wishing to use a phonetic or alphabetical graphic system. It has been attempted to trace the development of such rude images into a regular system of writing. The coarse marks employed for numbering days, sheep, or scalps were followed by attempts at conveying by similar signs such ideas as were only secondarily connected with them. This picturing of abstractions implies a much higher degree of civilization than the mere attempts at drawing the outlines of the actual objects. Another advance is indicated by the hieroglyphs which represent only parts of objects as mementoes of the whole. As soon as it has been learned to employ only a few strokes which suggest some distinctive feature of an object, either to call up the object itself or an abstract idea connected with it, the beginning of systematic writing is reached. It was generally followed by the practice of indicating ideas by picturing objects that possessed phonetically the same name. This opened the way for employing signs to represent sounds

only, at first syllabic and subsequently alphabetic. Many nations have not passed through all these stages, but continue to use hieroglyphs as a system of writing. Among these are the Chinese and Japanese, whose systems, like those of the ancient Egyptians, are given under the names of their respective countries.—The rudimentary savage paintings, scratchings,

FIG. 1.

or carvings are very much the same everywhere. They are not easily interpreted, unless it is known what they were intended to represent. It is probable that many are mere pictorial utterances without any attempt at recording a historical fact. The natives of North America were great proficient in the art of picture writing. Their hieroglyphs have been copied and interpreted by Schoolcraft. We give in the above specimen an Indian record on a pine tree. On the right are two canoes, with a catfish in one of them, and a fabulous animal, known as the copper-tailed bear, in the other. On the left are a bear and six catfish. The sense of the picture is simply that two hunters, whose names or totems were Coppertailed Bear and Catfish, went on a hunting expedition in their canoes, and took a bear and six catfish. Fig. 2 is a picture

FIG. 2.

on the face of a rock on the shore of Lake Superior, and records an expedition across the lake which was led by Myeengun, or Wolf, a celebrated Indian chief. The canoes with the upright strokes represent the force of the party in men and boats, and Wolf's chief ally, Kishkemunasee, that is, Kingfisher, goes in the first canoe. The arch with three circles be-

low it shows that there were three suns under heaven, that is, that the voyage took three days. The tortoise seems to indicate their getting to land, while the representation of the chief himself on horseback shows that the expedition took place since the time when horses were introduced into Canada.—The highest development of this art is found in the Mexican picture writing, or the system of hieroglyphics in use among the semi-civilized nations of Central America and Mexico previous to the discovery of America by Columbus. Among the nations which anciently had their seat near Palenque, there existed a probably pure hieroglyphical system; while among the nations of central Mexico, in the valley of Anahuac, as also among the affiliated families of San Salvador and Nicaragua, a less perfect or mixed system prevailed, which was composed of condensed pictures, and conventional or derivative representations of things, having a hieroglyphical character and a clear phonetic value. The capacity of even this less perfect or mixed system was considerable. By means of it the Mexicans recorded their history, composed their rituals and civil and religious calendars, recorded titles to property and the judgments of courts, assessed taxes or tribute, defined genealogies, &c. When Cortes landed, full accounts of him, his men, equipments, and, so far as he indicated them by word or action, of his purposes, were thus recorded and sent to Montezuma. The ecclesiastics who followed in the train of the army used their utmost exertions to acquaint themselves with this system, and adapt it to the purpose of converting the natives. The first attempt in this direction, or perhaps the first use of pictorial representations, out of which this adaptation gradually grew, was within eight or nine years after the capture of Mexico, by Testera of Bayonne, brother of the chamberlain of Francis I. Saha-

gun, Motolinia, and Peter of Ghent, as also the Franciscans generally, adopted his example of using pictures, more or less borrowed from the Mexicans, in their teachings. In the provinces near Mexico, as soon as the Franciscans commenced this adaptation, the interpreters, and numbers of the natives employed as missionaries, lent themselves to extend its scope; and Motolinia informs us that he was lit-

erally overwhelmed with Indians who presented their confessions to him in figures or paintings after their mode of representation. Valdez in 1579, and Torquemada nearly a century after the conquest, received similar confessions; and it appears that this system of recording confessions was preferred to alphabetical writing, even by Indians who were versed in the

latter. Many manuscripts or paintings, having their origin with the early priests and missionaries, have been confounded with the paintings and manuscripts of true Mexican origin, and of earlier date. Many condemn all the Mexican manuscripts in existence as monkish impostures, and of a date subsequent to the Spanish conquest; but a number of paintings and manuscripts are of undoubted aboriginal origin, historical and ritual in character, dating back beyond the discovery of the continent. Some of the historical manuscripts were continued in the spirit and style of the ancient system, by competent native hands, after the conquest, and contain the Indian version of that event. There are others of equally unquestionable ancient date, but generally of a religious or mythological character, which there is reason to believe have been changed in copies, or altered in the originals, with a view to conform with priestly teachings, and illustrate the dogmas of the church. And finally there is that large class of manuscripts originating with Testera, and perfected by his followers. These seem to have been of three kinds: 1, those of Testera and the early Franciscans, which were simple paintings, more or less adapted to Indian conventionalisms in their style of execution; 2, those of a mixed kind, in which some simple paintings were preserved, largely illustrated by arbitrary native and other figures; and 3, those in phonetic characters or representations, forming a complete adaptation of the Mexican system. The third class of Christian or post-Mexican paintings are correctly described by Torquemada, who says of the mode in which the *Pater Noster* was learned: "The word in their language most nearly representing *Pater* being *pantli*, the name of a kind of small flag, they put this flag for *Pater*. In place of *noster*, a word resembling their *nochtli*, they paint a *tuna* (cactus) fig, the name of which, *nochtli*, recalls the Latin *noster*; and so they go on to the end of the prayer. By a similar process and like characters they wrote down what they wished to learn by heart. This was during the first period of their conversion, for now [between 1592 and 1614] they no longer require to use these ancient characters." The following representation of the title *Pater Noster* is copied from a manuscript in the museum of Mexico:

Pa-te noch te, or Pa-tetzl noch-tetzl.

First is the figure of a little flag, or *pantli* in Nahuatl, the root of which is *pan* or *pa*; second is the sign of stone, *tetzl*, root *te*, the whole making syllabically *Pa-te* for *Pater*, the *r* being wanting in the Mexican language. Next we have the sign of the fruit of the cactus, *nochtli*, root *noch*, and that of stone, *tetzl*, root *te*, as before, making *noch-te* for *noster*. The whole is

therefore the nearest possible approach to the Latin, represented by Mexican figures of exact and unmistakable phonetic value. A general comparison of the ancient and positively Mexican paintings leaves no doubt that this mode of representation, by syllabic phonetics, in which the roots of words only were to be understood by the figures or sounded in reading, was the mode universally accepted, more or less mixed up with ideographic signs and simple pictures. In the historical and administrative documents of a superior order, written on skins or paper made from the maguey, the figurative writing, constantly phonetic, is no longer ideographic except in rare instances where the phonetic system fails. But paintings relating the same history do not always coincide in their signs, even when phonetically exactly alike. For instance, the name of Itzcoatl, the fourth king of Mexico, is expressed in some of the manuscripts by the figure of a serpent (*coatli*), with its back crested with knives or arrow heads of obsidian (*itzli*); the whole, *Itz-coatl*. In other paintings, however, it is written syllabically as follows: figure of an arrow head, *itzli*, root *itz*; figure of a vase, *comitl*, root *co*; figure or sign of water, *atl*; the whole, *Itz-co-atl*. The documents of this class, in which the syllabic writing predominates, are generally land registers, tribute rolls, judgments of courts, genealogies, &c., and were continued long after the conquest, and for the use of the Spanish administrations were often accompanied by literal translations from which alone a very full dictionary of the Mexican signs might be constructed. In numeration and chronology the Mexican system was exact and ample. Most of the historical paintings are simple annals, but some give more specific dates, down to the day of the month on which the event recorded took place. The most striking and to the uneducated eye the most interesting of the Mexican paintings are the ritual calendars, and schemes of judicial astrology, which make up the greater part of Lord Kingsborough's published collection. Excepting the designations of the days, these seem to be purely figurative or symbolical, intended only for the use of the priests and diviners, and possessed of an esoteric significance. They are valuable only in connection with the study of Mexican mythology and the Aztec religion and superstitions. There is a wide distinction to be drawn between those found in Mexico and those obtained in Central America. Of the latter but few examples are known to exist. The so-called Dresden manuscript, published by Lord Kingsborough, is perhaps the only perfect example of this kind in Europe. Its figures and signs coincide with those sculptured on the monuments of Palenque, Yucatan, and Copan, and identify it as the work of the same people. It has but slight resemblance to the Mexican manuscripts already discussed, and seems to mark a far higher development of the graphic art. So far as they can be made out, the elements of the Central

American or Toltecan system were few and very exact in their application, not admitting of that variation which would naturally result from the caprice or varying individual conceptions and tastes of those working under the system of Mexico. We discover in it no proper representations of things, except as pictures illustrative of what may be called the text of the manuscripts in which they are used, or in miniature in the text when employed as signs or characters, having a fixed and constant value, or modified only by the addition of arbitrary signs, like the points in oriental writings. It is undoubted that such manuscripts as that of Dresden were in common use in all parts of Central America occupied by the Tzendal or Toltecan stock at the time of the discovery, and that the existing aboriginal population of that country is chiefly made up of the descendants of the authors of the system then in use, who were equally the builders of the monuments to which uncritical investigators would assign a foreign origin and high antiquity. The Mexican system seems to have been intermediate between the rude picture records and mnemonic symbolism of the North American Indians, and the hieroglyphical and probably purely phonetic system of Central America, but at the same time of higher development and capacity than that of New Granada and Peru. It was evidently in an infant but progressive state at the time of the conquest.—Charles B. Brown has given in the "Journal of the Anthropological Institute of Great Britain and Ireland" (London, 1873) an account of hieroglyphical inscriptions occurring in British Guiana. On the river Essequibo they are found at the Waraputa cataract, at Cumutie rock, at the Onropocari cataract, at the Takarimi rock, and at the Bubumana cataract. They are also met with on the banks of the Quitaro, Cotinga, Ireng, Corentyn, and Berbice rivers. The Indians now living in Guiana know nothing of picture writing, and ascribe the hieroglyphical inscriptions to the handiwork of Makunaima,

Inscription on the Bubumana Rock.

their great spirit.—See Tylor, "Mexico and the Mexicans" (London, 1861) and "Researches into the Early History of Mankind" (1870); Brasseur de Bourbourg, *Monuments anciens*

*du Mexique, &c.* (Paris, 1864-'66); and the various archaeological and ethnological periodicals.

**HIERONYMUS.** See JEROME.

**HIEROPHANT** (Gr. *ιεροφάντης*, from *ιερός*, sacred, and *φαίνω*, to make known), the presiding priest in the Eleusinian mysteries, who conducted the ceremonies of initiation. He could be chosen only from the family of the Eumolpidae, whose ancestor Eumolpus was regarded as the founder of the mysteries. His body must be without defect, his voice sweet and sonorous, and his life without reproach. If he married, he thereby renounced the sacred office. A diadem adorned his brow, his hair hung down over his shoulders, and in the mysteries he represented the creator of the world with mystical symbols. He preserved and transmitted the secret and unwritten knowledge which was the object of the institution. In the last ages of paganism the hierophants seem to have become thaumaturgi and magicians.

**HIGGINSON. I. Francis**, an English clergyman, born in 1587, died in Salem, Mass., Aug. 6, 1630. He was educated at Cambridge, England, and subsequently became rector of a parish in Leicester. Becoming a nonconformist, he was deprived of his benefice, and was employed among his former parishioners as a lecturer. While apprehending an interruption in these duties in the shape of a summons to appear before the high commission court, he received an invitation from the Massachusetts company to proceed to their colony. He embarked early in May, 1629, and arrived at Salem June 29, and on July 20 was chosen teacher of the congregation established there, Samuel Skelton, his companion on the voyage, being chosen pastor. Each of them consecrated the other by the laying on of hands, assisted by several of the gravest men. Subsequently Higginson drew up "a confession of faith and church covenant according to Scripture," which on Aug. 6 was assented to by 30 persons, who associated themselves as a church. On this occasion, says Palfrey, "the ministers, whose dedication to the sacred office had appeared incomplete till it was made by a church constituted by mutual covenant, were ordained to their several offices by the imposition of the hands of some of the brethren appointed by the church." Higginson continued to discharge the duties of his office until the succeeding year, when, in the general sickness which ravaged the colony, he was attacked by a hectic fever of which he ultimately died. He wrote "New England's Plantations, or a Short and True Description of the Commodities and Discommodities of the Country" (4to, London, 1630), and an account of his voyage, which is preserved in Hutchinson's collection of papers. **II. John**, an American clergyman, son of the preceding, born at Claybrooke, Leicestershire, England, Aug. 6, 1616, died in Salem, Mass., Dec. 9, 1708. He emigrated to New England with his father, adopted the profession of a preacher, and for many years was settled

over a congregation at Guilford, Conn. In 1660 he was ordained pastor of the first church in Salem, of which his father had been teacher, and where he remained until the close of his life, at which time he had been 72 years in the ministry. He was a zealous opponent of the Quakers, although he subsequently regretted the warmth of his zeal; but he took no part in the proceedings respecting the witchcraft delusion in 1692. He is the author of a number of occasional sermons and miscellanies, including the "Attestation" to Cotton Mather's *Magnalia*, prefixed to that work (1697), which has been highly praised for its eloquence. **III. Thomas Wentworth**, an American author, a lineal descendant of Francis Higginson, born at Cambridge, Mass., Dec. 22, 1823. He graduated at Harvard college in 1841, and at the theological school of Cambridge in 1847, and was settled over the "First Religious Society" at Newburyport. In 1850 he was the freesoil candidate for congress, and was defeated. His anti-slavery principles being distasteful to a portion of his congregation, he resigned his pastorate in 1850, and two years later became minister of a "Free Church" at Worcester. In 1853 he headed an attack on the Boston court house for the purpose of rescuing Anthony Burns, a fugitive slave then in custody of the United States marshal. In this affair he was wounded in the face by a sabre cut; and one of the marshal's men having been killed, Higginson was indicted for murder, but the prosecution failed from a flaw in the indictment. In 1856 he went to Kansas, where he took part in the military struggle of the free-state settlers against the pro-slavery invaders from Missouri. He retired from the ministry in 1858, to devote himself to literature. Soon after the outbreak of the civil war he recruited several companies of volunteers for a Massachusetts regiment, and was commissioned as captain. In 1862 he was appointed colonel of the first regiment of South Carolina volunteers, the first slave regiment mustered into the national service. He served with them for two years, chiefly in South Carolina and Florida, making various expeditions into the interior, in one of which he captured Jacksonville, Florida. He was wounded in August, 1863, and in 1864 had to retire from the service in consequence. He took up his residence at Newport, R. I., and has since been occupied with public lecturing and literary pursuits. His first publication was a compilation, made in conjunction with Samuel Longfellow, of poetry for the seaside, entitled "Thalatta" (1853). He has since published the following books, most of the contents of which appeared first in the "Atlantic Monthly": "Outdoor Papers" (1863); "Harvard Memorial Biographies" (1866); "Malbone, an Oldport Romance" (1869); "Army Life in a Black Regiment" (1870); "Atlantic Essays" (1871); and "Oldport Days" (1873). In 1865 he published a new translation of Epictetus.

**HIGHGATE**, a village of Middlesex, England, adjoining Hampstead, 5 m. N. W. of St. Paul's, London; pop. in 1871, 5,339. It is renowned for its pleasant and salubrious situation on a hill, for its fine villas, and particularly for its cemetery, containing the tombs of Lord Lyndhurst and other eminent persons. Coleridge passed here the last 18 years of his life, and the place has always been a favorite resort of literary people and of wealthy London merchants. It has a number of beautifully situated female seminaries and other schools, and a fine parish church. Lady Burdett-Coutts has a magnificent mansion here.

**HIGHLAND. I.** A W. county of Virginia, bordering on West Virginia, bounded N. W. by the principal ridge of the Alleghany mountains, and S. E. by the Shenandoah range; area, 425 sq. m.; pop. in 1870, 4,151, of whom 348 were colored. The S. branch of the Potomac and some of the head streams of James river rise within its limits. The surface is diversified, but consists chiefly of table land, with a rich soil. It is well timbered, and affords excellent pasturage. Iron ore is found in some parts. The chief productions in 1870 were 25,133 bushels of wheat, 6,605 of rye, 26,075 of Indian corn, 11,755 of oats, 4,650 of buckwheat, 5,743 of potatoes, 17,913 lbs. of wool, 71,557 of butter, and 5,897 tons of hay. There were 1,903 horses, 2,112 milch cows, 6,942 other cattle, 7,950 sheep, and 2,782 swine. Capital, Monterey. **II.** A S. W. county of Ohio, drained by Paint, Brush, and White Oak creeks; area, 555 sq. m.; pop. in 1870, 29,133. Its surface is elevated and uneven, and its soil fertile. The Marietta and Cincinnati railroad and Hillsborough branch traverse it. The chief productions in 1870 were 415,370 bushels of wheat, 1,110,437 of Indian corn, 153,324 of oats, 50,278 of potatoes, 81,832 lbs. of wool, 517,622 of butter, and 16,970 tons of hay. There were 9,227 horses, 6,743 milch cows, 12,783 other cattle, 25,866 sheep, and 40,834 swine; 16 manufactories of carriages, 2 of clothing, 1 of iron castings, 1 of machinery, 2 of tombstones, 10 of saddlery and harness, 6 of tin, copper, and sheet-iron ware, 4 of woollen goods, 12 flour mills, 3 tanneries, 3 currying establishments, 2 distilleries, 1 planing mill, and 9 saw mills. Capital, Hillsborough.

**HIGHLANDS**, a name applied to the N. and N. W. districts of Scotland, in contradistinction to the S. and S. E. parts, which are called the lowlands. Their exact boundaries are unsettled. The Grampian hills are sometimes taken as the dividing line between the two great natural divisions; but, regarded as the country of the highland clans, the highlands include all the Scottish territory W. and N. W. of an imaginary line drawn from the mouth of the Nairn in the Moray frith nearly S. E. to a point on the N. Esk, near lon. 3° W., on the S. slope of the Grampians, and thence S. W. to Culross on the estuary of the Clyde. They thus comprehend more than half of Scot-

land, including the whole of the counties of Caithness, Sutherland, Ross, Cromarty, Inverness, and Argyre, parts of Nairn, Elgin, Banff, Aberdeen, Forfar, Perth, Stirling, and Dunbarton, and the Hebrides. They are remarkable for their wild and beautiful scenery and the peculiar character of their inhabitants. The mountainous tracts S. and E. of the Clyde are sometimes called the southern highlands. (See SCOTLAND.)—For the highlands of the Hudson, see HUDSON RIVER.

**HIGHMORE, Joseph**, an English anatomist, born at Fordingbridge, Hampshire, in 1613, died in 1685. He resided at Sherborne in Dorsetshire, where he became eminent in the practice of his profession. His name is connected with the triangular cavity in the upper maxillary bone, lined with mucous membrane and communicating by a small opening with the middle passage of the nares, termed the *antrum Highmoreianum*. He published in 1651 *Corporis Humani Disquisitio Anatomica*.

**HIGHWAY**, a place over which the public have a right of passage. It may be a footpath, a bridle path, a cart way, or a road wide enough for vehicles of any kind to pass each other; and for many purposes there may be a highway over water, whether it be a running stream or a lake. The origin of the word is not certainly known; but a simple derivation refers it to the time when all public roads were raised above the surrounding fields, by the addition of materials, for the purpose of securing a dry road bed. In English law it is usually called the king's highway, because by the theory of that law it was considered as having been originally given by him. In the United States a highway may exist by prescription, or by the dedication of the land to the public use by the owner, which may be expressed or implied from long and uninterrupted use by the public. But as highways are to be kept in repair by the public, no person can make a highway over his land by merely opening and surrendering it for that purpose, unless it be formally accepted by those having authority to do so; although this also may be implied from usage and lapse of time. With us, nearly all highways are now laid out by the proper officers; and, when laid out, they are generally either county roads or town roads. The public have, by the right of eminent domain, full power to take land for this purpose upon making compensation to the owner. But the public can take only what it needs; and as it needs for the purpose of a highway only the right of passage, or, as it is called in law, the right of way (which is what the law calls an easement), it leaves the absolute property in the land to the original owner; and should the highway be discontinued, the land would remain in the hands of the owner, free from the easement. Presumptively the abutters upon a road, by which is meant those who own to it, own to the middle of it, subject to the public right of way. This ownership does

not exist if the grant or conveyance to the abutor expressly and distinctly limited him to the edge of the road; but merely bounding a piece of land by the road has not this effect, for by the road there is meant the middle or thread of the road. A highway may be discontinued and the easement lost, either by the express action of competent authority, or by a complete nonuser for a sufficient length of time. The obligation of the public to keep highways in repair is not so far absolute as to give individuals injured by the neglect an action for damages unless so declared by statute; but in many of the states such actions are given, either against the town or county; and in most of the states municipal corporations existing under special charters are held liable to such actions on their implied undertaking with the state to keep their streets in safe condition.

**HILARION**, a saint of the church, born, according to St. Jerome, near Gaza about 291, died in the island of Cyprus in 371. He was the son of pagan parents, and was sent by them to Alexandria to be educated, where at the age of 15 he became a Christian. Returning to Palestine after the death of his parents, he embraced monasticism, gave away his property, and entered upon a life of austerity. He attracted to his retreat in the Syrian desert crowds of visitors. After the death of St. Anthony, he made with some of his monastic brethren a pilgrimage to the cell and tomb of the saint in Egypt. To escape as well the importunities of friends as the persecution of foes, he sailed for Cyprus, where he was soon discovered and joined by his disciple Hesychius. Hence he passed to the Dalmatian coast, and finally settled in Cyprus. A vast number of miracles are ascribed to him. His festival, which is kept on Oct. 21, was celebrated as early as the 5th century.

**HILARY**, a pope of Rome, successor of St. Leo I., born in Sardinia, died in 468. From the beginning of his priesthood he had been noted for his zeal for the faith and his hostility to heresy. At the "robber council" of Ephesus, in 449, he appeared as the representative of Leo, sustaining the doctrine of the church against the theory of Eutyches. He was chosen to the Roman see in 461. He improved the discipline of the church, confirmed the anathema against Nestorius and Eutyches, prohibited the long established practice of bishops nominating their successors, forbade men who had been twice married or who had married widows to receive holy orders, held at Rome in 465 a council for reforms, and solemnly ratified the former œcumenical councils.

**HILARY (HILARIUS)**, a saint of the church, born in Poitiers about the year 300, died there in 367 or early in 368. His parents, who were pagans of patrician rank and very wealthy, gave him a careful education. He was of ripe age, distinguished for learning and eloquence, when, with his wife and daughter, he embraced

the Christian faith. About 353 he was chosen bishop of his native city, and set himself zealously to combat the Arian heresy, which was then the religion of the emperor Constantius II., and predominant in Italy, Spain, and Africa, and which the protection of the emperor and his officers and their persecution of the orthodox were making popular among the people and clergy of Gaul. In 355 Hilary wrote to the emperor, remonstrating with him on this persecuting spirit. In 356 he was induced to present himself to the council of Béziers, almost entirely composed of Arian bishops, when he attacked Saturninus of Arles, the apostle of Arianism in Gaul, but was condemned by the majority, denounced to the emperor as a disturber of the peace of the church, and banished to Phrygia, together with his friend Rodanius, bishop of Toulouse. From his exile he wrote frequently to his flock and his brother bishops in Gaul to stir up their faith, fortitude, and zeal. He composed at the same time his work on "Synods," which was written in a conciliatory spirit, and his 12 books on "The Trinity," which became the standard of orthodoxy in the western churches. In 359, at the instance of the emperor and the Asiatic bishops, he assisted at the council of Seleucia in Isauria, and triumphantly defended the divinity of Christ. From thence he went to Constantinople, where he boldly arraigned the emperor and his Arian counsellors, who deemed it advisable to send him back to Gaul. Before leaving the capital he wrote his vehement "Invective against Constantius." He assembled several councils after his return to Poitiers, and obtained the deposition of Saturninus, and a formal retraction from nearly all the bishops who had subscribed to the creed of Ariminum. He then passed over into Italy to oppose as well the untimely severity of the orthodox Lucifer as the proselytizing and persecuting zeal of Auxentius, the favorite of the new emperor Valentinian; but he was forced by an imperial order to return to his diocese, where he soon after died. St. Jerome calls Hilary "the Rhône of Latin eloquence" (*Latinæ eloquentiæ Rhodanus*). The best editions of his works are that published by the Benedictine Constant (fol., Paris, 1693; republished by Maffei with several additions, Verona, 1730), and that of Oberthür (4 vols. 8vo, Würzburg, 1781-'8).—See Reinkens's monograph, *Hilarius von Poitiers* (Schaffhausen, 1864; Breslau, 1865).

**HILDA**, Saint, abbess of Streaneshalch (now Whitby) in Yorkshire, born in 617, died in 680. She was a grandniece of Edwin, king of Northumbria, was devoted to a religious life from her 13th year, and founded in the reign of Oswald a small nunnery on the Wear. In 650 she became abbess of Hartlepool, where in 655 she was intrusted by Oswy with the education of his daughter Elfleda. The royal munificence enabled her to erect soon afterward a monastery at Whitby, which her reputation

for sanctity soon made the most flourishing in England. It became the home of many eminent men, among whom may be mentioned Hedda, Wilfrid, and Cædmon, the poet. Hilda's feast is celebrated on Nov. 18. She is praised by historians for her successful efforts in converting the pagans.

**HILDBURGAUSEN**. **I.** A former duchy of Germany, since 1826 united with Meiningen. (See SAXE-MEININGEN-HILDBURGAUSEN.) **II.** A town, capital of the duchy, on the Werra, 20 m. S. E. of Meiningen; pop. in 1871, 5,148. It has a ducal castle, a gymnasium, an insane asylum, a normal school, and a deaf and dumb institution. The bibliographical institute of J. Meyer, which in 1828 was transferred hither from Gotha, is among the most prominent publishing houses of Germany. From 1695 to 1826 the town was the residence of the duke of Saxe-Hildburghausen.

**HILDEBRAND**. See GREGORY VII.

**HILDEBRANDT**. **I.** Ferdinand Theodor, a German painter, born in Stettin, July 2, 1804. He studied under Wilhelm Schadow at Berlin, with whom in 1826 he went to Düsseldorf, and in 1830 to Italy, finally taking up his residence at Düsseldorf, where he became professor. His works include examples in historical, religious, and genre art. Scenes from poetry, especially from Shakespeare, are his favorite subjects. Among his pictures are: "Faust" (1825), "Cordelia and King Lear," for which Devirent sat as a model (1826), "Romeo and Juliet" (1827), "Clorinda" (1828), "The Robbers" (1829), "Judith and Holofernes" (1830), "The Soldier and his Child" (1832), "The Children of King Edward" (1835), "Othello before the Doge of Venice" (1848), "Juliet taking the Draught" (1853), and "Cordelia reading the Letter to Kent" (1859). Among his later works are illustrations of Uhländ and designs from German ballads. He has also painted many portraits, those of old men being especially admired. He has been styled the first colorist of the Düsseldorf school. **II.** **Ednard**, a German landscape and genre painter, born in Dantzic, Sept. 9, 1817, died in Berlin, Oct. 25, 1868. He was a pupil of Isabey, and in 1843 gained the first prize at the Paris exhibition. He then took up his residence in Berlin, and became professor in the academy of art. Among his numerous pictures, of which aerial effects are the predominant characteristic, are scenes in North and South America, the Pyrenees, the Canaries, Madeira, the Orient, the Alpine regions, and the extreme north of Europe. He illustrated a hall in the Sans Souci palace with scenes from the Holy Land.

**HILDEGARD**, or **Hildegardis**, Saint, born in 1098 at Bückelheim, in the diocese of Mentz, died at Rupertsberg, near Bingen, in 1180. Her father, who held the rank of count, intrusted her in her 8th year to the abbess of the Benedictine convent of Disibodenberg, of which she afterward became abbess herself. While there she had her first ecstatic visions, of which she

drew up a relation. Her fame so increased the number of her nuns, that she built a new convent on the Rupertsberg, on the Rhine. She now wrote several books both in German and in Latin, and published a full account of her revelations in a work called *Scivias*. She corresponded with all the crowned heads, princes, and prelates of her time, and travelled through the cities of Germany, discoursing publicly on divine things. Her visions or revelations were considered by many as illusions. They were examined by the council of Treves in 1147, and their publication was authorized by Pope Eugenius III. Hildegard has never been solemnly canonized. Her feast is celebrated on Sept. 17. A complete edition of her writings was published in Cologne in 1566. Among the most important are: *Scivias, seu Revelationum Libri III* (fol., Cologne, 1698); *Sanctæ Hildegardis Epistolæ*, in Martène's collection (Rouen, 1700); *Hortus Sanitatis*, a medical dictionary, which, printed with the *Etymologicon* of Isidore of Seville, forms an encyclopædia of the middle ages; and *Libri quatuor Elementorum* (Strasbourg, 1533).—See Meiners, *De Sanctæ Hildegardis Vita, Scriptis et Meritis* (Göttingen, 1793); Dahl, *Die heilige Hildegard* (Mentz, 1832); and Reuss, *De Libris Physicis Sanctæ Hildegardis* (Würzburg, 1835).

**HILDESHEIM**, a town of Prussia, in the province and 18 m. S. E. of the city of Hanover; pop. in 1871, 20,532, including about 6,500 Roman Catholics and 400 Jews. The construction of the town is irregular, but the crooked streets are exceedingly quaint, and vestiges of remote antiquity abound in every direction, especially in the churches, many of which are Roman Catholic, owing to the mediæval celebrity of the place as the capital of a great episcopal see; and it continues to be the seat of a Roman Catholic bishop. The cathedral contains a treasury rich in antique church plate, and many famous relics and works of art. Other renowned Catholic edifices are those of St. Godehard and St. Michael, and St. Andrew's Lutheran church is remarkable for its lofty towers. Hildesheim abounds in hospitals and charitable institutions, and among the numerous schools are seminaries for Roman Catholics and Protestants. The trade consists chiefly in agricultural and horticultural products, and leather, sail cloth, tobacco, and carriages are manufactured. In 1868 many Roman antiquities were discovered here, including a number of silver vessels, supposed to belong to the camp equipment of Varus.—Charlemagne founded the see of Elze, which was transferred by Louis le Débonnaire to Hildesheim shortly after his father's death. In the 10th and 11th centuries, under the bishoprics of St. Bernward and St. Godehard, it reached an importance which, despite occasional conflicts, went on increasing till early in the 16th century, when a bitter struggle, known in history as the *Hildesheimer Stiftsfehde*, resulted in the annexation of a great part of the terri-

tory to the Brunswick dominions. Many of these possessions were restored to the see in 1643, and full religious liberty was secured in 1711 for the Protestant population, who had long been subjected to persecutions on the part of the Catholic authorities. The see was allotted to Prussia in consequence of the peace of Lunéville (1801). In 1807 it became part of the French kingdom of Westphalia, after the fall of which it was a Hanoverian principality till 1866, when it became part of Prussia.

**HILDRETH, Richard**, an American author, born in Deerfield, Mass., June 28, 1807, died in Florence, Italy, July 11, 1865. He graduated at Harvard college in 1826, and while studying law in Newburyport furnished contributions to the "Boston Magazine" and the "New England Magazine." He entered upon the practice of law in Boston, but abandoned it in July, 1832, to become the editor of the "Boston Atlas." In the autumn of 1834 he went for the benefit of his health to the south, where he resided about a year and a half on a plantation. While here his anti-slavery novel, "Archy Moore" (1837), was written. It was republished in England, and in 1852 an enlarged American edition appeared under the title of "The White Slave." In 1836 he translated from the French of Dumont Benthams "Theory of Legislation" (2 vols. 16mo, Boston, 1840). His next publication was a "History of Banks," an argument for the system of free banking with security to bill-holders, subsequently adopted in New York and several other states. In 1837 he wrote for the "Atlas" a series of articles against the annexation of Texas, which did much to stimulate the obstinate resistance it encountered in the free states. After passing the winter of 1837-'8 in Washington as correspondent of the "Atlas," he resumed his editorial post as an advocate of Gen. Harrison, of whom he wrote a biography. In 1840 he published, under the title of "Despotism in America," a volume on the political, economical, and social aspects of slavery, to which in the edition of 1854 was appended a chapter on the "Legal Basis of Slavery." His controversial pamphlets, including a letter to Prof. Andrews Norton of Cambridge on "Miracles," were contributions to a long and exciting theological discussion in Massachusetts. A residence of three years, commencing with 1840, in Demerara, British Guiana, stimulated his anti-slavery activity; and, as the editor successively of two newspapers in Georgetown, the capital of the colony, he earnestly advocated the system of free labor. His "Theory of Morals" (Boston, 1844), and his "Theory of Politics" (New York, 1853), written during his sojourn in Guiana, were attempts to apply rigorously to ethical and political science the same inductive method of inquiry which has proved so successful in other sciences. His principal work is his "History of the United States" (6 vols. 8vo, New York, 1849-'56). This undertaking he had project-

ed during his life in college, and he gave to it many years of thorough deliberation and study. The period covered extends from the settlement of America to the end of Monroe's first presidential term. He also published a historical work on "Japan as it Was and Is" (12mo, 1855). For several years Mr. Hildreth was engaged on the staff of the "New York Tribune," contributing also several articles to this Cyclopædia; and in 1861 he was appointed United States consul at Trieste.

**HILL**, a N. E. county of Texas, bounded W. by the Brazos river, and drained by small tributaries of that stream; area, 950 sq. m.; pop. in 1870, 7,453, of whom 806 were colored. The W. part is heavily timbered, and the E. part consists of prairie; the soil is rich and the climate healthy. The chief productions in 1870 were 295,668 bushels of Indian corn, 76,818 lbs. of butter, and 3,407 bales of cotton. There were 7,632 horses, 5,816 milch cows, 1,008 working oxen, 26,863 other cattle, 3,045 sheep, and 10,619 swine. Capital, Hillsborough.

**HILL, Ambrose Powell**, an American soldier, born in Culpeper co., Va., about 1825, killed near Petersburg, April 2, 1865. He graduated at West Point in 1847, served in the war with Mexico, and afterward in Florida, and was in the office of the coast survey from 1855 to 1860. He resigned his commission of lieutenant, March 1, 1861, and entered the confederate service. He took an active part in all the campaigns in northern Virginia, being present as colonel at the battle of Bull Run; at Williamsburg, where he was made a major general; during the seven days' fighting on the peninsula; at Cedar Mountain, Groveton, and Antietam; at Fredericksburg and Chancellorsville, where he succeeded to the command of Jackson's corps, but was soon disabled by a wound; at Gettysburg and the Wilderness; and finally in the siege of Petersburg. He was killed by a rifle shot at the end of the siege.

**HILL, Daniel Harvey**, an American soldier, born in South Carolina about 1822. He graduated at West Point in 1842, served in the war with Mexico, and was successively brevetted as captain and major for gallant and meritorious conduct at Contreras, Churubusco, and Chapultepec, and received a sword of honor from his native state. He resigned his commission in 1849, and became successively professor in Washington college, Va. (1849-'54), and in Davidson College, N. C. (1854-'59), and superintendent of the North Carolina military institute (1859-'61). During this period he published a work on algebra, a volume on the "Sermon on the Mount," and another on the "Crucifixion of Christ," besides several essays in southern periodicals. On the breaking out of the civil war he entered the confederate service. He commanded in the skirmish at Big Bethel, took part in the defence of Yorktown, and led a division in the battles of Mechanicsville, Cold Harbor, and Malvern Hill. When Lee made his first advance to the north,

Gen. Hill was left in command on the James. He joined Lee just after the second battle of Bull Run, took a prominent part in the battles of South Mountain, Antietam, and Fredericksburg, and was then placed for a time in command in North and South Carolina. After the war he took up his residence at Charlotte, N. C., where he has published a periodical, "The Field and the Farm."

**HILL, Isaac**, an American politician, born in Ashburnham, Mass., April 6, 1788, died in Washington, D. C., March 22, 1851. In 1809 he settled at Concord, N. H., where he established the "New Hampshire Patriot," of which he was editor for many years. He served in the senate and lower house of that state, and in 1830 was elected to the United States senate, where he remained five years. In 1836 he was elected by the democrats governor of New Hampshire, and continued in office by reëlection three terms. For ten years he published the "Farmer's Monthly Visitor."

**HILL, Rowland**, an English clergyman, born at Hawkestone, near Shrewsbury, Aug. 12, 1744, died April 11, 1833. He was educated at Eton and Cambridge. He early showed a predilection for the Methodists, and while at Cambridge used to preach in the prisons and private houses. The influence of his family, however, prevented him from joining them, and he took orders in the church of England. Whitefield's reputation was then at its height, and during his absence from his chapel Hill frequently filled his place. When Whitefield died, the Methodists looked to Hill as his successor, but he declined their offers. For 12 years he preached in Wiltshire, Somersetshire, and Gloucestershire. In 1782 he laid the first stone of Surrey chapel, Blackfriars road, London, and for 50 years he was the chief preacher there in the winter, spending the summers in provincial excursions, travelling over most of England and Wales, and visiting Scotland and Ireland. He always preached without notes, and his sermons were in a colloquial, familiar strain, abounding in anecdotes, and sometimes even in jokes and puns. His most celebrated work is his "Village Dialogues," first published in 1801; the 34th edition, with additions and corrections, was published in 1824 (new ed., 1854). His memoirs were written by the Rev. Edward Sydney (London, 1844), and by the Rev. W. Jones (1845).

**HILL, Rowland**, viscount, a British general, nephew of the preceding, born in Prees, Shropshire, Aug. 11, 1772, died at Hardwicke Grange, near Shrewsbury, Dec. 10, 1842. He entered the army at the age of 18, served at the siege of Toulon as aide-de-camp to three successive generals, in Egypt in command of the 90th regiment, and in the expedition to the Weser, and in 1808 arrived in Spain with the rank of major general. He participated in the memorable advance and retreat of Sir John Moore, and rendered important services in covering the embarkation of the British army at

Corunna (1809). In the subsequent campaigns in the peninsula he distinguished himself particularly at Talavera, Arroyo de Molinos, and Almaraz. His services were rewarded by the thanks of parliament, and his elevation to the peerage in 1814 as Baron Hill of Almaraz and of Hawkestone. He closed a brilliant military career at Waterloo, where he commanded a division of the allied army. In 1828 he was appointed commander-in-chief of the British army, a post he occupied till 1842, when, upon resigning office, he was created a viscount. He possessed almost every quality of a great commander, and was called the "right arm of Wellington," who bore frequent testimony to his strategic skill and high military capacity. His personal qualities rendered him perhaps the most popular soldier of his time in the British service.

**HILL, Sir Rowland**, author of the cheap postage system in Great Britain, born in Kidderminster, Dec. 3, 1795. He early showed a great fondness for figures, which was subsequently developed in the study of mathematics. His first occupation was that of mathematical tutor in a school kept by his father, and for a number of years he devoted himself to improving school instruction and organization. In 1833 he was appointed secretary to the South Australian commission, and aided in founding the colony of South Australia. About this time the defects in postal arrangements began to occupy his attention, and in 1837 he published a pamphlet on post-office reform. By his personal exertions he succeeded in 1838 in having the matter referred to a special committee of the house of commons. In August, 1838, the committee reported in favor of a uniform low rate of postage as recommended by Mr. Hill, and at the next session more than 2,000 petitions were presented in its favor. In July, 1839, a bill to enable the treasury to carry Mr. Hill's plan into effect, introduced by the chancellor of the exchequer, passed by a majority of 102; and on Aug. 17 the project became a law. A temporary office under the treasury was at the same time created to enable Mr. Hill to inaugurate his plan, and on Jan. 10, 1840, the uniform penny rate came into operation. The post-office authorities were, however, hostile to the change, and Mr. Hill found himself without adequate support from the existing ministry or from that which succeeded it. His scheme worked well; during the commercial depression which followed its adoption, the post-office revenue went on increasing, while every other source of national income proved less productive than before. He was nevertheless dismissed from his office soon after the accession of the Peel ministry. In 1843 he was appointed one of the directors of the Brighton railway, in which capacity he projected several useful improvements. A subscription for a testimonial to him, begun in 1844, reached the amount of £13,000. Upon the return of the whigs to power in 1846 he

was appointed secretary to the postmaster general, holding divided authority with Col. Maiberly; and eight years later, on the transfer of the latter to the audit office (April, 1854), he became sole secretary. In 1860 he was knighted in acknowledgment of his services at the post office, and received a parliamentary grant of £20,000, the first Albert gold medal of the society of arts, and the degree of D.C.L. from Oxford. In 1865 he was appointed a member of a royal commission on railways.

**HILL, Thomas**, an American clergyman, born in New Brunswick, N. J., Jan. 7, 1818. He was left an orphan at 10 years of age, and at 12 was apprenticed to the printer of a newspaper, where he remained four years. He then entered an apothecary's shop, after a year's attendance at school, and served in it 3½ years. He graduated at Harvard college in 1843, completed his term of residence at the divinity school in 1845, and was settled at Waltham, Mass., on Christmas of the same year. He has published an "Elementary Treatise on Arithmetic," "Geometry and Faith," and "First Lessons in Geometry." It is, however, in his investigations in curves that he has displayed the greatest originality and fertility. He has added to the number of known curves, and simplified their expression; and by overstepping the common methods of using coördinates, and introducing new combinations, he has vastly extended the field of research. In 1859 he became president of Antioch college, at Yellow Springs, Ohio, and in 1862 of Harvard university. Resigning in 1868, he resided for some years at Waltham, and is now (1874) pastor of a Unitarian church at Portland, Maine.

**HILL, Thomas**. See supplement.

**HILLARD, George Stillman**, an American author, born in Machias, Me., Sept. 22, 1808, died in Boston, Jan. 21, 1879. He graduated at Harvard college in 1828, taught for a time in the Round Hill school at Northampton, studied law, and was admitted to the bar in Boston in 1833. In 1846 he visited Europe, and on returning in 1847 he delivered a course of 12 lectures on Italy before the Lowell institute. He was one of the editors of the "Christian Register" (Unitarian) in 1833, and afterward of the "Jurist," and then of the daily "Courier." He contributed a life of Capt. John Smith to Sparks's "American Biography," edited Spenser's poetical works, translated Guizot's "Character and Influence of Washington" (1840), and edited the Boston "Memorial of Daniel Webster" (1853), and selections from the writings of Walter Savage Landor (1856). He has also published "Six Months in Italy" (2 vols., 1853), "Life and Campaigns of George B. McClellan" (1864), "Political Duties of the Educated Classes," "Dangers and Duties of the Mercantile Profession," and a series of school readers. He was United States district attorney for Massachusetts in 1867-'70.

**HILLEH**, or **Hillah**, a town of Asiatic Turkey, in the vilayet of Bagdad, on both sides of the

Euphrates, and amid the ruins of Babylon; pop. about 7,000. It is a quiet, peaceable place, with well supplied bazaars, but greatly decayed from its importance under the Sassanide shahs and the caliphs, when it was also remarkable for one of the most flourishing communities of the Babylonian Jews. It is supposed by some writers to have been the place where the Hebrew captives carried off from Jerusalem by Nebuchadnezzar were chiefly established.

**HILLEL**, a rabbi and president (*nasi*) of the sanhedrim of Jerusalem, who flourished in the latter half of the 1st century B. C. He is distinguished from other rabbis of the same name by the surname of Hazzaken (the Elder). He is also called the Babylonian from his native country. Admired for his humanity, mildness, and love of peace, he is also celebrated as the reformer and great propagator of the study of the traditional law, the results of which were afterward collected under the title of *Mishnah* by one of his descendants and successors in the presidency of the sanhedrim, Rabbi Judah the Holy. Hillel's school flourished especially during the reign of Herod the Great, the rival school being that of the austere Shammai. Besides the legal decisions of Hillel, various sayings of his are preserved in the *Mishnah*, as well as numerous anecdotes in the *Gemara*, all of which express his love of men as well as of study. It is he who, being applied to by a pagan for instruction in the Mosaic law, replied: "'Do not to others what you do not like others to do to you,' is the essence; everything else is but comment."—Another Hillel, who flourished about the middle of the 4th century, was the author of the existing Jewish calendar.

**HILLEL**, **Ferdinand**, a German composer, born in Frankfort, Oct. 24, 1811. His father, a wealthy Jew, fostered his disposition for music, and he received lessons in succession from Hoffmann, Schmidt, Vollweiler, and Hummel. At the age of 10 he was first heard as a pianist, and at 17 published his first composition, a quartet for piano and strings. He next spent seven years in Paris, devoting himself to the study of classical music, where he was heard with Liszt, Kalkbrenner, and later with Baillot the violinist, acquiring much reputation as a virtuoso. In 1836, returning to Frankfort, he was made director of the *Cäcilienverein*. During the succeeding 15 years he lived successively in Milan, Leipsic, Dresden, Düsseldorf, Cologne, Paris, and London. Finally in 1852 he settled at Cologne, where he has since remained. At Milan he brought out his opera *Romilde*; at Leipsic, in 1839, his oratorio *Die Zerstörung Jerusalems*; at Dresden his two operas *Der Traum in der Christnacht* (1844), and *Konradin, der letzte Hohenstaufe* (1847). In the winter of 1843-'4 he directed the Leipsic Gewandhaus concerts. In 1847 he was made music director at Düsseldorf, in 1850 chapelmaster at Cologne, and in 1851 director of the Italian opera at Paris. His compositions comprise operas, symphonies, oratorios, trios and

quartets for stringed instruments, and a large number of songs and pianoforte pieces. Among his later works is "Nala and Damayanti," a cantata brought out at the Birmingham festival in 1870. He holds honorable rank among modern German composers, and his critical writings are also esteemed.

**HILLHOUSE**. **I. James**, an American statesman, born in Montville, Conn., Oct. 21, 1754, died in New Haven, Dec. 29, 1832. He graduated at Yale college in 1773, of which institution he was treasurer from 1782 till his death. He studied law, and took an active part in the struggle of the revolution; was a member of congress in 1791, and in 1794 was chosen a member of the United States senate, where he remained for 16 years. Resigning his seat in 1810, he was appointed commissioner of the school fund of Connecticut, and continued to act as such for 15 years. **II. James Abraham**, an American poet, son of the preceding, born in New Haven, Sept. 26, 1789, died near that city, Jan. 4, 1841. He graduated at Yale college in 1808, and in 1812 delivered before the Phi Beta Kappa society a poem entitled "The Judgment, a Vision" (New York, 1812). He engaged in commerce in New York; in 1819 visited England, and published in London his drama of "Percy's Masque," which was reprinted in New York with changes in 1820; and in 1822 removed to a country seat near New Haven, where he passed the remainder of his life. In 1825 he published his second drama, "Hadad;" and in 1839 a collected edition of his writings appeared in Boston, under the title of "Dramas, Discourses, and other Pieces." It included, besides several polished prose compositions, "Demetria," a domestic Italian tragedy, which he had written in 1813.

**HILLIARD**, **Nicholas**, an English miniature painter, born in Exeter in 1547, died in 1619. He was by profession a jeweller; but having a taste for painting, he studied the works of Holbein, and became noted for his miniatures. He painted Mary, queen of Scots, Elizabeth several times, James I., and other eminent persons.

**HILLIARD D'AUBERTEUIL**, **Michel René**, a French author, born in Rennes, Jan. 31, 1751, died in Santo Domingo about 1785. He practised law in that colony, and published on his return to France *Considérations sur l'état présent de la colonie française de Saint-Domingue* (2 vols., 1776), which exposed official abuses and was suppressed by the authorities. He visited the United States during the revolutionary war, returned to Santo Domingo, and is said by some to have been assassinated, by others to have been executed. His principal works are: *Essais historiques et politiques sur les Anglo-Américains* (Brussels, 1782), and *Histoire de l'administration du lord North depuis 1770 jusqu'en 1782, et de la guerre de l'Amérique septentrionale* (London and Paris, 1784), the accompanying financial statistics being also published separately.

**HILLSBOROUGH.** I. A S. county of New Hampshire, bordering on Massachusetts, intersected in its E. part by the Merrimack river, and drained in the W. by the Contoocook; area, 960 sq. m.; pop. in 1870, 64,238. It has a gently diversified surface, but there are few hills of great elevation. The soil is fertile and well watered with running streams and small lakes. It is traversed by the Concord, the Contoocook River, the Peterborough and Shirley, the Monadnock, the Boston, Lowell, and Nashua, the Wilton branch, the Worcester and Nashua, the Manchester and Lawrence, and the Manchester and North Weare railroads. The chief productions in 1870 were 15,380 bushels of wheat, 163,801 of Indian corn, 74,716 of oats, 15,677 of barley, 349,692 of potatoes, 42,441 lbs. of wool, 718,696 of butter, 58,261 of cheese, and 68,089 tons of hay. There were 4,748 horses, 12,466 milch cows, 3,997 working oxen, 11,660 other cattle, 11,820 sheep, and 5,514 swine. There were 564 manufacturing establishments, with an aggregate capital of \$13,443,890, and an annual product of \$25,330,611, chiefly situated in Amherst, Manchester, and Nashua, the county towns. II. A W. county of Florida, bordering on the gulf of Mexico; area, 2,900 sq. m.; pop. in 1870, 3,216, of whom 546 were colored. Its coast is deeply indented by Tampa bay, and it is drained by Hillsborough, Alafia, and Manatee rivers. Its surface is low, level, and in some places marshy, and is timbered with live oak and palmetto. The soil is very rich. The chief productions in 1870 were 33,332 bushels of Indian corn, 27,663 of sweet potatoes, 35 hogsheads of sugar, 5,629 gallons of molasses, and 2,443 bales of cotton. There were 406 horses, 3,123 milch cows, 12,619 other cattle, and 3,679 swine. Capital, Tampa.

**HILLSDALE,** a S. county of Michigan, bounded S. by Ohio, and touching the N. E. extremity of Indiana; area, 555 sq. m.; pop. in 1870, 31,684. It is drained by the head waters of St. Joseph's river of Lake Michigan, St. Joseph's of the Maumee, the Kalamazoo, and Grand river. It has an undulating surface, heavily timbered in the south, and supporting elsewhere a thin growth of oak and hickory. The soil is a rich sandy loam. Iron ore and fine sandstone are found. It is intersected by the Michigan Southern, the Fort Wayne, Jackson, and Saginaw, and the Detroit, Hillsdale, and Indiana railroads. The chief productions in 1870 were 531,839 bushels of wheat, 879,032 of Indian corn, 271,732 of oats, 294,364 of potatoes, 385,051 lbs. of wool, 866,352 of butter, 35,891 of cheese, and 43,807 tons of hay. There were 8,996 horses, 10,567 milch cows, 11,303 other cattle, 89,457 sheep, and 17,492 swine; 8 manufactories of agricultural implements, 15 of carriages, 2 of cheese, 5 of furniture, 5 of iron castings, 3 of tombstones, 8 of saddlery and harness, 7 of sash, doors, and blinds, 1 of woollen goods, 8 flour mills, and 16 saw mills. Capital, Hillsdale.

**HILLSDALE,** a city and the capital of Hillsdale co., Michigan, at the intersection of the Lake Shore and Michigan Southern, and the Detroit, Hillsdale, and Indiana railroads, 55 m. S. of Lansing, and 85 m. W. by S. of Detroit; pop. in 1860, 2,177; in 1870, 3,518. It is surrounded by a fine agricultural region, and has an important trade in grain. It contains a chair factory, employing about 300 men, 3 flouring mills, 2 founderies and machine shops, 2 national banks, and 4 hotels. The city is the seat of Hillsdale college, an institution under the control of the Free-Will Baptists. It was originally established at Spring Arbor by a vote of the Michigan yearly meeting in 1844, and was chartered as Michigan Central college in the following year. It was removed to Hillsdale and received a new charter under its present name in 1855. The college building, a handsome brick structure four stories high, was partially destroyed by fire on March 6, 1874, and a new one is in course of erection. The grounds are spacious and well laid out. The college embraces seven departments, viz.: classical, scientific, classical preparatory, general preparatory, theological, music, art. The faculty consists of the president, 7 professors, and 14 instructors and tutors. The whole number of students in 1872-'3 was 606, of whom 391 were male and 215 female. Of this number there were 49 in the classical department, of whom 7 graduated; 175 in the scientific, of whom 20 graduated; classical preparatory, 33; general preparatory, 240; theological, 13; music, 73; art, 26. The library contains about 4,000 volumes. Hillsdale has 13 public schools, including a high school, 3 weekly newspapers, and 6 churches. It was settled in 1832, and incorporated in 1869.

**HILO,** a seaport town on the E. side of the island of Hawaii, in a district of the same name; pop. in 1872, 4,220, native and foreign. It is the second town in size, after Honolulu, in the Hawaiian islands. Hilo harbor, formerly called Byron's bay, has from three to eight fathoms of water; it is spacious, and protected by a reef of lava and coral from all winds except northerly ones, during which sailing vessels find it difficult to leave the port. The village and the district are among the most beautiful regions of the tropics. The climate is extraordinarily rainy. In a single year (1846-'7) there was a total rainfall of 182 in., of which 38'156 in. fell in March, 1847, and 10'466 in. in a single day. The district of Hilo is cut up by the deep channels of no less than 50 large streams, which fall into the sea within a space of coast about 25 m. in extent, discharging the rains that are poured by the trade winds upon the N. E. flanks of Mauna Kea. The freshets in these streams often come on so suddenly as to resemble the deluge produced by the sudden breaking of a mill dam. The town has four churches, viz.: Protestant and Catholic churches for the Hawaiians, a foreign church, and a seamen's Bethel.

**HILTON, William**, an English painter, born in Lincoln, June 3, 1786, died Dec. 30, 1839. He studied at the royal academy, and early devoted himself to historical painting, in which he displayed a complete mastery of the human figure, and singularly graceful composition. In his choice of subjects, many of which are from classic mythology, he evinced true poetic feeling. One of his best works is "Una and the Lion entering the Cave of Corceca." He was a royal academician, and succeeded Fuseli as keeper of the academy.

**HIMALAYA MOUNTAINS** (Sanskrit, *hima*, snow, and *alaya*, abode), a mountain chain of Asia, bordering upon India on the north, and separating it from Thibet. It is limited on the east by the Brahmapootra, and on the west by the Indus. Both these rivers, as well as the Ganges and the Sutlej, are now considered to spring from the snow fields of the Juhahir or Nanda Devi in the middle Himalaya, and those of the Kailasa in Thibet, to the north, between lon. 80° and 82° E. and lat. 30° and 31° N. The configuration of the earth is such at this point, that from the N. W. foot of the Kailasa the Indus flows N. W. along an enclosed valley, its deep-cut channel about 100 m. distant from the Himalaya to the south, until it passes through the chain about lat. 35° 40' N., lon. 74° 40' E., and from that point descends S. to the Arabian sea. On the other hand, the Brahmapootra (called at its origin the Dzang-bo-tzin or Sanpo) rises on the S. E. foot of the Kailasa, flows S. E. and E., then in lat. 27° 45' N., lon. 95° E., turns round the depressed hills on its right bank, and pursues its rapid and winding course to the bay of Bengal. Within the limits thus formed by nature the Himalaya measures in its curvings 2,000 m. in length, with a mean breadth of 180 m. The mighty ridges which rise above the plains of Thibet, and run parallel to the Himalaya from N. W. to S. E., compel both the Indus and Brahmapootra to flow from the divide of the Kailasa in a direction conformable with the enclosing mountain walls, until the increasing stream of the Indus is turned southward by the spurs sent down into its bed by the Karakorum and Hindoo Koosh, while the accumulated and rapid waters of the Brahmapootra are also turned southward and westward by the snowy masses which rise abruptly on its left bank to the east and south, where the eastern Himalaya terminates. The division of the chain into western, middle, and eastern Himalaya is founded upon like natural and obvious reasons. The western Himalaya is that portion drained by the five rivers of the Punjaub, from the Indus on the west to the Sutlej on the east, their united waters being conveyed to the ocean by the former. The middle Himalaya is that portion which is drained by the Ganges, and limited on the west by the mountain masses which overlook the left bank of the Sutlej, and in which the Jumna (Jumnotri) has its manifold sources, and on the east by the course of the

Teesta in Sikkim. It comprises the territory of Nepaul. Finally, the eastern Himalaya is drained by the Brahmapootra, and is all comprised within the little-explored country of Bhootan, from the wall of stupendous peaks which runs southward above the left bank of the Teesta, to where the Brahmapootra, under the local appellation of Dihong, enters Assam. The axis of this great mountain mass follows the line of watershed, and can by a careful inspection of a good map be drawn from point to point, where the streams originate which flow from the Himalaya northward into the Indus, the Sutlej, and the Brahmapootra, and those which empty southward into these same rivers and the Ganges. The axis thus traced along the line of watershed will be found to be also the line of mean greatest elevation, although the highest peaks do not happen to be on the axis. The direction of the secondary chains is often perpendicular to the main chain, oftener oblique to it, and not unfrequently parallel, while enclosing within the in-osculating ridges valleys of great length. This fact, and the height of the summits on so many of them, and the duration of the heavy snow with which they are mantled, have led local observers to confound these snowy ridges with the axis of the chain itself. The plains of India at the E. extremity of the Himalaya are but little elevated above the level of the sea; at the foot of the mountains they may be 350 ft. above this level in the meridian of Calcutta, and in the Punjaub toward the W. extremity of the range the elevation may be 1,000 ft. From these plains the view of the mountains is for the greater part of the time obscured by the vapors falling upon the southern ridges; but after the cessation of the S. E. monsoons the snowy peaks are sometimes seen at a distance of about 200 m., at an angle of elevation of only about 1° above a horizontal line. On approaching nearer to the chain, the distant peaks are lost to view behind the nearer wooded ones, and glimpses are rarely obtained that impress one with the vast magnitude and stupendous height of the chain.—Dr. Joseph D. Hooker, author of "Himalayan Journals," distinguishes four parallel longitudinal belts of country in the structure of these mountains. The lowest on the S. side extends from the plains of India to regions where snow is met with in winter. It is from 60 to 100 m. in width, ranging it may be from 5,000 to 8,000 ft. mean elevation, with peaks 13,000 to 14,000 ft. high. The lower portions are tropical, the upper temperate. It is cut up by ravines, but is not particularly precipitous. Beyond this ranges the second or snowy belt, that of the highest peaks 40 to 50 m. broad, its surface rugged and precipitous, with summits rising frequently to 20,000, some to 25,000, and a few even to 28,000 ft. above the level of the sea. Some of the rivers flow in deep gorges across this belt, their beds not more than 3,000 ft. above the sea level. The mean elevation is probably un-

der 13,000 ft. To this succeeds the central belt or axis of the chain, from 20 to 30 m. broad, its mean elevation perhaps 18,000 ft., at least in the middle Himalaya, and the main ridge or watershed seldom below 17,000 ft. except at the extremities; the surface is rocky and often precipitous. The northern belt is a region of mountains and valleys little explored, constituting the slope toward Thibet. Its climate is temperate, but of excessive vicissitudes, subject to drought, and the hills lack the luxuriant forest growth which covers those of corresponding elevations upon the other side. Skirting the southern foot of the Himalaya lies a tract of part forest, part jungle and marsh, from 10 to 20 m. in breadth. It is due to the humidity of the climate and to copious springs, as well as to the fact that this belt of pestilen-

tial waste is slightly depressed below the level of the plain to the south of it, thus allowing the collected waters to stagnate, and to produce beneath the tropical sun a rank and dense vegetation. This tract is called Terrai or Taragani, "passage through," and its outer habitable region Kadir. It gradually narrows away as it gains in height toward the central portion of the chain, and disappears W. of the Sutlej. Back of this tract Dr. Hooker says that "the mountains rise more or less suddenly, though seldom in precipices." They are reached sometimes by difficult paths that follow up the narrow and pestilential gorges of the rivers, or more commonly by the roads that ascend into the healthier atmosphere upon the summits of the secondary ridges. These ridges present to the traveller toward the axis of the chain a

Mount Everest, seen from above Darjeeling.

succession of ascents and descents; in each valley his progress is interrupted by a stream tributary to the nearest river to the right or left, or by the deep gorges of the larger branches themselves; and upon the slopes his course is impeded by forests and rocky precipices. No plain anywhere opens out before him; and during the warmer portion of the year cloud and fog shut in the view from the commanding points he reaches. So rugged are the mountains that 12 or 14 days are usually required for the journey of about 100 m. to the axis of the chain upon the main routes from India to Thibet. The difficulties thus opposed to exploration or settlement are not compensated by the presence either of great mineral wealth or of large tracts favorable to culture. On the other hand, it would be unjust to adopt the descriptions of occasional travellers. It takes a long time, even for one acquainted with

mountain regions, to trace correctly the various positions of ridges and spurs, of valleys and river courses, in any large area of an alpine aspect; but this difficulty is nowhere so formidable as among the huge masses and labyrinthine windings of the Himalaya. By most travellers the secondary ridges on the S. side, particularly of the E. portion of the chain, are represented as spurs leaving this at right angles, though as seen from the plains at a distance they present the appearance of longitudinal ridges. The strike of the rocky formations of which the chain is composed—the metamorphic slates and granitic rocks of the central portion, and the Silurian sandstone of the southern ridges—is described as everywhere with the general course of the mountains, thus suggesting a resemblance of the system to that of the Appalachians of the United States in its parallel ridges and valleys,

though this feature on the S. side of the Indian mountains may be obscured by the effect of rapid and excessive drainage.—The statements as to the relative amount and duration of the snow upon the N. and S. slopes of the chain have led to much controversy. The authorities generally concur in representing that milder temperatures prevail upon the N. side than at corresponding heights on the opposite side. The two Gerards place the line of perpetual snow on the S. side at 12,981 ft., and on the N. at 16,620. Lieut. Strachey, extending his observations over a district between lon.  $77^{\circ}$  and  $81^{\circ}$ , where heights covered with perpetual snow are found over a belt of 35 m. in width between lat.  $30^{\circ}$  and  $32^{\circ}$ , concluded that the snow line on the Thibetan side is 18,500 ft. above the sea, and on the Indian side 15,500. On the S. slope grain is cultivated with difficulty at 10,000 ft., while on the other side good crops are raised at 16,000 ft. It grows even at 18,544 ft., as seen by Capt. Gerard. This is more than 1,200 ft. higher than the snow line in the equatorial Andes. The belt constituting the watershed is described as excessively cold, bleak, and dreary, but in great part free from snow. This is no doubt owing to the rain clouds being deprived of their moisture as they are swept from the bay of Bengal over the secondary ridges, upon which it is in part precipitated in rain and the remainder in snow upon the higher peaks. But the cause of the milder temperature is not so obvious.—The highest peaks are not found along the line of highest mean elevation, but for the most part they are S. of it, rising in scattered groups from the secondary ridges. Of several of these groups E. of Sikkim little is known, except that as seen from a distance they appear to reach heights of 23,000 to 25,000 ft., or perhaps more. North of Sikkim is a noted group of immense peaks, among which stands preëminent Kintchinjunga, 28,156 ft. (Petermann), or 28,178 ft. (Hooker), in lat.  $27^{\circ} 42'$ , lon.  $88^{\circ} 11'$ ; and one degree further east Chumulari, 23,946 ft. (P.), or 23,929 ft. (H.). Upon the same parallel, in lon.  $85^{\circ} 58'$ , stands Mt. Everest, believed to be the highest summit on the globe, having, according to the survey of Col. Andrew Waugh, an altitude of 29,002 ft. Its English appellation is derived from the name of a distinguished officer of the Indian survey. In the Nepalese its name is Gaurisankar; by the people of Tibet it is called Chingofanmari. Mr. Hodgson had incorrectly given to it the name Deodunga or Deodhunga, which was that of a peak near by of comparatively small elevation. Dhawalagiri, in lat.  $28^{\circ} 42'$ , lon.  $83^{\circ} 32'$ , formerly estimated at 28,000 ft., is rated by Col. Waugh at 26,826. From the W. extremity of Nepal to the passage of the Indus through the chain, no fewer than 50 peaks are enumerated, the heights of which range between 19,500 and 25,749 ft., which latter is the height of Nanda Devi in Kumaon, drawn by Heber as a snowy spire,

its sides sloping at an angle of  $70^{\circ}$  with the horizon, and rising far above the similarly snow-clad summits around. Every 12th year the natives make a pilgrimage to this mountain, and the few who succeed in reaching the spot hold a religious festival at a point below the inaccessible summit. The mean height of the central portion along the western Himalaya is estimated at 20,000 ft.; and the passes sometimes cross at heights of 18,000 to 19,000 ft.—The lakes occurring in the Himalaya are few in number, and not of very great extent; the only important ones are on the N. side of the axis, and are the sources of the branches of the Indus, Sutlej, and Sanpo. Some of these are salt. The largest are from 20 to 30 m. in length. The Wullur lake in Cashmere, 5,000 ft. above the sea, is a sheet of water 21 m. long E. and W., and 9 m. broad, formed by the spreading out of the river Jhyllum, the only instance on the whole range of a river thus expanding into a lake. The rivers are fed during the summer by copious rains brought up by the S. E. monsoons, which sweep over the bay of Bengal, and, reaching the eastern Himalaya in April, gradually progress westward. The whole S. side of the chain by midsummer is enveloped in clouds and mists. In September they begin to clear off in the western divisions, but in the eastern the rains are not over till October or November. In the winter an upper current of S. W. winds brings new supplies of moisture, which falls in snow upon the higher mountains, and there is in the more humid provinces a short rainy season about the close of the year. The outer ranges receive the most of the rain. Dr. Hooker estimates the fall in Sikkim to amount to 120 in. in the year at 7,000 ft. elevation, and to gradually decrease to 10 in. at 19,000 ft. The river courses to the S. are thus much larger and more numerous than those upon the N. side of the chain. In their upper portions their descent is comparatively gentle, but further down they run with great rapidity, and generally in deep and almost inaccessible ravines; yet they rarely form cascades of any grandeur. Fish of the carp kind abound in them from the plains to 15,000 ft. elevation, except at heights between 5,000 and 10,000 ft. Those of eastern Tibet especially swarm with fish at elevations from 10,000 to 14,000 ft. Glaciers are numerous in the more elevated portions of the mountains, but are wasted away before they reach the lower valleys. Deposits of bowlders and extensive moraines, found in all the valleys at heights exceeding 8,000 or 9,000 ft., indicate that the glaciers formerly reached 6,000 ft. below their present limits. Volcanoes are entirely wanting throughout the range, and there are no evidences of extinct ones. Hot springs are frequently met with at heights from 10,000 to 18,000 ft., their temperature ranging from  $100^{\circ}$  to  $130^{\circ}$  F.—The geological formations through the most elevated portions of the range are

principally metamorphic slates alternating with granitic belts. They form the loftiest peaks; and against them rest strata of the Silurian period. The formations range with the chain, and are seen usually dipping toward its axis. In Kumaon rocks of the oolitic formation succeed to the Silurian, and in some of the larger river valleys, at elevations of 15,000 ft., are found tertiary beds with fossils referring them to the miocene period. Among them are specimens of extinct species of the horse, rhinoceros, elephant, hippopotamus, &c. Strata containing marine shells occur at an elevation of 16,000 ft. Fresh-water pleistocene deposits have been found by Dr. Thomson in the extreme western Himalaya of Thibet, on the flanks of mountains far above the present level of the rivers and lakes. The mineral productions are of little importance. Gold is found in eastern Thibet, but the Chinese government prevents its being worked to much extent. In Koonawur, a district at the passage of the Sutlej through the chain, are mines of specular iron ore, which have been long worked by horizontal excavations, extending sometimes half a mile into the mountains. The ore is converted into wrought iron by the natives, who make of it sabres, knives, and hatchets, the best metal being known as that of the locality called Sheel. Copper ores too are found here, and also in Nepal and Sikkim; but they are not worked.—The vegetable productions in the lower portions of the mountains are those of the tropics. They reach up to the height of 6,000 or 7,000 ft. in the humid central portions of the range, and in the extreme western to 3,000 or 4,000 ft. In the deep gorges of the rivers are plantains, palms, and fig trees; above are magnolias and laurels; to these succeed oaks, chestnuts, birches, &c.; still higher are pine forests, then rhododendra and the scanty alpine growth. All these products of the colder portions are recognized as European forms. These indeed begin to appear as the tropical plants give way to those of temperate climes; and at heights from 6,000 to 12,000 ft. are seen species of oak, maple, ash, cherry, poplar, hornbeam, juniper, willow, pine, and many other of familiar names, some of which are identical with the species of Europe and America. The grains, garden fruits, and vegetables cultivated in the upper portions of the mountains are very similar to those of northern Europe. In the state of Bussaher, of which Koonawur is a province, grapes are extensively cultivated, and tea is produced as an article of commerce. The distribution of the fauna is similar to that of the flora: tropical forms in the lower regions, among which are found tigers, leopards, buffaloes, the rhinoceros, elephants, &c.; in the upper districts European types predominate, mixed with Chinese and Japanese forms to the eastward, and partaking in the alpine districts of the Siberian character.—The inhabitants constitute many tribes and nations, of Hindoo

or Mongolian race. Those of all the valleys above 8,000 ft. elevation are Thibetans, in whom the Aryan is more or less intermixed with the Mongolian. The English have established many stations at points situated from 6,000 to 8,000 ft. above the sea, where they find a healthy atmosphere and a climate like that of England; and they anticipate the time when the habitable portions of the Himalaya will be peopled by their own colonists and their descendants. Dr. Hooker names the following as the most important of these hill sanatoria, as he calls them: Darjeeling, elevation 7,000 to 8,000 ft., in Sikkim; Nyni Tal, 6,000 to 7,000 ft., and Almora, 5,000 to 6,000 ft., in Kumaon; Masuri, 6,000 to 7,000 ft., in Gurwhal; Kangra, 7,000 to 8,000 ft., in the Beas valley; Murree, 7,000 to 8,000 ft., between the Indus and Jhyllum; and Simla, 7,000 to 8,000 ft., in the Punjab, near the Sutlej river, a favorite resort for Europeans, being usually the residence of the governor general during a portion of the hotter months.—Among the more distinguished explorers of the Himalaya mountains are Adolf Schlagintweit, who was murdered in August, 1857, while engaged in his investigations, and his brothers Hermann and Robert. They demonstrated the correctness of Humboldt's view that there was not the least connection between the Kuenlun and Karakorum ranges and the Himalaya range, each of them being in fact an independent chain. The following are some of the many important works relating to this chain: the "Himalayan Journals" of Dr. J. D. Hooker; numerous papers in the "Asiatic Researches" and the journal of the Asiatic society of Calcutta; Humboldt's *Asie Centrale*; Bishop Heber's "Journal;" "Western Thibet," by Capt. H. Strachey; Thomson's "Western Himalaya;" *Reisen in Hochasien*, by H. Schlagintweit; and the publications of the trigonometrical survey of India.

**HIMERA**, an ancient Greek city of northern Sicily, at the mouth of the river Himera, between Panormus and Cephalcedium. It is said to have been founded about the middle of the 7th century B. C. by a colony from Zancle (the later Messina). It was once subject to the tyrant Phalaris, and at another time was a city of refuge for the Zanclean tyrant Scythes. Subsequently, however, it came to have a despot of its own, named Terillus, who, being expelled, applied to the Carthaginians for assistance, which was the immediate occasion of the first great expedition of that people to Sicily, which took place in 480 B. C. The army of the Carthaginians, said to have been 300,000 strong, commanded by Hamilcar, was defeated at Himera with great slaughter by Gelon of Syracuse. This victory did not however restore liberty to the Himeræans, but merely transferred them from the tyranny of Terillus to that of Thrasydæus, the son of Theron of Agrigentum, under whom such numbers of the citizens were executed or ban-

ished that the city had to be repopled with new colonists, who, being mostly of the Dorian race, rendered it thenceforward a Doric city. After the death of his father, Thrasydæus was expelled, and then the citizens whom he had driven into exile were allowed to return. In 409 B. C. the second expedition of the Carthaginians to Sicily took place, under Hannibal, the son of Gisco and grandson of Hamilcar, to whom after a desperate resistance the city succumbed. The greater part of the inhabitants were put to the sword; 3,000 of those who had been taken prisoners were sacrificed by Hannibal to the manes of his grandfather Hamilcar, who had fallen in the great battle above mentioned, while the city itself was utterly destroyed. Himera was never rebuilt, but such of its inhabitants as survived its destruction fled to the neighboring town of Thermæ, to which they gave the name of Himera.

**HIMILCO**, the name of several distinguished Carthaginians, the most eminent of whom were the following: **I.** A navigator, who lived in the 6th or 5th century B. C., and who was sent on a voyage of discovery northward from Gades at the same time that Hanno was commissioned to explore and colonize the W. coast of Africa. On his return he is said to have reported that the stagnant nature of the sea, the vast mass of seaweed that floated on its surface, and the absence of wind, had prevented his progress toward the north. **II.** A general who commanded, in conjunction with Hannibal the son of Gisco, the third expedition sent by the Carthaginians to Sicily (406 B. C.). The latter having been carried off by sickness soon after their arrival, Himilco succeeded to the command. Having reduced Agrigentum and destroyed several of the Greek cities, he concluded an advantageous peace with Dionysius the Elder, tyrant of Syracuse, and returned to Africa. When Dionysius declared war against Carthage, and attacked her dominions in Sicily, Himilco was appointed to defend them. Being worsted, he retired from Sicily, but in the following spring returned with a powerful force, and after recovering the greater part of the lost territory advanced against Syracuse. This enterprise failed, and Himilco concluded an ignominious peace, returned to Carthage, and committed suicide by starvation.

**HIMMEL, Friedrich Heinrich**, a German composer, born at Treuenbrietzen, Prussia, Nov. 20, 1765, died in Berlin, June 8, 1814. He early attracted the notice of Frederick William II., who afforded him the means of pursuing his musical studies, and afterward appointed him royal chapelmaster. His chief opera was *Semiramide*, first performed in Naples in 1795. This work was said to contain the material of ten ordinary operas. He composed many cantatas and occasional pieces, and an immense number of pianoforte compositions and songs.

**HIMYARITES**, and *Himyaritic Language and Inscriptions*. Ethnologically and linguistically

considered, the term *Himyaritic* denotes the whole group of races and languages from the basin of the Euphrates, across South Arabia, to Abyssinia. The *Himyarites* are mentioned in classical literature under the name of *Homerites*. They traced their origin to *Himyar*, grandson of *Saba* and descendant of *Joktan* or *Kahtan*, one of the mythical ancestors of the Arabs. According to their traditions, they became the dominant race in Yemen about 3,000 years before the time of Mohammed. *Abulfeda*, in his "Short History of the Human Race," assigns to their dynasty a duration of 2,020 years. The date of the destruction of the first *Adite* empire, which apparently included the whole of Arabia Felix, and not alone Yemen proper, has been fixed by *Caussin de Perceval* at 18 centuries B. C. It is supposed that it was caused by the invasion of the *Joktanite* tribes. But the *Cushites*, or the first *Adites*, soon recovered the supremacy, and for many centuries the *Joktanites* continued in subjection, but increased in strength, and finally usurped the dominion. During the first centuries of the second *Adite* empire Yemen was temporarily subjugated by the Egyptians, who called it the land of *Pun*. They seem to have lost it again at the close of the 18th dynasty; but *Rameses II.* regained it, and it was not finally lost till the time of the 20th dynasty. The *Joktanites* under *Yarub* gained the political supremacy, according to *Caussin de Perceval*, at the beginning of the 8th century B. C. *Ibn Khaldun*, a comparatively trustworthy Arab historian, says: "*Lokman* and his children (the new *Adite* empire) preserved the royalty for 1,000 years. The power of this family lasted till it was overthrown by *Yarub*, son of *Kahtan*. Conquered by him, the *Adites* took refuge in the mountains of *Hadramaut*, and finally entirely disappeared." *Yashjob*, *Yarub's* son, was a feeble prince, who allowed the chiefs of the various provinces of his states to make themselves independent; this is the origin of the separate kingdoms of *Hadramaut* and *Mahrah*, which from that time always had their own rulers, sometimes independent, and sometimes vassals of Yemen. *Yashjob's* son, *Abd Shems*, surnamed *Sheba*, recovered the power, and reunited under his government all the petty dynasties of Arabia Felix. *Abulfeda* ascribes to him the construction of the famous dike of *Mareb*, the rupture of which a short time after the Christian era was one of the great events of the ancient history of Yemen. The more popular tradition, however, which attributes it to *Lokman* and the second *Adites*, is considered more probable. Its ruins remain to our day. *Abd Shems* had several children, among them *Himyar* and *Kahlan*, from whom were descended the greater part of the Yemenite tribes at the time of the rise of Islamism. The *Himyarites* seem to have settled in the towns, while the *Kahlanites* inhabited the country and the deserts of Yemen. *Himyar* was only an appellation signifying

"the red," and the real name of the son of Abd Shems was Ghazahaj. The children of Himyar at first shared the royalty with other families, especially that of Kahtan. The Arab historians do not supply a complete list of the successors of Himyar or Ghazahaj. Himyar's brother Kahlan, and Wathil, Alamluk, and Shammir, are named as his successors. An Assyrian inscription speaks of Yathaamir, on whom Sargon imposed a tribute of gold, spices, horses, and camels. Esarhaddon also seems to have made an expedition to South Arabia. A large number of Arabs emigrated to Ethiopia during several centuries preceding our era. About 100 B. C. the supreme power was concentrated in the house of Himyar, and caused the ancient name of Sabæans, given to the southern Arabs, to be replaced by that of Himyarites. (See SABÆANS.) In the account of the expedition of Ælius Gallus in 24 B. C., the Himyarites appear for the first time under the name of Homerites. The most flourishing period of the Himyarites appears to have commenced with Harith er-Baish, whom Caussin de Perceval places about 100 B. C., and ended with Dhu Norvas and his successor, who were defeated by the Abyssinians in A. D. 525. South Arabia subsequently fell under the dominion of the Persians, and in 629 the Himyarites succumbed to Mohammed and accepted Islam. (See ARABIA, and YEMEN.) Direct descendants of the ancient Himyarites are the tribes of Mahrah. They are black in color, medium in stature, Semitic in countenance, strong and sinewy in structure. Their dress is a cloth for the loins and another for the head. The women are covered with a kind of shawl, and wear pantaloons and veils only in towns. A man with breeches would be an object of ridicule. They belong to the orthodox sect of the Shafei.—The so-called Himyaritic language, or, better, the language of the Sabæans, says Osiander, seems to form with Arabic and Ethiopic the southern branch of the Semitic family, and stands in a peculiar relation at once of agreement and disagreement to both in common and to each separately. In common with Arabic, it possesses the whole delicate system of sounds, the diphthongs, the laws of the transmutation of sounds, and several peculiarities of the verb. In common with Ethiopic, it has its type of a graphic system, the want of the article, and many words not found in other kindred languages. It differs from Arabic and Ethiopic by terminating the imperfect in *n*, in the form of the infinitive, and other grammatical peculiarities. Several of its characteristics it has only in common with Hebrew and Assyrian; in others it resembles the Aramaic. Several scholars therefore do not classify Himyaritic as a dialect of Arabic, but consider it an independent language, and possibly an elder sister of Hebrew and Assyrian. Renan also considers the Himyaritic too widely different from Arabic to group them together.—Karsten Nie-

buhr (1774) was the first who called attention to the existence of inscriptions in a peculiar character in the southern districts of Arabia. In 1810 Dr. Seetzen, a German traveller, followed up the indications of Niebuhr, and discovered at Zhafar three inscriptions, and five others built into the walls of the mosque of the neighboring village of Mankat. The next discoveries were made by various officers of the Palinurus, a vessel of the British Indian navy, stationed in the Red sea in order to make a survey of the coast. In 1843 Arnaud copied 56 inscriptions at Sana, Khariba, Marib, and the so-called Haram of Bilkis. Baron von Wrede discovered inscriptions on a dike in the wady Webeneh in Hadramaut, and Kennett Loftus came upon a tomb closed in with a rough sandstone slab inscribed in the Himyaritic character, while making excavations in the mounds at Warka, in southern Babylonia. The British museum has also two gems with Himyaritic characters brought from Babylonia, and two others of which the history is unknown. Coghlan and Playfair presented the museum with a number of bronze tablets, principally dedications to Almakah, discovered by them at Amran, near Sana. An altar of limestone dedicated to Athtor was found at Ibyan or Abyan, about 80 m. N. E. of Aden. Several inscriptions have been found also on the dike at Marib. Many others have recently been found, which have increased the collection to several hundred specimens. It is probable that the larger number of these monuments must be referred to the later and more flourishing period of the Himyarite kings, between 100 B. C. and A. D. 500. Two inscriptions have been discovered bearing dates, one from Sana dated 573, and one from Hisn Ghorab dated 604. It does not appear however that it has been determined by what era these dates are calculated. Several Arabic writers have preserved to us alphabets of the Himyaritic character, which is called Musned by them, with the corresponding Arabic letters. These alphabets have formed the basis of the interpretation of the inscriptions by modern orientalists. The latter are in horizontal lines, generally from right to left, but occasionally a *boustrophedon* mode is adopted, chiefly where the lines are of great length. The words are usually separated from each other by a vertical stroke, which has greatly facilitated the interpretation of the inscriptions. This was discovered from the fact that in certain formulas which frequently occur a word would sometimes terminate exactly at the end of a line, leaving no space for the upright stroke, which was then altogether omitted, showing that it was not an integral part of the writing. The inscription which we give is copied from a copper tablet sent by Prideaux from Aden. Pratorius, in the *Zeitschrift der Morgenländischen Gesellschaft* (1872), has advanced the opinion that it is a forgery like many others, as Von Maltzan has discovered that a Jewish cop-

persmith in Sana had obtained possession of copies of genuine inscriptions and made others from them by combining portions of several of them. In the case before us we have true Himyaritic characters, but the first five lines are the same as those of a copy furnished by

Himyaritic Inscription.

Halévy. They have been translated as follows: "Halaida with his sons, the sons of Madikarib, the family of Iaf 'an, has given homage to the Athtar of Qabad."—The principal notices that have appeared on the subject of the Himyaritic characters, or the interpretation of the inscriptions, are by Rödiger, Ewald, Gese-nius, Gildemeister, Fresnel, Osiander, Levy, Halévy, and Prætorius. They are to be found in the *Zeitschrift für die Kunde des Morgen-landes*, the *Journal Asiatique*, and similar periodicals. The British museum published in 1863 all the inscriptions in the Himyaritic character then owned by it.

**HINCKLEY**, a town of Leicestershire, Eng-land, 12 m. S. W. of Leicester; pop. in 1871, 6,902. An ancient church, with a very curious oak roof, is the most interesting building. It has manufactories of hosiery, cotton thread, and worsted. Near it are Roman remains, and the neighboring village of High Cross, where two Roman roads intersect (Watling Street and the Fosse Way), is probably the site of the Roman station Benonæ or Venonæ.

**HINCKS**, **I. Edward**, an Irish archæologist, born in Cork about 1792, died at Killyleagh, county Down, Dec. 3, 1866. He studied under

his father, who was professor of Hebrew and head master of the classical school in the Bel-fast academical institution, graduated at Trin-ity college, Dublin, in 1812, took orders, and in 1826 became rector of the parish of Killy-leagh. He contributed many important pa-pers, especially on Egyptian hieroglyphics and Assyrian cuneiform inscriptions, to the trans-actions of various societies. Among the best known of these is a translation of portions of an inscription of Tiglath-pileser the elder, pub-lished by the royal Asiatic society (1857), in parallel columns with three other translations, in order to show by their general agreement that the true principles of interpretation had been discovered. He published a catalogue of the Egyptian manuscripts in the library of Trinity college (1849); "A Letter to Profes-sor Renouf on the Polyphony of the Assyrio-Babylonian Cuneiform Writing" (1863); and some religious works, among which is a report of a doctrinal discussion with three Roman Catholic priests (1829). **II.** Sir **Francis**, a Ca-nadian statesman, brother of the preceding, born in Cork, Ireland, in 1807. He engaged in commercial pursuits in Canada, and after-ward in journalism and politics, and became proprietor and editor of the "Toronto Exam-ner," and a member of the legislature. He was finance minister in 1842-'3 and from 1848 to 1854, being from 1851 also prime minister. He was governor of the Windward islands from 1855 to 1862, and of British Guiana from 1862 to 1869, when he was knighted, and was again finance minister of Canada until late in 1873. He was among the first to urge a re-sponsible ministry in Canada, and though op-posed by Lord Sydenham, the governor, and by other influential persons, he secured the recognition of this principle by the English government. He has published pamphlets on political and financial subjects.

**HINCMAR**, a Gallican prelate, born in Aquit-aine about 806, died in Épernay, Dec. 21, 882. He was brought up from childhood in the mon-astery of St. Denis, near Paris, where he be-came a monk under the reformed rule which he was himself instrumental in introducing. He was in high favor with Louis le Débon-naire, to whom he remained faithful in his adversity. In 845 he was consecrated arch-bishop of Rheims in place of Ebbonius, who was a partisan of the emperor Lothaire. His elec-tion was contested at Rome by Lothaire, but as Ebbonius did not urge his claim, Hincmar was confirmed. He showed much firmness in resist-ing the abuses of the kingly power and in re-storing discipline in the church; and he was in such favor with Charles the Bald, that con-temporary writers speak of him as ruling both church and state during that prince's reign. In 848 he presided over the council of Quierzy-sur-Oise, in which the Benedictine monk Go-deschalchus (Gottschalk) was at his instigation sentenced to be degraded from the priesthood, publicly whipped, and imprisoned for life.

This sentence, which Hincmar caused to be executed in presence of the king, excited much indignation. The most illustrious prelates of Gaul and Germany blamed its severity, and condemned both Hincmar and Rabanus Maurus, archbishop of Mentz, for falling themselves into a doctrinal error on the very matter of predestination on which they had condemned Godescalcus. A doctrinal exposition drawn up by Hincmar, and approved in 853 by a second council held at Quierzy, was censured by the archbishop of Lyons, and by the council of Valence in January, 855, Hincmar himself being present. In 852 he obtained a decree from the council of Soissons for ever excluding from preferment all persons ordained by Ebbonius. Among these was Wulfadius, elected in that year archbishop of Bourges. This decree and its execution by Hincmar were openly censured by Pope Leo IV. and annulled in 866 by Nicholas I. This pontiff also cancelled the sentence of two councils held by Hincmar at Soissons deposing Rothrad, bishop of that city, and condemning him to perpetual reclusion. In 864, however, Hincmar having refused to give episcopal consecration to an unworthy favorite of the king, the pope sustained his action. In 869 Hincmar made a vigorous opposition to Adrian II., when that pope interfered to prevent Charles the Bald from taking possession of Lorraine, after the death of the younger Lothaire. To the orders and menaces of the pope Hincmar replied by denying his right of intervention. In 871 Hincmar presided at the council of Douzy, which sentenced his nephew Hincmar, bishop of Laon, to deposition and imprisonment. No appeal to Rome was permitted; and two years afterward the prisoner's eyes were put out with a red-hot iron. Hincmar showed much courage in reproving the royal officers for their oppressive conduct, and reproached the king himself with conniving at their excesses. In 882 one of his last acts was to oppose Louis III. in his wish to have his favorite Odoacer consecrated bishop of Beauvais. On the advance of the Normans toward Rheims, Hincmar, taking with him the shrine and body of St. Remi, fled to Épernay, where he died. He did much for the welfare of the people, suppressed abuses and immorality, completed the cathedral of Rheims, founded there two famous schools, endowed their professorships, and established a public library. Sirmond published a complete edition of Hincmar's works (2 vols. fol., Paris, 1645). — See Flodoard's *Historia Ecclesiæ Rhemensis* (2 vols., Rheims, 1854, with French translation); Noorden's *Hinkmar, Erzbischof von Rheims* (Bonn, 1863); and J. C. Prichard's "Life and Times of Hincmar, Archbishop of Rheims" (London, 1849).

**HIND, John Russell**, an English astronomer, born in Nottingham, May 12, 1823. He was educated for a tradesman, but in 1840 entered the office of a civil engineer in London. Through the influence of Prof. Wheatstone he obtained

a situation the same year in the royal observatory at Greenwich, where he remained about four years. After a short stay in Ireland, where he was sent on the commission to determine the exact longitude of Valentia, he was appointed, at the recommendation of Prof. Airy, astronomer royal, to a post in the observatory of Mr. Bishop, in Regent's park, London. He began here in 1845 a series of observations, during the course of which he calculated the orbits and declinations of more than 70 planets and comets, noted 16 new movable stars and 3 nebulae, and discovered 10 new asteroids. In July, 1846, he discovered a comet, which had been observed by De Vico two hours before at Rome; and early in 1847 another comet, which at its perihelion passage, March 24, was bright enough to be seen in the strong morning twilight. In April, 1848, he made a very remarkable discovery of a new reddish yellow variable star of the 5th magnitude in Ophiuchus. In 1850 this star was only of the 11th magnitude, and it was calculated that it would soon disappear altogether. The asteroids discovered by Mr. Hind are as follows: Iris, Aug. 13, 1847; Flora, Oct. 18, 1847; Victoria, Sept. 13, 1850; Irene, May 19, 1851; Melpomene, June 24, 1852; Fortuna, Aug. 22, 1852; Calliope, Nov. 16, 1852; Thalia, Dec. 15, 1852; Euterpe, Nov. 8, 1853; Urania, July 22, 1854. In December, 1844, he was elected a member of the astronomical society of London, and was afterward appointed its foreign secretary. He has received many other honors at home and abroad, and since 1852 has had a pension of £200 from the government. He is the director of the "Nautical Almanac" of England. His writings have generally been published in the "Transactions" of the royal astronomical society of London, in the *Astronomische Nachrichten* of Altona, and in the *Comptes Rendus* of the academy of sciences of Paris. He is also the author of "An Astronomical Vocabulary" (1852); "The Comets" (1852); "The Solar System, a Descriptive Treatise upon the Sun, Moon, and Planets, including an Account of all the Recent Discoveries" (1852); "Illustrated London Astronomy, for the Use of Schools and Students" (1853); "Elements of Algebra" (1855); and "Descriptive Treatise on Comets" (1859).

**HINDOO KOOSH** (Pers. *Hindu Kuh*, Indian mountain), a range of mountains in central Asia, which was known to the ancients as the Indian Caucasus. Although the name more strictly belongs to the lofty snow-clad summit, upward of 20,000 ft. in height, which rises directly N. of the Cabool valley, it is applied to the entire mountain tract extending from the southern portion of the elevated table land of Pamir, in about lat. 37° N., lon. 73° E., to the region near lon. 68° immediately W. of the city of Cabool. It separates the Punjaub and Afghanistan on the south from Badakhshan and Koon-dooz on the north. The least elevation of the

range relative to the surrounding country appears to be on the plateau which forms its eastern extremity, where it is approached by the Karakorum mountains. The absolute height of the eastern portion of the Hindoo Koosh, however, is very great, the Nuksan pass, between Chitral on the south and Wakhan on the north, being estimated to be 17,000 ft. above the level of the sea. There are glaciers in this region. The range decreases in elevation as it stretches westward. Those peaks whose heights have been determined are upward of 20,000 ft. in altitude. The section which has been most thoroughly explored lies between the 70th and 68th meridians, from the Khawak pass on the east to the Hadjiyak passes on the west. It is described as an unpierced watershed, closely corresponding to the line of highest peaks, and crossed by 19 passes, none less than 12,000 ft. high. The Khawak pass, 13,500 ft., is supposed to be that which was traversed by Tamerlane on his way to the conquest of India, and by Alexander the Great on his return from Bactria. The three Hadjiyak passes, about 13,000 ft., lead from the head of the Cabool valley to Bamian in the basin of the Oxus, and are usually regarded as the limit of the Hindoo Koosh on the west, the name Koh-i-baba being applied to the western extension of the range. The Cabool and Helmund rivers rise on the southern slope of the watershed, and from the northern side flow several important tributaries of the Oxus. The Hindoo Koosh is characterized by excessive aridity and a remarkable absence of forests.

**HINDOSTAN.** See INDIA.

**HINDS**, a S. W. county of Mississippi, bounded E. by Pearl river and N. W. by the Big Black; area, 850 sq. m.; pop. in 1870, 30,488, of whom 20,659 were colored. It has a level surface and a rich soil. It is intersected by the New Orleans, Jackson, and Great Northern, and the Vicksburg and Meridian railroads, and the Raymond branch. The chief productions in 1870 were 10,619 bushels of rye, 410,553 of Indian corn, 58,304 of sweet potatoes, and 27,394 bales of cotton. There were 1,714 horses, 2,905 mules and asses, 4,274 milch cows, 1,034 working oxen, 7,071 other cattle, 4,179 sheep, and 14,330 swine; 2 manufactories of agricultural implements, 1 of boots and shoes, 2 of carriages, 1 of furniture, 1 of gas, 2 of iron castings, 1 of machinery, 3 of saddlery and harness, 4 of tin, copper, and sheet-iron ware, 2 bookbinderies, and 2 newspaper establishments. Capital, Jackson, which is also the capital of the state.

**HINGHAM**, a town of Plymouth co., Massachusetts, pleasantly situated on the S. side of Boston harbor, 14 m. S. of Boston, with which it has communication by the South Shore railroad; pop. in 1870, 4,422. It is a place of resort for residents of the city, and in summer steamers run daily to Boston. The fisheries employ several vessels, and the manufactures are of considerable importance. The

town contains a national bank, savings bank, insurance company, newspaper, 17 schools, and 8 churches. It was settled in 1635.

**HINSDALE**, a S. W. county of Colorado, formed in 1874 from portions of Conejos, Lake, and Saguache cos.; area, about 1,400 sq. m. It contains gold mines. Capital, San Juan City.

**HINTON, John Howard**, an English clergyman, born in Oxford, March 24, 1791. He first preached at Reading, and afterward at London, as minister of a Baptist congregation. He had the reputation of being an independent and original preacher, and he was a zealous advocate for the voluntary principle in religion and education. He edited the "History and Topography of the United States," completed in 1832 (American editions by S. L. Knapp, 2 vols. 4to, Boston, 1834; by J. O. Choules, with continuation, 2 vols. 4to, New York, 1853). He has also written "Memoirs of William Knibb;" "Theology, or an Attempt toward a Consistent View of the Whole Counsel of God;" "Elements of Natural History," &c. The complete edition of his works is in 7 vols.

**HIOGO**, or **Fiogo**, a seaport town of Japan, pleasantly situated on the island of Nipon, on the bay and about 20 m. W. of the city of Osaka, of which it is the port; pop. about 20,000, including a small number of foreign merchants, mostly Germans. Being the best harbor of Japan, its opening to foreign trade in 1868, and its proximity to the most fertile districts of the empire, gave rise to great commercial activity. The exports are very considerable, especially of tea. The annual imports are valued at about \$7,000,000. Upward of 1,000 vessels enter the port annually. A railway to Osaka was opened in 1874.

**HIPPARCHUS**, an ancient astronomer, born in Nicæa, Bithynia, flourished in the middle of the 2d century B. C. We have no details of his life, and our knowledge of his astronomical discoveries is derived altogether from his disciple Ptolemy. He was the first who systematically attempted to classify the stars, and to determine their position and magnitude. To his catalogue we are indebted for our knowledge of the retrograde motion of the equinoctial points. He was the inventor of the planisphere, and he conceived the idea of marking the position of places on the earth by circles drawn perpendicular and parallel to the equator. His only work still extant is the "Commentary on the Phenomena of Aratus and Eudoxus," the best edition of which is that of Petavius (Paris, 1630).

**HIPPARCHUS.** See HIPPIAS and HIPPARCHUS.

**HIPPARION**, an extinct perissodactyl or uneven-toed mammal, belonging to the solidungulate (solid-hoofed or single-toed) division, which includes the horse and the ass, or the family *equidæ*. In its skeleton it was decidedly horse-like, but, in addition to the single toe on each foot, it had an additional one on each side, raised from the ground, and pointing laterally backward, as in the hog and ruminants.

The enamel of the molar teeth was in more complex folds than in the present horse. Fossil horse-like animals have been found in the later tertiary and quaternary of North and South America, Europe, and northern Asia, and especially in the western regions of the United States. This genus has been obtained from the later tertiary of Europe, Asia, and North America. Of the species described by Hayden, *H. venustum*, half the size of the ass, has been found in South Carolina; *H. occidentale*, *speciosum*, and *affine*, from the pliocene of Dakota and Texas, about the size of an ass, are all nearly allied, if not the same species. *Protophippus*, *hippidion*, and *merychippus* are allied genera.—This series of horse-like animals is interesting from the point of view of the relation of past to present species, and of the derivation of the latter from the former; most naturalists of the present day, rejecting the principle of direct or miraculous creation, and recognizing a natural law or secondary cause, "the servant of predetermining intelligent

the modern horse first appears to have lost its lateral hooflets, and to have walked upon the end of the single second toe or digit, the two lateral splint bones being entirely internal and hoofless. He makes the series, from the hoofs and molar teeth, *palæotherium*, *paloplotherium*, *ancitherium*, *hipparion*, and *equus* (horse). To admit this does not require either the hypothesis of appetency or volition of Lamarck, the fitness of the surrounding medium of Geoffroy Saint-Hilaire, or the natural selection of Darwin; but simply the continuous operation of natural law or secondary cause, successively and progressively, "from the first embodiment of the vertebrate idea under its old ichthyic vestment, until it became arrayed in the glorious garb of the human form." (See HORSE.)

**HIPPEAU, Célestin**, a French author, born in Niort, May 11, 1803. He studied in his native town, and in 1855 was sent on an educational mission to England, and in 1867 to the United States to report on American education. His principal works are: *Histoire de la philosophie ancienne et moderne* (1863); *Histoire du gouvernement de la Normandie* (9 vols., 1863-'73); and *Dictionnaire de la langue française au douzième et treizième siècle* (1873).

**HIPPIAS AND HIPPARCHUS**, the sons and successors of Pisistratus, tyrant of Athens. According to an early popular opinion, Hipparchus was the elder brother; according to Herodotus and Thucydides, Hippias. While they ruled jointly the government was conducted on the same principles as that of their father, and that period was subsequently regarded by the Athenians as a kind of golden age; but from the murder of Hipparchus by Harmodius and Aristogiton (514 B. C.) the character of the government of Hippias became arbitrary, exacting, and oppressive. His despotism was, however, at length overthrown. The Delphic oracle was bribed to favor the cause of liberty, and the pythoness repeatedly enjoined the Lacedæmonians to free Athens from the despotism of the Pisistratidæ. A Spartan force under Cleomenes, having defeated Hippias in the field, and captured his children, compelled him to surrender the Acropolis, and to evacuate Attica with all his relatives (510). No sooner had they departed than a decree was passed condemning the tyrant and his family to perpetual banishment, and a monument was erected in the Acropolis commemorative of their crimes and oppressions. Hippias ultimately retired to the court of Darius, and there instigated the invasion of Greece. According to some, he fell at Marathon (490).

**HIPPO**, or *Hippo Regius*, an ancient city of Numidia, the ruins of which are still to be seen near Bona in Algeria. It was one of the residences of the Numidian kings, and afterward celebrated as the episcopal see of St. Augustine. It was taken and destroyed by the Vandals in 430. Its surname served to distinguish it from another town of the same name on the Carthaginian coast, W. of Utica.

1. Palæotherium. 2. Hipparion. 3. Horse

Will," as Prof. Owen has it, as operating in the production of species in orderly succession and progression. As proofs of the hypothesis that the existing are modifications of extinct species, changing by small degrees, it became important to collect a series of such intermediate forms from the fossil world. Prof. Owen, in his "Anatomy of Vertebrates," devotes a chapter to this subject, and especially mentions the series of anoplotherium, palæotherium, and hipparion, as supplying the links required by Cuvier to connect the pachyderms with the horse of the present day. In the accompanying illustration, *p* and *m* signify pre-molar and molar teeth, and 2, 3, 4 are the digits or toes. The palæotherium had three nearly equal toes, each with a hoof; the hipparion was also in one sense three-toed, but the lateral hoofs were spurious, not touching the ground; and it is interesting to note that these three-toed horses are found only in deposits of that tertiary period intervening between the older palæotherium and the newer strata in which

**HIPPOCRATES**, a Greek physician, called the "father of medicine," born in the island of Cos about 460 B. C., died in Larissa, Thessaly, between 375 and 351. He studied medicine with his father Heraclides, who belonged to the order of Asclepiades, or descendants of Æsculapius, and afterward went to Athens to place himself under the instruction of Herodicus. He was a pupil of the philosopher Gorgias of Leontini, and perhaps also of Democritus of Abdera. Having practised his profession in Cos, he travelled through Thessaly, Macedonia, and Scythia, and finally returned to Thessaly, where he passed the close of his life. The esteem in which he was held by his contemporaries renders very improbable the story that, having charge of a library at Cos or Cnidus, he made too free a use of the writings of others, and burned the collection to conceal his plagiarisms. Hippocrates raised medicine from a system of superstitious rites practised wholly by the priests to the dignity of a learned profession. He referred diseases to two leading causes, climate and diet, and regulated the latter to suit the changes of the former as well as the state of the patient. He taught that there were four humors in the human body, blood, phlegm, yellow bile, and black bile, an undue preponderance of any of which was a proximate cause of sickness. With such an imperfect knowledge of anatomy as might have been looked for in an age when superstition forbade the dissection of dead bodies, he nevertheless had some acquaintance with the structure of the cranium and viscera; but he was ignorant of the true relation between the arteries and the veins, and of the distinction between nerves, tendons, and ligaments, speaks of the muscles simply as flesh, and held some singular views on generation. He drew his principles from careful observation, and was little given to theorizing. He relied perhaps too much on the healing power of nature, and the remedies by which he assisted her were mostly of a simple character. He practised bleeding, cupping, cauterization, and auscultation, and used several mineral and vegetable remedies, including purgatives. He was particularly skilful in his diagnoses, and was the first to divide the course of a disease into three periods, for the last of which, called the crisis, he assigned certain days known as the critical days. Of the 72 books which bear the name of Hippocrates, only the "Aphorisms," "Prognostics," "Epidemics," the treatise on "Air, Water, and Locality," the treatise on "Diet," and a few others, can be attributed with much probability to the subject of this notice. Many were doubtless written by other physicians of the same name, of whom there were no fewer than seven among the Asclepiades. Hippocrates wrote in the Ionic dialect, in a concise and sometimes obscure style. The best editions of his works are those of Fœsius (fol., Frankfurt, 1595); Van der Linden (2 vols. 8vo, Amsterdam, 1665); Mack (2 vols. fol., Vienna, 1743-'9);

Littre (8 vols. 8vo, Paris, 1839-'53), with a French translation; Upman (3 vols. 8vo, Berlin, 1847); Ermerius (Utrecht, 1862-'4); and Reinhold (Athens, 1864-'5). There are English translations of the aphorisms and the treatises on "Air, Water, and Situation, upon Epidemical Diseases and upon Prognostics," &c., by Francis Clifton, M. D. (8vo, London, 1734), and of the "Genuine Works" of Hippocrates, by Adams (2 vols. 8vo, London, 1849).

**HIPPOCRENE** (Gr. ἵππος, horse, and κρήνη, fountain), called by Persius *Fons Caballinus* (the fountain of the horse), a fountain on Mount Helicon in Boeotia, owing its name to a myth according to which it was produced by Pegasus striking the ground with his hoofs. (See **HELICON**.)

**HIPPODROME** (Gr. ἵππος, horse, and δρόμος, a course), the course where the horse and chariot races of the ancient Greeks took place. The hippodrome was differently constructed according to the nature of the ground. In level countries artificial mounds were raised on both sides of it; in hilly districts a declivity was invariably chosen to form one side. The artificial mounds, or mound and declivity as the case might be, were connected at the inner end by a semicircular barrier. At the other or outer extremity was the portico, where each chariot had its stall, and whence it issued as soon as the cord which crossed the entrance was removed. A bronze eagle and dolphin were used as a signal at the time of starting; the eagle was raised in the air, while the dolphin was lowered. Along the sides of the hippodrome seats were erected for the spectators, special seats being reserved for the judges. The most celebrated of Hellenic hippodromes was that of Olympia.

**HIPPOLYTUS**, son of Theseus. See **PHÆDRA**.

**HIPPOLYTUS**, Saint, an ecclesiastical writer of the 3d century. Although his writings had been always numbered among those of the ante-Nicene fathers, his personal history had been surrounded with uncertainty until the middle of the present century. Two events, occurring at a distance of 300 years from each other, have served to clear away doubts and contradictions regarding his identity. In 1551, near the basilica of San Lorenzo in Rome, there was discovered an antique statue (now in the Vatican museum) belonging to the 6th century, which represented a bishop seated. The statue bears the inscription *Hippolytus Episcopus Portuensis*, the very title given to him by Prudentius, who lived in the 5th century. On the back of the chair are the paschal canon or cycle introduced by Hippolytus in the Roman church, and a list of his works, among which are mentioned treatises "against heresies." In 1842 M. Mynioide Minas, commissioned by the French government, had brought back from the monastery of Mount Athos a mutilated Greek manuscript on cotton paper containing a "Refutation of all Heresies" (Κατὰ πασῶν Ἀιρέσεων Ἐλεγχος), which was published at Ox-

ford in 1851, as a work of Origen. This authorship was immediately contested by Dr. Jacobi in Berlin and Dr. Duncker in Göttingen, who both claimed the work as belonging to Hippolytus. Finally this claim was successfully sustained by Bunsen in his "Hippolytus and his Times" (4 vols. 8vo, London, 1851), and in a second enlarged edition of the same work, under the title "Christianity and Mankind" (7 vols. 8vo, 1854). The light thrown on Hippolytus and his writings by Bunsen's conclusions, now generally adopted by critics, gives unity to the traditions, and explains the contradictions respecting him. The work "Against Heresies," specified in the inscription on the statue, is claimed as his own by the author of the Mount Athos manuscript, and is attributed by the most eminent authorities to Hippolytus, bishop of Portus, presbyter of the Roman church, who lived and wrote about 220, as the "Paschal Cycle" and his statue expressly state. It is thus established that he was a disciple of Irenæus, a member of the Roman presbytery, appointed (most likely because of his knowledge of Greek) bishop of the *Portus Romanus* or *Romæ*, the new harbor of Rome, established by Trajan on the right bank of the Tiber, over against the more ancient Ostia. He is called "bishop of the Gentiles," because the population of the new city was made up of floating masses of heathen strangers, drawn thither by commerce. In 218 he was actively ministering to them; in 222 he was engaged in a violent opposition to Pope Calixtus I., whose mild treatment of repentant sinners he reproached; in 235, in all likelihood immediately after the death of Alexander Severus, he was by the order of Maximin banished to Sardinia, together with Pontianus, bishop of Rome; was permitted to return to his see in 236; and not long after was put to death, as the tradition quoted by Prudentius states, by being torn to pieces by wild horses. Prudentius also informs us that he visited his tomb in the church of St. Laurentius in Rome, and Bunsen is of opinion that the statue discovered in 1551 was erected on the removal of his relics. The doctrine of Hippolytus on the Trinity and the incarnation of the Word is that proclaimed at Nicæa a century later, and his philosophical explanations of dogma show him to belong to the Platonic school. The best editions of his works are that of Fabricius (2 vols. fol., Hamburg, 1716-'18), reproduced with important additions by Galland in vol. ii. of his *Bibliotheca Patrum* (Venice, 1766), and that of Lagarde (Leipsic, 1858).

**HIPPONAX**, a Greek lyric poet of the latter half of the 6th century B. C. He was a native of Ephesus, was banished by its tyrants Athenagoras and Comas, and afterward lived in Clazomenæ in extreme poverty. He was small and ugly in person, and was one of the severest of Greek satirists. His favorite themes were the effeminacy and vices of his fellow citizens, and

the faithlessness of women. The Chian sculptors Bupalus and Athenis, who made caricature statues of him, were assailed in the bitterest of his satires. Of the poems of Hipponax about 100 lines are still extant.

**HIPPOPOTAMUS** (Gr. ἵππος, horse, and πῶταμος, river), a pachydermatous animal, inhabiting Africa. It is generally called sea cow by the Cape colonists, a term which is usually applied in America to the manatee. The dental formula is: four incisors in each jaw, long, cylindrical, pointed, and inclined forward below, short, conical, and curved above; canines four, resembling the incisors of rodents, the upper ones straight, the lower thick and bent, overlapping the upper; the molars six on each side in each jaw, the anterior three more pointed, and the posterior with the points in the adult worn in a trefoil shape. Its powerful jaws, sub-cylindrical lower incisors, and chisel-edged canines are formed for tearing and crushing rather than grinding the coarse tough plants and aquatic roots and grasses upon which it principally feeds; the canines seem excessively developed. In its skull the hippopotamus resembles the hog in the connection of the bones and their sutures, in other respects being more like the ox; the skeleton is very massive, indicating the great size and strength and rather slow locomotive powers of the animal. The skull is remarkable for the horizontal plane of its upper portion, the eyes, nostrils, and ears of the animal when in the water being nearly upon the same level, and the upper part of the head, when this alone is visible, looking not unlike that of a horse; the bony orbits are very prominent, projecting above the top of the skull. The stomach is multiple, something as in ruminants, though it is not known to chew the cud; it can contain five or six bushels of vegetable matter, and the large intestine is about 8 in. in diameter; the intestinal canal, without cæcum, is nearly 12 times as long as the body, considerably more than 120 ft. The average length of the male from the end of the nose to the tip of the tail (the latter being about a foot) is 14 ft., but they have been known to measure 17 ft.; the females are much smaller; the girth is nearly equal to the length, and the height at the shoulders between 5 and 6 ft.; the aperture of the mouth is about 2 ft. wide, and the tusks are more than a foot long. This huge uncouth body, of a form between that of an over-fed pig and a fattened ox, is supported on short stout limbs, with four toes on each small foot, nearly equal and with short hoofs; the massive head is broad, and the expression of the face singular from the high position of the eyes; the lips are wide and tumid, especially the upper, concealing the teeth when the mouth is shut, and furnished with a few tufts of hair; the nose is broad and truncated, and the nostrils, on the end and capable of protrusion so that the animal may breathe when all the body is under water, may be closed during submersion; the prominent eyes enjoy great freedom

of motion, and may be protruded or retracted to adapt its vision to an air or water medium; the last two contrivances are admirably adapted for the protection of an aquatic animal so wary and sluggish as the hippopotamus. The head is contracted behind the angles of the mouth, and the forehead is broad and flat; the ears are only 3 or 4 in. long, fringed and lined internally with a fine hair, just behind and but little above the eyes; the eyebrows are tumid, which makes the eyes appear deeply seated; the neck is short, thick, and hog-like, the back slightly arched, the body cylindrical, the nates full, the pendent abdomen almost touching the ground, the tail short, robust, and edged with wiry hairs, the mammae two in number and ventral, and the skin nearly naked. The color, when the skin is dry, is reddish gray, brownish on the back, lighter beneath; under water the colors are various shades of blue. Prof. Owen, in the "Annals and Magazine of Natural History," vol. v., 1850, gives some interesting particulars from a young living specimen received at the zoological gardens of London in 1850, the first seen alive in Europe since the time of the emperor Gordian III. in Rome in the 3d century. This animal was captured on the banks of the Nile in August, 1849, and was supposed to have been recently brought forth, as it was not much larger than a new-born calf, though stouter and shorter legged; it arrived in London in May, 1850, and was accordingly then about ten months old, yet it was 7 ft. long and of  $6\frac{1}{2}$  ft. girth in the middle of the body. The hind limb was buried in the skin of the flank nearly to the prominence of the heel; there was no trace of a glandular orifice, as in the rhinoceros, behind each foot; the naked skin, of a dark India-rubber color, and with fine transverse wrinkles, glistened with a sebaceous secretion as the animal emerged from the water; the eyes had a thick nictitating membrane, and the mouth a peculiar upward curve of its angles toward the eyes, which gave a comical expression to the massive countenance. Apparently in perfect health, it breathed three or four times in a minute, slowly and regularly; its food consisted of a kind of porridge of milk and maize meal, though it was more than half weaned from its baby diet. Other specimens have since been received at the zoological gardens, and also at the Paris *jardin des plantes*, and one has been exhibited in the United States. Several species are described, but the best known and most extensively distributed is the *H. amphibius* (Linn.), which was formerly found from Egypt to the Cape of Good Hope in all the large rivers, though now it is rare except in the lonely regions explored by Livingstone and Cumming. Of whatever species, they spend most of their time in the water, lolling about in a dreamy manner, frolicking like a porpoise, or wallowing in the mud like a hog; they leave the rivers chiefly at night to crop the succulent grasses on their banks, especially in localities

where brushwood abounds; they are also fond of passing the day in the ocean, near the mouths of rivers. Though clumsy upon the land, their movements in the water are graceful and rapid; they are gregarious, and both sexes delight to congregate at all seasons of the year in small

Hippopotamus amphibius.

herds; they can remain under water for about 15 minutes, walking upon the bottom, and probably longer if necessary; but it is not known whether this ability to sustain prolonged immersion is owing to an apparatus like the venous reservoirs of the seals, the arterial plexiform receptacles of the whales, or some other equivalent structure. They are playful, peaceable, and inoffensive when undisturbed; but if wounded, and especially if in company with their young, they are savage and eager to assail any enemy; the males in the love season are quarrelsome, and both sexes are often seen covered with scars; it is said that the young males are often killed by the older ones. The males are darker colored than the females. The period of gestation is about nine months, and a single young one is brought forth on land, taking to the water instantly when alarmed; the very young ones are carried in the water on the neck of the mother, and when they grow older on the withers. When they blow, they puff up the water about 3 ft. high, according to Livingstone. The sagacity of the hippopotamus, though inferior to that of the elephant, is considerable, as evinced by its adroitness in avoiding its enemies on land or in the water, its escaping from pitfalls and other stratagems of the natives, its going with its young to distant localities when annoyed by man, and its caution in exposing itself even in its watery abode when it has been once assailed. They are hunted for their flesh, which resembles pork; for the *speck* or layer of fat just under the skin, a *bonne bouche* for the Cape Town epicure; for their teeth, which are valuable articles of trade, and were formerly much

employed for their hardness in the manufacture of artificial teeth, and for various ornamental purposes; and for their tough skin, which is made into shields and helmets, and cut into cylindrical strips, which form the whips of the Cape colonists. The voice of the animal is between a grunt and a neigh, and has been compared by travellers to a variety of discordant sounds. Its voracity is very great, and its destruction of the native crops, both by devouring and treading them down, has been known and deplored from the earliest antiquity. Besides man, the principal enemy of the hippopotamus, and in its own element, is the crocodile; the ancients believed that an inextinguishable enmity existed between these animals, but both are so well armed and defended that they probably do not very often attack each other. This animal was well known to the ancients, and it figures under many shapes in their writings; accurate representations are given on Roman coins and Egyptian sculptures; it was occasionally seen in their triumphal pomps and gladiatorial shows. Since the time of Bochart the behemoth of the Hebrews has been supposed by many to be the hippopotamus, and some of the verses in the 40th chapter of Job well apply to this animal; some authors, however, Milton among the rest, deny that these animals are the same, without throwing any light upon what the behemoth really is.—For interesting details on the method of hunting these unwieldy creatures, see Gordon Cumming's "Hunter's Life in Africa," and Andersson's "Lake Ngami, or Explorations and Discoveries during Four Years' Wanderings in the Wilds of S. W. Africa;" and for notices of their character and habits, Livingstone's "Travels and Researches in South Africa."—The hippopotamus is found fossil in the tertiary and diluvial formations of Europe and Asia.

**HIRAM**, a township of Portage co., Ohio, 33 m. S. E. of Cleveland; pop. in 1870, 1,234. It is situated on the range of hills dividing the waters that flow N. to Lake Erie from those flowing S. to the Ohio river, about 2 m. from the Mahoning branch of the Atlantic and Great Western railroad. It is the seat of Hiram college, under the charge of the Disciples. This institution was founded as the Western Reserve eclectic institute in 1850, and its name was changed in 1867. The building occupies a healthy site, commanding fine views. In 1872-'3 there were 9 professors and instructors; number of students 286, of whom 126 were females, including 35 collegiate and 7 preparatory students, 19 in the commercial course, and 51 in the normal class. The rest were pursuing English and selected studies. The libraries contain 2,500 volumes.

**HIRING.** One may hire a person or a thing, and the thing hired may be real estate or personal chattels. For the law of hiring real estate, see LEASE. In this article we shall treat only of the hiring of persons, and of the hiring of chattels. In England the relation of mas-

ter and servant is peculiar, and is perfectly recognized both by custom and by law, and it is governed by principles which apply to no other relation. In the United States it is simply one of contract—so much work for so much wages; and it is governed by the ordinary rules of the law of contract. If the servant is disobedient or negligent, it may be a good ground for withholding wages, or for discharge, according to circumstances; and if he does any injury he is responsible in damages; and this is all. If a servant contracts to labor for a definite period, and leaves the service without excuse before that period has elapsed, it is held in a majority of the states that he can recover nothing; but in some, following a New Hampshire decision, it is decided that he may recover what his services actually performed are worth, not exceeding the contract price, but subject to a deduction of all damages sustained by the master for the breach of contract. This rule would seem to work justice to both parties. If, however, the servant leaves because of ill treatment, or is driven away, or is sick, or has any good cause for leaving, he may under all the cases recover wages for the time he has served. On the other hand, a servant who is hired for a certain term, and is turned away before the time is up, without good cause, may tender his service for the whole period, and keep himself ready to render it, and can then recover for the whole period. The question how far a master is responsible for the acts of his servant will be considered, with some connected questions, under the title SERVANT.—We will now pass to the hiring of a chattel. In one sense a ship is a chattel; but the hiring of a ship will be treated under SHIPPING. The contract of hiring a chattel is for the mutual benefit of the owner and the hirer; the hirer is therefore bound, not to extreme care, but to ordinary care, which is defined as that care which a man of ordinary capacity would take of his own property under ordinary circumstances; and he is responsible for any injury caused by a want of such care. This obligation varies with the thing hired; it is one degree of care with a costly watch or jewel, or a valuable horse, and another with coarser and cheaper things. The hirer is, in general, as responsible for the negligence of his servants about the thing hired as for his own. Whether he would be responsible for a wilful injury by his servant would depend somewhat on circumstances, and may not be certain from the authorities; but we should say, in general, that he would not be so responsible. It may be said that he is not responsible for injury caused by the theft, robbery, or violence of others, unless his own negligence or default caused or facilitated the wrong. If he sells the chattel or gives it away, he can pass no title, and the owner may demand and take it from the receiver or from any buyer, even if he bought in honest ignorance of the owner's title, and paid full price for it. The obligations of the owner of a thing hired

may be stated thus: he must deliver it in good condition for the intended and agreed or customary use, and keep it in good order, or pay the hirer his reasonable expense for so keeping it, as for example a carriage and horses hired for a journey; he must not interfere with the hirer's lawful and reasonable use of it; but if the hirer makes of it a use which he has no right to make, the owner may peaceably repossess himself of it, or have his appropriate action; and if the hirer refuses it, the owner may recover damages, although he repossess himself of the thing. The right and obligations of the hirer may be thus stated: he may use it in the intended and agreed or customary way, and must not use it in any other way; he must not abuse or injure it in any way, must surrender it at the time agreed upon, or if no time be agreed on, then whenever, within a reasonable time, it is demanded by the owner; and he is bound to pay the agreed price, or, if none was agreed, a customary and reasonable price. Nearly all, or indeed all, these particulars are open to the agreement of the parties, if they choose to provide expressly for them.

**HIRPINI**, an ancient people of Italy, of Samnite race, whose name is said to come from the Sabine word *hirpus*, a wolf. They dwelt in the southern part of Samnium, W. of Apulia, N. of Lucania, and E. of Campania. At the time of the second Punic war they were independent of the Samnites. They took up arms against Rome during the social war. Their chief places were *Æculanum* and *Aquilonia*.

**HIRSCHBERG**, a town of Prussia, in the province of Silesia, at the entrance of the Zaacken into the Bober, 30 m. S. W. of Liegnitz; pop. in 1871, 11,773. It consists of the town proper, surrounded by walls with three gates, and three suburbs. It has a Protestant and three Catholic churches, a gymnasium, a female high school, a mechanics' institution, a chamber of commerce, and a garrison. It is the centre of the linen industry of Silesia, and has also manufactories of cloth, veils, chinaware, machines, and paper, bleaching grounds, and dye works. A considerable trade is carried on in linen and veils. The Hausberg, Cavalierberg, Helicon, and Sattler are eminences near Hirschberg, with beautiful pleasure grounds.

**HIRST, Henry B.**, an American poet, born in Philadelphia, Aug. 23, 1813, died there, March 30, 1874. He was admitted to the bar of his native city in 1843, his youth having been spent in the study of law, frequently interrupted by mercantile duties. He published "The Coming of the Mammoth, the Funeral of Time, and other Poems" (Boston, 1845); "Endymion, a Tale of Greece" (1848); and "The Penance of Roland, and other Poems" (1849).

**HIRTIUS**, *Anlus*, a Roman statesman, born about 90 B. C., fell in battle near Mutina (Modena) in 43. He was a friend of Julius Cæsar, under whom he served as legate in Gaul (58), and one of the 10 prætors nominated by him for the year 46. During Cæsar's absence in

Africa he lived principally at his Tusculan estate, which was contiguous to the villa of Cicero, who was his personal friend, although opposed to him in politics. In 44 he received Belgic Gaul as his province, but governed it through a deputy, remaining in the capital in continued intimacy with Cæsar, who nominated him, together with Vibius Pansa, as consul for the next year. After Cæsar's assassination he retired to the country. Though not fully recovered from a dangerous illness, and politically undecided, he entered upon his duties as consul, Jan. 1, 43. He finally declared against Antony, and was sent at the head of an army to join Octavius, and relieve Decius Brutus, then besieged by Antony in Mutina. He fell while leading his victorious troops to an assault. He has been supposed to have written the eighth book of Cæsar's Commentaries on the Gallic war, and the histories of his Alexandrian and African campaigns; but the authorship of all these is also claimed for Oppius.

**HISPANIA**. See SPAIN.

**HISPANIOLA**. See HAYTI.

**HISTILEA**, or **Oreus**, an ancient city of Eubœa, on the river Callas, at the foot of Mt. Telethrium. It ranked among the oldest and most important of the Eubœan cities. Occupied by the Persians after the battle of Artemisium (480 B. C.), it afterward successively became subject to the Athenians (who, in consequence of a revolt in 445 B. C., displaced its inhabitants for Attic colonists, and changed its name to Oreus) and to the Spartans. During the wars of Alexander's successors, and those of the Romans and Macedonians, Oreus was a place of great strategic importance.

**HISTOLOGY** (Gr. *ιστος*, a web, and *λόγος*, a discourse), the science which describes the anatomical elements and tissues of the body, according to their form and organization. If we take any organ of the body, such as a muscle or a nerve, and subject it to minute dissection, we find that it can be divided into smaller and smaller portions, by simply separating from each other the various parts of which it was composed. Thus a muscle is distinctly fibrous in appearance to the naked eye, being formed of parallel bundles which may be successively separated from each other in dissection, by removing the intervening material. But the possibility of thus dividing an organ into smaller and smaller parts, similar to each other, has its limits; for, after it has been carried to a considerable extent and the parts are reduced to microscopic size, we then come in every instance to certain definite anatomical forms, which can no longer be divided in the above manner. They can still of course be divided or disintegrated by mechanical means; but this will be no longer a separation into similar parts already distinct from each other, but simply an artificial mutilation of its substance. Such a definite form, to which the organ is reduced in its minutest natural subdivision, is called an anatomical element. It is readily distinguished, as a

general rule, under the microscope, by its size, form, color, consistency, and chemical relations. Thus the striped muscular fibre of the voluntary muscles, and the smooth muscular fibre of the internal organs, are anatomical elements. The red globules and the white globules of the blood are two different anatomical elements, both mingled with the plasma of the circulating fluid. The tendons, ligaments, and periosteum contain a minute, white, straight, inelastic but very strong fibre, which is their most abundant and characteristic anatomical element. Other membranes and organs contain a larger, flattened, curled, yellowish, elastic fibre, which communicates to them the property of elasticity in proportion to its own abundance. These two kinds of fibre are also distinguished from each other by their reaction with dilute acetic acid; the white inelastic fibre becoming rapidly swollen and transparent by contact with this reagent, while the yellow elastic fibre is not affected by it. Other anatomical elements which may be enumerated are bone corpuscles, nerve cells, pavement, columnar and ciliated epithelium cells, glandular cells, adipose vesicles, cartilage cells, capillary tubes, &c.—When two or more kinds of anatomical elements are mingled together and interwoven in a determinate manner, they form a tissue, just as woollen or cotton threads interwoven with each other form a web or textile fabric; and the animal tissues, like artificial fabrics, derive their appearance, qualities, and texture from the number and variety of anatomical elements of which they are made up, and the particular manner in which they are interwoven. It is very rare that a tissue consists of but a single anatomical element. The tissue of the crystalline lens, containing only flattened fibres with finely toothed edges, and that of cartilage, containing only cartilage cells with an intervening hyaline substance, and certain epithelial tissues, are perhaps the sole examples of this in man and the higher animals. Generally speaking, a tissue consists of several anatomical elements, one of which is peculiar to it, the others perhaps common to several tissues. Thus muscular tissue consists of muscular fibres, arranged in parallel bundles, with ultimate nervous filaments and capillary blood vessels; the bundles themselves being surrounded by a thin layer of connective tissue, and associated into secondary and tertiary bundles of larger and larger size, with the trunks and branches of nerves and blood vessels ramifying between them. The liver contains a peculiar anatomical element, the glandular liver cells; but these are arranged in definite groups, forming the lobules or acini, with the intra-lobular capillary blood vessels, the commencement of the hepatic ducts, and the terminal filaments of the hepatic plexus of the sympathetic nerve.—In the study of histology the different powers of the microscope are employed for different objects. The highest powers are generally requisite for the examination of the ultimate ana-

tomical elements. But in order to learn in what form these elements are associated with each other, or how they are interwoven with still different ones—to ascertain, in short, the structure of the tissue—the lower powers must be employed; since a very highly magnifying lens can only be used when the tissue has been minutely subdivided, and this destroys of course the natural arrangement of its parts. Certain artificial aids and contrivances are often also of great value in bringing into view peculiarities of texture which would otherwise remain invisible, such as the injection of minute vessels with colored fluids, and the staining of the tissue with certain reagents, such as iodine, nitrate of silver, and the like, which will attack some of its anatomical elements and leave others entirely or comparatively unaffected. Thus two different anatomical forms which were originally so similar in color, consistency, and refractive power that they could not be distinguished by the microscope, may have their outlines made visible and easily recognized in the surrounding parts. These manipulations, however, should be used with great caution and judgment; otherwise deceptive appearances, produced by the action of reagents, such as the shrivelling of membranes, the contraction or enlarging of fibres, or the coagulation of soft material, may sometimes be mistaken for the natural characters of the tissue.—The best works on histology, often called microscopic anatomy, are those of Kölliker, *Handbuch der Gewebelehre* (Leipsic, 1852; translated by Busk and Huxley, Sydenham society publications, London, 1853, and Philadelphia, 1854); Peaslee, "Human Histology" (Philadelphia, 1857); and Stricker, *Lehre von den Geweben des Menschen und der Thiere* (Leipsic, 1869-'71).

**HIT** (anc. *Is*), a town of Asiatic Turkey, in the vilayet and 70 m. W. N. W. of the city of Bagdad, on the W. bank of the Euphrates; pop. about 2,000. It is situated on a hillside, and the streets are narrow, dirty, and often steep. The houses are chiefly of clay, one or two stories in height. A graceful minaret and some tombs are the only buildings worthy of notice. The inhabitants are employed in boat building and the preparation of wool, salt, naphtha, and bitumen, for which last the place has been famous for ages. Thothmes III. brought bitumen from Hit to Egypt about 1400 B. C. According to Herodotus, the bitumen of Is was used in the building of Babylon.

**HITCHCOCK**, a S. W. county of Nebraska, recently formed, and not included in the census of 1870; area, 720 sq. m. It borders on Kansas, and is watered by the Republican river.

**HITCHCOCK, Edward**, an American geologist, born in Deerfield, Mass., May 24, 1793, died at Amherst, Feb. 27, 1864. He was principal of the academy in his native place from 1815 to 1818; pastor of the Congregational church in Conway, Mass., from 1818 to 1825; professor of chemistry and natural history in Amherst college from 1825 to 1845; president of the

college from 1845 to 1854; and professor of natural theology and of geology there from 1845 till his death. He was appointed state geologist of Massachusetts in 1830, of the first district of New York in 1836, and of Vermont in 1857, and was for several years a member of the Massachusetts board of agriculture. In 1850 he was commissioned by the government of Massachusetts to examine the agricultural schools in Europe. His life was in a great measure identified with the history of Amherst college. During his presidency of ten years he procured for it buildings, apparatus, and funds to the amount of \$100 000, doubled the number of students, and established it on a solid pecuniary as well as literary and scientific basis. He began his career as an author by the preparation of an almanac, which he conducted for four years (1815-'18), and the publication of a tragedy, "The Downfall of Bonaparte" (1815). His first important contribution to science was a paper on "The Geology and Mineralogy of a Section of Massachusetts on the Connecticut River," with a map, published in the first volume of the "American Journal of Science" (1818), to which he became a frequent contributor. About the same time he gave an account of Bailey's new method of longitude. As state geologist he was added to the corps who had charge of the trigonometrical survey of Massachusetts. His first report, a pamphlet of 70 pages, on the economical geology of the state, was published in 1832. In 1833 he made a full report, containing about 700 pages, with an atlas of plates and a geological map. In 1837 he was commissioned to reexamine the geology of the state, which resulted in a final report of two 4to volumes of 840 pages, with 56 plates and 82 woodcuts (1841). After this he made several reports on the hematite of Berkshire county, and also a report on the "Ichnology of New England," the result of more than 20 years of study, which was published by the state (1840; supplement in 1865). In 1856, while suffering from physical infirmities, he commenced with his two sons the geological survey of Vermont, which was successfully completed, the report of the work appearing in 1862. His last geological paper of importance was "New Facts and Conclusions respecting the Fossil Footmarks of the Connecticut Valley," in the "American Journal of Science," July, 1863. He published more than 20 volumes. Among those not already mentioned are: "Geology of the Connecticut Valley" (1823); "Catalogue of the Plants within Twenty Miles of Amherst" (1829); a prize essay on the "Wine Question," an "Argument for Early Temperance," and "Lectures on Diet, Regimen, and Employment" (1831); "History of a Zoological Temperance Convention in Central Africa," and "Lectures on the Peculiar Phenomena of the Four Seasons" (1850); "Memoir of Mary Lyon," and "Religion of Geology" (1851); and "Illustrations of Surface Geology," published by the Smith-

sonian institution (1857). His "Elementary Geology" (1840; revised and enlarged, with a preface by J. Pye Smith, London, 1854) has passed through many editions in America and England. His last literary work was "Reminiscences of Amherst College" (1863). He was the first to give a scientific exposition of the fossil footprints of the Connecticut valley, and with him ichnology as a science began. (See FOSSIL FOOTPRINTS.) He suggested as well as executed the geological survey of Massachusetts, the first survey of an entire state under the authority of government in the world. The American geological association (now the scientific association) was originated at his suggestion, and he was its first president.—His son, CHARLES H., was associated with him in the geological survey of Vermont, after which he was engaged in a survey of Maine for two or three years, and was subsequently appointed professor of geology in Dartmouth college, and state geologist of New Hampshire.

**HITCHCOCK, Ethan Allen**, an American author, born at Vergennes, Vt., May 18, 1798, died at Hancock, Ga., Aug. 5, 1870. His mother was a daughter of Ethan Allen. He graduated at West Point in 1817, became assistant instructor in tactics there in 1824, and from 1829 to 1833 was commandant of cadets and instructor in infantry tactics. During the war with Mexico he took part in all of Gen. Scott's battles, and served a part of the time as inspector general, receiving brevets as colonel and brigadier general. From 1851 to 1853 he was in command of the Pacific division, and in 1854-'5 at Carlisle barracks. In October, 1855, he resigned his commission in consequence of the refusal of Jefferson Davis, then secretary of war, to confirm a leave of absence granted by Gen. Scott, and afterward resided in St. Louis, devoting himself mainly to literary pursuits. On the breaking out of the civil war he reentered the army, and was appointed major general of volunteers, Feb. 10, 1862, and acted as military adviser to President Lincoln, on the commission for the exchange of prisoners, and on that for revising the military code. He published "Remarks upon the Alchemists" (1857); "Swedenborg a Hermetic Philosopher" (1858); "Christ the Spirit" (1860); "Red Book of Appin, and other Fairy Tales" (1863); "Remarks on the Sonnets of Shakespeare" (1865); "Spenser's Colin Clout explained" (1865); and "Notes on the Vita Nuova of Dante" (1866). All his works are intended to enforce the notion that a very subtle and elevated theology and philosophy were taught hermetically by a great variety of writers.

**HITCHCOCK, Roswell Dwight**, an American clergyman, born at East Machias, Me., Aug. 15, 1817. He graduated at Amherst college in 1836, and in 1838-'9 was a member of the theological seminary at Andover. He was a teacher during one term at Phillips academy, Andover, and in 1839-'42 tutor at Amherst college. In 1842-'4 he was a resident licentiate at An-

dover seminary, and on Nov. 19, 1845, was ordained pastor of the first Congregational church in Exeter, N. H., which office he held till 1852, although spending the year 1847-'8 in study in Germany. In 1852 he was appointed professor of natural and revealed religion in Bowdoin college, and in 1855 of church history in the union theological seminary, New York, which office he still holds (1874). During the civil war he delivered a number of addresses upon national affairs, taking a very earnest stand in favor of the government. In 1866 he visited Italy and Greece, and in 1869-'70 Egypt, Sinai, and Palestine. After his return he took an active part in the organization of the Palestine exploration society, and in 1871 was elected its president. In 1869 he was elected a trustee of Amherst college. He received the degree of D. D. from Bowdoin college in 1855, and of LL. D. from Williams college in 1873. He has published a "Complete Analysis of the Bible" (New York, 1869), and numerous orations, addresses, and sermons. He has also contributed many important articles to the religious periodical press, and was one of the editors of the "American Theological Review" from 1863 to 1870.

**HITTORFF, Jacques Ignace**, a French architect, born in Cologne, Aug. 20, 1793, died in Paris, March 25, 1867. He worked for a time as a mason, but became in 1810 a pupil of the school of fine arts in Paris, and in 1818 architect of the government. He studied in Sicily the remains of Greek architecture, and from 1824 was engaged in the construction of important public buildings. The church of St. Vincent de Paul is generally regarded as his masterpiece. The embellishments in the Champs Élysées, the Bois de Boulogne, and other places, were also designed by him. He followed the ancient Greek artists in applying colors to most of his architectural designs. He was elected in 1853 to the academy of fine arts. His writings include *Architecture antique de la Sicile* (3 vols., Paris, 1826-'30); *Architecture moderne de la Sicile* (3 vols., 1826-'30); *Architecture polychrome chez les Grecs* (1831); and *Mémoire sur Pompéi et Petra* (1866).

**HITZIG, Ferdinand**, a German Biblical critic, born in Baden, June 28, 1807, died in Heidelberg, Jan. 22, 1875. He studied at Göttingen, and was professor of theology at Zürich from 1833 to 1861, his lectures comprising the New Testament and the Semitic and other oriental languages. He published *Begriff der Kritik am Alten Testament* (1831); *Des Propheten Jonas Orakel über Moab* (1831); translations of and commentaries upon Isaiah (1833), the Psalms (1835 *et seq.*), the twelve minor prophets (1838; 3d ed., 1863), Jeremiah (1841), Ezekiel (1847), Daniel (1850), and Canticles (1855). Among his other writings are: *Die Erfindung des Alphabets* (1840); *Ueber Johannes Marcus und seine Schriften* (1843); *Urgeschichte und Mythologie der Philistäer* (1845); *Die Grabschrift des Eschmunazar* (1855); *Geschichte des Volkes*

*Israel* (1866 *et seq.*); and *Die Inschrift des Mesha* (1870).

**HOADLEY, I. Benjamin**, an English prelate, born at Westerham, Nov. 14, 1676, died in Chelsea, April 17, 1761. After leaving Cambridge he was lecturer of St. Mildred's and rector of a church in London, and became known by his controversies with Atterbury and the high-church party; and his "Measure of Obedience," on the doctrine of non-resistance, so pleased the commons, that in 1709 they petitioned the queen for his preferment. After the accession of George I. he was made successively bishop of Bangor in 1715, Hereford in 1721, Salisbury in 1723, and Winchester in 1734. In 1717, while bishop of Bangor, he preached his celebrated sermon on the words, "My kingdom is not of this world," asserting the supreme authority of Christ as king in his own kingdom, and that he had not delegated his power, as absent temporal rulers sometimes do, to any persons as his vicegerents or deputies. In these positions he was assailed by William Law, and the discussion became so violent in the convocation that the body was prorogued in 1717, and not again permitted to meet for general business. His writings were collected and published by his son John Hoadley (3 vols. fol., London, 1773). Akenside has paid a handsome tribute to his memory. **II. Benjamin**, son of the preceding, born in London, Feb. 10, 1706, died in Chelsea, Aug. 10, 1757. He entered Cambridge university in 1722, graduated as doctor in medicine in 1729, and then settled in London, where in 1742 he became physician to the royal household, and in 1746 to the household of the prince of Wales, continuing to hold both offices at the same time. He produced in 1747 his comedy of "The Suspicious Husband," assisted Hogarth in his "Analysis of Beauty," and in 1756 published, in connection with Mr. Wilson, "Observations on a Series of Electrical Experiments." **III. John**, brother of the preceding, born in London, Oct. 8, 1711, died March 17, 1776. He was educated at Cambridge, and studied law, but did not practise; was admitted to orders in 1735, was chaplain to the prince of Wales and the princess dowager, prebendary of Winchester, rector of St. Mary's near Southampton and of Overton, and master of St. Cross. He was the author of "Love's Revenge," a pastoral (1737); "Jephtha," an oratorio (1737); "Phœbe," a pastoral (1748); and "The Force of Truth," an oratorio (1764). He wrote the fifth act of Miller's "Mahomet," is supposed to have written part of his brother's "Suspicious Husband," revised Lillo's "Arden of Feversham," and edited his father's works.

**HOANG-HAI**. See YELLOW SEA.

**HOANG-HO**. See CHINA, vol. iv., p. 442.

**HOANG-NAN**. See supplement.

**HOAR, Ebenezer Rockwood**, an American jurist, born at Concord, Mass., Feb. 21, 1816. His father, Samuel Hoar, was sent in 1844 by Massachusetts to South Carolina as a commis-

sioner to test the constitutionality of the act of that state under which free colored citizens of northern states were imprisoned and sometimes sold. The son graduated at Harvard college in 1835, studied law in Cambridge, and was admitted to the bar in 1840. He was appointed judge of the court of common pleas in 1849, but resigned in 1855 and resumed practice in Boston. In 1859 he was appointed a judge of the supreme court of Massachusetts, and retained this office till 1869, when he was appointed by President Grant attorney general of the United States. He held this office only one year, but during that time reorganized it, by authority of congress, as a distinct department of the government, under the title of the department of justice. In 1870 he was nominated a justice of the supreme court of the United States, but was not confirmed by the senate. He was a member of the joint high commission which negotiated the treaty of Washington in 1871. In 1872 he was elected representative in congress from the seventh district of Massachusetts. In the spring of 1874 he was an unsuccessful candidate before the legislature of Massachusetts for the seat in the United States senate vacated by the death of Charles Sumner.

**HOARE, Sir Richard Colt**, an English topographer and antiquary, born at Stourhead, Dec. 9, 1758, died May 19, 1838. He inherited great wealth, and devoted himself to art and literature. He made two extensive tours on the continent, returning from the second in 1791, during which he had made numerous valuable drawings, and published accounts of his travels in Elba (4to, 1814) and Italy (4to, and 2 vols. 8vo, 1819). He then travelled in Wales and Ireland, of which he also published descriptions. But his greatest work was a history of Wiltshire, ancient and modern, published in parts and forming 8 vols. folio with plates and maps (London, 1810-'19 and 1822-'52), which however he did not finish. All his works were richly illustrated, and he printed many in small numbers for private circulation.

**HOARE. I. William**, an English painter, born about 1707, died in Bath in 1792. He painted portraits of Pitt, Grenville, Lord Chesterfield, the duke of Newcastle, &c., and several altarpieces for churches in England. He was one of the original members of the royal academy. **II. Prince**, an English artist and author, eldest son of the preceding, born in Bath in 1754, died in Brighton in 1834. He studied in the royal academy and under Raphael Mengs at Rome. In 1799 he succeeded Boswell as foreign secretary to the royal academy. He wrote "Such Things Were," a tragedy, performed in 1788; "No Song, No Supper," a comic opera (1790); "The Cave of Trophonus" (1791); "Dido, Queen of Carthage" (1792); "The Prize" (1793); "My Grandmother" (1793); "The Three and the Deuce" (1795); "Lock and Key" (1796); "Mahmoud" (1796); "Julia" (1796); "A Friend

in Need" (1797); "Chains of the Heart" (1802); "Partners" (1805); "Something to Do" (1808); and "An Inquiry into the Requisite Cultivation and Present State of the Arts of Design in England" (1806).

**HOBERT, John Henry**, an American bishop, born in Philadelphia, Sept. 14, 1775, died in Auburn, N. Y., Sept. 10, 1830. He graduated at Princeton college in 1793, and entered a counting house, which he soon left to prepare for the ministry. He became a tutor at Princeton in 1796, and at the same time began there the study of theology, which he completed in Philadelphia, where he was admitted to deacon's orders in June, 1798, and took charge of two suburban parishes. He was pastor, for short periods, of churches in New Brunswick, N. J., and Hempstead, L. I., and in September, 1800, became assistant minister of Trinity church, New York, being ordained priest in 1801. He had already been secretary of the house of bishops, and was elected secretary of the convention of New York, deputy to the general conventions of 1801, '4, and '8, and was on the last two occasions secretary to the house of clerical and lay deputies. He was elected assistant bishop of New York in February, 1811. In 1812 he became assistant rector of Trinity church, and in 1816 was made bishop of the diocese and rector of the church. He was one of the founders of the general theological seminary of the Protestant Episcopal church in New York, in which in 1821 he became professor of pastoral theology and pulpit eloquence. In 1823, on account of failing health, he visited Europe, where he made an especial study of the social, moral, and religious condition of the people. Finding that in England he was accused of insisting upon external forms, to the neglect of essentials in religion, he published two volumes of his sermons (London, 1824) to disprove it. He was rigid in denying the validity of any but Episcopal orders, and opposed the formation of the American Bible and tract societies, as well as every other such organization including Christians of different denominations. Among his works are: "Apology for Apostolic Order" (1807), "The State of the Departed" (1816; new ed., 1846); several devotional manuals, an edition of D'Oyley and Mant's "Commentary on the Bible" (2 vols. 4to, 1818-'20), and a volume of sermons (1824). His posthumous works, with a memoir by the Rev. William Berrian, D. D., appeared in 1833 (3 vols. 8vo).

**HOBERT PASHA.** See supplement.

**HOBERT TOWN, or Hobarton**, the capital of Tasmania, on the S. side, 20 m. from the sea, at the head of a fine land-locked harbor called Sullivan cove; lat. 42° 53' S., lon. 147° 21' E.; pop. in 1871, 19,092. The river Derwent flows into the head of the bay, and the town is delightfully situated at its mouth. Most of the imports and exports of the colony come to this port. Hobarton and all the other ports of Tasmania are free to foreign whaling vessels.

The city is the seat of an Anglican and a Catholic bishop, has two cathedrals and 21 other churches and chapels, a high school, numerous private seminaries, a mechanics' institute, a magnetic observatory, and a royal society of sciences, which publishes its transactions. The Derwent is navigable by considerable vessels for 3 m. above the town, and by craft of 50 tons for 20 m. higher.

**HOBBEA**, or *Hobbima*, Minderhout, a Dutch painter, born probably in Coevorden, died in Amsterdam, Dec. 14, 1709. Nothing is known of his personal history, except that he probably lived in Amsterdam, and was on terms of intimacy with Ruysdael, Berghem, and Van der Velde. His subjects are simple landscapes, but the admirable perspective, the fullness and purity of color, and the firmness of execution give to his homeliest scenes a marked and distinctive character. The figures in his pictures were frequently added by Teniers, Ostade, or Van der Velde.

**HOBBS**, Thomas, an English philosopher, born in Malmesbury, Wiltshire, April 5, 1588, died in Derbyshire, Dec. 4, 1679. The son of a clergyman, he was sent at the age of 15 to Magdalen hall, Oxford, where for five years he applied himself to logic and the Aristotelian philosophy. He afterward became private tutor in the family of Lord Hardwicke (soon created earl of Devonshire), and travelled in France and Italy with his pupil, Lord Cavendish. On his return to England he was intimately associated with Lord Herbert of Cheshire, Ben Jonson, and Lord Bacon. Ben Jonson revised for him his first publication, the translation of Thucydides (London, 1628). Severely afflicted by the death both of his patron and pupil, he again visited France and Italy with a son of Sir Gervase Clifton, but returned to England in 1631 at the solicitation of the countess dowager of Devonshire to undertake the education of the young earl. With his new pupil he went abroad again in 1634, and during an absence of three years enjoyed the friendship of Father Mersenne, Gassendi, and Galileo. He withdrew again from England in 1640 at the approach of the civil war, and resided for more than ten years in Paris, where he became acquainted with Descartes. In 1642 a few copies of his *Elementa Philosophica de Cive* were printed at Paris and distributed among his friends, and the work was published by the Elzevirs at Amsterdam in 1647. In that year he was appointed mathematical tutor to the prince of Wales, afterward Charles II., then resident in Paris. In 1650 his treatises on "Human Nature" and *De Corpore Politico* appeared in London, and in 1651 "Leviathan, or the Matter, Form, and Power of a Commonwealth, Ecclesiastical and Civil." The last contains the complete system of his philosophy, treating the same subjects often in the same language as his three previous works. After its publication he returned to England, and wrote a "Letter

on Liberty and Necessity" (1654), which involved him in a long controversy with Bishops Bramhall and Laney. He carried on also for 20 years a controversy with Dr. Wallis, professor of geometry at Oxford, which gained him little honor among mathematicians; his claim was that he had discovered the quadrature of the circle. His opinions were during this period assailed by all classes of religionists and by many eminent writers; and in 1666 his "Leviathan" and *De Cive* were censured by parliament. Yet he was personally esteemed by his former pupil the king, who granted him a pension of £100 from the privy purse, though, yielding to the persuasions of divines, he forbade the philosopher his presence. His fame, too, was spread throughout Europe; foreign ambassadors were interested to see him; and Cosmo de' Medici, prince of Tuscany, visited him and solicited his portrait and a collection of his works to take to Florence. He passed the latter years of his life at the earl of Devonshire's seat in Derbyshire, and continued to write at an advanced age. His principal later publications are an English version of the Iliad and Odyssey (1675-'7), of which three editions were called for in less than ten years, though Pope characterizes it as "too mean for criticism;" the "Decameron Physiologicum, or Ten Dialogues on Natural Philosophy" (1678); an autobiography in Latin verse (1679, translated by himself into English verse), and "Behemoth, or the History of the Civil Wars of England, from 1640 to 1660," published posthumously (1679). He possessed remarkable independence and disinterestedness of character. The earl of Devonshire entertained him in ease, leaving him free to follow his own tastes, and was wont to speak of him as a humorist whom nobody could account for.—The speculations of Hobbes base all knowledge upon sensation; and, as the senses perceive only what is material, matter is the only reality. The mind is physical, and all thoughts result from the pressure of material objects upon it. Sensation consists in the movement of particles of matter, which gradually ceases after the actual period of impact, and the vividness of the conception gradually diminishes. This "decaying sense" is imagination, but, if viewed as a lingering image of the past, it is memory. Knowledge is of two kinds: first, "knowledge original," derived from direct impressions of external things by sensation; second, remembrance of the former, or knowledge of words or of the truth of propositions. He lays immense stress on language; understanding is only the faculty of perceiving the relation between words and things; and errors in reasoning arise only from defective definitions and the wrong employment of names. Yet Hobbes wrote the weighty aphorism: "Words are wise men's counters; they do but reckon by them; but they are the money of fools." His ethics follow necessarily from his metaphysics. Good and

evil have no absolute character, but mean simply personal pleasure or pain, and the highest motives of life must be to attain the one and avoid the other. Moreover, as man does not determine for himself the conditions of pleasure and pain, he is absolutely subject to circumstances and the creature of necessity. Hence results the political theory of Hobbes. Nature gives to every man the right to seek his own happiness, the highest end of being, at whatever expense to his fellow men. The state of nature, therefore, is a state of warfare among men, each seeking to advance only his own interests, and being therefore in hostile collision with every other. Experience, however, proves a state of universal warfare to be one of universal suffering, and reason therefore dictates the institution of government and other social institutions to be the antagonist of man's natural selfishness. The state should be sufficiently mighty to coerce the will of the individual, and its perfect form is an absolute monarchy, to which should be given supreme control over everything connected with law, morals, and religion. In respect of style Hobbes is one of the best English authors. The most complete edition of his English and Latin works is that prepared by Sir William Molesworth (16 vols., London, 1839-'45).

**HOBBY**, a falcon of the genus *hypotriorchis* (Boie). This genus differs from *falco* (Linn.)

Hobby (*Hypotriorchis subbuteo*).

in having longer and more slender tarsi, covered in front with large hexagonal scales, and very long and slender toes. The species of this genus, to which the American pigeon hawk (*H. columbarius*, Linn.) belongs, prefer wooded and cultivated places, and are generally migratory; they fly with great rapidity and for a long time, pursuing the swift migratory birds. The common hobby (*H. subbuteo*, Linn.) resembles the peregrine falcon in appearance, but is smaller, being only 12 in. long, with an expanse of wings of 26 in., the female being 2 in. longer and wider.

**HOBHOUSE, John Cam**, Lord Broughton, an English author, born June 27, 1786, died in London, June 3, 1869. At the university of Cambridge, where he graduated in 1808, he contracted an intimacy with Lord Byron, with whom in 1809 he travelled over southern Europe, and subsequently in Switzerland and Italy. After his return to England appeared his "Journey through Albania and other Provinces of Turkey with Lord Byron" (4to, 1812), which was highly commended; and in 1818 "Illustrations of the Fourth Canto of Childe Harold." In 1819, in consequence of the publication of a pamphlet which contained a severe attack on the house of commons, he was imprisoned in Newgate on a charge of having committed a breach of privilege; but the electors of Westminster returned him to parliament after a memorable contest. In 1831 he entered the cabinet of Earl Grey as secretary at war. In 1833 he was made secretary of state for Ireland, and he was president of the board of control from 1835 to 1841, and from 1846 to 1852. He was raised to the peerage as Baron Broughton of Broughton Gifford in Wiltshire, Feb. 26, 1851. His "Italy" was published in 1859. He was one of the originators of the "Westminster Review."

**HOBOKEN**, a city of Hudson co., New Jersey, on the Hudson river, opposite New York, with which it is connected by two steam ferries, and at the terminus of the Morris and Essex division of the Delaware, Lackawanna, and Western railroad; pop. in 1850, 2,668; in 1860, 9,662; in 1870, 20,297, of whom 10,334 were foreigners. It joins Jersey City on the south, with which and with the adjoining places it is connected by horse cars, and extends about 1½ m. N. and S., and 1 m. E. and W. It is regularly laid out, a portion of the streets running nearly parallel with the river, and the others crossing them at right angles, and is for the most part compactly built. There are three public squares, viz.: Hudson square, near the river; the "Public" square, near the centre of the city; and a smaller one in the S. part. The river frontage is only about ½ m., the N. portion of the city being separated from the Hudson by a narrow strip of land which was set off to Weehawken in 1859. At the S. end of this strip is Castle point, commanding a fine view of the river and New York harbor, and containing the Stevens mansion and grounds; and N. of the point are the "Elysian Fields," formerly a favorite place of resort for New Yorkers, but now mostly sold for business purposes. From just below the point to a short distance above a walk has been constructed along the margin of the Hudson, which forms a magnificent promenade. The river front is lined with wharves, and here are two United States bonded warehouses, and the termini of four lines of steamers to Europe, viz.: to Bremen, to Hamburg (two), and to Stettin. Hoboken is included in the New York customs district. The residents

chiefly do business or are employed in New York, and the local industry is not large. The city, however, contains the extensive works of the American lead pencil company, a large machine shop (manufacturing steam engines, &c.), the Hoboken iron works (foundry products), the machine shops of the Camden and Amboy railroad company, a national bank with a capital of \$110,000, a fire insurance company with \$100,000 capital, and a savings bank. It is divided into four wards, and is governed by a mayor and a common council of 12 members. The streets are paved and lighted with gas. Water is supplied from the Passaic river by the Jersey City water works, but it is proposed to erect separate works and supply the city from the Hackensack. The assessed value of property in 1873 (about 60 per cent. of the true value) was \$13,135,400; taxation, \$270,043 23, of which \$116,675 23 was for state and county purposes; debt, \$380,000; value of property belonging to the city, \$500,000. The Stevens battery occupies a block near the river. (See IRON-CLAD SHIPS.) The principal charitable institutions of Hoboken are St. Mary's hospital (Roman Catholic) and the widows' home. The Stevens institute of technology is a large stone building, three stories high with a basement, and the grounds comprise a square immediately N. of Hudson square. It was founded by E. A. Stevens, who bequeathed the site, besides \$150,000 for the building and \$500,000 as an endowment. It was opened in 1871, and in 1873-'4 had 8 professors, 61 students, and a library of 5,000 volumes. It has extensive collections of apparatus in the various departments of physics, in engineering, and in chemistry, and cabinets of minerals, &c. The course is four years. The Stevens high school (preparatory department of the institute) in 1873-'4 had 6 instructors, of whom 2 were professors in the institute, and 36 pupils. The Martha institute, an elementary and classical school with a kindergarten department, occupies a fine brick building, and in 1874 had 8 instructors and 200 pupils. There are three large brick public school houses. The schools comprise primary and grammar grades, and in 1874 had 27 teachers and about 3,000 pupils. Evening schools are opened in the winter. There are also an academy, a female seminary, a Catholic school, four weekly newspapers (two German), and 11 churches. —Hoboken was settled by the Dutch in the early part of the 17th century, and named from a village on the Scheldt a few miles S. of Antwerp. It became a city in 1855.

**HOICHE, Lazare**, a French soldier, born at Montreuil, a suburb of Versailles, June 25, 1768, died Sept. 18, 1797. He was the son of a poor workman, enlisted in the army at the age of 16, and on the breaking out of the revolution was sergeant in the regiment of *gardes françaises*. Being promoted to the rank of lieutenant in 1792, he distinguished himself at the siege of Thionville and in the battle of Neer-

winden. After the defection of Dumouriez he was charged with want of patriotism, and arrested; but a plan of a campaign which he was devising being sent to the committee of public safety, Carnot not only liberated him from arrest, but at once promoted him to the rank of brigadier general. He defended Dunkirk against the duke of York, and received the chief command of the army on the Moselle. He was not successful in his first encounters with the duke of Brunswick, and consequently joined Pichegru, who was at the head of the army on the Rhine; he now defeated the Austrians at Weissenburg, and after taking Gernersheim, Spire, and Worms, forced them to evacuate Alsace in 1793. He was suspected by Marat, who caused him to be arrested and brought to Paris; but on the revolution of the 9th Thermidor he was placed in command of one of the three armies which were to suppress royalist insurrections, routed the Vendéans, and in July, 1795, defeated the royalists, who had landed on the peninsula of Quiberon, with the assistance of an English squadron. The committee of public safety then gave him the entire control of the troops along the Atlantic coast. He now forced or persuaded the Vendéans into submission, pursued their chiefs with unrelenting activity, took Charette and Stofflet prisoners, and put an end to the civil war. On Dec. 16, 1796, he sailed from Brest with a fleet carrying 18,000 soldiers, to invade Ireland; but stormy weather scattered his ships. On his return he received the command of the army of the Sambre and Meuse, and made preparations for a great campaign. He crossed the Rhine April 18, 1797, defeated the Austrians in three battles, and reached Wetzlar before learning of the armistice of Leoben. He now resumed his plans for the invasion of Ireland, and meanwhile aided the revolution of the 18th Fructidor with a part of his troops and with 30,000 francs belonging to his wife; and upon its success the army lately under Moreau was added to his own. With these united forces, which assumed the name of the "army of Germany," he might have accomplished his vast schemes, but he died suddenly. A post-mortem examination showed that he had been poisoned, but by whom or for what object has never been ascertained. His death was celebrated by a great funeral solemnity in the Champ de Mars, and a statue of him was erected on the spot where he crossed the Rhine. His name was given to a square in Versailles, which contains a bronze statue of him erected in 1832. A life of Hoche, edited from original documents by Du Chatellier, was published at Paris in 1872.

**HOCHELAGA**, a county of Quebec, Canada, occupying the E. portion of Montreal island; area, 76 sq. m.; pop. in 1871, 25,640, of whom 20,224 were of French origin or descent. The surface is level, and the soil fertile and well cultivated. Capital, Longue Pointe.

**HOCHHEIM**. See GERMANY, WINES OF.

**HOCHKIRCH**, a village of Saxony, 7 m. E. S. E. of Bautzen, memorable for a battle between Frederick the Great and the Austrian general Daun, Oct. 14, 1758. The Prussians, whom the king, contrary to the advice of his officers, had ordered to encamp in an exposed position on an open plain, were attacked before it was light, and under cover of a thick fog, and in the confusion and darkness suffered a terrible defeat, losing all their camp equipage and baggage. When day broke Frederick found himself nearly surrounded by the Austrians, and ordered a retreat. His loss was 9,000 men, including several of his best generals, and more than 100 guns. On May 21, 1813, the allies were defeated here by the French under Marmont and Macdonald.

**HÖCHST**, a town of Prussia, in the province of Hesse-Nassau, near the Taunus mountains, on the railway from Frankfort to Mentz,  $5\frac{1}{2}$  m. W. of Frankfort; pop. in 1871, 3,108. In the thirty years' war Tilly achieved a brilliant victory there, June 10, 1622, over the duke Christian of Brunswick. It was taken six times during that war; and the old castle, where the archbishops of Mentz used to reside occasionally, was then converted into a ruin. On Oct. 11, 1795, the French under Jourdan were defeated there by the Austrians.

**HÖCHSTÄDT**, a town of Bavaria, in the circle of Swabia and Neuburg, near the Danube, 4 m. N. E. of Dillingen; pop. in 1871, 2,288. In the vicinity was fought in 1704 the celebrated battle of Blenheim, between the English and Austrians and the French and Bavarians, which in Germany and France is known as the battle of Höchstädt. (See **BLENHHEIM**.)

**HOCK**. See **GERMANY**, **WINES OF**.

**HOCKING**, a S. E. county of Ohio, drained by the river of the same name; area, 380 sq. m.; pop. in 1870, 17,925. It has a hilly surface with several considerable elevations, and is generally fertile. Coal and iron are found. It is traversed by the Columbus and Hocking Valley railroad and the Hocking canal. The chief productions in 1870 were 132,714 bushels of wheat, 498,660 of Indian corn, 108,726 of oats, 54,432 of potatoes, 82,010 lbs. of tobacco, 130,960 of wool, 387,395 of butter, and 13,792 tons of hay. There were 5,062 horses, 4,903 milch cows, 7,897 other cattle, 36,361 sheep, and 15,924 swine; 3 flour mills, 9 saw mills, 3 tanneries, 2 currying establishments, 3 manufactories of furniture, 1 of pig iron, and 1 of woolen goods. Capital, Logan.

**HOCKING**, or **Hockhocking**, a river of Ohio, rising in Fairfield co., near the centre of the state. It flows S. E. through a picturesque hilly country, and after a course of about 80 m. joins the Ohio at the S. E. extremity of Athens co. About 7 m. from Lancaster in Fairfield co. it has a perpendicular fall of 40 feet. It is deep enough for boat navigation for a distance of nearly 70 m., but is obstructed by falls and dams. The Hocking canal passes along its banks, and connects with the Ohio canal.

**HODEIDA**, or **El-Hudaidah**, a seaport of Arabia, in Yemen, situated on the Red sea, about 100 m. N. N. W. of Mocha. It is a well built town, having a number of mosques and a good market. Its harbor, which is shallow, is sheltered on the north, but exposed to the S. wind. It is frequently visited by the pilgrim ships from India, which, unable to beat up against the wind, transfer their passengers here to the lighter native vessels, five or six of which, of from 30 to 250 tons each, are built here annually of Malabar teak. A large part of the coffee raised in the district N. of Sana, which was formerly shipped from Mocha, is now sent to Hodeida for exportation. Hodeida is now the seat of the Turkish government of Yemen and of a pashalic under Jiddah, and a considerable garrison is stationed there.

**HODGE**. **I. Charles**, an American theologian, born in Philadelphia, Dec. 28, 1797, died in Princeton, N. J., June 19, 1878. He graduated at Princeton college in 1815, and at the theological seminary in 1819, and became assistant professor in that institution in 1820, and full professor of oriental and Biblical literature in 1822. In 1840 he was made professor of didactic and exegetical theology, to which in 1852 polemic theology was added. In 1825 he founded the "Biblical Repertory and Princeton Review," enlarging its plan in 1829, and remained its editor until it was changed into the "Presbyterian Quarterly and Princeton Review" in 1872. In 1846 he was moderator of the general assembly of the Presbyterian church (old school), and in 1858 one of a committee to revise the "Book of Discipline." The semi-centennial anniversary of his professorship was celebrated at Princeton, April 24, 1872, by a gathering of between 400 and 500 classmates and former pupils. A record of the celebration was published in a volume. Among the works of Dr. Hodge are a "Commentary on the Epistle to the Romans" (Philadelphia, 1835; abridged, 1836; rewritten and enlarged, 1866); "Constitutional History of the Presbyterian Church in the United States" (2 vols., 1840-'41); "The Way of Life" (1842); commentaries on Ephesians (1856), 1st Corinthians (1857), and 2d Corinthians (1860); "Systematic Theology" (3 vols., 1871-'2); and "What is Darwinism?" (1874). Selections from his contributions to the "Princeton Review" have been reprinted in the "Princeton Theological Essays" (2 vols., 1846-'7), and in his "Essays and Reviews" (1857). **II. Archibald Alexander**, an American clergyman, son of the preceding, born at Princeton, N. J., July 18, 1823. He graduated there in 1841, was tutor in the college from 1844 to 1846, graduated at the Princeton theological seminary in 1847, and went as a missionary of the Presbyterian board to Allahabad, returning in 1850. He became pastor at Nottingham, Cecil co., Md., in 1851, at Fredericksburg, Va., in 1855, at Wilkesbarre, Pa., in 1861, and at Allegheny City in 1866. In 1864 he was appointed professor of didactic,

historical, and polemic theology in the Western theological seminary in Allegheny City. He has published "Outlines of Theology" (New York, 1860; translated into Welsh, 1863); "The Atonement" (1867); "Commentary on the Confession of Faith" (1869); and "Presbyterian Doctrine briefly stated" (1869).

**HODGEMAN**, a S. W. county of Kansas, drained by the Pawnee fork of Arkansas river; area, 900 sq. m.; still unsettled.

**HODGES, William**, an English painter, born in London about 1744, died March 6, 1797. After gaining some repute as a painter of landscapes, theatrical decorations, and architectural views, he accompanied Capt. Cook on his second voyage to the South seas, furnishing the illustrations for his narrative. He subsequently went to India under the patronage of Warren Hastings, and amassed a fortune, which he lost in an attempt to establish a bank. He published an account of his travels in India, with plates.

**HODGKINSON, Eaton**, an English physicist, born at Anderton, near Northwich, in Cheshire, Feb. 26, 1789, died at Broughton, near Manchester, June 18, 1861. He was intended for the church, but, possessing a great taste for mechanics, soon determined to make it his exclusive study. Among the first fruits of his researches was the discovery that by giving to cast-iron rails and beams the form of an inverted T (⊥) a gain of strength equivalent to upward of 40 per cent. would be secured. Continuing his investigations on the properties of iron, he instituted a series of 227 experiments with reference to the strength of columns, from which he deduced formulas for solid and hollow iron columns, which have been generally adopted and formed into tables for ready reference. His published account of these researches procured him the gold medal and the membership of the royal society. In 1845 he was employed by Robert Stephenson to prepare the data for the construction of the celebrated tubular Britannia bridge, and for these calculations received a medal at Paris in 1855. In 1847 he was appointed on the royal commission to inquire into the application of iron to railway structures, and added to its report memoranda of great value. His papers on the use of iron for engineering and architectural purposes, interspersed through the "Transactions" of the British association and other learned bodies, are of high authority.

**HODGSON, John E.**, an English painter, born in London in 1811. He is the son of a merchant at St. Petersburg, passed the early part of his life in his father's counting house, and subsequently studied at the royal academy in London. He spent some time in Tunis and other parts of the East, and acquired reputation by humorous and genre pictures. Among these are "The Reorganization of the Army of Morocco" and "A Snake Charmer," exhibited in 1872. He was elected an associate of the royal academy in 1873.

**HOEVEN, Jan van der**, a Dutch naturalist, born in Rotterdam, Feb. 9, 1801, died in Leyden, March 10, 1868. In 1819 he entered the university of Leyden, where he remained till 1822, studying chiefly natural philosophy and medicine. He began the practice of medicine in his native city, but in 1826 was appointed extraordinary and in 1835 ordinary professor of zoölogy at Leyden. His principal work is *Handboek der Dierkunde* (Leyden, 1827-'33), translated into English by the Rev. W. Clark ("Handbook of Zoölogy," 2 vols. 8vo, London, 1856-'8.)

**HOFF** (formerly Regnitzhof), a town of Bavaria, in the circle of Upper Franconia, on the Saale, near the N. E. boundary of the kingdom, 30 m. N. E. of Baireuth, and 150 m. N. by E. of Munich; pop. in 1871, 16,010. It has considerable manufactories of hosiery, woollen and cotton goods, and leather, and extensive breweries. It has a large transit trade, chiefly by railway. In 1823 it was almost entirely destroyed by fire.

**HOFER, Andreas**, a Tyrolese patriot, born Nov. 22, 1767, in a tavern at St. Leonard's in the Passeyr valley, called the Sand house (whence his popular name of the *Sandwirth*, or Sand Landlord), shot at Mantua, Feb. 20, 1810. He was known as a wine dealer and horse drover between Tyrol and the north of Italy. In 1796 he led a company of riflemen against the French on Lake Garda, and in 1803 organized the rural militia. In 1805 he was made a member of the deputation to which was committed the political direction of the country. Shortly after Tyrol was taken from Austria by the treaty of Presburg, and given to Bavaria. In January, 1809, when the disaffection toward Bavaria had become extreme and hostilities were on the point of breaking out between France and Austria, Hofer was one of the secret envoys who went to Vienna to confer with the archduke John on the subject of their national grievances. The archduke advised a rising in Tyrol, and the baron von Hormayr was early in 1809 charged to carry it out. The preparations were skilfully concerted, and in a few days the whole Tyrol was in arms, and 8,000 French and Bavarian troops were taken prisoners at Hall and Innsbruck, and in Sterzing, where Hofer commanded. The Tyrolese were supported by 10,000 Austrians, but Bavaria sent 25,000 troops to quell the revolt. While the latter were toiling through narrow valleys, Hofer fell upon them, and on April 10 defeated Bisson and Lemoine in the moors of Sterzing. Within a week the whole province was free, and nearly 10,000 French and Bavarian troops were destroyed. Napoleon now sent into Tyrol three armies, one of which, commanded by Marshal Lefebvre, defeated Chasteler's Austrians at Wörgl, and the Tyrolese at Feuer-Singer. Hofer soon rallied his countrymen, and defeated the Bavarians with great loss at Innsbruck. But Napoleon's victory at Wagram (July 6, 1809) resulted in a

stipulation that Austria should evacuate Tyrol. Lefebvre marched from Salzburg into Tyrol with over 20,000 French, Saxons, and Bavarians, while Beaumont with 10,000 advanced from Bavaria. It was under these trials that the military genius of Hofer displayed itself most brilliantly. After sustaining several reverses, Lefebvre with 25,000 Bavarian and French soldiers, including 2,000 cavalry, was completely routed (Aug. 13) by 18,000 Tyrolese peasants, and driven from Tyrol. An independent government was formed, with Hofer at its head as absolute ruler. After the peace of Vienna, however, the archduke addressed a proclamation to the Tyrolese urging them to submit, while at the same time three veteran armies marched into the country to force them to obedience. Under these circumstances Hofer sent in his submission in November to Eugène Beauharnais, the viceroy of Italy, and to the Bavarian commander-in-chief. Deceived by reports of Tyrolese victories and the entrance of the archduke into Tyrol, he took up arms again, but being defeated fled for concealment to the mountains, where the peasants resisted all inducements to reveal his hiding place. He was at last betrayed to Gen. Baraguey d'Hilliers by one of his most trusted partisans for 300 ducats, arrested on the night of Jan. 20, 1810, and taken to Mantua. He was tried before Gen. Bisson. A majority of the judges wished to save his life, but Napoleon gave orders that he should be put to death within 24 hours. He died without the slightest indication of fear, refusing to have his eyes bound, and himself giving the word to fire. His property was confiscated. In 1819 the emperor Francis of Austria conferred upon his family, under the name of Von Passeyr, the patent of nobility already decreed in 1809. This was the name of the place where Hofer was captured, and where a monument was erected to his memory. The house where he was born and lived was converted by the emperor into an asylum for 16 old Tyrolese, while his remains were brought in 1823 from Mantua to Innspruck, and buried in the cathedral there, near the monument of the emperor Maximilian. A marble statue was placed in 1834 over the tomb.

**HOFFMAN, Charles Fenno**, an American author, born in New York in 1806. In 1817 his leg was crushed between a steamboat and the wharf and had to be amputated. He was educated at Columbia college, which he left in the junior year, was admitted to the bar at the age of 21, and practised for three years, during which time he became associated with Charles King in the "New York American" newspaper. He was the first editor of the "Knickerbocker Magazine," but resigned the post after the issue of a few numbers. In 1835 he published "A Winter in the West" (2 vols.), recording the experience of a journey made in 1833; and in 1837 "Wild Scenes in the Forest and the Prairie" (2 vols.). His only novel, "Greyslaer," appeared in 1840. In 1842 his

lyrics were published in a volume entitled "The Vigil of Faith, and other Poems," and in 1844 "The Echo, or Borrowed Notes for Home Circulation," a second volume of poetry. "Love's Calendar, and other Poems" (New York, 1848), is a more complete collection of his lyrics. In 1846-'7 he edited the "Literary World." About 1850 he became afflicted with a mental disorder, and has since lived in a lunatic asylum. A new edition of his poems, edited by his nephew, Edward Fenno Hoffman, was published in 1874.

**HOFFMAN, David**, an American lawyer, born in Baltimore, Dec. 25, 1784, died in New York, Nov. 11, 1854. From 1817 to 1836 he was professor of law in the university of Maryland. Having resigned his professorship, he travelled in Europe for two years, and afterward practised law in Philadelphia till 1847, when he again went to Europe, returning in 1853. During this time he furnished to the London "Times" several papers relating to the government and people of the United States. He published "A Course of Legal Study" (1817; 2d ed., 2 vols. 8vo, 1836), of which Justice Story said, "It contains by far the most perfect system for the study of the law which has ever been offered to the public." His "Legal Outlines," of which only one volume appeared (1836), has also been commended as a text book. He also published "Miscellaneous Essays" (1837), "Viator" (1841), and "Chronicles selected from the Originals of Cartaphilus the Wandering Jew" (2 vols., London, 1855).

**HOFFMAN, Murray**, an American jurist, born in New York, Sept. 29, 1791, died May 7, 1878. He graduated at Columbia college in 1809, studied law, and practised for a number of years. In March, 1839, he became assistant vice chancellor, which office he held for four years. He was appointed judge of the superior court in New York in November, 1853, and held that office till the end of 1861. He published "Office and Duties of Masters in Chancery" (1824); "Treatise on the Practice of the Court of Chancery" (3 vols., 1840-'43); "Treatise on the Corporation of New York as Owners of Property, and Compilation of the Laws relating to the City of New York;" and "Vice Chancery Reports" (1839-'40). As an active layman in the Episcopal church, he published "Treatise on the Law of the Protestant Episcopal Church in the United States" (1850); "Ecclesiastical Law in the State of New York" (1868); and "The Ritual Law of the Church, with Notes on the Offices, Articles, &c." (1872).

**HOFFMANN, Daniel**, a German clergyman, born in Halle about 1540, died in Wolfenbüttel in 1611. At first professor of ethics in Jena, he afterward taught theology in Helmstedt, and became well known in the controversies of the reformation, opposing Beza on the eucharist. He was censured by an assembly of divines in 1593, and threatened with excommunication, and published in reply a famous apology. In

1598 he asserted that there must always be a contradiction between the truths of theology and those of philosophy. Accused by Martini and Caselius, he was obliged in 1601 to recant; but returning the next year to his original views, he was deprived of his professorship. His followers, on account of their belief in opposing truths, were called Duplicists, their opponents Simplacists.

**HOFFMANN, Ernst Theodor Wilhelm** (AMADEUS), a German author, born in Königsberg, Jan. 24, 1776, died in Berlin, July 24, 1822. He manifested an early taste for music and drawing, studied law at the university of his native place, graduated in 1795, and in 1796 began practice at Glogau. He was soon afterward appointed referendary to the superior court of Berlin, and in 1800 was named assessor of the province of Posen; but having drawn a number of caricatures containing allusions to the "scandalous chronicle" of the city of Posen, the minister, instead of signing his appointment as councillor, sent him to Plock (1802). Before his departure Hoffmann married a young Polish lady, who shared his exile. While at Plock he wrote much, composed masses and a grand sonata, and copied in pen drawing all the vases of the Hamilton collection. In 1803 he was appointed counsellor of the regency at Warsaw, where his life became a strange mixture of legal duties and theatrical management, his clients visiting him behind the scenes, where he was painting or training musicians. The entry of the French army reducing him to poverty, he wandered to Berlin and Bamberg, and was finally invited by Rochlitz, his future biographer, to write for the newspaper which the latter then edited at Leipsic. His sufferings at this period were great and varied. He lost his daughter, saw his wife shockingly maimed by an accident, and had his system shaken by a nervous fever. But during eight years he was always busy, passing his nights in revels, and his days as editor, leader of an orchestra, translator, designing machinist, fresco painter, or church singer, and finally became, with Holbein, director of the theatre of Bamberg. In 1816 he was appointed counsellor of the court of appeal, and soon became famous for his musical compositions. His means were now abundant, and his eccentricities and dissipations were redoubled. He was sought by the first society, but took refuge in wine cellars among wild companions. To render his dissipation less gross and public, his literary friends formed a club known as the *Serapiensbrüder*, and the results of their meetings were written by Hoffmann in the form of a collection of articles bearing the same name, which contains his best tales (4 vols., Berlin, 1819-'21; with a supplementary volume, 1825). One of his most characteristic books, all of which are marked by an extraordinary exuberance of fancy and replete with grotesque caricature, is *Die Elxire des Teufels* (Berlin, 1816). Toward the

close of his life he was afflicted with a painful disease; but he dictated a number of curious books, among which is *Lebensansichten des Katers Murr*, occasioned by the death of a favorite cat. There is a complete edition of his works in 12 vols. (Berlin, 1857).

**HOFFMANN, Friedrich**, a German physician, born in Halle, Feb. 19, 1660, died there, Nov. 12, 1742. He graduated at Jena, visited Holland and England, and after his return was appointed physician to Frederick William, elector of Brandenburg. The elector Frederick III., afterward king of Prussia, appointed him in 1693 chief professor of medicine in the university recently founded at Halle. In 1708 he was appointed physician to the king, and removed to Berlin; but in 1712 he returned to his professorship at Halle. He was one of the first to advance medicine from the old mediæval grounds, maintaining that the phenomena of living bodies are not to be explained by the laws of inanimate or inorganic nature, but that they depend on the continued action of life. He tested the action of many medicines, and invented new ones, of which the *elixirum viscerale* and *liquor anodynus* are still in use. He was the discoverer and introducer of Seidlitz waters, and of the salt obtained from them. Among his works which are still of value are *Systema Medicinæ Rationalis* (9 vols., Halle, 1718-'40), *Medicina Consultatoria* (12 vols., 1721-'39), and *Consultationum et Responsorum Medicinalium Centuriæ* (1734). His life, in Latin, was written by J. H. Schultze, and published at Halle in 1730.

**HOFFMANNSEGG, Johann Centurius**, count, a German botanist, born in Dresden, May 23, 1766, died there, Dec. 13, 1849. He studied in Leipsic and Göttingen, served as an officer in the Saxon guard from 1783 to 1786, and spent some years in travel. He discovered several hundred new plants, and made important contributions to entomology. He published *Voyage en Portugal* (Paris, 1805), and, with the aid of H. F. Link, *Flore portugaise*, in French and Latin (fol., Berlin, 1809-'33), toward the cost of which he himself contributed nearly \$40,000.

**HOFFMANN VON FALLERSLEBEN, August Heinrich**, a German poet, born at Fallersleben, Hanover, April 2, 1798, died at the palace of Korvei, near Hörter, Jan. 21, 1874. He intended to study theology, but the brothers Grimm directed his attention to German philology and literature, to which he zealously devoted himself. He was keeper of the university library at Breslau from 1823 to 1838, and professor of the German language and literature from 1830 to 1842, when he was suspended for political reasons, and for one year was not allowed to live in Prussia. In 1854 he settled at Weimar, and in 1860 became librarian of the duke of Rati-bor and prince of Korvei. The latter part of his life was devoted to the publication of his autobiography (*Mein Leben*, 6 vols., 1862-'8). His works, archæological, historical, poetical,

and miscellaneous, are numerous, and his popular songs acquired great celebrity, chiefly from their witty and liberal character.

**HOFHUF**, a city of Hasa, Arabia, near the Persian gulf, in lat.  $25^{\circ} 20' 56''$  N., lon.  $49^{\circ} 40' 50''$  E.; pop. about 24,000. It was once strongly fortified, but its walls and towers are now little more than heaps of ruins. It is divided into three quarters or districts, which meet in a public square 300 yards in length by 75 in breadth. The *Kot*, the quarter in which resides the governor and his officials, is a vast citadel, surrounded by a deep trench, with massive walls and towers built of earth and stone. The great mosque is a building in the Moorish style, with arches and light porticos. Small enclosed gardens are attached to many of the houses, and fig and citron trees overhang the streets, but most of the orchards and plantations are without the walls. A general fair is held every Thursday, and one is held on Mondays at Mebarraz, a town of 20,000 inhabitants, 3 m. N. of Hofhuf.

**HOFLAND, Barbara**, an English authoress, born in Sheffield in 1770, died Nov. 9, 1844. She was the daughter of Robert Wreaks, a manufacturer in Sheffield, and in 1796 married Mr. Hoole, who died about two years later, leaving her poor. She published a volume of poems in 1805, and with the proceeds established a small school at Harrogate. In 1808 she married Thomas C. Hofland the artist. In 1812 she published five different works, and from that time was almost constantly busy with her pen, producing in all about 70 works, of which the sale was very large both in Europe and America. Most of them were novels and moral tales for the young. Among the most popular were "The Daughter-in-Law," "Emily," "The Czarina," "The Clergyman's Widow," "Says She to her Neighbor, What?" and especially "The Son of a Genius."

**HÖFLER, Karl Adolph Konstantin**, a German historian, born at Memmingen, Bavaria, March 26, 1811. He graduated at Munich in 1838, and continued his studies at Göttingen and in Italy. In 1836 he became editor of the official government organ in Munich, and in 1838 adjunct, and about 1840 full professor at the university. In 1847 he was removed from his professorship in consequence of the publication of *Der Constitution seid der Katholiken in Baiern*, but was soon after appointed keeper of the archives in Bamberg. In 1851 he was made professor of history in Prague. His works include *Die deutschen Päpste* (2 vols., Ratisbon, 1839); *Quellensammlung für fränkische Geschichte* (4 vols., Baireuth, 1849-'52); *Fränkische Studien* (6 parts, Vienna, 1852-'3); *Lehrbuch der allgemeinen Geschichte* (3 vols., Ratisbon, 1850-'56; 1 vol., Vienna, 1857); and *Die Geschichtschreiber der Hussitischen Bewegung* (2 vols., Vienna, 1856-'65).

**HOFMANN, August Wilhelm**, a German chemist, born in Giessen, April 8, 1818. He is the son of an architect, and studied chemistry under

Liebig, whose assistant he was at the university of Giessen. In 1845, after having been appointed professor at Bonn, he was at Liebig's recommendation placed in charge of the newly established royal college of chemistry in London, which was united in 1853 to the royal school of mines; and in 1855 he received the additional appointment of chemist to the mint. His reputation as one of the most successful teachers of chemistry of the present day brought him many offers from German governments, and in 1865 he succeeded Mitscherlich in the university of Berlin. Faraday's discovery of benzole among the oily products found in compressed oil-gas holders early attracted Hofmann's attention, and his important researches resulted in 1845 in his discovering the presence of the same substance in coal-tar oil. He indicated by formulas the successive changes in the transformation of benzole into nitro-benzole, and of the latter into aniline; and it is to him that science is indebted for most of the discoveries which have been made in these colors. The dye known as fuchsine, azaleine, mauve, solferino, magenta, &c., he showed to be a combination of a base, which he named rosaniline, with an acid, usually acetic or hydrochloric. He has recently investigated the conversion of aniline into toluidine, and is now (1874) investigating processes for the production of homologues of amines of other classes, and of some of the bases occurring in the organization of plants. He has conducted, with Dr. Bence Jones, the later editions of Fowne's "Manual of Chemistry," and contributed many disquisitions on organic chemistry and other subjects to scientific publications in England and Germany. A royal medal was awarded to him in 1854 for his memoirs on the molecular constitution of the organic bases, and he afterward became president of the chemical society. He wrote the report on the chemical department of the great London exhibition of 1862, and that on the tar dyes in the Paris international exhibition of 1867. His other important works relate to hygiene and to chemical technology, and include *Einleitung in die moderne Chemie* (1865; 5th ed., Brunswick, 1871), and essays commemorative of Thomas Graham and of Gustav Magnus in the *Berichte der deutschen chemischen Gesellschaft* (Berlin, 1869-'70).

**HOFWYL.** See FELLEBERG.

**HOG** (*sus*, Linn.), a well known pachydermatous animal, found throughout the world, and sufficiently characterized in the article BOAR. Besides the common *sus scrofa* (Linn.), the hogs as a family have been made to include the peccary (*dicotyles*, Cuv.) and wart hog (*phacochoerus*, F. Cuv.) and the name of hog or pig has been erroneously applied to some of the cavies, the armadillo, the porpoise, and other animals with porcine appearance and habits. The dentition is as follows: incisors  $\frac{4}{4}$  or  $\frac{6}{6}$ , canines  $\frac{1}{1}$ - $\frac{1}{1}$ , and molars  $\frac{7}{7}$ - $\frac{7}{7}$ , 42 or 44 in all; the lower incisors project forward, and

the canines, even the upper, curve upward. The feet are four-toed, the two anterior or intermediate toes being the largest, and the two lateral or posterior scarcely if at all touching the ground. The utility of the hog as an article of food is in great measure owing to the remarkable fecundity of the animal; it being capable of reproduction at about a year old, and producing from 8 to 12 and even more at a birth twice every year, the supply will always be equal to the demand. Vauban has estimated the product of a single sow, with only six young at a time, in 10 generations to be about 6,500,000, of which 500,000 may be deducted on account of accidental death. The hog was highly esteemed by the ancients, and was the animal sacrificed to Ceres, the goddess of the harvest. In hot climates, as in Egypt, pork is not considered wholesome, and accordingly the ancient legislators and priests of that country for sanitary reasons forbade its consumption; the Hebrew and Moslem lawgivers also prohibited it, and these sects abstain from its flesh even in cold climates, where it might be used with safety. The filthy habits of the hog are in great measure due to its domestication; the wild hog is cleanly, and selects its food chiefly from vegetable substances. The hog has the propensity to wallow in the mire common to all pachyderms, and generally for the purpose of ridding itself of vermin, or of protecting its thinly covered skin from the attacks of insects; the wild boar in this respect is no more dirty than the elephant, the rhinoceros, and the hippopotamus.—The hog occupies so prominent a place in domestic economy, commerce, and the arts, that it may be well to mention those generally considered the best varieties. If this animal, whose flesh,

particular object of the farmer. The Chinese hogs, both the white and black varieties, are easily fattened, and have small bones; indeed they are generally too fat to be esteemed as pork, and are considered to make poor bacon; bred carefully, and mixed with other stocks,

Original Old English Hog.

they are valuable animals. The Neapolitan is the most celebrated of the Italian breeds, and the stock of most of the English breeds; though not very hardy, the flesh is of superior quality; it is small, black, with few bristles, short snout, erect ears, and small bones; crossed with the Berkshire breed, the form is improved and the constitution hardened, with a remarkable tendency to fatten easily. The Berkshire, an English breed, black or white, is larger than the Neapolitan, with more bristles, and less fat to the meat, which is well suited for bacon and hams; this was formerly preferred above all others in many parts of New

Chinese Hog.

fat, hair, and bones are so valuable, can be improved even to the amount of \$1 for every animal, an immense sum will be realized to the farmer. Different breeds are prized in different districts, according to the fancy of producers, the facility of raising them, and the

Improved Berkshire Hog.

England, but its cross with the Chinese is more profitable, as the weight is heavier with light feeding, and the disposition milder. The Essex, crossed with the Neapolitan, is one of the most valuable, and has taken more prizes in England than any other breed; it is black, of good size

and symmetry, mild disposition, easily fattened, the meat of excellent quality, and the dressed weight at 12 and 18 months 250 to 400 lbs.; it is not subject to cutaneous diseases. The Irish grazier is slow in coming to maturity, but crossed with the Berkshire is an excellent

Improved Essex Hog.

variety. The Woburn or Bedford breed was originally sent by the duke of Bedford to Gen. Washington, and was produced at Woburn, England, by a cross of the Chinese boar and a large English hog; when pure they are white, with dark ash-colored spots; they are of large size, with deep round bodies, short legs, and thin hair, easily kept and maturing early. The Middlesex is a popular breed in England, and has been considerably imported into the United States; it is derived from a mixture of the Chinese with some larger stock; the color is usually white, and the size larger than the Suffolk, weighing at 18 months 800 to 900 lbs.; the bones are smaller than in the Essex. But the favorite of all breeds seems now to be the Suffolk, so named from that county in England, whence the London market has long been supplied; the present breed is believed to have originated from the old Suffolk crossed with the Chinese and Berkshire; the pure breed is remarkably symmetrical, small and compact, short-legged and small-headed, the exact opposite of the long, lank, and lean hogs of the western prairies; their early maturity, small consumption of food, and tendency to fat compensate for their want of size; the color is white. These are the most esteemed varieties; there are many others, imported and domestic, which thrive well in peculiar districts. While hogs are kept in New England and the middle states mostly in pens, in the west they are allowed to range in the woods and fields till within three months of the time of killing them, feeding upon clover, corn, acorns, and mast.—No animal displays the changes arising from domestication more than the hog, as may be seen by contrasting the large, savage, long-legged wild boar, leading dogs and horses a weary chase, with the small, docile, plump, short-legged Suffolk, with difficulty getting

from one side of his pen to the other. It is not probable that all the varieties of the hog are derived from the wild boar of Europe and Asia; the Polynesian species, the African, and perhaps the babyrroussa, have become crossed with introduced breeds, causing the same variety and confusion observed in all domesticated animals. The hog is not a stupid animal; like other pachyderms it is susceptible of education, and the stories of learned pigs and hunting hogs do no discredit to the order which contains the elephant.—Several species of fossil hogs, of the genus *sus*, are found in the tertiary and diluvial deposits of central Europe; the fossil hogs seem to have been, like the present animal, charged with fat; the teeth are the portions generally met with, as the bones from their spongy character would soon decay. Allied species are also found in the same formations in India.—According to the census of 1870, the total number of swine on farms in the United States was 25,134,569. The states containing the most were Illinois, which had 2,703,343; Missouri, 2,306,430; Iowa, 1,872,230; Kentucky, 1,838,227; Tennessee, 1,828,690; and Ohio, 1,728,968. In many of the western states the slaughtering of hogs and the packing of pork form an important industry. A great majority of the hogs are slaughtered and packed between the 1st of November and the 1st of March; but recently summer packing has been found profitable, and now large quantities of pork are packed during that season. The greatest centres for this industry in the United States are Chicago and Cincinnati. Formerly Cincinnati ranked first, but the supremacy is now held by Chicago. The extent of the operations at these two points is indicated by the statement that of the 5,383,810 hogs packed in the southern and western states between Nov. 1, 1873, and March 1, 1874, 1,520,024 were packed in Chicago and 581,253 in Cincinnati. The states ranking highest in the magnitude of this industry are Illinois, in which the number of hogs packed during this period was 1,870,855; Ohio, 897,627; Missouri, 735,868, of which 463,793 were packed in St. Louis; and Indiana, 699,223. The total value of all the hogs packed in the southern and western states during the winter season of 1873-'4 was \$63,370,339; aggregate gross weight, 1,444,311,304 lbs.; average gross weight, 268.27 lbs.; total product of lard, 191,139,000 lbs.

**HOGAN, John**, an Irish sculptor, born at Tal-low, county Waterford, in October, 1800, died in Dublin, March 27, 1858. Originally a lawyer's clerk, he showed so decided a taste for sculpture that at the age of 23 he was enabled by the liberality of some friends to visit Rome for the purpose of study. His "Drunken Faun" was pronounced by Thorwaldsen worthy of an Athenian studio, and he received for it a medal at the exposition in Paris in 1851. His career was passed in Ireland, and his works are chiefly religious and monumental subjects.

**HOGARTH, George**, a British writer on music, born in Scotland about 1797, died Feb. 12, 1870. In early life he was a writer to the signet in Edinburgh, but went to London as a musical critic and author. In 1836 he published "Musical History, Biography, and Criticism" (enlarged ed., 1838), and in 1839 "Memoirs of the Musical Drama," of which an abridged edition, under the title of "Memoirs of the Opera—Italy, France, Germany, and England," appeared in 1851. He published some other miscellaneous works on music, was for many years musical and dramatic editor of the "Morning Chronicle," and on the establishment of the "London Daily News," edited by his son-in-law, Charles Dickens, became its musical critic. His writings are considered standard authorities on the subjects of which they treat.

**HOGARTH**, or more properly **Hogart, William**, an English painter, born in London in 1697, or according to some authorities in 1698, died Oct. 26, 1764. His father, who was the son of a Westmoreland yeoman, and by profession a teacher and an occasional corrector of the press, could do little more for him than "put him in the way of shifting for himself." His education was therefore scanty; but his early taste for design was evinced in the number and variety of the ornaments with which his school books were adorned. He was apprenticed to a silversmith, and, in the intervals of his labors in engraving arms and ciphers, gradually acquired a knowledge of drawing from nature. At 20 years of age engraving on copper was his utmost ambition. The first indication of the direction his talents were to take was given in a humorous illustration of a pothouse brawl, of which he was a witness. Upon the expiration of his apprenticeship in 1718 he attended the lectures of Sir James Thornhill, sergeant painter to the king, and drew from the life at the academy in St. Martin's lane, but without attaining any great proficiency. His first employment seems to have been the engraving of shop bills and arms, after which he furnished frontispieces and plates for books, of which his illustrations of "Hudibras" afford a not very felicitous example, as he was always more successful in illustrating his own ideas than those of others. Having meanwhile acquired some facility in painting, he endeavored to find employment in painting portraits, a branch of his art in which he might have attained eminence had he chosen. Thus struggling on, and always contriving, as he tells us, to be "a prompt paymaster," he ventured in 1730 upon a "stolen union" with the daughter of his former master, Sir James Thornhill, which at first proved very unpalatable to the court painter; but when his son-in-law began to gain distinction Sir James became reconciled to the young couple. Shortly after his marriage Hogarth adopted portrait painting as a profession, and also commenced what he called "small conversation pieces," in which the figures were drawn from the life, and often

in humorous attitudes, though not burlesques. From this class of subjects he naturally proceeded to those more earnest scenes of daily life on which his fame rests. In 1734 appeared the six prints of "The Harlot's Progress," designed and engraved by himself, and the artist at once became famous. Upward of 1,200 subscribers entered their names for the series, of which eight piratical imitations almost immediately appeared, to the detriment of the painter, who in 1735 procured the passage of an act of parliament securing to an engraver the copyright of his plates for 14 years. Recognizing by the applause which greeted these works, his true path to fortune, he renounced portrait painting, and followed up his success by "The Rake's Progress," "Industry and Idleness," "Marriage à la Mode," "The Four Times of the Day," "The Four Stages of Cruelty," "Beer Lane" and "Gin Lane," and other works, in series or single, which were engraved by himself, and were produced at regular intervals until the close of his life. Appearing at a time when the national efforts in art were few and feeble, they won a popularity which has perhaps increased with time, and to which that of no contemporary artist can be compared. To the last he retained his wonderful powers, and a careful comparison of all his works will show no lack of invention or satiric humor in any of them. Like many men of genius, Hogarth had his foibles, and among them was the impression that historical painting was his true vocation. He railed at the old masters, especially deriding the pretensions of connoisseurs and the popular estimates of the value of old pictures, and undertook to show that no preliminary training was necessary to produce a good historical painting. The result was his "Paul before Felix," "The Pool of Bethesda," and some other works executed at the outset of his career; and "Sigismunda," painted in 1759, in competition with a picture on the same subject by Correggio, and in direct illustration of his principle. The ridicule which the last mentioned picture encountered equalled that bestowed upon his "Analysis of Beauty" (4to, London, 1753), the leading principle of which is that a curved line, in shape somewhat like the letter S, is the foundation of all beauty. But Hogarth preserved his equanimity until his quarrel in 1762 with Wilkes and Churchill, which he seems to have provoked by a print, entitled "The Times," indirectly ridiculing Wilkes and the opponents of the ministry. Wilkes replied in a strain of coarse abuse in the 17th number of the "North Briton," and Churchill in a poetical epistle lashed the painter, and more particularly "Sigismunda," with all his strong powers of satire. Hogarth revenged himself upon his opponents with his pencil, depicting the former simply in his natural ugliness, with a Satanic leer which the demagogue could not but acknowledge was genuine, and the latter as a canonical bear, holding a pot of porter and hugging a post inscribed

with an ascending scale of lies. The controversy affected Hogarth's health and spirits, and probably hastened his death.—It is a striking fact that the six pictures of "Marriage à la Mode" were sold in 1744 for £19 6s., though 50 years afterward they brought £1,381. Modern critics have declared that, with the single exception of color, these works are superior to most of the recent productions of English painters. His life has been written by Allan Cunningham, and by G. A. Sala (London, 1867). Of the various editions of his works, the best is that published by the Boydells (atlas fol., London, 1790), the original plates of which, retouched by Heath and others, have been issued in several subsequent editions. Another edition in atlas folio, containing Hogarth's works reengraved by Thomas Cook, was published in London in 1802, but is far inferior to that of the Boydells. The best 4to edition is that edited by Nichols and Steevens (3 vols., London, 1808-'17), with letterpress illustrations. An edition has been issued in 12mo, in which the plates are reduced in exact facsimile (London, 1874). Several reproductions of the engravings of Hogarth have appeared in Germany, among which are: *Hogarth's sämtliche Kunstwerke in 74 Blättern* (Leipsic, 1841); *Hogarth's Werke in verkleinerten aber vollständigen Copien, 75 Tafeln* (Göttingen, 1850-'53); and *Hogarth's Zeichnungen, mit Erklärung* (Gera, 1856-'8). The "Analysis of Beauty," in which he is said to have been assisted by Dr. Benjamin Hoadley and Dr. Morell, was reprinted in 1810; it has been translated into German, French, and Italian.

**HOGG, James**, better known as the Ettrick Shepherd, a Scottish author, born in the parish of Ettrick, on the river of that name, in Selkirkshire, Jan. 25, 1772 (according to his own statement, although the parish register records his baptism under date of Dec. 9, 1770), died at Altrive, Nov. 21, 1835. He was descended from a family of shepherds, and his youth and early manhood were devoted to the same occupation. He probably never received a year's schooling, but when he was 24 years old he began to compose verses, and his earliest efforts were seriously impeded by his imperfect penmanship. He soon became known to the shepherds and farmers of the neighborhood as "Jamie the poet," and in 1800 a patriotic song of his entitled "Donald MacDonald" obtained great popularity, although the name of the author was not known. From Whitsunday, 1790, to Whitsunday, 1799, he was in the employ of James Laidlaw of Blackhouse, in Yarrow, who gave him free access to his library; and by the age of 30 Hogg had repaired the defects of his early education by a tolerably full course of reading. In 1801, while on a visit to Edinburgh to sell sheep, he was even tempted to publish a small collection of his songs, under the title of "Scottish Pastorals, Poems, and Songs." Shortly after Sir Walter Scott, while exploring the border counties for

materials for his "Minstrelsy of the Scottish Border," met with Hogg, who furnished him with a number of old ballads; and it was at Scott's instigation that in 1803, to repair his losses in an attempt to start a sheep farm in the Hebrides, he published a second collection of poems entitled "The Mountain Bard." With the proceeds he again attempted farming, was again unsuccessful, and in February, 1810, went to Edinburgh to follow the career of an author. For a year he barely supported himself by editing a weekly paper called "The Spy," and in 1813 published "The Queen's Wake," which at once obtained a great popularity. The duke of Buccleuch presented him with the rent-free life occupancy of the farm of Altrive Lake in the braes of Yarrow, but he rented a much larger farm adjoining, and in a few years was reduced to bankruptcy. He was all this time a frequent contributor to "Blackwood's Magazine," and the broadly drawn character of the "Ettrick Shepherd," which figures so prominently in the *Noctes Ambrosianæ*, made his name familiar. In 1831 he went to London to superintend the publication of some of his works, and received extraordinary attentions. He died of dropsy, after a short illness. Among his principal works, in addition to those mentioned, are the poems of "Madoc of the Moor," "The Pilgrims of the Sun," "Queen Hynde," "Jacobite Relics," &c.; in prose, "The Brownie of Bodsbeck," "Winter Evening Tales," "The Three Perils of Woman," "The Three Perils of Man," "The Altrive Tales," &c. His "Anecdotes of Sir Walter Scott" was first published in New York (1834). His collected works, first issued in 11 vols., were published in 1869 in 2 vols. 8vo. A monument has been erected in his memory near St. Mary's Loch. His widow survives (1874), receiving from the literary fund a pension of £100.

**HOGSHEAD**, an old English measure of capacity, which, not being mentioned in the act 5 George IV. relative to weights and measures, cannot now be considered as having any legal existence. The hogshead of wine was two wine barrels, or 63 old wine gallons, equal to 52½ imperial gallons. The London hogshead of ale was 1½ ale barrel, or 48 ale gallons, equivalent to 48·81814 imperial gallons. The London hogshead of beer was 1½ beer barrel, or 54 beer gallons, equal to 54·92040 imperial gallons. The ale and beer hogshead for the rest of England was 1½ barrel, or 51 gallons, or 51·86927 imperial gallons. All excise measurements are made in gallons, and the term hogshead now signifies only a large cask.

**HOGUE, La.** See CAPE LA HAGUE.

**HOHENLINDEN**, a village of Upper Bavaria, 20 m. E. of Munich, memorable for a battle fought Dec. 3, 1800, which resulted in a victory of the French general Moreau over the archduke John of Austria. After the truce of Parsdorf (Nov. 13) Moreau's army was stationed between the rivers Isar and Inn, and

the Austrians on the right bank of the Inn. The archduke believed that the French were retreating, and his plan was to attack them in front, while Klenau should cut off their retreat to Munich, and Hiller intercept them on the road to Augsburg. Moreau was indeed retreating, but he chose to concentrate his army at Hohenlinden, and to wait for the enemy. The Austrian army was divided on Dec. 3 into three columns. The main corps, forming the middle column, advanced in a heavy snow storm through the woods toward Hohenlinden, where they attacked the corps of Grenier and Grouchy, which were reinforced in time to beat them back into the defile of the main road. Confused, and attacked by Richepanse, who was subsequently assisted by Ney, the column lost ground and finally dispersed. The other columns were also forced to retreat, and at 2 o'clock the victory was completely in the hands of the French, who desisted from pursuing the Austrians on account of the condition of the weather, as well as of the roads. The Austrians lost 8,000 men dead and wounded, upward of 10,000 prisoners, and 100 guns. The French announced a loss of only 5,000 men. Negotiations were now renewed, and terminated in the treaty of peace of Lunéville.

**HOHENLOHE**, the name of a German princely family, claiming its descent from the dukes of Franconia, named from the territory of Hohenlohe, originally a county, afterward a principality, mediatised in 1806, and now belonging partly to Bavaria and partly to Würtemberg. It was early divided into the lines of Hohenlohe-Braunec and Hohenlohe-Holloch. The former became extinct in the fourth generation, and the latter in 1340 formed the two branches of Hohenlohe-Hohenlohe and Hohenlohe-Speckfeld. This last alone has been perpetuated. Georg, count of Hohenlohe-Speckfeld, who died in 1551, left two sons: 1, Ludwig Casimir, the ancestor of the branch of Hohenlohe-Neuenstein-Oehringen, which became extinct in 1805, as well as of Hohenlohe-Neuenstein-Langenburg, now subdivided into Hohenlohe-Oehringen or Ingelfingen and Hohenlohe-Langenburg; and 2, Eberhard, the ancestor of the branch of Hohenlohe-Waldenburg, divided into Hohenlohe-Bartenstein and Hohenlohe-Schillingfürst.—Of the descendants of Ludwig Casimir, the best known is FRIEDRICH LUDWIG, prince of Hohenlohe-Ingelfingen, a Prussian general (born in 1746, died in 1818). He became a colonel in 1788, and in the war against France distinguished himself as lieutenant general in storming the defensive lines near Weissenburg. In 1794 he gained a brilliant victory at Kaiserslautern; in 1800 became a general of infantry, and in 1804 governor of Franconia and general military inspector of Silesia. After holding subsequently several important commands, he was defeated at Jena, Oct. 14, 1806, capitulated at Prenzlau on Oct. 28, and thenceforward withdrew from public life.—Of the Hohenlohe-Waldenburg-Schillingfürst branch

the most distinguished are: I. ALEXANDER LEOPOLD FRANZ EMMERICH, born at Kupferzell, Würtemberg, Aug. 17, 1794, died in the castle of Vöslau, near Vienna, Nov. 14, 1849. He was ordained priest in 1815, distinguished himself at Stuttgart by his charity during an epidemic, and subsequently at Munich by his preaching. In 1816 he went to Rome, where he is said to have entered the society of "Fathers of the Sacred Heart." In 1824 he became canon of Grosswardein, and was made grand provost in 1829. In 1844 he was appointed bishop of Sardica *in partibus infidelium*. He is chiefly known for the miraculous cures attributed to his prayers in continental Europe and the British isles; the first person thus reported healed by him being the princess Schwarzenberg, who had been for several years a paralytic. Much discussion was also occasioned in the United States by the sudden cure of Mrs. Ann Mattingly in Washington, D. C., March 10, 1824. The pope had been urged in 1821 to give his sanction to the method employed by Prince Hohenlohe, but declined; nor has any approval of these cures been since obtained in Rome. His works are made up of ascetic and controversial treatises, together with several volumes of sermons. His posthumous works were published by Brunner (Ratisbon, 1851). II. CHLODWIG KARL VICTOR, a Bavarian statesman, born March 31, 1819. He was first known as prince of Ratibor and Korvei, and succeeded to his brother's title Feb. 12, 1846. In 1867 he became high chamberlain to the king of Bavaria, and minister of foreign affairs. During his administration he labored to promote German unity, while opposing the Prussian policy, which aimed at absorbing the minor states. He introduced the Prussian military system into Bavaria; but as vice president of the customs parliament, he seemed to favor the formation of a South German confederation. He also endeavored to prevent the meeting of the council of the Vatican, and entered for that purpose into negotiations with other European governments. The Bavarian chambers of 1869 being almost equally divided between the friends and opponents of the clerical party, he advised the king to dissolve them. In the new chambers he advocated a policy adverse to Prussia; but failing to make it prevail, he resigned in 1870. After having taken a conspicuous part in making Bavaria join the new German empire, he became a member of the German Reichstag, and on March 23, 1871, was elected its first vice president. He strenuously supports the policy of Bismarck, particularly in the complications with the holy see. In March, 1874, he was appointed German ambassador in Paris.

**HOHENSTAUFEN**, the name of a German family of princes, which ruled the German empire, with short interruptions, from 1138 to 1254. The name is derived from a castle on Mount Staufen in Würtemberg, built by Frederick

of Büren, one of the ancestors of the family. His son, known as Frederick of Staufen, was a staunch adherent of the emperor Henry IV. during his long struggles with the see of Rome and various rivals in Germany, and after the battle of Merseburg received the hand of his daughter Agnes, and the duchy of Swabia. This sudden elevation of the house, which from another possession in Swabia, Waiblingen, was also called Ghibelline, was the origin of its long struggle with the mighty rival family of the Guelphs. Of Frederick's two sons, Frederick II., the One-eyed, was confirmed by Henry V., the son and successor of Henry IV., in the possession of Swabia, while Conrad received Franconia. After the death of Henry, Conrad and Lothaire of Saxony appeared as competitors for the imperial dignity, and the great power of the Hohenstaufen was the chief cause of the success of Lothaire; but after his death (1137), Conrad, who had waged a long war against the emperor, the pope, and the Guelphs, ascended the throne of Germany as the third of that name.

His nephew Frederick Barbarossa became his successor (1152-'90), and was succeeded by his son Henry VI. (died 1197). The son of the latter, Frederick, a child of two years, was not acknowledged as successor; and his uncle Philip, too, had to struggle against rivals, and was finally slain by Otho of Wittelsbach (1208). But soon after the young Frederick II. (1212-'50) rose in defence of his rights, and waged a gallant struggle against his enemies in Germany, as well as in

Italy, where he had inherited from his mother Constance the Norman possessions. His son Conrad IV. died early in Italy (1254), where all the remaining male inheritors of the name of Hohenstaufen soon after perished in their struggle against Rome and the house of Anjou: Manfred, a son of Frederick II., in the battle of Benevento in 1266; Conradin, the young son of Conrad IV., on the scaffold at Naples in 1268; and Enzo, a natural son of Frederick, and the sons of Manfred, in prison. The possessions of the house were divided among various families, and now belong to Baden, Württemberg, and Bavaria. The principal work on the history of the family is Raumer's *Geschichte der Hohenstaufen und ihrer Zeit* (4th ed., 6 vols., Leipsic, 1871).

**HOHENZOLLERN**, a territory of S. W. Germany, since March 12, 1850, an administrative

division of Prussia, but which previous to that date formed two small independent principalities of the Germanic confederation under the names of Hohenzollern-Hechingen and Hohenzollern-Sigmaringen, Hechingen and Sigmaringen being the capitals. The territory forms a long and narrow strip of land, surrounded by Württemberg, except on the S. W., where it is bounded by Baden; area, about 440 sq. m.; pop. in 1871, 65,558. It is watered by the Neckar and some of its affluents, and by the Danube, which crosses it. Its mountains belong to the Rauhe Alps. Agriculture, cattle raising, and the manufacture of wooden ware are the chief occupations of the inhabitants. The Roman Catholic is the predominant religion.

**HOHENZOLLERN**, or **Zollern**, a princely family of Germany to which belongs the royal house of Prussia. The name is derived from the castle of Hohenzollern, in the district of Sigmaringen, on the Zollerberg, a mountain of the Alps, about 2,850 ft. above the sea. Count Thassilo, about 800, is the remotest ancestor named, but

Castle of Hohenzollern.

the family name does not appear before the 11th century. The house was divided in 1226 into two branches. The Frankish branch acquired new possessions in almost every generation. Frederick V. (died 1398) was the first to bear the title of prince, which was given him by the emperor Charles IV. After several divisions the entire estate fell to Frederick VI. (died 1440), who in 1415 received from the emperor Sigismund the electorate of Brandenburg, and called himself as such Frederick I. His 11th successor, Frederick III., became the first king of Prussia as Frederick I. (1701). The Swabian branch failed to gain distinction before the 16th century. Count Eitel Frederick IV. (died 1512) obtained from the emperor Maximilian I. the domain of Haigerloch in exchange for the Swiss county of Rätzüns, which he had acquired by marriage. His grandson

Charles I. (died 1576) received from the emperor Charles V. in 1529 the counties of Sigmaringen and Vöhringen. Charles's sons Eitel Frederick VI. and Charles II. divided the estates. The former took Hohenzollern, and adopted for his line the name Hohenzollern-Hechingen; the latter received Sigmaringen and Vöhringen, and assumed the name Hohenzollern-Sigmaringen. The son of Frederick VI., John George, was in 1623 raised by the emperor Ferdinand II. to the dignity of a prince of the empire, which was also conferred in 1638 on the Sigmaringen family. In 1695 and 1707 the Frankish and Swabian branches agreed upon a common law of succession, subsequently ratified by the king of Prussia as the head of the house. The treaty established among them the right of primogeniture, and provided that in case one of the branches should be without a male successor, the estates should be transferred to the other branch; and that in case both branches should become extinct in the male and female lines, the estates should fall to the royal house of Prussia. In consequence of the political troubles of 1848, the princes Frederick William of Hohenzollern-Hechingen and Charles Anthony of Hohenzollern-Sigmaringen resigned the government of their territories, Dec. 7, 1849, and the principalities, according to the treaty, fell to the crown of Prussia, which took possession of them March 12, 1850. The two princes received the rank of younger princes of the royal house.—Prince CHARLES ANTHONY of Hohenzollern-Sigmaringen, born Sept. 7, 1811, presided over the Prussian cabinet from Dec. 2, 1858, to March, 1862. His eldest son, Prince LEOPOLD, born Sept. 22, 1835, married in 1861 the infanta Antonia of Portugal. His paternal grandmother was a princess Murat, and his mother was a niece of the empress Josephine and adopted daughter of Napoleon I. On July 4, 1870, the provisional government of Spain proposed him to the cortes as candidate for the Spanish crown. The French government declared that the occupation of the Spanish throne by a prince of Hohenzollern would be incompatible with the interests of France, and demanded that the king of Prussia should forbid Prince Leopold to accept the crown. The king refused to make such an order, on the ground that he had no right to give orders to a prince of his house who was of age; and although Leopold (July 12) voluntarily declined to be a candidate for the Spanish crown, France was not satisfied, and the result was the Franco-German war of 1870-'71. He is a major general in the Prussian army. His brother CHARLES, born April 20, 1839, was in 1866 elected prince of Roumania. (See CHARLES I. of Roumania, vol. iv., p. 309.) ANTHONY, the third son, born Oct. 7, 1841, died July 5, 1866, from wounds which he received at the battle of Königgrätz, July 3. FREDERICK, the fourth son, born June 25, 1843, is an officer of the Prussian dragoons of the guard.

**HOLBACH, Paul Henri Thyry** (or DIETRICH) d', baron, a French philosopher, born at Heidelberg, near Carlsruhe, in 1723, died in Paris, Jan. 21, 1789. He was taken to Paris when very young by his father, from whom he inherited a considerable fortune. A large part of this he expended in hospitalities to the free-thinkers of his time, whom he regularly entertained at his splendid table, so that Galiani styled him the *premier maître d'hôtel de la philosophie*. The boldest opinions and the most irreligious principles were here discussed without restraint. Much information concerning these dinner parties is given in the memoirs of the abbé Morellet, of Mme. d'Épinay, in Grimm's "Correspondence," and in the curious but not impartial work of Mme. de Genlis, *Les dîners du baron d'Holbach*. Holbach attacked with great zeal Christianity and all other positive religions, and labored for the promulgation of naturalistic ideas. He began his literary career by translating a number of German philosophical works. He edited and published in 1759 the works of Boulanger, a young engineer, who died in that year, and afterward published under Boulanger's name his own works, *Le Christianisme dévoilé, ou examen des principes et des effets de la religion révélée* (1767), and *L'Esprit du clergé, ou le Christianisme primitif vengé des entreprises et des excès de nos prêtres modernes*, which a decree of parliament, Aug. 18, 1770, sentenced to be burned by the public executioner. The same year he published his most celebrated book, *Le système de la nature, ou des lois du monde physique et moral*, under the fictitious name of Mirabaud, *secrétaire perpétuel de l'académie française*; this created such scandal that Voltaire himself thought proper to refute it in the article *Dieu* of his *Dictionnaire philosophique*, while Goethe declared that he recoiled from it in abhorrence as from a "cadaverous spectre." It passed, however, through eight editions between 1817 and 1824, and a new edition in German was published in Leipsic in 1843. In 1772 a short pamphlet, *Le bon sens, ou idées naturelles opposées aux idées surnaturelles*, reproduced in a more familiar form the principles he had previously advocated; and this pamphlet, which has been frequently reprinted and largely circulated under the title of *Le bon sens du curé Meslier*, has more powerfully than any other publication contributed to diffuse the principles of infidelity among the middle classes in France. *Le système social, ou les principes naturels de la morale et de la politique*, appeared in 1773, and *La morale universelle, ou les devoirs de l'homme fondés sur la nature*, in 1776. Most of these works were, as soon as they appeared, proscribed by the church and the parliament, and were even disclaimed by philosophers. All his writings appeared either anonymously, or under the name of deceased persons, or as translations from the English. In his literary performances he had the help of Lagrange, the teacher of his children, of Nai-

geon, to whose supervision he confided all his works, and of Diderot.

**HOLBEIN, Hans, or Johann**, called the Younger, a German painter, born in Augsburg or Grunstadt between 1495 and 1498, died of the plague in London in 1554 or in 1543. He was the son of a painter of the same name (Hans the Elder), of considerable eminence during the latter half of the 15th century, and while a boy followed his father to Basel. Here he executed remarkable works for private houses, public buildings, and churches, many of which have been preserved. About 1526 he contracted an intimacy with Erasmus, whose portrait he painted, and soon after visited England, where he passed the remainder of his life. A letter from Erasmus recommended him to Sir Thomas More, who introduced him at court. Henry VIII. at once made him court painter, with a liberal pension, and thenceforth Holbein was intrusted with many commissions, chiefly for portraits, both from the king and the principal personages of the kingdom. He is distinguished as a historical and portrait painter, and engraver on wood. He painted in oils and distemper, and excelled in miniatures. As an engraver he is chiefly known by the celebrated "Dance of Death," a series of 53 woodcuts engraved from his own designs, although it is seldom found with more than 46. (See DANCE OF DEATH.) This series has been frequently engraved, and the prints of Wenzel Hollar are particularly fine. It is said that he used the left hand in painting.—The Holbein collection in the museum of Basel, which had been prepared by his friend Amerbach, comprises the portraits of the latter and of Holbein's wife and children, and other masterpieces. His portraits of Sir Thomas More and other personages are at Windsor, and many are at Kensington and in various English and continental galleries, private and public. Much controversy exists in regard to the genuineness of some of the works ascribed to him, especially in respect to two pictures both claiming to be originals and representing the "Madonna of the Burgomaster Meyer of Basel;" one of these is in Darmstadt, and the other in Dresden; both were critically examined in 1871 by competent authorities, but without a decision on the subject. Many works have appeared in modern times on Holbein's life and works, the latest of which is *Holbein und seine Zeit*, by A. Woltmann (2 vols., Leipsic, 1868; revised, with illustrations, 1874).

**HOLBERG, Ludvig**, baron, a Danish dramatist, born in Bergen, Norway, Nov. 6, 1684, died in Copenhagen, Jan. 28, 1754. When a boy he was placed under the care of the bishop of Munthe, his relative, who caused him to be sent to the college of Bergen, whence at the age of 18 he went to the university of Copenhagen, where he graduated in 1705, and afterward studied philosophy at Oxford. Returning to Copenhagen after 15 months, he was made professor extraordinary in the university,

and was commissioned to examine and report upon the Lutheran schools of Holland. He was again appointed professor in the university, first of metaphysics (1718), but ultimately of rhetoric (1720). In 1722 he produced his comedy "The Political Timman," which received unbounded applause; and at very short intervals 14 other pieces were composed and played with increasing success. His patron Frederick IV. was succeeded in 1730 by King Christian VI., whose religious zeal led him to forbid theatrical entertainments; but Holberg's "Sleeper Awakened," "John of France," "Lying in Chamber," "False Savant," and others, all pictures in caricature of the manners of the Danish middle classes, had been stamped indelibly upon the public mind. He next wrote a satirical romance in Latin (1741) called "The Subterranean Travels of Nicholas Klim," which was translated into many languages. Frederick V. restored the theatre in 1746, and gave Holberg a patent of nobility. He never married, and bequeathed his property chiefly to an academy which had been founded at Soroe by Christian IV. for the education of young noblemen. He gave 16,000 crowns as a fund to portion a number of young Danish women. His *Danmarks Riges Historie* (3 vols., 1732-'5) was the first attempt at writing a thorough history of Denmark. His "History of the Jews" and "Stories of Heroes and Heroines" are works of lasting merit. A collection of his works in 27 vols. appeared at Copenhagen in 1826. He left an "Introduction to Universal History" in Latin, translated into English by Gregory Sharpe, LL. D. (8vo, London, 1755), and his autobiography, an English translation of which also appeared in London in 1830. In 1842 the Holberg society was founded at Copenhagen, which published a critical edition of his comedies (7 vols., 1843-'53).

**HOLBROOK, John Edwards**, an American naturalist, born in Beaufort, S. C., in 1795, died in Norfolk, Mass., Sept. 8, 1871. He graduated at Brown university in 1815, studied medicine in Philadelphia, spent two years in Italy, Germany, and Paris, established himself in Charleston in 1822, and in 1824 was chosen professor of anatomy in the medical college of South Carolina. His most important work is the "American Herpetology, or a Description of Reptiles inhabiting the United States" (5 vols., Philadelphia, 1842). He began a work on "Southern Ichthyology," but finding the field too wide, he confined his labors to the fishes of South Carolina. Of this work ten numbers were published (Charleston, 1854 *et seq.*), when the publication was stopped by the outbreak of the civil war.

**HOLCROFT, Thomas**, an English dramatist, born in London, Dec. 10, 1745, died March 23, 1809. His father was a shoemaker who owned several horses, and added to his income by letting them. His mother dealt in greens and oysters. He passed his early life in London and in Berkshire, following the occupa-

tions of his father. He was afterward in the service of a trainer of race horses at Newmarket, then a schoolmaster, and then an actor, but soon abandoned the stage, as he met with little success. The most popular of his dramatic compositions is "The Road to Ruin" (1792). At the time of the French revolution he incurred the suspicions of government as a member of the society for constitutional information, and with Horne Tooke, Hardy, Thelwall, and others, was in 1794 indicted for high treason. Some of the accusers were acquitted, and Holcroft was discharged with others, without being brought to trial. He wrote about 30 plays and four novels, published translations of Lavater's "Physiognomy" and the works of Frederick the Great, and "Travels in France and Germany" (2 vols. 4to, 1806). His "Mémoires," written by himself and edited by Hazlitt, were published in 1816, in 3 vols. 12mo.

**HOLINSHEDE, Holingshed, or Hollynshe, Raphael**, an English chronicler, born in the first half of the 16th century, died about 1580. He probably received a university education, and is supposed to have taken orders. Little else is known of his life. Of the "Chronicles of England, Scotland, and Ireland" (2 vols. fol., London, 1577), his share comprises the histories of England and Scotland, the latter being for the most part a translation from the Latin of Hector Boëthius. The other portions were done by Stow, Harrison, Hooker, and others. The second edition containing matter added by Thynne, which was offensive to Queen Elizabeth, means were taken to suppress certain sheets in that edition, which were restored in that of 1807. Shakespeare was largely indebted to Holinshe, whole pages in "Macbeth," and the character of Wolsey, being taken from the "Chronicles."

**HOLL, Frank.** See supplement.

**HOLLAND. I.** A division of the Netherlands, comprising the present provinces of North and South Holland, which in the middle ages successively formed a part of the Frankish empire, of Lorraine, and of the German empire, being governed by counts, of whom those of Vlaardingen rose to considerable power. This line became extinct in 1299, and the land was inherited by the counts of Hainaut. In the middle of the 14th century arose a dispute between Margaret, wife of the emperor Louis the Bavarian, who had inherited the county after the death of her brother Count William IV., and her son William V., which threw it into long continued conflicts between two parties who took the names of *Hoeks* (hooks) and *Kabeljaauws* (codfish). Finally, in 1430, the county was annexed to Burgundy. (See **BURGUNDY**, and **NETHERLANDS**.)—The kingdom of Holland, under the rule of Louis Bonaparte, from 1806 to 1810, included nearly all the territory of the present kingdom of the Netherlands, together with part of the former kingdom of Hanover and the duchy of Oldenburg.

**II. North**, a province of the kingdom of the

Netherlands, bounded W. and N. by the North sea, E. by the Zuyder Zee, and S. by Utrecht and South Holland; area, 1,054 sq. m.; pop. in 1872, 602,539. The islands of Terschelling, Vlieland, and Texel, in the North sea, and Wieringen, Marken, and a few smaller ones, in the Zuyder Zee, belong to it. The surface is flat, increasing in depression toward the north, and the districts of Waterland, Kennemerland, and Purmerland are partially below the level of the sea. Expensive dikes extend along the whole coast of the North sea, and for about 100 m. on the coast of the Zuyder Zee. Haarlem lake has been closed and drained. (See **DRAINAGE**, and **HAARLEM MEER**.) The river Y penetrates far into the land, which is crossed by numerous small rivers, and drained by a still larger number of canals. The climate is damp, changeable, and cool. Flowers are cultivated, especially about Haarlem. Hemp, flax, and madder are raised. Wood is scarce; the pasturage is excellent, and horses, cattle, and swine abound. There are important manufactures of linen, paper, woollen cloths, silks, carpets, leather, sugar, &c. Capital, Amsterdam. **III. South**, a province of the Netherlands, bounded W. by the North sea, N. by North Holland, E. by Utrecht and Gelderland, and S. by the Maas and its mouths; area, 1,155 sq. m.; pop. in 1872, 710,753. The islands of Ysselmonde, Voorne, Beijerland, and Overflakkee form part of its territory. The general character of the province resembles that of North Holland. There are numerous canals, rich pasture lands, and fertile fields. Portions of the Bies-Bosch, a shallow marshy lake formed by the inundation of 1421, have of late been reclaimed, and converted into meadow land. Capital, the Hague.

**HOLLAND, Sir Henry**, an English physician, born at Knutsford, Oct. 27, 1788, died in London, Oct. 28, 1873. He studied at the university of Glasgow, where in 1805 he gained the prize for English verse. In 1811 he took his degree of M. D. at the university of Edinburgh, and then travelled for two years in Greece and the Ionian islands, publishing an account of his travels in 1815. Subsequently he established himself in London, and in 1828 was elected a fellow of the royal college of physicians. In 1834 he married, as his second wife, Saba, a daughter of Sydney Smith, who published a life of her father in 1855, and died in 1866. In 1852 he became physician in ordinary to the queen, and in 1853 was made a baronet. During many years he was accustomed to make an annual trip of two months to foreign countries. He visited the United States several times, and there were few public men in Europe or America with whom he was not personally acquainted. He contributed largely to periodicals, and published several works, the most important of which are: "Medical Notes and Reflections" (1839); "Chapters on Mental Physiology" (1852); "Essays on Scientific and other Subjects" (1862); and "Recollections of

a Past Life" (1871). His son by his first wife, Sir Henry Thurstan Holland, is to arrange and publish a collection of his papers (1874).

**HOLLAND, Henry Richard Vassall**, baron, an English statesman, born at Winterslow house, Wiltshire, Nov. 21, 1773, died at Holland house, Kensington, Oct. 22, 1840. He was the only son of Stephen Fox, second Lord Holland, and a nephew of Charles James Fox, at whose hands, according to Macaulay, he received his "political education." He succeeded to his father's title when a little more than a year old, and was educated at Eton, and subsequently at Oxford, where he graduated in 1792. In 1793 he travelled extensively over Spain, making himself familiar with the language and literature of the country, and subsequently visited other portions of the continent. In Italy he formed a connection with Elizabeth, daughter and heiress of Richard Vassall, and wife of Sir Godfrey Webster, who procured a divorce from her and recovered damages in £6,000 from Lord Holland. The latter married her in 1797, and took by royal license the surname of Vassall, in lieu of his patronymic of Fox; but his children retained the latter name. In 1798 he made his first speech in the house of lords, and thenceforth was a frequent participant in debates, being to the close of his life a steady and consistent whig. Between 1802 and 1805 he made another long visit to Spain, and in 1806 he was appointed joint commissioner with Lord Auckland to arrange with Messrs. Monroe and Pinkney, the American commissioners, the matters in controversy between England and the United States. In 1806 he published "Some Account of the Life and Writings of Lope Felix de Vega Carpio," to which he subsequently added a biography of Guillen de Castro, which appeared in 1817 under the title of "Lives of Lope de Vega and G. de Castro." This work, the fruit of its author's visits to Spain, without aiming at profoundness, treats the subject in a genial and appreciative manner. It was followed in 1807 by "Three Comedies from the Spanish," and in 1808 he edited, with a long preface, Mr. Fox's fragment entitled "A History of the Early Part of the Reign of James II." He held the office of privy seal for a few months in 1806, and resigned with his colleagues after the death of Fox, because the king refused to concur in Catholic emancipation, and on account of the failure of the negotiations with France. He resided in a private capacity at Vienna during the session of the congress of 1814-'15, and rendered himself conspicuous by an ardent opposition against the policy adopted toward Napoleon, until the government ordered him to leave the city. Several times in parliament he demanded a milder treatment of the ex-emperor at St. Helena. Lady Holland assisted the prisoner by sending him books, periodicals, and other comforts. Under the reform ministry of Grey in 1830 he was unable from ill health to accept

an appointment as cabinet minister, but he took the office of chancellor of the duchy of Lancaster, because it gave him a vote in the cabinet council, and held it until his death, with the exception of the brief ministerial interregnum in May, 1832, and the period of Sir Robert Peel's administration from December, 1834, to May, 1835. Lord Holland was much esteemed in private life for his courtly grace of manner, genial humor, and amiability; and Holland house, his suburban residence, a building having many interesting historical associations, and stored with much that was rare and beautiful in art and literature, was for nearly 50 years the resort of eminent personages and the scene of elegant hospitality. (See "Holland House," by Princess Maria Liechtenstein, an adopted daughter of the fourth Lord Holland, 2 vols., London, 1874.) Although in mental calibre inferior to Charles James Fox, to whom he bore a strong family resemblance, he was an effective speaker, and, according to Macaulay, was more distinguished in debate than any peer of his time who had never sat in the house of commons. His "Foreign Reminiscences," published by his son (8vo, London, 1850), is a work full of gossip and piquant anecdotes. The first two volumes of "Memoirs of the Whig Party during my Time, by Henry, Lord Holland" (1854, edited by his son), are inferior to his earlier works. A publication entitled "The Opinions of Lord Holland, as recorded in the Journals of the House of Lords from 1797 to 1840," appeared in London soon after his death, affording a complete view of his public career. He had projected a life of his uncle, but never advanced beyond the collection of a few notes and materials, which are included in Lord John Russell's "Memoirs and Correspondence of Charles James Fox."—He was succeeded by his son, HENRY EDWARD, fourth baron, born March 7, 1802, died in Naples, Dec. 18, 1859. He was member of parliament for Horsham in 1826-'7, and in 1839-'42 minister to Tuscany. As he died without issue, the title became extinct, Holland house and the other estates being inherited by his sister, married to Thomas, Lord Lilford, who died March 15, 1861.

**HOLLAND, Josiah Gilbert**, an American author, born in Belchertown, Mass., July 24, 1819. Having studied medicine and practised for three years, and afterward edited a literary journal for a few months in Springfield, Mass., he passed a year in Vicksburg, Miss., as superintendent of public schools. In May, 1849, he became associate editor of the "Springfield Republican," and two years afterward one of the proprietors of that journal, in which connection he remained till 1866. Since 1870 he has been the conductor of "Scribner's Monthly" in New York. He has for many years been a public lecturer on social and literary topics, and has written many books, those of a didactic character under the *nom de plume* of "Timothy Titcomb." This series includes "Letters

to the Young" (New York, 1858), "Gold Foil" (1859), "Lessons in Life" (1861), and "Letters to the Joneses" (1863). His other publications are: "History of Western Massachusetts" (2 vols., Springfield, 1855); "The Bay Path," a novel (New York, 1857); "Bitter-Sweet," a poem in dramatic form (1858); "Miss Gilbert's Career," an American story (1860); "Plain Talks on Familiar Subjects" (1865); "Life of Abraham Lincoln" (Springfield, 1865); "Kathrina," a poem (New York, 1868); "The Marble Prophecy and other Poems" (1872); and "Arthur Bonnicastle," a novel (1873). In 1873 a complete edition of his poems was published in New York, under the title of "Garnered Sheaves."

**HOLLAND, Sir Nathaniel Dance**, an English artist, born in London in 1734, died in Winchester in 1811. He was the son of George Dance, the architect of the mansion house in London, and early devoted himself to painting, passing several years in Italy in the study of his art. On his return to England he distinguished himself as a painter of portraits, of which that of Garrick as Richard III. affords a good example, and also of history and landscape. By his captivating figure and address he was enabled to secure the hand of Mrs. Dummer, a wealthy Yorkshire heiress, after which he relinquished his profession, assumed the name of Holland, was made a baronet, and entered parliament. He still exhibited occasionally as an amateur.

**HOLLAND, Philemon**, an English scholar, born at Chelmsford in 1551, died Feb. 9, 1636. He was educated at Trinity college, Cambridge, became master of the free school at Coventry, and also practised medicine. He was the first English translator of Livy, Suetonius, and Plutarch's "Morals." He also translated Ammianus Marcellinus, the "Natural History" of Pliny, the "Cyropædia" of Xenophon, and Camden's "Britannia."

**HOLLAR, Wenzel**, a Bohemian engraver, born in Prague in 1607, died in London, March 28, 1677. At 18 years of age he produced his plates of the "Virgin and Child" and the "Ecce Homo." In 1636 he attracted the attention of the earl of Arundel, the British ambassador to the German emperor, who took him in his suite to England. He now practised his art with great reputation and success, and executed portraits of the royal family and of the earl of Arundel, besides views of places, and a set of 28 plates of female costume of all ranks, entitled *Ornatus Muliebris Anglicanus*. Under the commonwealth he became somewhat involved in political affairs through his association with the royalist friends of his patron, with several of whom he was taken prisoner at the surrender of Basing House in Hampshire in 1645. Being set at liberty after a short imprisonment, he joined the earl of Arundel in Antwerp, where he passed several years. During this period he engraved Holbein's "Dance of Death" and other works of the

old masters. He returned to England in 1652, but in the latter part of his life became reduced to great indigence. His prints numbered nearly 2,400, many of them of small size executed for the booksellers, who paid him at the rate of fourpence an hour.

**HOLLIDAYSBURG**, a borough and the capital of Blair co., Pennsylvania, on Beaver Dam creek, a branch of the Juniata, about 85 m. E. of Pittsburgh, and the same distance W. by N. of Harrisburg; pop. in 1870, 2,952. It is situated near the base of the Alleghany mountains, on a branch of the Pennsylvania Central railroad, and is a terminus of the E. division of the main line of the state canal. It is the centre of a large trade by railroad and canal, having most of the forwarding business of a rich surrounding country abounding in agricultural and mineral resources. The iron of the Juniata region and large quantities of anthracite coal and grain are exported through this town. It contains several founderies, rolling mills, blast furnaces, machine shops, flour mills, a national bank, and two weekly newspapers. Hollidaysburg was incorporated in 1836. Gaysport on the opposite bank of the river, with which it is connected, is a borough of 799 inhabitants.

**HOLLINS, George N.**, an American naval officer, born in Baltimore, Sept. 20, 1799, died there, Jan. 18, 1878. He entered the navy in 1814, and was on board the President, Commodore Decatur, when she was captured by the British, remained a prisoner of war at Bermuda until the peace, and served under Decatur against the Algerines. At the close of the war he took command of an East India merchantman, and became lieutenant in the navy in 1825, and commander in 1841. He bombarded and destroyed the town of San Juan de Nicaragua in 1854. After commanding the navy yard at Sackett's Harbor for a short time, he was ordered to join the Mediterranean squadron. In 1855 he was promoted to captain. Returning to the United States in 1861, he resigned his commission; but the department refused to accept the resignation, struck his name from the rolls, and ordered his arrest. He escaped to the south, entered the Confederate navy, received a commission as commodore, and on Oct. 11 attacked the federal blockading squadron at the passes of the Mississippi, doing slight damage, but claiming an important victory, and was therefore appointed flag captain of the New Orleans station. Before Farragut's attack on that city in April, 1862, he was superseded by Commodore Whittle.

**HOLLIS, Thomas**, a benefactor of Harvard college, born in England in 1659, died in London in 1731. He was for many years a successful merchant in London, and a bequest made to Harvard college in his uncle's will, of which he was trustee, first attracted his attention to that institution. Having made two considerable donations, he gave directions in 1721 for the employment of the fund, by

which the Hollis professorship of divinity was constituted. He was himself a Baptist, and the candidate for the professorship was required to be of "sound or orthodox principles." In 1727 he established also a professorship of mathematics and philosophy, and the net produce of his donations amounted at that time to £4,900. He also gave books for the library, and secured from a friend a set of Hebrew and Greek types for printing. His memoirs were published by Thomas Brand Hollis (2 vols. 4to, London, 1780).—His nephew, Thomas Hollis, also gave money, books, and philosophical apparatus, and left a son, the third Thomas Hollis (died in 1774), an antiquary, whose donations to the college amounted to nearly £2,000.

**HOLLOWAY, Thomas**, an English engraver, born in London in 1748, died at Coltishall, near Norwich, in 1827. He was apprenticed to a seal engraver, and became known by his plates illustrating Dr. Hunter's translation of "Lavater's Essays on Physiognomy" (5 vols., 1792, with about 700 plates), and by similar works, the most celebrated of which, on account of their elaborate execution, are his engravings of the cartoons of Raphael. A memoir of his life was published in 1827.

**HOLLY**, the common name of several ever-green species of *ilex*, of the order *aquifolia-ceæ*. They have small axillary flowers, which when perfect are inclined to be solitary, but when sterile are in small clusters; these have a four-toothed calyx and as many petals, which are separate or only united at the base; stamens four; fruit a berry-like drupe containing four nutlets. The American holly, *ilex opaca*,

American Holly (*Ilex opaca*).

is found along the Atlantic coast from Maine southward, it being especially abundant in Virginia and the states south of it; as seen at the north, it is a low tree, but in a favorable climate it attains a height of 30 or 40 ft.; the erect trunk is clothed with an ashy-gray bark,

and the branches spread horizontally; the short-petioled leaves are oval in outline, with scattered spiny teeth, very thick and leathery, deep green above, and yellowish green beneath. This was formerly supposed to be identical with the European holly, but that has more

European Holly (*Ilex aquifolium*).

glossy leaves with much more conspicuous spines, brighter scarlet berries, and the nutlets more strongly veined. It is much more hardy than the European, which will not endure the climate of New York city with certainty, but it is not often seen in cultivation. There is no difficulty in removing small plants from their native localities, if the top be so far cut back as to remove all the foliage; new shoots will start in abundance if the tree be treated in this manner, but if removed with all its foliage success is very doubtful. The uses of our species are the same as those of the European holly, *I. aquifolium*, which has long been a favorite in Great Britain as a hedge plant and for the ornamental character of single specimens. It is especially abundant in the south of Europe, but is not found in the northern portions, it not being hardy even in the north of Scotland. It is a very long-lived tree, some specimens having been estimated to be 800 and 1,200 years old. There are numerous varieties. Some of the green ones have the leaves entirely without spines, while others, such as the hedgehog holly, have them developed to a remarkable degree; there are several in which the foliage is beautifully margined or blotched with pure white or yellow, some of which are among the finest ornamental plants. There are also yellow- and white-fruited varieties. As specimen plants, the hollies are pruned in a pyramidal form, making a cone of dense green, with its base close to the ground, or they are made to assume the form of a tree with a clean trunk 3 ft. or more high. The variegated hollies are so fine that some American amateurs cultivate them in large pots or tubs, which are

plunged in the ground during summer and removed to a cellar or other shelter for the winter. In Europe the holly is used for an ornamental hedge; it forms an impenetrable barrier, but is of too slow growth for a mere protecting hedge. There are in England many fine specimens of holly screens, 20 ft. high, and filled with dense foliage from the very bottom. The dark persistent leaves, against which the bright scarlet berries show in fine contrast, make the holly a favorite plant for Christmas decorations; it is said to have been used for this purpose by the early Christians in Rome, and is in Europe still the plant chiefly employed in churches. Large quantities of the native holly are brought each year from Long Island and southern New Jersey to the New York market for the same use. The wood of the holly is remarkably white, except that at the centre of old trees, which is brown; it has a fine grain and a satiny lustre that well adapt it to ornamental work; it is used for small carved and turned articles, for whip and other handles, for inlaid work, and for various other purposes requiring a white, fine-grained wood. It receives dyes of various kinds readily, and much of what passes for ebony is the wood of the holly dyed black. Bird lime was formerly made from the mucilaginous matter furnished by the bark when boiled and fermented. The berries are purgative and emetic, and a decoction of the bark is sometimes used as a demulcent. The common holly is raised from seeds, which are kept in a rot heap mixed with earth for a year, and then sown; the finer varieties are propagated by budding or grafting them in the usual manner upon these seedlings.—The other native evergreen species of *ilex* are the *I. Cassine* (see YAUPOH), *I. Dahoon*, and *I. glabra* (see INKBERRY), which are shrubs with serrate or toothed, not spiny leaves. The Dahoon holly, not found north of Virginia, has leaves varying from oblong to linear-oblong, sharply serrate, downy beneath. A narrow-leaved form has been called *I. myrtifolia*. The deciduous species of *ilex* were formerly placed in a separate genus, *prinos*, but modern botanists include them in *ilex*; the most important of these are noticed under WINTERBERRY. A South American species, *I. Paraguayensis*, is the Paraguay tea. (See MATÉ.)

**HOLLYHOCK** (*althæa rosea*), an ornamental plant of the order *malaceæ*, introduced into English gardens from Syria in 1573. In warm countries it is a perennial, but with us it is a biennial with large, rounded, heart-shaped, angled, or lobed, rough leaves, and a stem 6 ft. or more high, upon the upper portion of which are placed the nearly sessile large flowers, so closely together as to form a dense spike 3 ft. or more in length. The calyx, of five sepals, is subtended by an involucre of several bracts, united at the base, giving the appearance of a double calyx; the petals are five, obcordate and united at the base with the staminal column, which consists of united filaments, and is

anther-bearing at the top; pistils several, their ovaries united in a ring around a central axis, from which they fall away when ripe in as many one-seeded carpels as there were styles. The original hollyhock was single, and of a rose or purplish color, a form now rarely seen. No plant of our gardens has been more improved by cultivation than this; semi-double flowers are very common, and the choicer kinds have the flower completely filled with petals and form hemispherical masses of great beauty. Even in the most double forms the original five petals remain unchanged, often showing as a narrow border around the central petals, which are much crowded, crimped, and folded, and of a delicate crape-like texture. In color a great change has been effected also; we now have white, shades of yellow, pink running through various shades of red to purple, the latter being in some so dark as to be called black. Not only are there self-colored

Dwarf Double Hollyhock.

flowers, but those in which the tints are varied by streaks, veining, and shading, and sometimes the under sides of the petals are of a different color from the upper. On account of the size and showy character of its flowers, the hollyhock is well adapted to garden decoration, and is usually planted where it can be seen from a distance; if the flower spikes are relieved by a background of green, their effect is much enhanced. Some of the more delicately tinted ones are often used by florists in making up large bouquets and floral decorations; the central portion of the flower is furnished with an artificial stem, and when worked in with other flowers those unfamiliar with the matter would not suspect its real nature. However double a hollyhock may be, it still remains partially fertile, and seeds from the finer kinds, if they have not been fertilized through the agency of insects by pollen from inferior sorts, will reproduce the variety with considerable

certainly; a large proportion of the seed of a good strain will produce fine flowers; hence this, being the least troublesome, is the most common method of propagation. As the plants do not bloom until the second year, they are kept for the first season in a reserve bed, and set where they are to flower in the fall after sowing, or in the following spring. If the flower stalks, as soon as the flowers are past their prime, are cut away, the root may be taken up, divided, and reset; in this way a choice specimen may be kept along year after year; the named sorts of the fanciers are propagated in this way as well as by cuttings of the stalks treated in the usual manner. Even grafting is resorted to in the case of very fine sorts, scions made from the stems being set upon the roots of any common kind. Cultivators prefer the dwarfer specimens, they being less injured by winds than the tall, and by selecting in this direction the height of the plants is much less than formerly. The hollyhock has usually been free from enemies of all kinds, but in 1873 a parasitic fungus, *puccinia malvacearum*, heretofore only known in South America and Australia, appeared in England and France; the only known remedy is to destroy all affected plants and thus prevent its increase. The roots of the plant are mucilaginous, and are sometimes substituted for those of marsh-mallow, but they are coarser and darker colored. The French use the dried flowers in infusions, probably more for the color they impart than for any medicinal quality.

**HOLMAN, James**, known as "the blind traveler," born in England about 1787, died in London in July, 1857. He entered the royal navy in 1798, and nine years afterward received a commission as lieutenant. In 1812 he lost his eyesight, and the king consequently appointed him one of the six naval knights of Windsor. During the years 1819-'21 he travelled through France, Italy, Savoy, Switzerland, and along the Rhine, and published an account of his impressions, which was so well received by the public that he set out in 1822 on a journey around the world. Commencing at St. Petersburg, he took the route by Moscow, Novgorod, and Irkutsk, intending, when the season should permit, to proceed through Mongolia and China; but being suspected as a spy, he was stopped by an order from the Russian government and sent back under escort to the German frontier, whence he returned to England in 1824. He published in 1825 an account of this journey, under the title of "Travels in Russia," &c. The five years from 1827 to 1832 he passed in a voyage around the world, of which he published an account in 1834. His route was from England to Madeira, Tenerife, and the west coast of Africa, thence to Brazil, which he passed some time in visiting, thence to Cape Colony, Caffraria, Madagascar, Mauritius, Ceylon and India, New South Wales, Van Diemen's Land, and New Zealand, returning by Cape Horn to England. He afterward, in

1843-'4, made a tour in the Danubian principalities and Transylvania. His books are more curious than useful.

**HOLMBOE, Christopher Andreas**, a Norwegian philologist, born at Vang in 1796. He studied in Christiania, and also in Paris under Sylvestre de Sacy and Caussin de Perceval, and became in 1822 professor at the university of Christiania. His works, written in Norwegian, Danish, German, French, and Latin, relating to Scriptural studies, archæology, numismatics, and comparative philology, include *De Prisca Re Monetaria Norvegia* (Christiania, 1841; 5th ed., 1854); *Sanskrit og Oldnorske* (1846); *Det norske Sprog væsentligste Ordforraad sammenlignet med Sanskrit* (1852); and *Traces du bouddhisme en Norvège avant l'introduction du christianisme* (Paris, 1857-'70).

**HOLMES. I.** A N. W. county of Florida, bordering on Alabama, and intersected by the Choctawhatchee river; area, 396 sq. m.; pop. in 1870, 1,572, of whom 137 were colored. Its surface is nearly level. The soil is a rich alluvium in the river bottoms, and sandy elsewhere. The chief productions in 1870 were 18,424 bushels of Indian corn, 7,035 of sweet potatoes, 116 bales of cotton, 4,480 gallons of molasses, 2 hogsheds of sugar, and 76,985 lbs. of rice. There were 116 horses, 1,112 milch cows, 3,749 other cattle, 1,237 sheep, and 3,543 swine. Capital, Cerro Gordo. **II.** A central county of Mississippi, bounded S. E. by Big Black river and N. W. by the Yazoo; area, 756 sq. m.; pop. in 1870, 19,370, of whom 13,225 were colored. It has an undulating surface and a very rich soil. The Yazoo is navigable by steamboats in this part of its course during the whole year, and the New Orleans, Jackson, and Great Northern railroad passes through the county near its S. E. border. The chief productions in 1870 were 352,623 bushels of Indian corn, 16,433 of sweet potatoes, and 19,027 bales of cotton. There were 1,110 horses, 2,343 mules and asses, 2,962 milch cows, 5,838 other cattle, 2,680 sheep, and 10,426 swine. Capital, Lexington. **III.** An E. central county of Ohio, intersected by Kilbuck creek and watered by Walhonding river; area, 405 sq. m.; pop. in 1870, 18,177. It has a diversified surface and a soil of generally good quality. Coal is found near Kilbuck creek, and gas springs have been discovered. The Cleveland, Mt. Vernon, and Delaware, and the Pittsburgh, Fort Wayne, and Chicago railroads pass through it. The chief productions in 1870 were 351,516 bushels of wheat, 569,895 of Indian corn, 538,383 of oats, 18,275 of barley, 102,117 of potatoes, 246,520 lbs. of wool, 589,193 of butter, and 26,410 tons of hay. There were 7,015 horses, 14,805 cattle, 62,491 sheep, and 20,111 swine; 11 flour mills, 2 saw mills, 3 manufactories of agricultural implements, 1 of furniture, and 3 of woollen goods. Capital, Millersburg.

**HOLMES, Abiel**, an American clergyman, born in Woodstock, Conn., Dec. 24, 1763, died in

Cambridge, Mass., June 4, 1837. He graduated at Yale college in 1783, and became subsequently a tutor in the college, pursuing at the same time his theological studies. In 1785 he was settled over a parish at Midway, Ga., where he remained till compelled by ill health to resign his charge in 1791. In 1792 he became pastor of the first parish in Cambridge, and continued to fill the office till Sept. 26, 1832. Dr. Stiles, his father-in-law, at his decease had bequeathed to him his large collection of manuscripts, containing researches upon various subjects, and from these Dr. Holmes wrote a "Life of President Stiles," which was published in 1798. The study of these papers turned his attention to the early history of America, and he devoted himself to the composition of the "Annals of America" (2 vols. 8vo, Cambridge, 1805), which established for its author a high reputation for accuracy, and has maintained its place as a leading authority in American history. It was republished in England in 1813, and in 1829 a new and enlarged edition was published in this country, bringing the annals down to 1820. Dr. Holmes contributed frequently to the "Collections of the Massachusetts Historical Society," in vol. xxvii. of which will be found a complete list of his publications. In 1817 he delivered a course of lectures upon ecclesiastical history, particularly that of New England, which have not been published.

**HOLMES, George Frederick**, an American educator, born in Demerara, Guiana, in 1820. He was brought up and educated in England. When 11 years of age he was presented by the bishop of Bristol with a scholarship in the London university, admitting him to the senior class. This was not accepted, but at a later period he went to the university of Durham, and gained an open scholarship. He came to the United States at the age of 18, and was engaged in a classical academy near the Wilderness, Virginia, in 1838-'9. Next he taught in Georgia. In 1840 he was placed in charge of the Walterborough academy, South Carolina. He had while teaching studied jurisprudence, and in 1842 was authorized by a special act of the South Carolina legislature to practise law, although not naturalized. Soon afterward he was made assistant editor of the "Southern Quarterly Review." In 1845 he was recalled to Virginia as professor in Richmond college; and in 1847 he became professor of history, political economy, and international law in William and Mary college. In 1846 he was elected president of the university of Mississippi, with the departments of mental and moral philosophy, political economy, and history. He held this post but a short time, declining health obliging him to seek rest in the Virginia mountains. In 1857 he was elected professor of history and literature in the university of Virginia. He has prepared a series of text books designed especially for schools in the southern states.

**HOLMES, John**, a Canadian author, born at Windsor, Vt., in 1799, died at Lorette, near Quebec, in 1852. He was preparing to enter the ministry of the Wesleyan church, when he embraced the Roman Catholic faith; he studied philosophy and theology in the seminary of Montreal, became professor in the college of Nicolet, where he was ordained priest, and spent some time as a missionary in the Eastern Townships. In 1828 he entered the seminary of Quebec as professor, was elected one of its directors, and soon became principal of the seminary. In 1836 he was commissioned by the provincial government to inquire into the system of normal schools in Europe and America, and returned to Canada in 1837 with professors, apparatus, &c., for the Canadian normal school, which was opened forthwith in Montreal. From 1838, owing to a domestic affliction, he lived in seclusion, only appearing to deliver Lenten courses of lectures, published in 1850 as *Conférences de Notre Dame de Québec*. His *Manuel abrégé de géographie moderne* has reached its sixth edition.

**HOLMES, Oliver Wendell**, an American author, son of the Rev. Abiel Holmes, born in Cambridge, Mass., Aug. 29, 1809. He graduated at Harvard college in 1829, and entered upon the study of the law, which he soon abandoned for medicine, and in 1832 went to Europe to pursue his studies, passing several years in attendance on the hospitals of Paris and other large cities. He received the degree of M. D. in 1836, in 1838 was chosen professor of anatomy and physiology in Dartmouth college, and in 1847 was elected to fill the same chair in the medical college of Harvard university. Early in his college life he attracted attention as a poet. He contributed to the "Collegian," a periodical conducted by the undergraduates of the college, and also to "Illustrations of the Athenæum Gallery of Paintings" in 1831, and to the "Harbinger, a May Gift," in 1833. In 1836 he read before the Phi Beta Kappa society "Poetry, a Metrical Essay," which was published in the first collected edition of his "Poems" (Boston, 1836). "Terpsichore" was read by him at a dinner of the same society in 1843, and "Urania" was published in 1846. In 1850 he delivered before the Yale chapter of the same society a poem entitled "Astræa," which was published in the same year. His poems have passed through many editions since they first appeared in a collected form, and have been republished at different times in England. He has been a frequent contributor to periodical literature. In the "Atlantic Monthly" (Boston, 1857) he began a series of articles under the title of "The Autocrat of the Breakfast Table," which were continued for a year, and constituted one of the most brilliant events in contemporary American literature. They were followed by "The Professor at the Breakfast Table," and in 1872 by "The Poet at the Breakfast Table." As a writer of songs and lyrics, both humorous and

serious, Dr. Holmes stands in the first rank; many of his best poems are of this class, and have been written for social or festive occasions at which they have been recited or sung by the poet himself. Of patriotic lyrics few are likely to have a longer life than his stirring verses to "Old Ironsides," and his "Last Leaf" is one of the most famous of those rare poems in which humor and pathos are successfully blended. He is also popular as a lyceum lecturer. He has distinguished himself by his researches in auscultation and microscopy. In 1838 he published three "Boylston Prize Dissertations;" in 1842, "Lectures on Homœopathy and its Kindred Delusions;" in 1848, a "Report on Medical Literature," in the "Transactions of the National Medical Society;" a pamphlet on "Puerperal Fever;" and, in conjunction with Dr. Jacob Bigelow, an edition of Hall's "Theory and Practice of Medicine" (8vo, 1839). His later works are: "Currents and Countercurrents in Medical Science" (1861); "Elsie Venner, a Romance of Destiny" (2 vols., 1861); "Songs in Many Keys" (1864); "Soundings from the Atlantic" (1864); "The Guardian Angel" (1868); and "Mechanism in Thought and Morals" (1870).

**HOLOTHURIANS.** See SEA CUCUMBER.

**HOLST, Hans Peder,** a Danish poet, born in Copenhagen in 1811. He received a superior education, and became in 1836 professor of Danish and of logic at the military academy of Copenhagen. His works include *Nytaarsgave* (4 vols., Copenhagen, 1835-'8), *Dansk Leesebog* (1837-'9; 5th ed., 1857), and the poems *Mindeblatt om Kong Frederik VI.* (1839), and *Farvel*, in honor of the same sovereign (1840), which have been translated into many languages. He has also published novels and translations from German and French.

**HOLSTEIN** (Lat. *Holsatia*), a former duchy of Denmark, and a state of the Germanic confederation, now part of Schleswig-Holstein, a province of Prussia. Of the history of Holstein until its union with Schleswig little is known. It is probable that the great migration of the Cimbri extended as far north as Holstein. It is known that Tiberius Cæsar penetrated in the following century to the mouth of the Elbe. Tacitus seems to indicate that the seven small German tribes which worshipped the goddess Hertha inhabited the coasts of the Baltic as far as Mecklenburg and Schleswig. Of the names of these tribes, that of the Angles exists in the county of Angeln in Schleswig, and that of the Varini in the towns of Warnow and Warnemünde, in Mecklenburg; all the other names disappear in the consolidation of tribes under the name of Saxons, who are mentioned for the first time by the geographer Ptolemy. (See SAXONS.) Angles, Saxons, Jutlanders, and Frisians appear together in the great emigration to Britain during the 5th century. The Saxons in Holstein were subsequently designated as North Albingians (from *Albia*, Elbe), and the country

was known during the middle ages as North Albingia, or *Saxonia Transalbiana*. They were subjugated by Charlemagne, who obtained in 811, by a treaty with Hemming, king of the Danes, the whole of Holstein as far as the Eider. His son Louis le Débonnaire founded in 834 the archbishopric of Hamburg, and gave it to Ansgar, the apostle of the north; but in 854 it was consolidated with the bishopric of Bremen. Christian civilization made however little progress in Holstein. The country was for many years harassed by Danish invaders, until Henry I. of Germany succeeded in restoring the ancient boundary between the Eider and the Schlei (934). Conrad II. ceded the territory between the two rivers to the Danish king Canute the Great in 1027, and the Eider remained from that time the northern line of demarkation. Holstein continued to be part of the duchy of Saxony, and to be ruled by Saxon vice counts, until Duke (subsequently Emperor) Lothaire invested with it in 1106 Count Adolphus I. of Schauenburg. Adolphus II. (died in 1164) conquered Wagria, and Adolphus III. Dittmarsh; but the latter was taken prisoner by the Danes, and was compelled to cede Holstein to Waldemar II. Adolphus IV. reconquered it in 1225, and divided it between his two sons. After their death arose five lines, of which the line Segeberg became extinct in 1308, Kiel in 1321, Plön in 1390, and Rendsburg in 1459. The Schauenburg line, which continued till 1640, possessed only part of Stomarn, the so-called domain of Pinneberg. Mechthild, daughter of Adolphus IV., married in 1237 Duke Abel of Schleswig, who was subsequently king of Denmark (1250-'52). The Danish crown fell after his death to another house, and his heirs were engaged in numerous conflicts for the possession of the duchy of Schleswig, and received great assistance from their relatives, the counts of Holstein. Denmark fell into anarchy, and Gerhard, of the Rendsburg line, ruled it from 1384 to 1340, and obtained Schleswig as a hereditary fief. His sons were not able to retain the regal power, and Denmark was reconstructed by Waldemar IV. Some portions of Schleswig remained the property of the counts of Holstein, who took possession of the whole duchy in 1375, at the death of Duke Henry, the last descendant of Abel, and obtained it in August, 1386, by treaty at Nyborg in Fünen, as a hereditary fief, and Gerhard VI., of the Rendsburg line, was invested with it. The history of Holstein from this time is included in that of Schleswig. (See SCHLESWIG-HOLSTEIN.)

**HOLSTON,** a river formed by the junction at Kingsport, Tenn., of the N. and S. forks, which rise in the Alleghany mountain in S. W. Virginia. It flows S. W., passing by Knoxville, and, after a course of about 200 m., joins the Clinch, near Kingston, Roane co., to form the Tennessee. It is navigated by steamboats at all seasons to Knoxville, and during the winter to Kingsport. The principal tributaries are the French Broad and the Little Ten-

nessee, which rise in the Blue Ridge mountains in western North Carolina. The former joins the main stream near Knoxville, and is navigable to Dandridge, Jefferson co.

**HOLT. I.** A N. county of Nebraska, separated from Dakota by the Niobrara river, and watered by the Elkhorn; area, about 2,100 sq. m. It is not included in the census of 1870. **II.** A N. W. county of Missouri, separated from Kansas and Nebraska on the S., S. W., and W. by the Missouri river, and bounded E. by the Nodaway; area, 470 sq. m.; pop. in 1870, 11,652, of whom 184 were colored. It has an undulating surface, with some bluffs on the Missouri river, and a fertile soil. The Kansas City, St. Joseph, and Council Bluffs railroad traverses it. The chief productions in 1870 were 71,421 bushels of wheat, 1,321,620 of Indian corn, 91,994 of oats, 61,402 of potatoes, and 155,100 lbs. of butter. There were 3,551 horses, 3,924 milch cows, 6,738 other cattle, 7,768 sheep, and 25,220 swine; 6 flour mills, 15 saw mills, and 4 manufactories of saddlery and harness. Capital, Oregon.

**HOLT, Sir John**, an English jurist, born at Thame, Oxfordshire, Dec. 30, 1642, died in March, 1709. He was educated at Oxford, became a student of law, was called to the bar in 1663, and rose to eminence as an advocate. In 1686 he was elected recorder of London, but was removed at the expiration of a year and a half in consequence of his opposition to the measures of the court. In the convention parliament which met to arrange the succession to the crown, after the departure of James II., he displayed so much ability that William III. appointed him in April, 1689, chief justice of the king's bench, which office he retained until his death. In 1700 he was solicited to accept the great seal, upon the removal of Lord Somers from the office of chancellor, but declined. Of his integrity, courage, and firmness in the discharge of his duties, a traditional instance is related upon the occasion of a summons from the commons to appear at their bar, for deciding in favor of the Aylesbury burgesses, who had been committed for complaining about the illegal rejection of their votes. He took no notice of the first message from the house; and upon being summoned by the speaker in person, he told that officer to return at once to his chair, or he would commit him to Newgate. The reports of his decisions, compiled by his pupil and successor, Chief Justice Raymond, commencing with the Easter term, 6 William and Mary, give a good impression of his judicial abilities. Sir John Holt published in 1708 a folio volume of crown cases collected by Chief Justice Kelyng, with notes and three of his own decisions.

**HOLT, Joseph**, an American statesman, born in Breckenridge co., Ky., Jan. 6, 1807. He was educated at St. Joseph's college, Bardstow, and at Centre college, Danville, and in 1828 began to practise law at Elizabethtown, Ky., whence in 1832 he removed to Louisville,

and in 1835 to Port Gibson, Miss. He returned to Louisville in 1842. In 1857 he was made commissioner of patents at Washington, and in 1859 became postmaster general under President Buchanan. In December, 1860, upon the withdrawal of John B. Floyd, he took temporary charge of the department of war. He afterward served in civil departments until September, 1862, when he was appointed judge advocate general of the army. He was brevetted as major general, March 13, 1865.

**HÖLTY, Ludwig Heinrich Christoph**, a German poet, born at Mariensee, near Hanover, Dec. 21, 1748, died in Hanover, Sept. 1, 1776. He studied theology at Göttingen, became acquainted with Bürger, Miller, and Count C. Stolberg, and was member of the society of poets which they had formed. He was preparing a collection of his poems when he died. They were afterward edited by his friends Stolberg and Voss in 1783, and again by Halm in 1869. He translated the philosophical works of the earl of Shaftesbury and other English works into German.

**HOLTZENDORFF, Franz von**, a German jurist-consult, born at Vietmannsdorf, Prussia, Oct. 14, 1829. He studied law at Berlin, Heidelberg, and Bonn, was appointed in 1861 professor at Berlin, and in 1867 became a member of the North German parliament. Since 1861 he has edited the *Allgemeine deutsche Strafrechtszeitung*, since 1866 in conjunction with Virchow the *Sammlung gemeinverständlicher wissenschaftlicher Vorträge*, and since 1871 the *Jahrbuch für Gesetzgebung, Verwaltung und Rechtspflege des Deutschen Reichs*. His most prominent works are: *Die Reform der Staatsanwaltschaft in Deutschland* (Berlin, 1864); *Kritische Untersuchungen über die Grundsätze und Ergebnisse des irischen Strafvollzugs* (1865); *Die Principien der Politik* (1869); *Encyklopädie der Rechtswissenschaft* (1870 et seq.); and *Handbuch des deutschen Strafrechts* (1874 et seq.). He is an active promoter of philanthropy and of public education.

**HOLUB, Emil**. See supplement.

**HOLY ALLIANCE**, a league formed by the emperors Alexander I. of Russia and Francis of Austria, and King Frederick William III. of Prussia, Sept. 26, 1815, after the second abdication of Napoleon, and acceded to by the other principal powers of Europe, except Rome, England, and France. Its ostensible object was to regulate the states of Christendom on principles of Christian amity, but the real aim was to maintain the existing dynasties. Alexander himself drew up the agreement and gave to it its name. The three monarchs signed it at Paris, Sept. 26, 1815, but it was not wholly made public till Feb. 2, 1816, when it appeared in full in the "Frankfort Journal." A special article of the treaty excluded for ever the members of the Bonaparte family from all the thrones of Europe. It was in virtue of the holy alliance that Austria in 1821 suppressed the revolutions in Naples and Piedmont, and

that France in 1823 restored absolutism in Spain. After Alexander's death the compact lost authority, and the French revolution of 1830 may be said to have ended it.

**HOLYHEAD** (Welsh, *Caer Gybi*, fort of Gybi), a parliamentary borough, market town, and seaport of N. Wales, on a small island of the same name at the W. extremity of the county of Anglesea, 67 m. W. of Liverpool; pop. in 1871, 6,193. An embankment three fourths of a mile in length, 16 ft. high, with a bridge midway, under which the tide rushes with great violence, connects the island across a sandy shallow with the island of Anglesea. The island of Holyhead is mostly a barren rock, ending in a huge headland of serpentine, and is noted for its magnificent caverns excavated by the sea. The town is irregularly built, but the houses are massively constructed of stone.

A harbor of refuge has been formed by a north breakwater 7,860 ft. long and an east breakwater 2,000 ft. long, the completion and formal opening of which, after 25 years' labor, was celebrated Aug. 23, 1873. The north breakwater is terminated by a head on which is erected a lighthouse. The harbor and roadstead cover about 667 acres. The foundation of the work is a great mound of rubble stone, 400 ft. wide at the base, and nowhere less than 250 ft. in width at low-water level. It contains altogether about 7,000,000 tons of stone. The superstructure is a solid central wall of masonry built of stone from the Holyhead mountain quarries. The inhabitants are mostly engaged in rope making, ship building, and the coasting trade. The parish church is an ancient structure, dedicated to St. Gybi, with some rude but curious carving

New Harbor of Refuge at Holyhead.

on its walls, and situated in a churchyard surrounded by a stone fence which appears to have been a Roman fortress. Holyhead is a terminus of the Chester and Holyhead railway. A submarine telegraph extends across the channel from Holyhead to Howth, and on account of its advantageous situation Holyhead has been made the principal station of the post-office packets to Dublin.

**HOLYOAKE, George Jacob**, an English reformer, born in Birmingham, April 13, 1817. He studied and afterward taught mathematics in the mechanics' institute of that city, and became known as an advocate of political and religious radicalism. Among his numerous publications is a "History of Coöperation in Rochdale," describing the benefits of the pioneer society founded in that town in 1844, which has been translated into many languages. He

has edited for many years "The Reasoner," an organ of secularism, as he calls the system of civilization based upon secular and not upon theological ideas. This system is defined by its advocates as the religion of the present life, not in opposition to theology, but apart from it. It teaches that intelligent sincerity is sinless; that we should believe nothing until compelled to believe it by positive demonstration; that the performance of duty, not the pursuit of happiness, is the end of life; and that utility, broadly and unselfishly considered, is the test of right. It advocates free thought and free criticism, and makes the quality of thought, not its motive, the subject of discussion. It avoids theology on the ground that its truth or falsity can only be demonstrated after death. In its practical bearing it seeks for "that material condition in which it shall be impossible

for man to be depraved or poor," and professes to furnish for those who cannot accept Christianity a rule of conduct, drawn from the wisdom of science and experience, which shall enable them to live purely, act nobly, and deserve another life (if there be one) by the unfaltering pursuit of duty in this. Holyoke was under arrest for some time on a charge of atheism, and is said to have been the last person committed for that offence. He was indicted for publishing unstamped papers, and had incurred fines to an immense amount when the duty was repealed in 1855. His "History of Cooperation" (2 vols., London) was published in 1874.

**HOLYOKE**, a city of Hampden co., Massachusetts, on the W. bank of the Connecticut river, 7 m. N. of Springfield and 80 m. W. by S. of Boston; pop. in 1850, 3,245; in 1860, 4,997; in 1870, 10,733, of whom 5,490 were foreigners. It is regularly laid out on high ground, is divided into seven wards, and is lighted with gas and supplied with water from Ashley pond. The Connecticut River railroad and a branch of the New Haven and Northampton line pass through the city. Its prosperity dates from the construction in 1849 by the Hadley Falls company, now the Holyoke water power company, of a dam across the Connecticut, which here falls 60 ft. in three fourths of a mile. (See DAM.) The principal manufactures are of cotton and woollen goods and of paper, the latter being the most important. There are 16 paper mills, with capacity for 50 tons a day, of which 8 manufacture writing paper and the rest collar, blotting, and wrapping paper; 7 cotton mills, with 136,000 spindles, producing spool cotton, twine, thread, yarn, cottonades, ginghams, dress goods, sheetings, shirtings, drills, lawns, &c.; and 6 woollen mills with 29 sets of machinery, manufacturing beavers, cassimeres, doeskins, and horse blankets. There are also a shoddy mill, a manufactory of flocks, two machine shops, a screw mill, a flour mill, three lumber mills, and two national banks with a capital of \$400,000. The assessed value of property in 1873 was \$8,578,192. The city has 31 public schools, having 44 teachers and an average attendance of 1,221 pupils in 1872; a weekly newspaper, and 8 churches.—Holyoke was originally a part of Springfield. It was incorporated as a part of West Springfield in 1786, receiving the name of Ireland parish, and became a separate town in 1850. It received a city charter in 1873.

**HOLYOKE**, Edward Augustus, an American centenarian, born in Essex co., Mass., Aug. 1, 1728, died in Salem, Mass., March 31, 1829. He graduated at Harvard college, of which his father, Edward Holyoke, was president, in 1746, and began to practise as a physician at Salem in 1749. At his death he had practised in Salem for 79 years, and had never been 50 miles from that city. He was married in 1755, and a second time in 1759, and was the father of 12 children, only two of whom survived him. He was the first president of the Mas-

sachusetts medical society. He was temperate in his diet, eating freely of fruit; was accustomed to walk in his professional practice until his 80th year; and regarded his constant care to have a full proportion of sleep as one of the causes of his longevity. At 80 years of age he had lost his teeth, and his hearing and memory had begun to fail. Between the ages of 45 and 85 his sight required the aid of convex glasses; it gradually improved afterward, till at his death he could read the finest print with his naked eyes. On his 100th birthday about 50 physicians of Boston and Salem gave him a public dinner, when he appeared at the table with a firm step, smoked his pipe, and gave an appropriate toast. A memoir of his life was published by the Essex medical society.

**HOLYROOD PALACE.** See EDINBURGH.

**HOLY SPIRIT PLANT**, a name which, as well as dove plant, has been given to a Central American orchid, *peristeria elata*, which has

Holy Spirit or Dove Plant (*Peristeria elata*).

large, green, egg-shaped pseudo-bulbs, strongly ribbed leaves 3 ft. or more long, and a flower stem 5 or 6 ft. high, which bears upon its upper portion numerous, nearly globose, white, fragrant flowers. The structure of the flowers in the orchids is quite unlike that with which most persons are familiar; it is sufficient to say here that the stamen or stamens and pistil are curiously united into what is called the column, and refer the reader to ORCHIDS for further description. In many of this family the petals and sepals present the most grotesque and irregular forms, often simulating the appearance of insects; in *peristeria*, however, the envelopes of the flower are unusually regular and form an almost spherical case of alabaster whiteness, within which is enclosed a delicate little bird with outspread wings. The column in this plant bears so strong a resemblance to a bird as to require scarcely any effort of the fancy to make it appear like a

dove, of the form which artists choose in typifying the Holy Spirit. It is not surprising that a plant which to the educated eye is so striking should, to the ignorant and superstitious among the Spanish Americans, appear of some supernatural significance, and be regarded with veneration. Under the name of *el Spirito Santo* it is employed in religious festivals in Central America. At the time when the current of travel to California was by the way of Panama, living plants, as well as the flowers preserved in alcohol, were frequently brought home by passengers. It is now not rare in the collections of those who cultivate orchids, though it is not often seen in cultivation with the size and vigor of the plant in its native country.

**HOLY WEEK**, the last week of Lent, immediately preceding Easter Sunday. It is sometimes called Passion week, but that denomination is given in the Latin and Greek churches to the week preceding Palm Sunday, and commencing with Passion Sunday. The term holy is applied to it because it is commemorative of Christ's death for the redemption of mankind. It was called in the early Christian ages the great week, both because of the mighty event it commemorates, and because it is observed with the greatest solemnity and strictness. Tertullian, Lactantius, and Chrysostom, among other ancient writers, mention the fact that during this week Christians were wont to fast on one meal of bread, salt, and water, taken in the evening, while many abstained from all food the entire week, and a still greater number took no nourishment during Good Friday and Holy Saturday. In the middle ages it was called the authentic week; and in Germany, Denmark, and the Scandinavian peninsula it is known as still week. The greater number of Protestant churches do not solemnize this week. The Lutheran churches, the church of England, and the Protestant Episcopal church have special services each day. In the Greek and other eastern churches the observances and ceremonial are substantially the same as in the Latin. It commences with Palm Sunday, when the blessing of palm branches or other evergreens, and the distribution of them to the people who carry them in procession, are designed to recall the circumstances attending Christ's triumphant entrance into Jerusalem. On Wednesday, Thursday, and Friday evenings the office of *Tenebræ* (darkness, from the darkening of the churches) is chanted. It consists of the matins and lauds for the following mornings, which it is customary to recite over night. During this office a large candlestick is placed near the altar, bearing 15 tapers disposed in the form of a triangle, and representing the light of Christ and of the prophets who had announced his coming. As the psalms are sung, the tapers are extinguished, until only the topmost remains. This, as it represents Christ, is taken down and carried behind the altar during the *Miserere*, after which it is put back in its place, to signify the temporary

extinction of the light of Christ between his death and resurrection. Thursday, being the anniversary of the institution of the eucharist and of the priesthood of the new law, is distinguished by two ceremonies of great significance which take place at the solemn mass in cathedral churches: the consecration by the bishop assisted by 12 priests, in full sacerdotal costume, of the oils used in the administration of the sacraments, &c., and the washing of feet. At the end of mass, and after the procession, the celebrant washes the feet of 12 poor persons, while the choir sings the words of St. John, *Mandatum novum do vobis*, "A new commandment I give unto you," &c. Hence the name of Maundy Thursday by which this day is still known. In Rome the pope washes the feet of 13 poor priests, in memory of the body of the apostles raised to that number by the extraordinary calling of St. Paul. During the *Gloria in excelsis* of the mass of Thursday, all the bells are rung, and thenceforward remain silent until the *Gloria in excelsis* in the mass of Holy Saturday. A large host, consecrated during this mass, is carried in procession at the end of it to a side altar (called the sepulchre) richly decorated, on which it remains and where it is visited by the faithful during the whole of the ensuing day. On Good Friday the altar is denuded to signify the desolation of the church, the prophecies are sung which pertain to the story of Christ's suffering, the whole body of the faithful perform what is called the adoration of the cross, the passion according to St. John is chanted, and all proceed in silence to the sepulchre, whence the consecrated host is brought back in procession, offered in adoration to the people, and consumed by the celebrant. This is called the "mass of the pre-sanctified" or pre-consecrated elements, no consecration taking place on that day. On Saturday the services begin by the blessing of the "new fire" obtained from flint and steel, because our true vital light and warmth come from Christ, our Rock; the blessing of the paschal candle, an emblem of Christ arisen; the chanting of all the prophetic passages of the Old Testament pointing to Christ's resurrection; then the benediction of the baptismal fonts, from which the clergy return in procession, singing the litany of the saints, and the joyous mass with its Alleluias, a foretaste of the resurrection.

**HOLYWELL**, a municipal and parliamentary borough and market town of Flintshire, N. Wales, near the left bank of the estuary of the Dee, and on the Chester and Holyhead railway, 15 m. N. W. of Chester; pop. in 1871, 5,335. It takes its name from the holy well of St. Winifred, formerly celebrated for its virtue in the cure of diseases. The well discharges 21 tons of water per minute, and now serves as the motive power of most of the machinery in the place. Margaret, countess of Richmond, mother of Henry VII., erected a handsome

Gothic building over the spring, the upper part of which is now used as a school house. In the vicinity are collieries, and valuable mines of lead, copper, and zinc. The chief manufactures are copper wire, bolts, nails, sheathing, white and red lead, shot, flour, and flannels. Limestone is largely exported.

**HOMBURG** (Ger. also *Homburg vor der Höhe*, at the height), a town of Prussia, capital of the circle of Upper Taunus in the province of Hesse-Nassau, 9 m. N. N. W. of Frankfort; pop. in 1871, 8,626. It derives its name from being situated on and near the heights of the mountain ridge of Taunus. The principal buildings are a castle, built in 1680 and renovated in 1835, a library, a picture gallery, and a Protestant church. The town is a celebrated watering place, but owes much of its reputation to the former existence of an authorized gambling house. The government of the landgraviate concluded in 1840 a contract with the brothers Louis and François Blanc of Paris, permitting them to keep open bank, in return for building a *Kursaal* at a cost of \$100,000, and a high annual rent. At the expiration of the contract in 1870 the Prussian government refused to renew it and prohibited the further existence of gambling houses. There are four ferruginous and two saline springs, which contain more carbonic acid than any other mineral water known. (See HESSE-HOMBURG.)

**HOME, Daniel Dunglas**, an English spiritualist, born near Edinburgh, March 20, 1833. He was adopted by an aunt, with whom he came to America when nine years of age. It is said that spiritual manifestations attended him from his infancy, but the earliest of his own recollection was a remarkable vision in his 14th year of a deceased playmate. When 17 years old he became publicly known as a medium, though against the wishes of his family. He resided at different times in Troy and Newburgh, N. Y., in Lebanon, Conn., and in Springfield, Mass., in the last place many remarkable manifestations taking place. These manifestations have continued with intermissions to attend Mr. Home to the present time. Besides the ordinary phenomena of rapping, table-tipping, writing, and playing upon musical instruments, they include in his case, it is affirmed, visions seen by the medium, appearances of hands, arms, and spirit forms, seen by other persons, "levitation," or the preternatural uplifting of the medium, elongation and shortening of his body by several inches, and his handling of fire and heated objects without hurt. The occasional intermission of his power is without any known cause, and its occurrence has been generally beneficial to his physical health. He claims to have performed some remarkable cures, and to have been himself protected from sudden danger. The manifestations have been witnessed by many persons, and contradictory accounts of them have been published by different and reputable witnesses.

In 1853 he went to New York to study medicine, but abandoned the intention. In 1855 he went to England, and has since made London his principal residence. He visited many parts of Europe, and was presented to the emperors of France and Russia, and to the pope. In 1856, while in Rome, he united with the Roman Catholic church. He subsequently met in Rome a Russian lady of noble birth, whom he married in St. Petersburg in 1858. She died in southern France, where they were staying for her health, in 1862, leaving him a son born in 1859. Memorial sketches of her were written by Mary Howitt and Mrs. S. C. Hall. In 1864 he was expelled for spiritualist practices from the city of Rome by the papal authorities. In 1866 he became secretary of the spiritual atheneum, a society in London for the extension of spiritualism. In the same year he became acquainted with Mrs. Jane Lyon, who conveyed to him by gift and bequest large sums of money, including the bulk of her property. Subsequently she sued for its recovery, and it was restored to her by law. In 1871 Mr. Home again married a Russian lady of rank. He has published an autobiographical work on spiritual manifestations, entitled "Incidents of my Life" (London, 1862, and republished in New York and Paris), and a second volume with the same title (London and New York, 1872). A third volume is announced.

**HOME, Sir Everard**, a Scottish surgeon, born at Greenlaw castle, Berwickshire, May 6, 1756, died Aug. 31, 1832. He studied medicine with his brother-law, the celebrated John Hunter, and practised in London for more than 40 years. In 1813 he was created a baronet and appointed sergeant surgeon to the court, in which office he was continued by William IV. He was also professor of surgery and anatomy, and for many years president of the royal college of surgeons. His "Lectures on Comparative Anatomy" (6 vols. 4to, London, 1814-'28) is his most important work. He is indebted for his reputation as an author to the folio volumes of minutes of dissections left by John Hunter, which he took from the Hunterian museum under the pretence of preparing a catalogue of the museum, and burned.

**HOME, Henry**, Lord Kames. See KAMES.

**HOME, or Hume, John**, a Scottish author, born at Ancrum about 1722, died in Edinburgh, Sept. 5, 1808. He was educated at the university of Edinburgh, and after a course of theological studies was licensed to preach in April, 1745. Upon the outbreak of the rebellion in 1745 he took up arms on the Hanoverian side. He was taken prisoner at Falkirk in 1746; but having effected his escape, he resumed his professional studies, and in the latter part of the year was presented to the parish of Athelstaneford. He gave much time to historical reading and dramatic composition, and in 1749 went to London with a tragedy entitled "Agis," which Garrick, then manager

of Drury Lane, declined to accept. Although mortified by his ill success, he set about the composition of another tragedy, "Douglas," founded on the old ballad of "Gil Morrice," which, upon being presented to Garrick in 1755, was likewise refused. It was produced at Edinburgh in December, 1756, with great success; but so violent a storm was raised by the fact that a minister of the church of Scotland had written a play, that Home was threatened with deposition, to avoid which he resigned his living in June, 1757. He removed to London in the same year, when "Douglas" was brought out at Drury Lane with complete success. By the aid of the sinecure office of conservator of Scots privileges at Campvere, presented to him by the earl of Bute, and of a pension of £300 from George III., he passed the remainder of his long life in affluence, the last 40 years in Scotland. He wrote four other tragedies, "The Fatal Discovery," "Alonzo," "Alfred," and "Aquilaia." His literary reputation rests upon his "Douglas," which is still performed, notwithstanding the declaration of Garrick that it was totally unfit for the stage. He also wrote a "History of the Rebellion of 1745" (4to, London, 1802). His complete works, with an account of his life and writings, were published by Henry Mackenzie (3 vols. 8vo, Edinburgh, 1822).

**HOMER** (Ὅμηρος), the supposed author of the Iliad and Odyssey, the earliest monuments of Greek literature. The several ancient biographies of Homer extant are either legendary or conjectural, and often contradictory, and the narratives of the poems are full of extraordinary incidents, in great part of a mythological character, and of striking discrepancies. Hence various opinions are entertained as to the origin of the poems and the amount of fact or fiction contained in them. G. Curtius, following Müllenhoff, conjectures that Homer was a name given to the ideal patron of an association of poets (δμηροί). In common use the word δμηρος meant hostage, but Düntzer and others suppose that its original meaning was "one who connects or combines," analogous to that of Vyasa (collector), the name given to the compiler or compilers of the Hindoo Vedas and Puranas. Sengebusch identifies it with the name of Thamyras, the Thracian bard. It is noteworthy that the name is repeatedly spoken of by ancient writers as only a pseudonym of the poet. Either Homer was himself the "hostage," sent to Chios or Colophon, or it was his father who was surrendered to the Persians. On the island of Ios the name was explained as "follower," supposing that he followed the Lydians when they were compelled to move away from Smyrna. Suidas gives it the signification of "counsellor," and Ephorus dismembers it into ὁ μὴ ὁρᾶν, "one who does not see," referring to the legend of the poet's blindness. It does not appear, however, that any of these interpretations can furnish a clue to the problem whether it is really

the name of a person, and whether that person was the author of the Iliad and Odyssey.—Two biographies of Homer have come down to us from antiquity, one of which is attributed to Herodotus and the other to Plutarch. Both have been pronounced forgeries, yet it is probable that they contain the legends relating to the life of the poet current in ancient times. His mother is said to have been Critheis; and one legend represents him to have been born on the bank of the river Meles, near Smyrna, whence the name Melesigenes; according to another, Critheis was married to Mæon, king of the Lydians, who brought up her son (the offspring of a dæmon or genius) as his own, whence the name Mæonides. Another legend relates that Homer became a schoolmaster and poet in Smyrna; that he was induced by Mentes, a foreign merchant, to travel; that while visiting Ithaca he was attacked by a disease in the eyes, which resulted in total blindness; that he composed verses, which he recited wherever he went; that Thestorides, a schoolmaster of Phocæa, carried a copy of Homer's poetry to Chios, and recited it as his own; that Homer followed him thither, and resided long at Bolissos, a town in Chios; and finally, that he died on the little island of Ios, when journeying to Athens. Still another legend declares that the poet on his way to Thebes landed at Ios, and there died of vexation at being unable to solve a riddle propounded to him by some young fishermen, in answer to his question if they had got anything. "As many as we caught," said they, "we left; as many as we did not catch, we carry." The prevailing opinion of antiquity seems to have been that Homer was born in Smyrna, resided for a long time in Chios, and was buried in Ios. Rhodes also is said to have been his home, but without evidence. In later times the island of Cyprus also made such a claim. The Cypriotes said that Homer was born in a field near Salamis, of a girl named Themisto, and that the birth of the great singer had long previously been announced by the Salamine oracles, in verses which they could produce. Athens, Argos, Pylos, and other cities wished likewise to be regarded as Homer's native place. Herodotus places Homer about 400 years before his own time, or in the second half of the 9th century B. C., which is 400 years after the time which he fixes for the Trojan war. The dates assigned to Homer by other ancient writers range from the beginning of the 12th to the beginning of the 7th century B. C.—The principal poems ascribed to Homer are the Iliad and the Odyssey. Among the minor, and evidently of different origin, are the so-called Homeric hymns and the *Batrachomyomachia*. The Iliad comprises a period of about 50 days of the 10th year of the Trojan war, and narrates the wrath of Achilles and its consequences as far as the death of Hector. Achilles is enraged because Briseis, who had been allotted to him, was taken away and given to Agamemnon; and,

angered with all the Greeks, he no longer takes part in the battles with the Trojans. But the misfortunes of his comrades touch his heart, and he at length permits his friend Patroclus to borrow his armor and go out to battle at the head of his Myrmidons. Patroclus is slain by Hector. This event is the central and turning point of the whole epic. The progress toward it is very gradual and artistic. The cause of the anger is told first. Then, while Achilles is lying in his tent, several scenes of battle are described, which afford an opportunity for introducing the principal heroes of the Greeks, and especially for bringing Diomedes into prominence. The fruitlessness of their efforts and valor heightens their desire for the aid of Achilles. This furnishes the opportunity for introducing and praising the hero. At last he comes. He has suppressed his anger against the Greeks, and turned it against the Trojans, who have killed his friend. He turns the fortunes of war, and avenges the death of Patroclus by slaying Hector. This portion of the poem has a rapid movement. But Hector's death does not end the Iliad. His body is given up to the Trojans and interred, and Achilles' wrath is turned to pity for Priam, the aged father of the dead hero; and the poem is thus brought to a peaceful conclusion. The Odyssey describes the return of Ulysses (Odysseus) to his island home. It is a story of 40 days; but within this short period is compressed a mass of events. It is composed of four main divisions. In the first Ulysses dwells with Calypso on the isle of Ogygia, far from his home, where the suitors of his wife Penelope threaten the ruin of his fortune. Telemachus, his son, now on the threshold of manhood, resolves to oppose their designs, and, counselled by Minerva, undertakes a journey to Pylos and Sparta to seek his father. In the second part Ulysses leaves Ogygia, arrives in the land of the Phæacians, to whom he narrates his adventures, and goes to Ithaca. The third part details the plan of vengeance which Ulysses and his son resolved upon in the house of a faithful servant, the shepherd Eumæus, and which is executed in the fourth and last division. The Odyssey, like the Iliad, is centred in one person and one event—Ulysses and his return and vengeance. Its action, however, is more complicated, through Telemachus's journey.—Two views are held by modern scholars on the nature of the contents of the Iliad and Odyssey. One is that the destruction of Troy (Ilium) was an actual historical event, which took place either before the Æolian migration, or in connection with it. The first to give a scientific basis to this view was Völkner, in *Die Wanderungen der aiolischen Kolonien nach Asien als Veranlassung und Grundlage der Geschichte des trojanischen Krieges* (1831). The other, which has found a defender in E. Curtius, makes the narrative of the Iliad not that of the legendary destruction of a certain town, but the recollection of the deeds of the

Achæans, who were descendants of Pelops, Agamemnon, and Achilles, who contended with the Dardanians, from whom they conquered a new territory. Blackie, a recent and strenuous advocate of the traditional theory, in his "Homer and the Iliad" (1866), expresses his belief "that there was a kingdom of Priam, wealthy and powerful, on the coast of the Dardanelles; that there was a great naval expedition undertaken against this Asiatic dynasty by the combined forces of the European Greeks and some of the Asiatic islanders, under the leadership of the king of Mycenæ; that there was a real Achilles, chief of a warlike clan in the Thessalian Phthiotis, and a real quarrel between him and the general-in-chief of the Hellenic armament; that this quarrel brought about the most disastrous results to the Greek host, in the first place, and had nearly caused the failure of the expedition; but that afterward, a reconciliation having been effected, a series of brilliant achievements followed, which issued soon after in the capture of the great Asiatic capital." Bishop Thirlwall in his "History of Greece" rejects all belief in the detailed narratives of the Iliad and the Odyssey, while he affirms that "the incidents cursorily noticed in these poems were exhibited in full mythical garb in other epics." Grote says in regard to the Trojan war that, "as the possibility of it cannot be denied, so neither can the reality of it be affirmed." Max Müller says that "it would be mere waste of time to construct out of such elements a systematic history, only to be destroyed again sooner or later by some Niebuhr, Grote, or Lewis." The theory in his "Lectures on the Science of Language," second series (1864), that "the siege of Troy is a repetition of the daily siege of the east by the solar powers, that every evening are robbed of their brightest treasures in the west," has found an exhaustive commentary in the "Mythology of the Aryan Nations," by G. W. Cox (1870), in whose "History of Greece" (1874) the subject is treated in the same spirit. While the Trojan war is thus divested of all historical character, Gladstone reiterates in his "Juventus Mundi" (1869) what he said in his "Studies on Homer and the Homeric Age" (1858), namely, that the Iliad and the Odyssey are emphatically historical poems; and in his "Homer's Place in History" (1874), building on Egyptological researches, as Chabas's chapter on *Les nations connues aux Égyptiens en l'antiquité historique* (1873), and Lenormant's *Les premières civilisations* (1874), he thinks there is room for the presumption that the capture of Troy occurred in the 14th century B. C. For the attempts made to identify the site of Troy, including the recent excavations by Dr. Schliemann, see TROY.—The discussion of the origin of the Homeric poems turns principally on the theory which, since the publication of Wolf's famous *Prolegomena* (1795), is known as the Wolfian theory. It maintains that the Iliad is made up

of a number of songs which first existed as detached poems, handed down from generation to generation by a school of rhapsodists or professional minstrels; the poems were thus not the work of one man, and possibly not the product of any one age—a conclusion grounded partly on the absence of writing until long after the time when these poems first came into existence, and partly on the contradictions of the poems themselves. This opinion had to some extent been entertained before Wolf by Vico, Casaubon, Perrault, Hedelin, Bentley, Wood, and other scholars; but their views were outweighed by the current opinion of Homer's personality. Since the day of Wolf the question has been amply discussed by the greatest scholars of all lands, but without resulting in a definite conclusion. In 1866 F. A. Paley attempted to prove that the Greek lyric, tragic, and comic poets either knew nothing or exceedingly little of our Iliad and Odyssey, or at least preferred to draw their material from other poems. Some hold that, in order to prove that these poems have from the first been known in their entirety, and that therefore the Greeks had only one Homer, it must be shown that they were from the first written poems. Barthélemy Saint-Hilaire, in his recent *Iliade d'Homère traduite en vers français*, attempts to establish that the Homeric age possessed the art of writing; but against this opinion it has been argued that facilities for writing would lead rather to the rise of contemporary chroniclers than to the practice of writing down poems. Many historians doubt therefore that poems were written centuries before the time of Herodotus, and also that the Greeks had any written literature before the Persian wars. Paley has expressed his conviction that no such literature existed in the time of Pindar; and the subject has been further examined by Tennell, in a paper on "The First Ages of a written Greek Literature" (*Transactions of the Cambridge Philosophical Society*, 1868). When people neither wrote nor read, the only way that poems could be made known was by recitation; and as it cannot be supposed that the whole of the Iliad and Odyssey could be recited on ordinary occasions, recourse is had to hypothesis. Poems were recited in historical times at Athens at the festival of the Panathenæa, and there were contests of rhapsodists at Sicyon, Syracuse, Epidaurus, Orchomenus, Thespiæ, Acræphia, Chios, Teos, and Olympia. Such contests are alluded to in the Homeric account of the Thracian poet Thamyras, whom the muses struck blind at Doriem because he had boasted that he was able to contend even with them. It has therefore been supposed that such poems as the Iliad and Odyssey were recited at festivals by several rhapsodists in succession, and Nitzsch believes that such recitations lasted more than one day. But, as Ihne says, the subject of the rhapsodists is one of the most complicated and obscure of all.—Ancient writ-

ters agree in ascribing to Pisistratus the merit of having first committed the Homeric poems to writing, and an old Latin scholium, translated from the Greek of Tzetzes and discovered by Ritschl in a manuscript of Plautus at Rome, gives the names of Onomacritus, Zopyrus, Orpheus, and the corrupted name of Coneylus, as those of the four poets who assisted Pisistratus. It seems that before him Solon had undertaken to make such a compilation. The Alexandrian critics, however, do not even notice the Pisistratic recension among the many manuscripts of the Homeric poems which they had before them, and Payne Knight and others have inferred from their silence that they either did not possess it or esteemed it of no great authority; which could not have been the case if it had been, as is alleged, the prime originator of Homeric unity. There is evidence that the contemporaries of Pisistratus considered his labors valuable, and that from the Attic manuscript other cities, even Chios, had copies made. Besides that of Chios, Alexandria possessed manuscripts from Argos, Crete, Cyprus, Massilia, and Sinope; also another called *Αἰολική*, probably from a predominance of Æolic forms. Other copies were known by the names of the persons who made them, as the famous one made by Aristotle for Alexander the Great. An important epoch in the history of the Homeric poems opened in Alexandria, where they were revised by the most celebrated men of learning, as Zenodotus of Ephesus, Aristophanes of Byzantium, and above all by Aristarchus of Samothrace, whose recension is the most esteemed by modern critics, though all we have of it consists of short fragments scattered through scholia. Aristarchus's edition became the basis of all subsequent ones, and hence it may be accepted that, generally speaking, the text of the Homeric poems such as it has come down to us, and the division of each poem into 24 rhapsodies, are his work. Aristarchus was opposed in his criticisms and explanations by Crates of Mallus, the founder of the Pergamene school of grammar. The writings of Aristonicus, Didymus, Nicanor, and Herodian seem to have been the sources of the Venetian scholia, published for the first time by Villoison in 1788, through which it was hoped to restore the edition of Aristarchus. The old editions of Homer, as well as the manuscripts, are of little value for the restoration of the text. The first printed edition appeared in 1488, but until the time of Wolf only about seven critical editions had been made. With Wolf's *Prolegomena*, published in 1795, prefixed to the second edition of his *Homeri et Homeridarum Opera*, begins the modern period of Homeric criticism. The advocates of the Wolfian theory infer from the history of the Homeric text that the original unconnected songs composing the Iliad and Odyssey were collected and combined by Pisistratus. The work of these critics consists in eliminating

from the Homeric text the spurious verses, and accounting for the probable causes of the interpolations. Those who believe in the original unity of the poems are, however, not unwilling to admit that in the long period of the preservation of the Homeric text numerous interpolations may have been made. These interpolations, as they are admitted by the conservative school, have been ranged in five groups in Kammer's work entitled *Die Einheit der Odyssee nach Widerlegung der Ansichten von Lachmann-Steinthal, Köchly, Hennings, und Kirchhoff dargestellt* (1873). The first group comprises those which carry out the original plan, but nevertheless modify it by additions and introductions of new themes; they are the largest of all, mostly found in the second part of the *Odyssey*, and in part have a high poetical value. The second group consists of those which extend the poem, but have little or no poetical value. The third are editorial interpolations which attempt to establish a stronger connection between a loose theme and the preceding portions by introducing preparatory verses; the fourth, interpolations which enlarge on certain scenes, and are probably due to the loquacity of rhapsodists, but are out of taste and poor in thought; the fifth, interpolations due to a thoughtless introduction of Homeric verses in a wrong connection. Grote supposes that the *Iliad* consisted originally of a comparatively small poem on the exploits of Achilles, which he calls the *Achilleid*, and that the other portions of the *Iliad* were not included in the first plan of it. He sums up the controversy with a statement which probably all critics of the Homeric poems are ready to accept: "For, in truth, our means of knowledge are so limited, that no man can produce arguments sufficiently cogent to contend against opposing preconceptions. . . . We have nothing to teach us the history of these poems except the poems themselves. Not only do we possess no collateral information respecting them or their authors, but we have no one to describe to us the age in which they originated; our knowledge respecting contemporary Homeric society is collected exclusively from the Homeric compositions themselves. We are ignorant whether any other or what other poems preceded them, or divided with them the public favor; nor have we anything better than conjecture to determine either the circumstances under which they were brought before the hearers, or the conditions which a bard of that day was required to satisfy."—Recent works on the grammar and vocabulary of the Homeric text are: Förstemann, *Bemerkungen über den Gebrauch des Artikels bei Homer* (Salzwedel, 1861); Buttmann, *Lexilogus, oder Beiträge zur griechischen Worterklärung, hauptsächlich für Homer und Hesiod* (2 vols., 5th ed., Berlin, 1864); Classen, *Beobachtungen für den homerischen Sprachgebrauch* (Frankfort, 1867); Seiler, *Vollständiges Griechisch-Deutsches Wörterbuch über die Gedichte*

*des Homeros und der Homeriden* (7th ed., Leipzig, 1872). Critical works on questions connected with the origin and contents of the Homeric poems are: Nitzsch, *Die Sagenpoesie der Griechen* (Brunswick, 1852); Hoffmann, *Homische Untersuchungen* (Clausthal, 1857-'9); Köchly, *De Iliadis Carminibus Dissertationes* (Zürich, 1857-'9), and *De Odyssee Carminibus Dissertationes* (1862-'3); Kirchhoff, *Die homerische Odyssee und ihre Entstehung, Text und Erläuterungen* (Berlin, 1859); Bergk, *Emendationes Homericae* (Halle, 1859-61); Nägelsbach, *Homische Theologie* (2d ed., Nuremberg, 1861), and *Anmerkungen zur Ilias* (3d ed., 1864); Bonitz, *Ueber den Ursprung homerischer Gedichte* (2d ed., Vienna, 1864); Lachmann, *Betrachtungen über Homers Ilias, mit Zusätzen von Moritz Haupt* (Berlin, 1865); La Roche, *Die homerische Textkritik im Alterthum* (Leipzig, 1866); Baletta, *Ὅμηρος Βίος καὶ Πόηματα* (London, 1867); O. Meyer, *Quaestiones Homericae* (Bonn, 1868); Düntzer, *Die Homerischen Fragen* (Paderborn, 1874). Several of these works have been translated into English. As the Homeric poems are considered not only a principal source of the Grecian mythology, but also of the earliest history of the Greeks, and as their influence upon the general culture of that people was immense, they are fully discussed in the histories of Greece by Thirlwall, Grote, Curtius, and Cox; and also in works on the history of Greek literature, as those by Mure, K. O. Müller, and Nicolai. As poetical productions and models of the epic art, they have been treated and liberally borrowed from by eminent writers of all civilized nations. Among the best editions of the Homeric poems are those of Heyne, Wolf, and Bothe. More recent editions have been published by Bärmlein (Leipzig, 1854), Sengebusch (Leipzig, 1855-'6), Bekker (Bonn, 1858), Charles Anthon (New York, 1858), Baumeister (Leipzig, 1860), Hoffmann (Clausthal, 1864), Ameis (Leipzig, 1865-'8), F. A. Paley (London, 1866), Hermann (Leipzig, 1866), Düntzer (Paderborn, 1866-'7), Faesi (Berlin, 1867), La Roche (Leipzig, 1867-'8), Hayman (London, 1867), G. Dindorf (Paris, 1868), and V. H. Koch (Hanover, 1868-'9). Among translations of Homeric poems may be mentioned those in German by Voss (first published in 1780; last ed., 1873), Uschner (Berlin, 1862), Ehrental (Hildburghausen, 1865), Carlowitz (Dresden, 1868), and Wiedasch (Stuttgart, 1869); in French by Dugas-Montbel (Paris, 1853), Bignan (1853), Pesonneaux (1861), and Feillet (1865); in English by Chapman, Pope, Cowper, Munford (1846), Newman (1856), Worsley and Conington (1861-'5), Dean Alford (1861), Simcox (1865), Lord Derby (1865), Herschel (1866), Merivale (1869), and W. O. Bryant (1870-'71).

**HOMER, Winslow.** See supplement.

**HOMESTEAD**, the place where one's dwelling is. By this is meant the home itself, with the outbuildings connected with it, and a portion of the land, as the garden, and it may be some

fields, &c. From the nature of the case, where one occupies and uses in connection with his dwelling a considerable tract of land, the term homestead must be somewhat indefinite, and if employed in deeds or contracts, its precise meaning must be determined by the context and surrounding circumstances. Of late it has become common in the United States, by constitutional or statutory provisions, to exempt a homestead to a specified amount or value from attachment or sale for debt. Under these, if the debtor have more than the requisite amount or value lying in one body, he is usually permitted to make selection within the specified limits; but failing to do this, or if the circumstances present impediments, it will be done for him by the court in which proceedings to enforce debts against him are taken.

**HOMICIDE**, in criminal law, the killing of one human being by another. By the common law, it is not homicide to kill an infant before its birth, the authorities declaring that if one purposely kills a babe not yet born, it is only a misdemeanor and not a felony; but if the child is born alive and then dies from the previous injury, it is felony. So, if one intending to procure abortion does an act which causes a child to be born prematurely, and being so born, it dies because not mature enough to live, this is murder. But where a woman cut off the head of her child before it was wholly born, it was held not to be murder. The crime of child murder and wilful abortion is made punishable in many of our states by statute. Homicide is divided into three classes, justifiable, excusable, and felonious. Felonious homicide is either manslaughter or murder, which will be treated under those titles. In this article we shall speak only of homicide which is justifiable, and that which is excusable. These two are often confounded, and are sometimes spoken of as if they were the same thing, even in technical books of criminal law. But this is an inaccuracy. Justifiable homicide is that which is just and right, and not to be regretted; while excusable homicide is that for which excuses may be offered which take away wilful guilt from the killer, however much the act may be lamented. In this strict sense, there is perhaps no justifiable homicide except that which is committed officially and in the discharge of a legal duty; that is, there is no homicide strictly justifiable except the homicide by an executioner, or that of a public enemy in open war. If one, at great risk to himself, and in defence of the innocent, encounters and destroys an assassin, who could not otherwise be prevented from putting many to death and inflicting injuries worse than death, he may deserve and receive general applause. And the excuse extends much beyond those crimes which are punishable with death; because a man would be excused for putting an offender to death if that were the only way of preventing certain crimes which if committed might not be punished with death, such as rape, bur-

glary with arms, or robbery with arms. Again, the excuse in this case, as in that of self-defence, does not depend altogether upon the actual facts of the case, but much, and perhaps principally, upon the appearance of it to the person committing the homicide; for if, as a reasonable man, he was fully justified in believing that the peril from which he could deliver himself only by homicide was actual and imminent, the excuse is not taken away by proof that he was deceived. Thus, if one were attacked by an assailant threatening to shoot him with a pistol, and would be justified under the circumstances in killing his assailant if the pistol were loaded and the assailant intended to use it, and the assailed party had reason to believe this to be the case, his excuse would not be lessened by proof that the pistol was not loaded and his death not intended. The excuses for homicide sometimes mingle; thus one who is attacked by a murderer and cannot otherwise escape, may put him to death, either to prevent this felony, or to save his own life. But one who would escape the consequences of homicide by the excuse of self-defence, must be able to show that there was some overt act on the part of the assailant, and that the assailed was not moved by threats only, or merely by fears of what would be done, however just and rational they might be; but waited until some act took place to protect himself, not merely from fatal violence, but from grievous bodily injury. What this means is not plainly defined by the law; but it does not mean the injury caused by a blow from a fist or a stick, or a slight wound, which might be painful for a time, but from all effects of which the injured person would certainly and entirely recover within a few days. And here, too, as before, death must not be inflicted until nothing but this remains. That is, the party assailed must retreat as long and as far as he can retreat; must seek and use any refuge or means of escape open to him; and only when these are exhausted, or non-existent, can he put his assailant to death. It should however be stated, as a settled rule of law, that an assailed party, in danger of death or grievous harm, is bound to retreat only when he can do this with safety. For if retreat will only increase a danger already imminent, and give his assailant new power over him, he need not retreat at all, but may at once inflict death upon his assailant. So, too, homicide is excusable if inflicted as the only means of preventing a great crime. Here the law comes in with what may seem to be a definition; for it says that one may inflict death if there be no other way to prevent a felony. But the reader will see, under the title **FELONY**, that its meaning is quite undetermined; and there are things which are still called felonies, at least in England, of which we should be unwilling to say that they might lawfully be prevented by putting the offender to death. And yet it must be certain that the law would call this only excusable homicide, and not

justifiable. Excusable homicide is then that which is caused by self-defence, or the prevention of great crime, or accident. It is excusable by reason of self-defence, if it was strictly necessary for this purpose, and not otherwise. We believe that there is no rule of criminal law which ought to be more certain, and more universally acknowledged, than that homicide in self-defence must be grounded upon a strict and absolute necessity. It cannot be doubted that any one may save his own life by taking the life of his assailant; but it is equally certain, as matter of law, that he must not secure his safety by homicide provided he could secure it in any other way, as by retreating, or seeking refuge, or inflicting a less than fatal injury. We suppose that any difficulty which belongs to this subject must attend upon the application of these principles, and not upon the principles themselves. Thus, it is certain that the laws of England and of the United States agree in an absolute refusal to recognize the point of honor in cases of homicide. Juries, and possibly courts, may be influenced by it, perhaps unconsciously; but the law ignores it. If one attacks another with every form and method of insult, and the attacked party, finding no other way of stopping the insult, or escaping from it, puts the assailant to death, it is felonious and not excusable homicide. In reference to the excuse of accident also, it may be mingled with another. Thus, while one has no right to protect himself from slight bodily injury by putting his assailant to death, or to use that means of preventing wrongful conduct not of the gravest sort, yet he has a right to defend himself against any assault, and to protect himself from any injury, and to prevent any wrong doing. And if in all this he uses no weapons likely to produce death, and does not manifest by violence and excess a fatal purpose, he would be excused although the death of the wrong doer was the unintended result. Thus, one may turn a mere intruder out of his house, although he is quiet there, and, if necessary, put him out by force; but must not put him to death because he will not go out. But if, while using only such force as may seem necessary, he kills the intruder, he would be excused. In reference to this right of self-protection, the question has been raised whether the use of spring guns is lawful. It seems to be the law that one may use a spring gun to prevent felony, and that homicide caused by it would be excusable; but that it is not justifiable to use such instruments for protection against mere trespassers.

**HOMMAIRE DE HELL, Ignace Xavier Morand**, a French traveller, born at Altkirch, Nov. 24, 1812, died in Ispahan, Persia, Aug. 29, 1848. He studied at the college of Dijon and at the school of mines in St. Étienne, and after having been employed in railway surveys was in 1835 appointed by the Turkish government to make a scientific exploration of the region around Constantinople. In 1838

he was commissioned by the Russian government to explore the Crimea and the steppes of southern Russia. Ill health compelled him to return to France in 1842, when he presented to the academy of sciences a paper on the difference of level between the Caspian sea and the sea of Azov; and for his first volume of travels (Strasbourg, 1844) he received the prize of the French geographical society. In 1845 he was commissioned by the French authorities to explore the Black and Caspian seas; and after having made in 1846 a survey of the former and subsequently explored the interior of Persia, he succumbed to illness at Teheran. The numerous geological specimens which he had collected were purchased by the French museum of natural history. The narrative of his later travels, *Voyage en Turquie et en Perse* (4 vols., Paris, 1854-'60), was published at the cost of the French government. The fourth volume, containing an account of his last journey, was edited by Jules Laurens, the painter, who was his travelling companion.—**ADÈLE**, his wife, born about 1820, accompanied him for five years, and assisted him in *Les steppes de la mer Caspienne* (3 vols., 1844-'7), contributing the picturesque descriptions and the sketches of manners, character, and physiognomy, and in his last work on Turkey and Persia. She also published in 1845 a volume of poetry, *Réveries d'un voyageur*; and in 1860 appeared her *Voyage dans les steppes de la mer Caspienne et dans la Russie méridionale* (2d ed., 1868).

**HOMŒOPATHY** (Gr. *ὁμοος*, like, and *πάθειν*, to be affected), a system of medicine first definitely propounded by Hahnemann. (See **HAHNEMANN, SAMUEL**.) Its cardinal principle, from which it derives its name, is expressed in the aphorism, *Similia similibus curantur*, "Like cures like;" that is, the proper medicines to be administered in disease are those which produce similar symptoms in a healthy person. This principle had been partially enunciated by Hippocrates, the "father of medicine" (about 460 B. C.), who asserted that medicines sometimes acted according to the rule of *similia*, and at others according to that of *contraria*; thus intimating the truth of both the allopathic law of *contraria* and the homœopathic law of *similia*. Antiphanes, who lived about the same time, wrote a poem which contains the earliest known announcement of the homœopathic theory. Galen (born A. D. 130), the first great light in medical history after Hippocrates, first gave form and shape to that law of *contraria* which for many centuries ruled the medical world. Starting up, however, from time to time, during the centuries which intervened between Hippocrates and Hahnemann, were Paracelsus, Stahl, Haller, and others, who insisted upon the truth of the law *similia*, and pushed their investigations with more or less success in that direction; but it was not until it attracted the attention of Hahnemann that it created

much attention, or assumed the definite form of an important law in medical science. Hahnemann at the age of 35 occupied a prominent position as a scholar and chemist. While translating (1790) into German Cullen's "Materia Medica," the passage in which Cullen describes the action of cinchona bark excited his curiosity as to how this substance acted in curing ague. By way of experiment he took four drams of it in different doses, being at the time in perfect health. In a few days he experienced all the symptoms of ague. Was this ague, he inquired, the result of the action of the cinchona, or did it arise from the usual causes of the disease? There were two ways of testing this matter. One was to examine collections of reported cures, in order to ascertain whether among them any notice was to be found of instances in which the remedy employed was known to possess the property of exciting symptoms in the healthy similar to those which it cured in the sick. The other was to ascertain by experiment what was the effect of medicinal substances when taken by those in health, and then to administer them to those who were ill, and whose illness presented symptoms similar to those caused by these substances. The result of his historical researches is given in the "Introduction to the Organon of Medicine." He collected from an immense variety of sources testimony in regard to the twofold action of more than 30 medicinal substances; and one set of authorities proved the power of a certain drug to produce symptoms similar to those reported by other authors to have been cured by the very same means. Medical works in the present time are full of similar illustrations. For example, in the "Cyclopædia of Practical Medicine," edited by Forbes, Tweedy, and Connolly, we read, under the head of Fever: "Arsenical solution is the anti-periodic medicine on which, next to quinine, most reliance may be placed." One of the recognized authorities on the subject of ague is Dr. Boudin, who, after quoting a similar experience by M. Biot, says: "For my part, I saw an intermittent quotidian fever supervene, which I was obliged to combat with quinine, in a patient to whom I had given for ichthyosis about five grains of arsenic in twelve days." This occurred when there was no ague in the place. Thus, on the one hand, we have arsenic producing the disease, and on the other curing it. Dr. Copland, editor of the "Dictionary of Practical Medicine," says: "Ipecac is one of the best remedies that can be resorted to for asthma;" and Dr. Pereira, the author of the great work on materia medica, says: "In asthma benefit is obtained from ipecac in small and repeated doses." Sir John Forbes, one of the most distinguished physicians of his time, says: "Practitioners of experience, without subscribing to the doctrine of homœopathy, will certainly think more favorably of ipecac on account of its peculiar tendency

to induce fits of asthma in the predisposed." This direct antidote to asthma is known to cause asthmatic attacks in many persons. "How singular," says Dr. Marshall Hall, "that ipecac taken into the bronchia should excite asthma." "If I remain in a room," says Mr. Roberts of Dudley, "where the preparation of ipecac is going on, I am sure to have a regular attack of asthma." Sulphur cures peculiar forms of eruptive diseases; and all frequenters of the baths of sulphurous waters are acquainted with its effects in producing similar eruptions. Laennec, the discoverer of the stethoscope, says of tartar emetic: "From its use we sometimes find patients, doomed to almost certain death, out of all danger after the lapse of a few hours, without having experienced any evacuation or change but the rapid and progressive amelioration of the disease." Dr. Williams, a celebrated medical author, says: "Next to blood-letting tartar emetic is the most powerful remedy we can employ for the cure of acute pulmonary inflammation." Tartar emetic, according to these writers, and very general experience, cures pulmonary inflammation. The great French physiologist Magendie made this drug the subject of special experiment. After describing other changes it produced in animals which he poisoned with it, he says: "It acts specifically in inflaming the lungs." M. Pelletier, who has written the best monograph on this drug, says: "Its effect on the respiratory organs is to produce difficulty of breathing in dogs; the lungs were found hepatized. One would imagine that, admitting its action in man to be similar, far from being useful, its administration would be particularly pernicious in the treatment of pneumonia."—For several years Hahnemann seemed to be groping among specifics before he discovered the key to their successful administration. Medicines were given at first in massive doses, which, notwithstanding they generally cured the patient, sometimes produced fearful aggravations. At length, after a long course of experiment, the idea became firmly established in his mind that the organism through disease became exceedingly susceptible to the action of a drug given in accordance with the law of *similia*, and whose action was that of a direct specific on the diseased part. In 1799 an unusually fatal epidemic of scarlet fever prevailed at Königsbutter. Hahnemann, guided by the law of *similia*, selected belladonna as the appropriate remedy, administering it in minute doses; the curative effect was marked and decided. In 1801 his experiments with belladonna in scarlet fever were published at Gotha, and created much interest and no little opposition in Germany. In the same year he published a reply to the objections raised against his statements on the ground that so small a dose must be powerless, in which he says: "To the ordinary practitioner it is incredible that a person when sick is violently affected by a millionth part of

the same drug that he swallowed with impunity when he was well. Will physicians ever learn how infinitely small may be the dose that is sufficient for a cure, when the system of the patient is raised to a condition of intense and morbid sensitiveness? So powerfully do such small quantities act upon the over-sensitive frame, that the most serious disease is sometimes subdued in a few hours." Dr. Jörg, one of the most distinguished opponents of Hahnemann, says: "Medicines operate most powerfully on the sick when their symptoms correspond to the disease. Where there is inflammation of the intestines, a very minute dose of mercury will produce pain and other symptoms. It is in the very nature of things that a medicine must have a much greater effect when administered to a person already suffering under an affection similar to that which the medicine is capable of producing." Photography, according to homœopaths, presents a striking illustration of this idea. The healthy body, they say, may be compared to the plate before it has been washed, when it reflects the rays of the sun without its surface being at all affected by his influence; and the unhealthy body to the same plate washed by a chemical process, and thus rendered so sensitive to light that the faintest ray makes on it an indelible impression.—Thus far Hahnemann's knowledge of the specific action of medicine had been derived mostly from his collection made from medical history. But this, although sufficient to establish in his mind the truth of the law of *similia*, was not sufficiently accurate to serve as a foundation upon which to build the structure of a thoroughly scientific system of therapeutics. In 1805 he published a work on the positive effects of medicine and the effects produced by them on the healthy body, containing his observations upon 25 substances, most of them powerful vegetable medicines, in which their toxicological action, as shown by actual experiment on the healthy living body, is minutely described. In conducting his experiments, the substance to be tested was distributed among his assistants, who each took a succession of doses and carefully recorded the symptoms. These were compared with his own; and several years after, when the same drugs were re-proved by a society at Vienna, every one of the observations of Hahnemann was confirmed. In 1831 the cholera first invaded Europe. In Hungary 8,000 died out of 10,000 who were seized. Medicine seemed powerless, and the consternation was universal. Hahnemann, guided by his law of *similia*, selected camphor as the appropriate remedy to be given at the first onset of the disease; and experience has since justified the wisdom of his selection. Other remedies were pointed out in the different stages of cholera, but the usefulness of camphor, given according to Hahnemann's directions, is now generally admitted.—To be guided intelligently by the law of *similia*, the

keynote of their system, homœopaths believe we must have an accurate picture of the pathological changes resulting from the drug as indicated by the appearance of tissues after death, and its action as shown upon the living structure in vivisection. For this the most careful observation is required—not only the selection of cases of accidental poisoning, and others from historical records and daily practice, but the actual placing of the system under the direct action of the drug, and the careful noting of each individual symptom. Hence has arisen the plan of "proving" medicines, as inaugurated by Hahnemann, and which they claim as the only correct basis of a true scientific materia medica. Their materia medica is made up of drugs so tested by several observers, and the symptoms corresponding noted as the characteristic ones of the drug. Growing out of this law, as a natural sequence, and forming the second grand division of the system, is that of the dynamization of medicines. The system having become sensitively acute to the action of a drug, this, when given homœopathically, or in accordance with the law of *similia*, should be given in a dose so minute as only to act on the part morbidly susceptible. If given in too large doses, so as to produce its primary or drug action, no relief would be obtained, but harm might ensue; while if given in too small doses, no action whatever would result. Hence the importance not only of the homœopathic selection of the remedy, but its administration in doses of only sufficient strength to produce its tonic or curative action. The homœopath insists upon the positive purity of his drugs, and in those of a vegetable character usually prefers the expressed juice, discarding the inert material. By the process of dynamization, in which the particles are more completely broken and subdivided, it is believed the latent power or life of the drug is often set at liberty, and materials which in their crude state are almost inert are found to possess a strong influence as remedial agents. Thus mercury or quicksilver in its crude state has no medicinal action; but when its particles are subdivided by trituration with a non-medicinal substance, the conserve of rose, we get blue mass, or blue pill, whose power is well known. So, in the preparation of homœopathic attenuations, the crude drug, carefully divested of impurities, is triturated thoroughly with a non-medicinal substance, sugar of milk, or dissolved in alcohol or distilled water. One grain of the crude drug triturated with nine of sugar of milk, or dissolved in nine drops of alcohol, forms the first decimal attenuation; and one part of the drug combined with 99 of the sugar of milk or alcohol forms the first centesimal attenuation. To get the second decimal or centesimal, one part of the first is combined with 9 or 99 parts of the non-medicinal substance; and so on through the successive steps of the process. The first step is to select the drug homœopathic

to the disease, and give it either in its crude form or in its attenuation, as best seems to meet the exigencies of the case.—What homœopaths claim as cardinal principles are: 1. The law of *similia*, or the treatment of disease by medicines whose effects, tested on the living, healthy organism, are similar to the symptoms present in disease. They do not claim this principle as universal or exclusive, since medicines are often required for their mechanical, nutritive, and chemical effect; but they assert that it is of great value, and, when carefully considered and correctly applied, gives when indicated the most satisfactory results. 2. They assert that the law of *similia* demands an intimate knowledge of the effect of the drug upon the healthy organism. The question of dose is left to the individual judgment of the practitioner; but when given in accordance with the law of *similia* it is found that a greatly reduced dose gives the most satisfactory results. The homœopathic doctrine, as above stated, admits of a wide diversity on minor points. Some in this school confine themselves to the high potencies; but the majority range in their prescriptions from the crude drug up through what are called the lower potencies; all however admitting, as the key-stone of the system, the law of *similia*.—In 1825 homœopathy was introduced in the United States by Hans B. Gram, a native of Boston, but educated in Copenhagen. His success attracted the attention of several physicians, among whom were Gray, Channing, Willson, Hall, and Hering. A careful study of the principles of the new theory secured their adherence; and its success, not only in ordinary diseases, but in usually fatal epidemics, soon won for the system a large support. In the United States the school now (1874) numbers about 6,000 physicians. There are nine homœopathic colleges, which at the session of 1872-'3 graduated 204 students. Every college has a dispensary connected with it for clinical teaching, and five have flourishing hospitals; and there are 32 dispensaries not connected with any college. There are 31 hospitals and asylums under the charge of this school.—The school, for its age, is rich in practical literature. Among the important works are: Hahnemann's *Organon*, *Materia Medica Pura*, and "Chronic Diseases;" Hartmann's "Acute and Chronic Diseases;" Jahr's *Symptomen-Codex* or "Manual of Materia Medica;" Bönninghausen's "Therapeutics;" Baehr's "Theory and Practice;" Grauvogel's "Practice;" E. Guernsey's "Practice;" H. H. Guernsey's "Obstetrics;" Dudgeon's "Lectures;" Hempel's "Materia Medica;" Helmuth's "Surgery;" and Franklin's "Surgery." There are also published in the United States 13 periodicals devoted to homœopathy.

**HOMOIOUSIANS** (Gr. *ὁμός*, the same, and *οὐσία*, being, essence), in ecclesiastical history, a term which was originated in the 4th century to distinguish the Athanasian or orthodox party from

the Arians, who were called, among other names, Heterousiasts (*ἕτερος*, different, and *οὐσία*), and the Semi-Arians, who were termed Homoiousians (Gr. *ὁμοιος*, similar, and *οὐσία*). The Homoiousians maintained that the Son was of the same essence as the Father; the strict Arians, that he was of different essence; and the Semi-Arians, that he was similar to the Father in essence, but not identical with him. (See **ARIANISM**.)

**HOMOPTERA.** See **HEMIPTERA**.

**HOMPESCH, Ferdinand von**, the last grand master of the order of St. John, born in Düsseldorf, Germany, Nov. 9, 1744, died in Montpellier, France, in 1803. He was of a noble Prussian family, and at the age of 12 went to Malta, where he became a page of the grand master Rohan, and gradually rose to the rank of grand cross, through the influence of Austria, of which he was for 25 years the representative at Malta. In 1797 he became grand master, succeeding Rohan. In June, 1798, Bonaparte, on his way to Egypt, touched at Malta and took possession of the island, seizing 1,200 guns and a large amount of treasure. Hompesch received 100,000 crowns as the value of his plate, and was offered an annuity of the same amount, which he refused to accept. He was sent to Trieste, and upon his arrival there protested against the seizure of Malta, and made over his grand mastership to Paul I., czar of Russia, who granted him a pension. This ceasing on the death of the czar, Hompesch fell into want, and went to France to urge the French government to pay him the annuity which he had previously declined. He received a grant of 5,000 francs in 1803.

**HOMS, Hums, or Hems** (anc. *Emesa* or *Emissa*), a fortified city of Syria, 90 m. N. by E. of Damascus, about 1 m. from the river Aasy or Orontes; pop. about 30,000, including 7,000 Greek Christians. It is a prosperous town, having considerable trade, and manufactories of woollen, cotton, and silk fabrics, and of gold and silver thread. The houses are built of black basalt, and many of the streets are paved with the same material. In pagan times Emesa was celebrated for its magnificent temple of the sun, one of whose priests, Elagabalus, was made emperor of Rome in A. D. 218 by the legions of Syria. Odenathus, husband of Zenobia, the renowned queen of Palmyra, was murdered in this city in 266, and Zenobia herself was vanquished in its vicinity, in 273, by the emperor Aurelian. Lying in the direct route which an army must traverse in passing between Egypt and the Euphrates, the ancient Emesa was occupied in turn by invaders from either direction. In 636 it was captured by the Saracens, and it passed under the control of the successive Moslem dynasties. In 1099 it was taken by the crusaders, and in 1175 by Saladin. After many vicissitudes it was in 1517 added to the Ottoman empire. In July, 1832, Ibrahim Pasha of Egypt here gained a decisive victory over the pasha of Aleppo. In 1840 it was with the

rest of Syria restored to Turkey by the intervention of the European powers.

**HONDURAS**, a republic of Central America, lying between lat.  $13^{\circ} 10'$  and  $16^{\circ} 5' N.$ , and lon.  $83^{\circ} 12'$  and  $89^{\circ} 47' W.$ , and bounded N. and E. by the Caribbean sea, S. by Nicaragua (from which it is separated for about half its length by the river Segovia), the Pacific, and San Salvador, and W. and N. W. by Guatemala; length from E. to W., 440 m.; greatest breadth N. to S., 200 m.; area, about 50,000 sq. m. The coast line on the Atlantic is much more extensive than that on the Pacific, its length being about 400 m.; it is comparatively even, low and marshy E. of lon.  $85^{\circ}$ , and often high and rocky W. of that point. The Pacific coast line is but 60 m. in length, very irregular and

low, and subject to inundation by spring tides. Both coasts are unhealthy, but the miasmatic influence does not extend far inland. Off the Atlantic coast are Ruatan, Guanaja or Bonaca, Utila, Helena, Barbaretta, Morat, and other smaller islands dependent upon the first, the whole group being known as the Bay islands, and under the jurisdiction of Jamaica. They are chiefly inhabited by British subjects, an occupation in violation of the express terms of a treaty made with the United States in 1850. Guanaja is celebrated as having been the point from which Columbus in 1502 descried for the first time the Central American mainland. The principal ports of Honduras, which are among the most commodious in Central America, are Omoa, Trujillo, Puerto Cortés (formerly called

Puerto Caballos), and Amapala; the first three are on the Caribbean sea, and the last on Fonseca bay in the Pacific. That of Omoa, formed by a small bay opening to the N. W., and offering safe anchorage to vessels of the deepest draft, is the exporting and importing centre for the departments of Yoro, Olanchito, and part of Tegucigalpa; the town, situated  $\frac{1}{2}$  m. from the harbor in a marshy region, is very unhealthy. Trujillo, on a delightful bay of the same name, was an important shipping town in colonial times; but being situated so far from the populous parts of the country and the more frequented paths (there being no roads), it has gradually lost its prestige. Puerto Cortés was for more than two centuries the principal entrepot on the coast; it stands on a bay 9 m. in circumference, at a short dis-

tance from Omoa, and may be entered by the largest ocean steamers, which there find secure mooring ground and convenient docks. Amapala, on the N. E. shore of the island of Tigre, facing the island of Sacate Grande, the only port of Honduras on the Pacific, has excellent anchorage, thorough shelter, and good facilities for repairing ships. All the ports in the republic are now free; that of Amapala was declared so in 1857, the inhabitants being exempt from military service and all imposts, save in time of war, and from tithes and excise. The bay of Fonseca, washing the shores of San Salvador, Honduras, and Nicaragua, is about 35 m. long and 45 m. wide, and contains the finest "constellation of ports" on the W. coast of America. Among its numerous islands are Sacate, the largest, and Tigre, rising like a

huge cone to an altitude of 1,950 ft. Tigre is 20 m. in circumference, and is mainly covered with valuable timber.—Taken as a whole, the face of the country is essentially mountainous, and though nowhere attaining an elevation equal to the greatest in Guatemala, the surface is more diversified than in that state. The only consecutive chain of mountains is the Sierra Madre, which enters the republic at the west from Guatemala, and separates in the knot of Merendon into two great branches, N. E. and S. E. The former reaches to the bay of Honduras, terminating in the mountains of Omoa, the mean altitude there being 8,000 ft., and the maximum 9,000 ft.; it takes in its course thither the names of Sierra del Espiritu Santo and Grita. The latter, trending first S. E., then E., under the name of Pacaya mountains, deflects to the N. W., and forms the great knot designated as the Selaque mountains, whose highest peak, 10,000 ft., may be regarded as the culminating point of Honduras. N. E. of the Selaque group are the Puca mountains, presenting also a lofty peak, and connected by a S. E. range of comparatively low hills with the Opalaca chain, which is in turn linked by another series of hills curving S. and W. to the mountains of San Juan, and these again to the Montecillos chain, N. of which are two parallel chains, Santa Barbara to the west and Canchia to the east, separated by the broad valley of Lake Yojoa. The republic is here bisected by the valleys of the Humuya-Ulua system and the Goascoran, which rivers, rising in the same ridge S. E. of the Montecillos, flow N. and S. respectively, the Ulua to the bay of Honduras, and the Goascoran to Fonseca bay. East of this bisecting line are the Comayagua mountains, with a few lofty summits; the Lepaterique chain lies S. of these, and the remarkable Sulaco group N. E., sending down from their elevated crests waters to either ocean. Due S. of the Sulaco knot are the Chili mountains, forming part of the southern boundary with Nicaragua; and due N. of it, near the Atlantic coast, rise the Congrehoy peaks, ranging in height from 5,500 to 8,000 ft. Of the orography of the country stretching E. of lon.  $86^{\circ} 30'$  nothing definite is known. The N. E. portion has successive mountain ranges, some of which descend to the very coast, while others dwindle at a considerable distance inland; and all are separated by vast terraced plains, such as those of Yoro and Olancho, celebrated for the number and excellence of their cattle, but inhabited only by tribes of savage Indians. A feature worthy of remark in the mountain system of Honduras is the absence of the volcanic coast range on the Pacific, which is so extensively developed in the other Central American states, especially in Guatemala and San Salvador, but which is here represented by the numerous volcanic islands dotting the bay of Fonseca, supposed to have been itself formed by volcanic agency. The plain of Comayagua is

of extraordinary beauty; it is about 40 m. long from N. to S., with a mean breadth of perhaps 10 m.; and with it may be enumerated the plain of Espino immediately N. and almost contiguous to it; that of Sensenti, walled round by the Merendon, Pacaya, and Selaque mountains; and still others, all extremely picturesque and fertile.—In Honduras, as elsewhere in America, the principal rivers flow to the Atlantic. The Segovia, called also Coco, Oro, and Wanks, already mentioned as forming a portion of the southern boundary, receives its principal waters from Honduras, and hence should be regarded as forming a part of its river system; its course, about 350 m., through an unbroken wilderness, is over a rocky bed, which, together with a succession of rapids, renders the river unnavigable except by canoes. The largest river entirely within the territory is the Ulua, formed by the united waters of the Santiago and Humuya, with their respective tributaries the Santa Barbara and Sulaco, and holding a course N. by E. to the Atlantic, into which it falls about lon.  $87^{\circ} 49'$ ; the Humuya is the main branch, rising in the mountains on the southern border of the plain of Comayagua. There is but 9 ft. of water on the bar traversing the mouth of the Ulua, but steamers of small draft can ascend as far as the junction of the Santiago, a distance of about 70 m. by the course of the stream. The aggregate waters of the Santiago-Humuya system are computed to drain nearly one third of the territory of the republic. Next in order is the Rio Tinto, rising in the mountains bordering the valley of Olancho, in the N. E. portion of the country, and with a course of perhaps 150 m.; but its shallowness, and a bar with but 7 ft. of water at the entrance, impede its navigation except by small craft, which go up about 60 m. The Patuca, still further E., is a powerful stream, receiving tributaries of considerable magnitude from most of the mountains in the vast department of Olancho; one of these tributaries, the Guayape, is about 250 m. long, and remarkable for its extensive gold washings; the whole course of the Patuca proper is probably not less than 200 m. Its bed presents similar obstructions to those of the other rivers named, but in spite of this the Patuca is said to be navigable for small steamers as far as the Portal del Inferno, and to be for commercial intercourse with the interior the best river on the E. coast of Central America. The Chamelican rises in the Merendon mountains, and after a serpentine course, generally N. E., discharges into the Caribbean sea a short distance W. of the Ulua; its valley abounds in valuable products, but it has little capacity for navigation. The other streams, mostly descending from the Sulaco mountains, and the largest of which are the Lean and the Aguan, are relatively unimportant. Two fine rivers flow southward to Fonseca bay: the Goascoran, which rises but a few miles S. of the head waters of the Humuya, and is about 80

m. long, and easily fordable in the dry season; and the Choluteca, which rises on the northern slope of the Lepaterique mountains, around the N. E. extremity of which it sweeps, and then runs S. W., having a total length of more than 150 m., and passing the cities of Tegucigalpa and Choluteca. Large canoes (*bongos*) and other light craft navigate the latter to a considerable distance from the sea. The only lake of note is that of Yojoa, in the bottom of the valley between the mountains of Santa Barbara and Cancchia, at an elevation of 2,050 ft.; it is 25 m. long by about 7 wide, with an average depth of 4 fathoms; it sends to the Humuya two tributaries, the Santa Barbara from its southern extremity, and the Blanco from its northern, which join the Humuya within two or three miles of each other. Near the E. shore of Yojoa an immense spring of crystalline bluish water, 75 ft. in diameter, gushes from the earth, and flows into the lake in a volume equal to that of any of the outlets of the latter. The eastern portion of the Caribbean coast is lined with salt-water lagoons and marshes, some of the former being of considerable extent, such as the Laguna de Cartago, 40 m. long, and the Laguna de Cartine, 50 m. long.—Mining, in early times the absorbing industry of the country, has dwindled almost to insignificance for lack of capital and enterprise, and of suitable roads for the transport of adequate machinery to the mining districts. Civil strife has also contributed to restrict operations, and hundreds of mines susceptible of being profitably worked are abandoned in every part of the country. Silver and gold are the most abundant metals; the silver mines lie mostly in the S. W. ranges of mountains, while gold is more plentiful toward the Atlantic. The chief silver mines are those of Tegucigalpa and Gracias; the mineral is there found in various combinations with iron, lead, copper, and sometimes antimony, while chlorides are among the richest of all the ores. Few gold mines are now worked, those of San Andrés in the department of Gracias, and others near San Juan Cantaranas in Tegucigalpa, forming almost the only exceptions. The rivers Guayape and Jolan, as also the Guayambre, in the department of Olancha, abound in auriferous sands, the washing of which is still extensively carried on, and yields handsomely. Copper mines are numerous and of great value; but most of them have been abandoned, or rather were never worked except in the search for silver. Coal exists in several localities, and there is an abundance of limestone, veined, white, and blue, in every part of the republic, and especially in the transverse valley extending from Fonseca bay to the bay of Honduras; and there are quarries of beautiful marble suited for statuary in the Omoa mountains. Ancient monuments in the vicinity of Copan, near the Guatemala frontier, and of the same or a kindred type with those of Palenque, would seem to point to the early

occupation of that region by a civilized people. (See COPAN.)—The climate is hot on the Caribbean coast, but remarkably mild and equable in the highlands, the temperature varying for the whole year from 62° to 86° F., according to elevation. In the interior the months of April, May, and June are the hottest, while in November, December, and January the atmosphere is sufficiently cool to admit of fire. Elsewhere than on the Caribbean coast the dry season lasts from November to June, little rain falling during that period. The rainy season is usually ushered in by violent thunderstorms, which rarely occur in the forenoon; while thunder, accompanied by northers, is frequent at the end of that season. Squier says that "there can be no generalization on the subject of the climate of Honduras, except so far as to say that it has a variety adapted to every caprice, and a temperature suitable for the cultivation of the products of every zone." Miasmatic and intermittent fevers are only known on the coast; goitre is prevalent in the highlands.—The soil of Honduras is extremely fertile; in the coast regions the various species of tropical vegetation are luxuriant; and on the elevated table lands of the interior maize and the several European grains yield ample harvests with the rudest cultivation. The sugar cane is indigenous in Honduras as in the other Central American states, and of a distinct species from that cultivated in the Antilles; it thrives well in all parts of the country, even at elevations of 4,000 ft. Coffee likewise flourishes, but its culture is greatly neglected; indigo and other dyes are produced in limited quantities; but cochineal is no longer an object of care, although the nopal abounds in the plain of Comayagua, and its leaves are covered with the webs of the *cochinilla silvestre* or wild cochineal. Tobacco of excellent quality is raised, and even exported at times to Cuba, where it is prepared and sold as of native production. Pimento, capsicum, and many other spices are plentiful. The various fruits and vegetables of the temperate zone abound in the interior and require but little care; manioc is everywhere produced; and the yams of Omoa are celebrated alike for their prodigious size and exquisite flavor. The arboreal vegetation of Honduras is unsurpassed by that of any other region N. of the Orinoco; the mahogany, rosewood, and other precious cabinet woods, together with the vast forests of timber for constructions of all kinds, may be classed among the chief sources of the national wealth. Fustic, Brazil wood, annatto, and other dyewoods, and also gum and medicinal trees and plants, as copaiba, copal, liquidamber, and India-rubber trees, ipecacuanha, the palma Christi (yielding castor oil), and many others, are very abundant.—The indigenous fauna includes animals both of more northerly and of the equatorial regions. The felidæ comprise the jaguar, puma, black tiger (*felis discolor*), and ocelot; the coyote or Mex-

ican wolf is common; there are several varieties of armadillos and ant-eaters; pacas are numerous, and their flesh is by some accounted a delicacy; and to these may be added two species of deer, red and brown, peccaries, wares (wild hogs), tapirs, raccoons, opossums, squirrels, and hosts of monkeys of different varieties. Alligators abound in every river and lake, and sharks along both coasts. Lizards of various kinds are extremely numerous, among them being the iguana, often 4 ft. in length, the flesh of which is commonly eaten. The rattlesnake and corral are the only venomous serpents, but many harmless species exist. The green and hawksbill turtles, the latter furnishing the tortoise shell of commerce, and many kinds of land turtles, are found. Endless varieties of edible and other fish inhabit the rivers and lakes, and abound on the coasts; and there are several species of edible mollusks, and crustaceans, such as oysters, lobsters, crabs, &c. Bees are plentiful and yield large quantities of honey. Mosquitoes are unknown, save in the marshy regions of the Caribbean coast, where the *nigua*, a small insect which burrows under the skin of the feet producing sluggish sores, is also found in considerable numbers. Tarantulas, scorpions, and enormous scolopendræ infest all regions; and myriads of locusts sometimes visit the country, darkening the air as their column passes, and utterly destroying every green thing where they alight. Hawks, vultures, and zopilotes or turkey buzzards are the only predatory birds; pelicans and many other aquatic birds abound; partridge, quail, snipe, pigeons, wild turkeys, plovers, and similar birds are numerous in the interior; humming birds of many varieties are found, as are also numerous species of warblers.—Agriculture is extremely backward; laborers are scarce, and the natives are strongly opposed to continuous exertion, especially in the open air; so that even the comparatively small portion of the country under cultivation is very imperfectly tilled. In the plains of the interior large numbers of cattle, horses, asses, and mules find rich and abundant pasture; yet little care is taken of these animals, except the mules, by which almost all the carrying trade is performed; and the quantities of hides and other animal products exported are comparatively insignificant.—The manufactures consist exclusively of coarse woollen stuffs and rude utensils for domestic and field uses, and are analogous to those of Guatemala and Mexico. Mahogany cutting is an important occupation during the months of August, September, and October. Of the commerce of the republic it is difficult to give accurate statements, there being no official returns published. The chief staples of export are mahogany, tobacco, cattle, hides, sarsaparilla, indigo, and other dyestuffs. According to a communication of President Medina in 1872, the value of the exports may be estimated at \$1,230,000, dis-

tributed as follows: bullion, \$600,000; indigo, \$200,000; cattle, \$150,000; timber (mahogany, &c.), \$180,000; hides, &c., \$100,000. The imports comprise cotton and silk fabrics, hardware, and machinery, the first two mainly from Great Britain, and much of the others from the United States. The internal communication is chiefly effected, as already observed, by mules; on some of the rivers, however, the transportation is carried on in bongos or large canoes. There is an interoceanic railway in process of construction from Amapala to Puerto Cortés, through the transverse valley of the Goasoran and Humuya rivers; the total length is to be 232 m.; the first section, extending from Puerto Cortés southward 56 m., is built, and it was reported in 1873 that the traffic was already sufficient to almost meet the running expenses. The line, according to the terms of the contract, was to have been completed in 1872; but it has been retarded by civil wars and the lack of adequate capital. A material drawback to the public welfare is the want of suitable roads, very few worthy of the name as yet existing. In 1873 some measures were taken by the government for repairing a road leading from the capital to Potrerillos, and otherwise facilitating the transportation of merchandise.—Honduras is divided into the seven departments of Choluteca, Comayagua, Gracias, Olancho, Santa Barbara, Tegucigalpa, and Yoro, each of which is subdivided into districts. The same uncertainty attends the statistics of population as those of commerce; no official census has ever been taken, nor has the government published any data on the subject. It may fairly be presumed, however, that Honduras has 400,000 inhabitants, of whom some 184,000 are Indians, 205,000 mestizos, 5,750 whites, and 5,250 negroes. The whole country E. from the longitude of the river Aguan is almost exclusively occupied by independent aboriginal tribes, the two best known of which are the Jicaques and the Poyas, both probably being branches of the Carib stock. Numbers of them have embraced the Catholic faith, and are fairly entered upon the career of civilization; their chief occupation is husbandry. There is in the region adjacent to the Laguna de Cartago a people called black Caribs, who have evidently a large admixture of African blood. The whites are mostly descended from the early Spanish settlers; they inhabit the larger towns, especially the seaports, and the extensive haciendas scattered through the interior in the western portion of the country.—The government is based upon a charter promulgated in November, 1865. The executive power is vested in a president elected for a term of four years, and aided in the administration by a council of state composed of two ministers appointed by himself, a senator elected by both houses of congress, and the judge of the supreme court. The legislative power rests in a congress consisting of a senate and a chamber

of deputies. The finances of the republic are in great disorder, nor can any definite statements thereof be obtained, inasmuch as the receipts of the custom house are usually farmed out to merchants and other capitalists, whose interest it is not to make regular returns. The revenue, one third of which is derived from imports, is estimated at \$400,000 annually. Nothing is known of the home debt; the foreign debt amounted at the end of 1872 to \$29,950,540, made up of three loans: the first contracted at the London stock exchange in 1867, for the nominal amount of £1,000,000; the second issued at the Paris bourse in 1868, for the nominal amount of 62,252,700 francs; and the third negotiated at the London stock exchange in 1870, for the nominal amount of £2,500,000. The English loans were at 10 per cent. interest, and issued at the price of 80; and the French loan at 6 per cent., issued at the price of 75; and all were raised for the purpose of constructing the interoceanic railway. In May, 1872, the Honduras government issued in London the prospectus of a "10 per cent. ship railway loan" of £15,000,000, "for the purpose of adapting the railway now in course of construction to a ship railway across the republic of Honduras," that is, "a railway capable of conveying ships of heavy tonnage, without disturbing the cargo, between the Atlantic and Pacific oceans, to and from Puerto Cortés and Fonseca bay." This loan, which was to be in 150,000 bonds of £100 each, at the price of 80, and to be repaid in 15 years, met with no subscribers in England.—Education is at a low ebb, there being, besides the so-called universities of Comayagua and Tegucigalpa, very few schools, and those existing devoted only to the primary branches. Indeed, the children of such as can afford the expense are sent either to Guatemala or to Europe for their education. President Arias, shortly after his accession in 1872, signified a desire that an adequate number of public schools should be established throughout the country. The religion of the people is the Roman Catholic, under the jurisdiction of the bishop of Comayagua.—The coast of Honduras was discovered by Columbus in 1502; and in 1526 Cortes, at the head of an army which he brought from Mexico, composed of Europeans and Indians, took possession of the country, and founded the towns of Trujillo and Puerto Caballos (now Puerto Cortés). The whole known portion of Central America was shortly afterward proclaimed to belong to Spain, and placed under the government of the *audiencia de los confines*, the seat of which was fixed at the present town of Gracias, which from that circumstance rose rapidly in importance. In 1823 Honduras entered into the Central American confederation; but it became an independent republic in 1839, and took part in the wars and intrigues which followed each other in rapid succession till 1862. Civil strife also contributed to retard the material progress of

the country. In 1861, for instance, many attempts were made at insurrection, the principal instigators being the clergy, who preached dissension from the pulpit. Guardiola, who was at that time president of the republic, thwarted all their designs, but granted a universal amnesty, not excluding even the vicar, who was the chief promoter of the discontent. Guardiola was shortly after assassinated, and Montes succeeded him. One of his first acts was to make a treaty of alliance with San Salvador against Guatemala and Nicaragua. His army was defeated at Santa Rosa in Guatemala, and one of his generals, Medina, joined the victorious army of the enemy, overthrew Montes, and caused himself to be proclaimed president (July, 1863). Medina resigned the government in 1864, but was immediately re-elected; and he continued in the presidency until his deposition in 1872 by Don Celeo Arias, now (1874) provisional president of the republic. A treaty of peace and amity with Spain was signed March 15, 1866.

**HONDURAS, Bay of**, a large triangular body of water, an arm of the Caribbean sea, lying between the republic of Honduras and the peninsula of Yucatan. It is remarkable for its great depth of water, which some writers suppose to have originated the name Honduras (Sp. *hondura*, depth), subsequently applied to a portion of the mainland. The S. W. portion of the bay, penetrating into the continent, between Guatemala and Honduras, is known as the bay of Amatique. Along the coast of the peninsula of Yucatan the bay is studded with coral keys or cays, which form an almost continuous line, at a distance of 10 to 25 m. from the shore, and act as a kind of natural break-water to the continent. It was in the smooth water behind these keys that the bucaners, well acquainted with the intricate channels between them, found refuge against the attacks of the Spanish fleets. Approach to the peninsula is at all times difficult and sometimes dangerous, and many vessels are annually lost in endeavoring to reach the coast of British Honduras. The most dangerous reefs or banks are those of Chinchorro, or the Northern Triangles. On the side of Honduras the bay is open, the water deep, and navigation only impeded by the group of islands known as the Bay islands, which however are high, and easily avoided by mariners. The waters of the bay are generally tranquil, and storms occur only during the prevalence of the northers in the gulf of Mexico, which sometimes sweep over it, but with diminished force. Few of the cyclones of the Antilles reach the bay of Honduras.

**HONDURAS, British, or Balize**, a British colony occupying the extreme N. E. corner of Central America, and lying between lat. 15° 54' and 18° 30' N., and lon. 88° and 90° 30' W. It is bounded N. W. and N. by Yucatan, E. by the bay of Honduras, and S. and S. W. by Guatemala; area, about 13,500 sq. m.; pop. in 1871,

24,710. The people are mainly negroes, the descendants of slaves, with some Caribs springing from refugees from San Vicente, who first established themselves on the northern coast of Honduras, and after the independence of that republic settled in Balize. There are some other Indians in the colony, originally from Yucatan; but of the aboriginal tribes, traces of whose handiwork still exist in the tumuli called by the mahogany cutters "Indian hills," none are now to be found anywhere E. of the Chama range of mountains. Balize, the capital and the only town of importance, has a population of about 6,000, which at Christmas time, however, owing to the mahogany trade, increases to about 15,000. The surface of the country is very irregular, though none of the mountains attain a greater elevation than 4,000 ft. The coast is generally low and swampy, and the shore is studded with islets or keys, clothed with a dense arboreal vegetation. These keys, while they serve as a natural breakwater and so afford secure refuge for ships save when northers prevail, render the approach difficult. The country on receding from the coast completely changes its aspect, rising into low hills separated by delightful valleys; and in the south are several parallel ridges, the highest of which are the Cockscomb mountains. The rocks are principally primary and calcareous. Gold has been discovered in the streams; valuable specimens of crystals have been found; and strata of fine marble and alabaster formations are known to exist.—Of the rivers, the Hondo, forming the northern boundary with Yucatan, is the longest; it rises in or near Lake Gumustan in Vera Paz, and has a generally N. E. course of perhaps 250 m. to its mouth on the Caribbean shore. The Balize rises in the same region, holds a N. E. by E. course of about 200 m., and discharges into the Caribbean sea by one mouth at the town of the same name, which it divides into two portions, and by another  $3\frac{1}{2}$  m. N. Laboring creek, a branch of this river, about 100 m. inland, is remarkable for the petrifying properties of its waters, which have a cathartic effect upon strangers, and a healing property when applied to ulcers. New river, between and parallel to the two first mentioned, is also a fine stream, issuing from an extensive lagoon. About 35 m. S. of Balize is the river Manatee, which one mile from its mouth spreads into a magnificent sheet of water, several leagues in extent; the picturesque of the scenery surrounding this lagoon is greatly enhanced by the mountains of the same name, rising on its southern margin to a height of 1,000 ft. The Sibun, a short distance N. of the Manatee, is like that remarkable for rapids of considerable acclivity, as also for a series of singular and beautiful caves excavated by the waters. Still further S. a half dozen other streams of minor proportions hurry by short courses to the sea. The climate, though generally mild, is said to

be unfavorable to Europeans; the heat rarely exceeds 83° F., and the annual mean is considerably less than this at Balize and along the whole coast, where tempering eastern breezes prevail nine months in the year. During the wet season from June to October heavy rains are frequent, and the malaria arising from the decomposition of organic matter in the lowlands renders this period unhealthy. The soil in most parts is very fertile. In this respect the country is distinguished into two divisions, the pine and the Cahoum ridges. The subsoil in the first is composed of a loose reddish sand, peculiarly genial to the pine from which it takes its name, and similar productions; and extensive prairies also cover this soil. In the Cahoum ridge the soil consists of a rich deep loam, suitable for every species of European and many species of tropical food plants; brushwood grows thickly here, and the wild cotton and other large trees abound. Rice and arrowroot are cultivated to a limited extent, maize thrives well, yams and manioc are largely produced, and there is a great variety of spontaneous tropical fruits. Sugar, coffee, cotton, and indigo are comparatively neglected, in spite of the suitability of the soil for their culture. Tobacco culture has proved remunerative, and the quality of the plant is little inferior to that of the finest Cuban. The want of adequate capital and labor prevents the extension of agricultural industry. A company was formed about 1865, with a considerable capital, for the production of sugar; but their efforts have not been very successful. The great staple of export is mahogany, the felling of which constitutes the main industry of the inhabitants, who float the logs down the rivers, and bring them for sale to Balize at Christmas time. As many as 10,000,000 ft. of the wood have been exported in a single year. Logwood, next in importance after mahogany, is found in immense quantities; and the cahoum palm, from the nut of which is extracted an excellent oil for exportation, likewise abounds, especially in the Cahoum ridge. The *pinus occidentalis*, growing to a height of 60 ft., is valuable for its tar and turpentine. The fauna of this territory is exactly similar to that of Honduras.—The articles exported are mainly mahogany, logwood, and other dyestuffs, sugar unrefined, coffee, raw cotton, and India rubber. The value of exports to Great Britain for five years was: 1868, \$703,600; 1869, \$946,050; 1870, \$480,110; 1871, \$780,185; 1872, \$879,090. The imports from the same country in the same period were as follows: 1868, \$668,775; 1869, \$634,130; 1870, \$801,280; 1871, \$829,385; 1872, \$737,960. A curious article of export is the queen conch shell, abundant on the coral reefs which fringe the coast; 12,000 of these were sent in one year to Paris, to be worked into cameo brooches, shirt studs, &c. The total value of the exports and imports in 1871 was \$1,856,845. Internal communication is here hindered by the same diffi-

culties as in the neighboring states. The revenue in 1872 amounted to \$193,595; and the public debt in the same year was reduced to \$112,650. The colony contributes about \$25,000 toward defraying an expense of \$66,820 incurred annually by the mother country for maintaining a military station here. Education is little attended to, and the few schools have but a small attendance. The government of British Honduras has been administered by a lieutenant governor since May, 1862, when the settlement was raised to the rank of a colony. The governor is appointed by the crown. The legislative power is vested in a council composed of seven magistrates elected annually by the people.—Little is known of the early settlement of this coast. It seems to have been resorted to occasionally by wood cutters in the 16th century. Some British subjects, attracted by the abundance and excellence of the mahogany and logwood, came from Jamaica and made the first permanent settlement; and this thrived so rapidly that the immigrants were soon followed by a large number of others, who extended their explorations as far W. as Campeachy, in the vicinity of which town they established some colonies. After many unsuccessful efforts by the Spaniards to drive out the intruders, these were at last compelled to retreat within the present limits of the territory. In 1754 an invading expedition of 1,500 Spaniards was defeated by a small body of English settlers; another attack was made in 1779, and the inhabitants were obliged to flee to Mérida and Havana, where many of them died in captivity. By 1783 the settlement was again prospering, and the people, after repeated altercations with their Spanish neighbors, on July 10, 1798, repulsed a formidable attack made by a fleet of vessels and a land force of 2,000 men. Since that time the country has remained in tranquillity as a British possession, having been specially excepted from the treaty between England and the United States, June 29, 1850, by which the two powers mutually agreed "not to occupy, fortify, or colonize any part of Central America."

**HONE, William**, an English author, born in Bath in 1779, died in Tottenham, Nov. 6, 1842. At the age of 10 he was placed with an attorney in London, but after the expiration of his apprenticeship he abandoned the law, and in 1800 set up as a bookseller, with a circulating library in Lambeth Walk. During the next 16 or 17 years he experienced a succession of vicissitudes. Having no talent for business, he failed in almost every enterprise he undertook, and repeatedly became bankrupt. In 1817 he brought himself into great notoriety by the series of political satires entitled "The Political House that Jack built," "The Man in the Moon," "The Queen's Matrimonial Ladder," "A Slap at Slop," "The Political Showman," "Non Mi Ricordo," &c. Among these were several in the nature of parodies on various parts of the "Book of Common Prayer,"

for the printing and publishing of which Hone was tried on three separate indictments in December, 1817, but was acquitted in each instance. His "Three Trials," describing the proceedings on this occasion, went through 19 editions before the close of 1818. His friends attempted to set him up in business as a book auctioneer, but in a few years he found himself the inmate of the King's Bench prison, where during a confinement of about three years he edited and published his "Every-Day Book" (2 vols. 8vo, 1826-'7), "Table Book" (8vo, 1827-'8), and "Year Book" (8vo, 1829), his most useful works. Upon his release from prison he attempted to establish himself as landlord of the Grasshopper coffee house, but failed. Finally he joined an Independent church, became a preacher, and officiated until disabled by paralysis. Among his other works were: "Ancient Mysteries Described" (8vo, 1823); an edition of Strutt's "Sports and Pastimes of the English;" and "Early Life and Conversion of William Hone."

**HONESDALE**, a borough and the capital of Wayne co., Pennsylvania, in the N. E. part of the state, at the confluence of the Lackawaxen and Dyberry creeks, 113 m. N. of Philadelphia, and 124 m. N. E. of Harrisburg; pop. in 1870, 2,654. It is situated on a branch of the Erie railway, 135 m. from New York, and the Delaware and Hudson canal connects it with the Hudson river at Kingston, N. Y. It is an active business place, the greater part of the coal mined by the Delaware and Hudson canal company being brought here from the Lackawanna coal fields, 16 m. distant, and transferred to canal boats and cars. It is neatly built, and has water and gas works, founderies, boot and shoe manufactories, tanneries, glass works, flouring mills, a national bank, a savings bank, and two weekly newspapers.

**HONEY**, the saccharine juices of plants, collected by bees from flowers, and deposited by them in the waxen cells of the comb. These juices undergo some modification in the honey bag of the bee; but though their chemical character is somewhat changed, they still retain the flavor and to some extent the peculiar properties of the plants from which they were collected. Under a powerful microscope the pollen that was mixed with the juices may be detected in the honey, and even referred to the particular kind of plant to which it belonged. The prevalence of certain varieties may determine what sort of localities have been most frequented by the bees. Flowers of sweet perfume impart agreeable odor and flavor to the honey; so that the product of some districts is famed and prized, while the bees of others, drawing upon very different sources, give to the honey they make the disagreeable or even dangerous properties of the plants themselves. Thus the honey of Mt. Ida in Crete has been always held in the highest estimation, as also that of Narbonne and Chammouni; but the honey of Trebizond causes

headache and vomiting, and possesses poisonous qualities, supposed to be derived from the rhododendron, *azalea Pontica*. The substances recognized in honey are grape sugar, manna, gum mucilage, extractive, a little wax, pollen, acid, and odoriferous substances. When allowed to drain from the comb it is wholly fluid, and this, as well as the superior quality first made in the season, and deposited in the upper part of the hives, is known as virgin honey. But as ordinarily pressed out it holds a solid crystalline sugar, which may be separated by draining and pressing the fluid portion through a linen bag. The sugar is believed to be identical with grape sugar; but excepting its consistency and tendency to crystallize, it is not apparently different from the fluid honey. Their taste and chemical properties are the same. The proportion of crystallizable sugar increases with the age of the honey, so as to give it in time a granular character. The consistency of honey is thus very variable. The best and newest of the spring season is a clear fluid contained in a white comb; older honey is yellowish and reddish. It is freely dissolved in cold water, and in this condition honey undergoes the vinous fermentation. Various substances are introduced into honey to add to its weight or to improve its color. Starch is most commonly employed, but chalk, plaster of Paris, and pipe clay are also used. The presence of such matters may be detected by dissolving some of the honey in warm water, and letting the mixture stand for the deposit to fall, when its character may be easily ascertained. The different sugars are also used as adulterants, the presence of all which may be detected either by microscopic observations directed to the forms and comparative sizes of the crystals, or to the presence of the sugar acari, or by the chemical tests also cited with the others by Dr. Hassall in his work, "Adulterations Detected." Starch sugar, possessing the same chemical properties as the sugar of honey, cannot be detected; but being often accompanied by sulphate of lime, resulting from the materials used in its preparation, the presence of this is an indication of adulteration with starch sugar. From the remotest times honey has been employed as an article of food; and to the ancients, in the absence of sugar, it was of greater importance than to the moderns. A land flowing with milk and honey was to them a region abounding in the chief necessities of life.—As an article of diet and of medicine, honey possesses the properties of sugar, and is perhaps more laxative. Many constitutions, especially those subject to dyspepsia, cannot resist its disordering tendency; but those accustomed to its use find it wholesome and agreeable. In medicine its use is principally as a vehicle for other more active substances; but its composition and action upon all constitutions being somewhat uncertain, a solution of pure sugar is generally preferred even for this purpose. When in

combination with vinegar, the preparations are called oxymels. Honey is easily clarified by heating it in a water bath till it becomes so fluid as to be readily strained through flannel. The wax and lighter impurities may be removed by skimming, while the heavier substances sink to the bottom.

**HONEY ANT**, a name given to several species of ants, of Mexico and Texas, the major workers of which secrete a saccharine fluid or kind of honey, which is used for the nourishment of the young brood. In the *myrmecocystus Mexicanus*, the abdomen of these workers becomes swollen like a balloon, and filled with a transparent honey; these individuals are inactive, not quitting the nest, their sole occupation being apparently the elaboration of this fluid, which they discharge into receptacles prepared to receive it. In *crematogaster inflatus* there is a bladder-like swelling on the hinder part of the thorax, furnished with small circular orifices at the posterior lateral angles, from which the saccharine fluid exudes.

**HONEY BEE.** See BEE.

**HONEY DEW**, a saccharine liquid found upon trees, and, when abundant, sprinkled upon the surface between them. This phenomenon has been the subject of much discussion; by some its origin is attributed to insects, and by others it is held that insects have no agency in the matter. It would appear that both parties are correct. That plant lice or aphides do excrete a saccharine liquid is a well established fact (see APHIS), of which any one by careful observation can satisfy himself. On the other hand, it seems to be equally well established that sometimes this liquid is exuded by the leaves of trees, without any insect being concerned in the operation. What causes the plant to throw off sugar in this manner, and always upon the upper surface of the leaves, is a question needing further investigation. Dry weather is most favorable to its production; it is readily washed away by rains, and has been observed to reappear upon the same tree several times in succession. The production of honey dew is especially frequent upon linden trees. Bee-keepers regard this as of some importance as a source of honey, and ants and other insects are fond of it.

**HONEY GUIDE**, a bird of the cuckoo family, and genus *indicator* (Vieill.). The bill is short, broad at the base, with the culmen curved; wings long and pointed, with the first quill nearly as long as the third, fourth, and fifth, which are equal and longest; tail moderate, emarginate in the middle, and rounded on the sides; tarsi very short, covered with transverse broad scales; toes unequal, the outer anterior one the longest; claws moderate and strong. About ten species are described, inhabiting the wooded districts of Africa, India, and the Indian islands. It is about as large as a chaffinch, and flies chattering about the trees apparently in a state of great excitement in order to attract the traveller's atten-

tion; this effected, it flies in a certain direction toward the nearest wild bees' nest, now and then perching and looking back to see if the person follows; arriving at the tree or deserted ant hill containing the honey, it hovers over it, pointing toward it with the bill, and,

Honey Guide.

alighting on the nearest branch, anxiously and noisily awaits its share of the spoil. It sometimes attacks the nests on its own account when pressed for food, and is occasionally found dead within them, stung to death by the bees, and covered in by a vault of wax to prevent the inconveniences caused by decay. It will sometimes lead to two or three nests in succession. The natives of South Africa trust implicitly to their guidance in search of honey, and will leave almost any occupation to follow their course, uttering as they go several sentences which they believe have magic power. The unwary traveller, however, instead of wild honey sometimes finds a concealed crocodile or a crouching lion. Persons following it should answer its twitter by a constant whistle. The natives obtain the honey by first stupefying the bees by burning grass at the entrance of the nest. The flight of the bird is heavy, and for only short distances at a time; the nest is made in the holes of trees; the eggs are three or four, and both sexes assist in incubation; the birds are usually seen in pairs.

**HONEY LOCUST**, the common name for *Gleditsia triacanthos*, a leguminous tree, also called three-thorned acacia, found in the greatest abundance in the southwestern states, and sparingly in the Atlantic states from Pennsylvania to Florida. The tree grows to the height of 80 and even 100 ft., with branches spreading somewhat horizontally; the young stems are armed with stout, often triple thorns, and upon the trunk and larger branches are produced numerous clusters of long, much-branched thorns, which often give the tree a formidable aspect. These thorns are really branches suppressed in their development, and may frequently be seen asserting their real nature by bearing leaves. The foliage of the tree is exceedingly light and graceful; the leaves

are compound, 6 to 10 in. long, and of numerous leaflets which are less than an inch long. The small flowers are in racemes 1 to 2 in. long, and, as in most of the suborder to which it belongs (*Casalpinieæ*), are not papilionaceous, but nearly regular; staminate and perfect flowers occur on the same tree; the fruit is a narrow flat pod, 1 to 2 ft. long, and so contorted as to have been compared to a large apple paring; the numerous hard brown seeds are imbedded in a pulp, which when the pods first ripen is sweet, but soon becomes sour; this pulp is much relished by swine and other domestic animals. The wood of the tree is hard and coarse-grained, and splits readily, but is not of much value except for fuel. As an ornamental tree the honey locust has its merits and demerits; while its foliage is too thin to afford a satisfactory shade, its graceful character and the very distinct habit of the tree render it useful in landscape gardening. It is not suited for a lawn tree or to be planted near dwellings, as accidents are liable to happen from its fierce thorns; the clusters of these, produced so abundantly upon the trunk, are often easily detached, and hidden in the grass may produce a serious wound upon the foot of the animal or person who treads upon them. There is a great difference in the thorniness of the specimens, the variety *inermis* being nearly thornless; in a quantity of seedlings plants almost without thorns may be found, and these should be selected for ornamental planting. The honey locust is chiefly valuable as a hedge plant. (See HEDGE.) In Illinois, and more

Honey Locust (*Gleditsia triacanthos*).

common southward, is found the water locust, *G. monosperma*, which has smaller thorns and an oval, one-seeded pod without any pulp; its timber is of even less value than that of the preceding.

**HONEYSUCKLE**, the name of several kinds of twining and erect shrubs of the genus *Lonicera*, in the order *caprifoliaceæ*. They have tubular

flowers, many of them possess fragrance, and most of them are ornamental and among the shrubs generally cultivated. The genus *Lonicera* was named in honor of Lonitzer, a German herbalist of the 16th century. The trumpet honeysuckle (*L. sempervirens*, Aiton) is

Trumpet Honeysuckle (*Lonicera sempervirens*).

found occasionally on rocky places in Massachusetts, more abundantly near New York, and thence to Virginia and southward. Under cultivation its foliage falls off toward winter. The flowers are numerous, with scentless corollas, of a scarlet or deep red color outside, and yellowish within. The plant is a strong and vigorous climber, continuing to bloom from spring until autumn; there is a variety with pale yellow blossoms. The American woodbine honeysuckle (*L. grata*, Ait.) is also cultivated and prized for its fragrant flowers, of a white color fading into yellowish, borne in whorls in the axils of the uppermost leaves. The yellow honeysuckle (*L. flava*, Sims), found in New York, Wisconsin, and southward, has long been cultivated. Its flowers are in closely approximate whorls, with corollas of a light yellow, deeply bilabiate, the tube hairy within, with a delicious fragrance. The small-flowered honeysuckle (*L. parviflora*, Lamarek) has little beauty to recommend it, it being a straggling bush 2 to 4 ft. high. It is found mostly in northern localities. A variety (*Douglasii*), with greener leaves and dull purple or crimson-colored corolla, occurs in the western states. The hairy honeysuckle (*L. hirsuta*, Eaton) has large, coarse, hairy leaves, and bright, orange-colored corollas, and is found from Maine to Wisconsin and northward. The English honeysuckle (*L. periclymenum*, Linn.) has its leaves all separate, deciduous, ovate, obtuse, attenuate at the base. Its flowers are in terminal heads, and are deep red externally; its berries are nearly globular, deep red, bitter, and nauseous. The Dutch honeysuckle is a variety of the English (*L. p. Belgica*), with

smooth purplish branches, and flowers reddish on the outside and yellowish within, of a very agreeable odor. It is sometimes called the monthly honeysuckle. The common honeysuckle is a native of England, and is there likewise called the woodbine, a corruption of woodbind, from its habit of winding itself around any tree or shrub within reach. It is a favorite plant with the poets, and often enters into their descriptions. The perfoliate honeysuckle (*L. caprifolium*, Linn.) has deciduous, obovate, acutish, glaucous leaves, the uppermost broader and connate, the flowers highly fragrant, 2 in. long, with a blush-colored tube. It ranges from the middle and south of Europe to Siberia, and is naturalized in England. *L. brachypoda*, a Japanese and Chinese species, also called *L. Japonica* and *L. Sinensis*, is now in very general cultivation; its oval or oblong leaves are nearly evergreen in the climate of New York, and quite so in milder localities; its flowers are neither very large nor showy, but very fragrant. The recently introduced *L. Hallii*, from Japan, is probably a form of this. A variety of it, called the golden Japanese honeysuckle (var. *aureo-reticulata*), has the leaves beautifully veined and variegated with yellow; being quite hardy, it is one of the most valuable ornamental climbers. The climbing honeysuckles are of easy cultivation, and are much used for covering porches, verandas, &c.; they are readily propagated by cuttings and by layers.—The fly honeysuckles, the upright or bush honeysuckles of the nurserymen, belong to a distinct section of *Lonicera*, and were formerly placed as a separate genus (*xylosteon*); they are distinguished by their bushy, non-climbing habit, single, axillary, two-flowered peduncles, with the two berries sometimes united into one. *L. cærulea*, *ciliata*, and *oblongifolia* are the native species in the northern states. *L. involucrata*, with its flowers surrounded by conspicuous leafy bracts, is a Californian species, which extends eastward to Lake Superior; it is sometimes seen in gardens, more as a curious than an elegant species. *L. Tartarica*, the Tartarian, is the most common bush honeysuckle of the gardens, and is ornamental whether for its abundant pink or white flowers or its red berries. The fragrant honeysuckle (*L. fragrantissima*), a native of China, puts forth in early spring, before the leaves, a profusion of pure white, highly odoriferous flowers. It is such an early bloomer that in the climate of New York its flowers are often caught by the frost; but it is worth cultivating even if the season is only now and then favorable to it. The name bush honeysuckle is also given to our native species of *Diervilla*; the shrub commonly called *Weigela* properly belongs to that genus also, and this and the native species will be treated under *WEIGELA*. Our native azaleas are frequently called honeysuckles. (See *AZALEA*.)

**HONFLEUR**, a seaport town of France, in the department of Calvados, on the S. bank of the

estuary of the Seine, here 7 m. wide, and nearly opposite Havre; pop. in 1866, 9,946. It has a commodious port, which is only accessible however at high tide, and is resorted to chiefly by fishing vessels and craft engaged in the timber trade. Its commerce, which was once important, is now engrossed by Havre, but it retains a trade in farm and dairy produce, large quantities of eggs, fruit, and vegetables being exported to England. It has fisheries of herring, cod, and mackerel, and manufactories of lace, rope, leather, casks, mineral acids, and ship biscuit. Ship building is also carried on to some extent. The town is ill built and ill fortified, but contains some old and interesting edifices. The principal public buildings are the custom house, bank, and a chapel on a neighboring hill which is a favorite shrine for sailors. It contains a communal college, chamber of commerce, exchange, and school of navigation. Honfleur was long in the possession of the English, and figures largely in their French wars.

**HONG**, the Chinese name for a foreign factory or mercantile establishment. The word means a row or series, and is applied to warehouses because they consist of a succession of rooms. The factories at Canton are built in this manner, and each block is called by the natives a hong. Formerly the European trade at Canton on the part of the Chinese was granted by the government as a monopoly to 10 or 12 great merchants, called the hong merchants, through whose hands all foreign cargoes passed, and by whom the return cargoes were furnished. They became security for the payment of duties by the foreign ships, and maintained a high reputation for integrity. This monopoly is now abolished.

**HONG KONG** (Red Harbor), or **Hiang Kiang** (Fragrant Streams), a British colony in China, comprising the island of Hong Kong and a part of the peninsula of Kooloon on the mainland opposite. The island lies off the coast of the province of Kwangtung, on the E. side of the estuary of the Chu-kiang or Canton river, 35 m. E. of Macao and 75 m. S. E. of Canton; area, about 29 sq. m.; pop. in 1871, 124,198. The peninsula of Kooloon has an area of 5 sq. m. The island has a coast line of about 26 m., and is very irregular in shape, being indented by numerous bays. Two of the largest of these are on the S. E. side. Tytam bay, the most easterly one, extends 4 or 5 m. inland, forming two long peninsulas. Tytam peninsula, on its W. side, separates it from Stanley bay, at the head of which is the small town of Stanley. On the N. side the island is separated from the mainland by a narrow irregular strait, which at the Limoon pass at its E. end is only a quarter of a mile wide, and at Kooloon point a little more than a mile. At the W. end of this strait are Hong Kong road and Victoria bay, the latter a spacious harbor, having deep water close in shore and affording the best of anchorage. The surface of the isl-

and is rugged and uneven, consisting of a range of barren granite rocks, running nearly E. and W., the highest of which is 1,825 ft. above the sea, broken by occasional narrow valleys, with a little level land along the beach. The natural vegetation is confined mostly to rank herbage and brushwood growing in the interstices of the rocks, and a few plants on the margins of the streams. There are no large trees. The mango, the orange, and the pear are indigenous, and the English have introduced the fruits of Canton and Macao. But a very small part of the island is susceptible of cultivation, scarcely enough to produce vegetables for the consumption of the inhabitants. Rice, sweet potatoes, and yams are raised by the natives, and potatoes and various European vegetables have been successfully grown. The island is abundantly supplied with good spring water. The climate is hot but comparatively healthy, although in some seasons there has been a large mortality from malaria. Of the population in 1871, 115,444 were Chinese, 5,933 Europeans and Americans, including the military and naval establishments, and 2,623 East Indians. The resident white population was only 2,736, of whom 1,367 were Portuguese, 869 English, 170 Germans, 133 Americans, and 60 French. —The chief settlement on the island is the city of Victoria, on the bay of the same name, in lat. 22° 16' 30" N., lon 114° 8' 30" E. Including the Chinese town, it extends 3 m. along the shore, occupying all the space between the water and the foot of the hills, and rising up the latter in terraces. The public buildings, which are of stone and brick, are superior to those usually seen in China. The houses of the merchants are large and elegant, with broad verandas and fine gardens. There are water works and gas works, and the main thoroughfare is protected by a sea wall. Among the public buildings are the government house, magistracy, court house, exchange, jail, ordnance and engineers' department, club house, and public offices. There are also a cathedral and bishop's palace, the chapel and school of the London missionary society, hospital of the medical missionary society, Morrison educational society, and seamen's and military hospitals. All the principal foreign nations have consulates. There are ten banking houses, one French, one local, and the rest English; two daily newspapers, one semi-weekly, one weekly, and one fortnightly, all English, and the weekly a government publication; one Portuguese weekly, and one in Chinese published every second day. Fine government gardens have been laid out, and much has been done of late to improve the appearance and the sanitary condition of the city. The population is about 95,000, of whom more than 90,000 are Chinese. Many of the latter are merchants, but the greater part are laborers and boatmen. About 13,000 of the poorer class live in boats in the harbor. The natives are not allowed to go abroad without a pass after

8 o'clock in the evening, but no restrictions are placed on the foreign population. The streets are guarded at night by a strong police force of Indian sepoy, and life and property are now secure. The government has paid considerable attention to education, and native schools have been established in Victoria and in other parts of the island. The village schools are purely Chinese, and use Chinese text books alone; but, owing to the extreme poverty of the people, only a fraction of the children attend them.—The administration of the colony is in the hands of a governor, aided by an executive council composed of the colonial secretary, the officer commanding the troops, and the attorney general. There is also a legislative council, over which the governor presides, composed of the chief justice, the colonial

secretary, the attorney general, the treasurer, the auditor general, the surveyor general, and four unofficial members nominated by the crown on the recommendation of the governor. Hong Kong is mainly a factory for British commerce with China and the headquarters for the British military and naval forces in China and Japan. It is a free port, and no dues are levied on goods or ships entering, discharging, or loading. The revenue is derived from land rents, licenses to sell opium and spirits, postage, taxes, fines, fees of office, &c., which generally more than cover the expenses of the administration. Since 1855 the colony has generally had a surplus above its expenditures. It pays at present £20,000 annually to the British government as a military contribution. Its total revenue in 1870 was £190,673,

Hong Kong.

and the expenditure £183,595. In 1871 the revenue was £175,920, of which £36,000 was derived from lands and rents, £40,000 from taxes, and £23,000 from the opium monopoly; expenditure, £186,273, of which a large portion was devoted to the maintenance of the police force. Hong Kong has now no public debt. Its commerce is chiefly with Great Britain, the United States, and Germany, the first absorbing about one half of the exports and imports. There are no official returns of values, but according to mercantile estimates, the imports average about £4,000,000 and the exports about £2,000,000. The principal imports are textile fabrics, mainly cotton goods, and the exports are mostly teas. The weights and measures both of China and of Great Britain are in general use. The money in circulation is the Mexican dollar, and the silver

dollar coined at Hong Kong, with the effigy of the British sovereign on one side and its name and value in Chinese characters on the reverse; and for smaller sums the usual Chinese coins. The new American dollar has been recently introduced, and meets with much favor.—Hong Kong was occupied by the British in 1841, and confirmed to them by the treaty of Nankin in 1842. The peninsula of Kooloon, which commands the N. side of Victoria harbor, was ceded in 1861. The population before the cession was only about 2,000, a poor and ignorant race, subsisting partly by fishing and partly by the cutting of building stone.

**HONITON**, a town of Devonshire, England, pleasantly situated on the left bank of the river Otter, 16 m. N. E. of Exeter, and 142 m. W. S. W. of London; pop. in 1871, 3,470. It is neatly built, and contains many good houses

and a literary institute. It gives its name to a celebrated kind of lace once exclusively made here, but now manufactured in many localities. Butter is largely exported to London. Honiton returned two members to parliament for many centuries till 1867, when it lost one member, owing to the population being less than 10,000, and it was subsequently disfranchised altogether.

**HONOLULU**, the capital of the Hawaiian islands, on the S. side of the island of Oahu, in lat.  $21^{\circ} 18' 12''$  N., lon.  $157^{\circ} 55'$  W.; pop. in 1872, 14,852. It covers the lower portion of Nuuanu valley, and extends over the raised coral reef at the base of the lofty mountains for several miles. The houses are usually of wood, seldom more than two stories high, with capacious verandas, and mostly surrounded with trees. The supply of water comes from a mountain stream, and is distributed by pipes

soil absorbs the water quickly, and miasmatic complaints are rare. The scenery about Honolulu is of the most charming tropical character, and there is a pleasant foreign society in the capital, principally American and English. The value of the imports at Honolulu in 1872 was \$1,583,583; more than half came from San Francisco, and a considerable portion from Oregon, England, and Germany. The value of the exports in 1872 was \$1,607,521, of which \$1,345,585 consisted of domestic produce, and \$204,836 of foreign merchandise re-exported. The total custom-house receipts in the same year were \$218,375. The number of American merchant vessels arriving was 86, of Hawaiian vessels 22, British 15, German 6, Norwegian and Italian each 3, Tahitian 2, Swedish 1; total, 138. Besides these, 47 whalers arrived. The arrivals from Pacific ports of the United States were 62, from Australia

and New Zealand 26. The number of national vessels was 7. A line of English mail steamers runs from San Francisco to Melbourne and Sydney, touching at Honolulu and the Feejee islands.—Honolulu harbor was discovered in 1794 by Capt. Brown of the English ship *Butterworth*, who, together with Capt. Gardner of the *Prince Lee Boo*, was murdered by the natives Jan. 1, 1795. The harbor is a deep basin in the coral reef which surrounds the island; it is secure at all seasons and under all winds, and has a depth of from  $4\frac{1}{2}$  to 6 fathoms. The light-

Parliament House in Honolulu.

throughout the city. Honolulu is the residence of the king and of his government, and the centre of the chief interests of the islands. The principal public buildings are the parliament house, the treasury, the supreme court, the general post office, and the coral-built palace of the king. There are a hotel, a theatre, and a bank. American gold and silver coins are the standard currency. There are two American churches, established in 1833 and 1852, a Catholic cathedral, an Anglican church, established in 1862, and two considerable Hawaiian churches; two hospitals; numerous schools for native and foreign children; an academy called Oahu college, attended mainly by foreign youths; and three weekly and two monthly publications. The climate of Honolulu is remarkably mild and uniform; the extreme range of the thermometer is between  $60^{\circ}$  and  $87^{\circ}$  F. The rainfall is very irregular; in 1870 it was 59.51 in., and in 1871 40.09 in. The porous

house of the port stands on the inner edge of the reef, a mile from the wharves; it has a Fresnel light, 26 ft. above the sea, and visible from a deck 9 m. away. The wharves are substantial and capacious.

**HONORIUS**, the name of four popes and one antipope. **I.** Born in Capua toward the close of the 6th century, died in Rome, Oct. 12, 638. He was descended from a consular family, became in his youth a canon regular, and after the death of Boniface V. (624 or 625) was elected pope. In the beginning of his pontificate he encouraged the zeal of St. Paulinus of York for the conversion of the Northumbrians, sent into Britain St. Birinus, who converted the royal brothers Cynegils and Cuihelm, and made the Irish and Scotch conform to the general law for the celebration of Easter. He also put an end to the 70 years' schism which had divided the churches of Istria. But what has rendered his name memo-

nable is his connection with the Monothelite heresy. The emperor Heraclius, for the purpose of conciliating the numerous Monophysite churches in the East, had encouraged the adoption of a dogmatic formula affirming that in Christ there was "only one mode of willing and working." This formula, recommended by Sergius, bishop of Constantinople, had been embodied by Cyrus, bishop of Alexandria, in the 7th article of what is known as the accommodation, a doctrinal compromise by which thousands of Monophysites were reconciled to the church. It was denounced in 634 by Sophronius, bishop of Jerusalem, in a circular letter to the bishops of Christendom containing a formal statement of the two distinct natures in Christ. Sergius on the reception of this letter wrote to Honorius detailing the good effected by the adoption of the formula, and urging him to put a stop to the controversy waged by Sophronius. Honorius replied, praising Sergius for discarding all novelties of expression, and saying that it is enough for us to know that the one person of the Mediator is the author of every act produced both in his divine and human natures. The self-same incarnate God, he says, manifests his divine power by miracles, and his human infirmity by enduring suffering and shame. There cannot be in the Saviour, born above the condition of our fallen nature, the struggle between the law of concupiscence in our members and the law of our minds; because he assumed our nature as it was created in innocence, not as it is vitiated by sin. "We should conform our wisdom and zeal to the divine oracles, and reject these new formulas which prove a stumbling block to the unwary. The little ones of the flock will consider us Nestorians if we persist in speaking of a twofold operation in Christ; and they will deem us Eutychians if we affirm only a single operation." In a second letter to Sergius, he says that he has written to the bishops of Alexandria and Jerusalem to abstain from speaking in this unusual way either of a single or of a twofold operation in Christ. The representative of Sophronius has pledged himself that his superior shall in future avoid the term "twofold operation," if Cyrus on his side refrains from using that of "single operation." The emperor Constans II. subsequently issued an edict called "Type" (*Τύπος τῆς Πίστewος*), enjoining the same prudential silence; but it was condemned by Pope Martin I. in 649. The doctrine of Honorius was favorably explained, however, by Pope John IV. in 641, and by St. Maximus in 660, as well as by some bishops at the council of Constantinople in 680-'81. But that council in the 13th session condemned both his letters to be burned, and in the 15th he was himself anathematized. His fault, according to Archbishop Manning, lay in not using his authority, when appealed to, by defining the true doctrine, and thereby repressing the incipient heresy. The question of his heterodoxy has been vehemently discussed in

ancient and modern times; and the dogma of pontifical infallibility, defined in 1870 by the council of the Vatican, has once more brought the name of Honorius prominently forward.—See Labbe's collection of the councils, vol. v., and *Collection royale or du Louvre*, vol. xv. (II.) **Pietro Cadalao**, *Cadalus*, or *Cadalouïs*, antipope, died in 1072. He was bishop of Parma when he was nominated pope by the emperor Henry IV. in opposition to Alexander II. He was consecrated by the new bishop of Parma, Oct. 28, 1061, and immediately marched to Rome at the head of an army. He was excommunicated by the bishops of Germany and Italy in the council of Augsburg, 1062, and deposed by the council of Mantua in 1064. Although not recognized by any power but Germany, he maintained his claims to the papacy until his death. **II. Lamberto di Fagnano**, born in Bologna about 1070, died in Rome, Feb. 14, 1130. He was successively archdeacon of Bologna, canon regular of St. John Lateran, bishop of Velletri, cardinal bishop of Ostia, and legate to the emperor Henry V. He was elected pope under pressure of popular violence Dec. 15, 1124, but resigned, and was reelected unanimously on Dec. 21. From the beginning he labored incessantly for the correction of clerical abuses and the reform of manners. He had the reformatory decrees of the first Lateran council published and enforced in the synods of Westminster, September, 1125, and May, 1127, and in a synod of the Norman clergy at Rouen in October, 1128. In France he used the influence of St. Bernard to reform both clergy and laity, and called several councils: that of Nantes, for all Brittany, in 1127; that of Troyes, in 1128, at which the rule and white habits given to the templars by St. Bernard were approved; that of Paris, in 1129, for the restoration of monastic discipline; and that of Châlons-sur-Marne, in the same year, against simoniacs. The order of Prémontré was approved Feb. 16, 1126. In Germany and Italy the laws against simony were enforced by the papal legates. In the council of Worms, April, 1127, the simoniacal election of Godfrey, archbishop of Treves, was annulled; and in that of Ravenna the schismatic bishops of Aquileia and Grado were deposed. The Spanish bishops also assembled in Palencia in 1129, to apply to their churches the reforms ordered by the pope. Honorius, at the request of the kings of Denmark, Sweden, and Bohemia, sent legates to their respective countries to restore morality and discipline. In the East the provinces conquered by the crusaders were erected into bishoprics, and great efforts were made to unite the Greek and Latin churches. Honorius confirmed the election of the emperor Lothaire II., excommunicated his opponents Frederick and Conrad of Swabia, and deposed the archbishop of Milan for having crowned Conrad at Monza. He opposed by force of arms the claim of Roger of Sicily to Apulia and Calabria, but after a disastrous war sued for peace, Roger on his part

demanding of the pope the investiture of his kingdom. Eleven letters of Honorius II. are in vol. x. of Labbe's collection of the councils.

**III. Cencio Savelli**, born in Rome, died there, March 18, 1227. He was successively a canon regular of St. John Lateran, tutor to Frederick II., cardinal deacon, cardinal priest, chamberlain, and vice chancellor of the Roman church. He was elected pope in Perugia, July 18, 1216. One of his first cares was to enforce the laws of his predecessor Innocent III. for promoting clerical studies. He compelled the French to acknowledge Henry III. of England after the death of John, and interfered to secure the rights of Berengaria, widow of Richard I. On the day after his consecration he wrote to the king of Jerusalem and to the principal sovereigns, urging them to succor Palestine. He crowned Peter de Courtenay as emperor of Constantinople, April 9, 1217, and organized an army of crusaders under Andrew II., king of Hungary. In order to enlist the forces of Germany in the same cause, he negotiated with his former pupil, Frederick II., crowned his infant son king of the Romans in April, 1220, and Frederick himself as emperor in the following November, exacting at the coronation a solemn promise, which was not redeemed, to proceed to Palestine with an army within two years. Honorius induced Louis VIII. of France to undertake a crusade against Raymond of Toulouse, and persuaded the German princes to take up arms in defence of the new Christians of Prussia and Pomerania. His letters are published in Innocent Ciron's *Compilatio Epistolarum Decretalium Honorii III.* (Toulouse, 1645). **IV. Giacomo Savelli**, born in Rome, died there, April 3, 1287. He was educated in Paris, became a canon of Châlons-sur-Marne, and cardinal deacon of Santa Maria in Cosmedin. He was elected pope at Perugia, April 2, 1285, in violation of the constitution of Gregory X., without the formality of a conclave, which the new pope termed "a censurable abuse lately introduced into the Roman church." He endeavored without success to introduce the study of oriental languages into the university of Paris. Charles the Lame, heir to the kingdom of Sicily, being held a prisoner by Alfonso III. of Aragon, Honorius encouraged the French king, Philip the Bold, to make war on Aragon, bestowing for that purpose on the latter the tithe of all ecclesiastical revenues in France. He suppressed brigandage in his own states, and gave a great impulse to art and science. The letters of Honorius, preserved in Wadding's "Annals" and Ughelli's *Italia Sacra*, bear the stamp of wisdom and moderation; but contemporary historians reproach him with nepotism.

**HONORIUS, Flavius**, a Roman emperor of the West, second son of Theodosius the Great, born in Constantinople in September, 384, died in Ravenna in August, 423. On the death of his father in 395 he succeeded to the possession of the West, and resided during several years of

his minority at Milan, while his commander-in-chief and father-in-law Stilicho carried on the war against Alaric, king of the Visigoths. Stilicho was put to death in 408 on a charge of treason, and in 410 Rome was taken and plundered by Alaric. (See **STILICHO**, and **ALARIC**.) While insurrections broke out in many parts of the empire, and his general Constantius was able to protect only Italy and portions of the transalpine provinces, Honorius resided ingloriously in Ravenna. He was weak, vacillating, and stupid, and his long reign determined the downfall of the empire.

**HONT**, a N. W. county of Hungary, bounded S. by the Danube; area, 986 sq. m.; pop. in 1870, 123,800, of whom about 47,000 were Magyars and 57,000 Slavs, 76,000 Roman Catholics and 34,000 Protestants. In the north the county is traversed by ramifications of the Carpathians, gradually sloping southward to the Danube. The soil, particularly in the valleys, is generally fertile, producing large crops of grain, hemp, flax, and tobacco. Wine is also made to some extent. There are productive mines of gold, silver, lead, and iron, which have long been worked, particularly around Schemnitz. The capital is Ipölyszág, but the most important town is Schemnitz.

**HONTHEIM, Johann Nicolaus von**, a German juriconsult, born in Treves, Jan. 27, 1701, died at Montquintin in Luxemburg, Sept. 2, 1790. He was educated at the Jesuit school in Treves, studied jurisprudence at Louvain and Leyden, and became doctor of law in 1724. In 1728 he was appointed ecclesiastical counsellor of the consistory in Treves, in 1732 professor of civil law; and in 1748 he was made bishop of Myriophis in *partibus*, and suffragan of the see of Treves. He became favorably known for erudition, and published several works, the most famous of which is *De Statu Ecclesiæ et legitima Potestate Romani Pontificis* (4to, 1763), published under the pseudonyme of Justinus Febronius. In this work, which attracted great attention and was translated into French and Italian, he took ultra-Gallican or national views, and propounded a system of church government which has been called Febronianism. It was condemned in Germany and in France, as well as by Clement XIII., to whom it was dedicated, and drew forth a number of replies, the most noteworthy of which were those of Zaccaria and Ballerini. In 1778 the author issued a retraction, but this was followed by a commentary (1781) which threw doubts on his sincerity. His doctrines led to the congress at Ems; but as the French revolution swept away the Gallican church and the civil constitution of the clergy, Hontheim's ideas lay dormant until the present century, when they have been revived in the Old Catholic movement.

**HOOD**, a N. E. county of Texas, intersected by the Brazos river, and watered by numerous tributaries of that stream; area, 614 sq. m.; pop. in 1870, 2,585, of whom 97 were colored.

The surface is greatly diversified, being to a considerable extent broken and rugged, and consisting of mingled prairie and timber land. The highest point is Comanche peak, near the centre of the county, rising 600 ft. above the Brazos. The soil is a red or black sandy loam, and is very productive. Building stone is abundant. The chief productions in 1870 were 192,540 bushels of Indian corn, 11,352 of sweet potatoes, 45,155 lbs. of butter, and 779 bales of cotton. There were 3,442 horses, 3,348 milch cows, 16,098 other cattle, 2,453 sheep, and 10,452 swine. Capital, Granbury.

**HOOD, John B.**, an American soldier, born in Bath co., Ky., about 1830. He graduated at West Point in 1853, and was mainly engaged in frontier service in Texas till 1859. He was severely wounded in an encounter with the Lipan and Comanche Indians, July 20, 1857, and was on leave of absence in 1860. He resigned his commission April 16, 1861, and entered the confederate army, in which he soon rose to the rank of major general. He took part in the Chickahominy campaign, and subsequently fought at the second battle of Bull Run, Antietam, and Fredericksburg. At Gettysburg, where he commanded a division of Longstreet's corps, he lost an arm on the second day of the battle. Rejoining the corps when it was sent to Georgia, he was at the battle of Chickamauga, where he lost a leg, and was made lieutenant general. He subsequently commanded a corps in the army of J. E. Johnston, whom he succeeded in July, 1864, and was thereafter in command of the confederate army in its operations against Gen. Sherman. After three bloody and unsuccessful attacks on that general before Atlanta (July 20, 22, 28), and the evacuation of that city (Sept. 1); he undertook a hazardous march northward, and fought another bloody battle at Franklin, Tenn. (Nov. 30), against Gen. Schofield, but suffered a crushing defeat near Nashville, from Gen. Thomas, Dec. 15-16, 1864, and soon after was relieved from his command, being succeeded by Gen. Richard Taylor.

**HOOD, Robin**, an English outlaw, supposed to have lived at the end of the 12th and beginning of the 13th century. The traditions concerning him are mostly embodied in the account given by Stow: "In this time (about the year 1190, in the reign of Richard I.) were many robbers and outlaws, among which Robin Hood and Little John, renowned theeves, continued in the woods, despoiling and robbing the goods of the rich. They killed none but such as would invade them, or by resistance for their own defence. The said Robert entertained an hundred tall men and good archers with such spoils and thefts as he got, upon whom 400 (were they never so strong) durst not give the onset. He suffered no woman to be oppressed, violated, or otherwise molested; poore men's goodes he spared, abundantlie relieving them with that which by theft he got from the abbeyes and the houses of rich old

carles; whom Maior (the historian) blameth for his rapine and theft, but of all the theeves he affirmeth him to be the prince, and the most gentle theefe." The researches of modern scholars, however, tend to make it a matter of doubt whether Robin Hood ever existed at all. No contemporary writer makes any mention of him, the first allusion to him by any historical writer being in the *Scotichronicon*, which was written partly by Fordun, canon of Aberdeen, between 1377 and 1384, and partly by Bower, abbot of St. Columba, about 1450. He is next mentioned by Major, in his *Historia Majoris Britannia*, written in the early part of the 16th century. His most famous associates were "Little John," his chaplain Friar Tuck, who is supposed to have been a real monk, and his paramour Marian; and Sherwood forest, in Nottinghamshire, was the theatre of most of his exploits. Robin Hood is said to have been bled to death by a nun, his cousin, to whom he repaired for advice on account of her skill in medicine, and died at the nunnery of Kirklees, Yorkshire. An apocryphal epitaph at that place styles him Robert, earl of Huntingdon, and gives "24 Kal. Decembris" (perhaps Dec. 24), 1247, as the date of his death. The exploits of Robin Hood were a favorite subject of ballad poetry as early as the time of Edward III., although many of these ballads, at least in their present shape, are comparatively modern. The "Lytel Geste of Robin Hood" was printed by Wynkin de Worde about 1495. A complete collection of the Robin Hood ballads, with "Historical Anecdotes," was published by Ritson (8vo, London, 1795), and enlarged by J. M. Gutch (2 vols. 8vo, 1847).

**HOOD. I. Samuel**, Viscount, a British admiral, born at Thorncombe, Devonshire, Dec. 12, 1724, died in Bath, Jan. 27, 1816. He was the son of the rector of his native place, entered the navy at the age of 16, and became post captain in 1756. In 1757 he was appointed to the command of the *Antelope*, a 50-gun ship, with which he captured a French vessel of equal size; and in 1759, having been transferred to the *Vestal* of 32 guns, and attached to the expedition sent against Quebec, he captured the French frigate *Bellona*, after a battle of four hours. On his return he was presented to George II., who gave him command of the *Africa* of 64 guns. He was present at the bombardment of Havre, was employed two years on the coast of Ireland, and during the remainder of the war under Sir Charles Saunders in the Mediterranean. From Nov. 14, 1768, to July 13, 1769, he was at Boston, then occupied by British troops, as "commander-in-chief of all the men-of-war in those parts." In 1778 he was made a baronet, and in 1780 rear admiral of the blue, with which rank he joined Rodney in the West Indies the same year. On April 28, 1781, he encountered De Grasse with a French fleet superior in numbers, but the latter avoided an engagement. He fought a

drawn battle with De Grasse during the same year near Chesapeake bay, but could not prevent its blockade nor the surrender of the British army. In the great battle of April 12, 1782, when De Grasse was defeated, Hood commanded the van division of the fleet under Rodney, and was in the same year created an Irish peer, under the title of Baron Hood. When the war with France commenced in 1793 he was sent to the Mediterranean to aid the royalists of the south, who surrendered Toulon to him. When the republicans under Bonaparte were about to regain possession of the place, which was no longer tenable, Hood destroyed the arsenal and dockyard, and 32 French ships, and withdrew with his fleet. In 1794 he expelled the French from Corsica and blockaded the port of Genoa. In 1796 he was raised to the English peerage as Viscount Hood of Whitley, and in 1799 became admiral of the red. **II. Alexander**, Viscount Bridport, brother of the preceding, born in 1727, died in Bath, May 3, 1814. He entered the naval service, and early became distinguished by the capture of two French vessels of war in two actions in Hyères bay in 1757. He passed rapidly through the lower grades, and in 1782, as rear admiral, was second in command of the fleet sent out under Lord Howe to relieve Gibraltar. In 1794 he contributed materially to Lord Howe's great victory with the channel fleet, his flag being hoisted on the Royal George, which sustained the hottest of the fire. In the same year he was created an Irish peer, under the title of Baron Bridport. In 1795 he attacked the French fleet of 12 ships of the line and 10 frigates, off Lorient, with an inferior force, and captured three sail of the line. For this he was in 1796 made a British peer as Baron Bridport, and in 1800 Viscount Bridport.

**HOOD, Thomas**, an English poet, born in London, May 23, 1798, died there, May 3, 1845. His father, who was a bookseller, died when he was but 12 years old. After acquiring the rudiments of an education, he was placed in a counting house; but the confinement of a mercantile life so affected his health that he was sent to Dundee to recruit, where mountain tramps and roving on the Tay restored his strength, but rendered him unwilling to resume a commercial life. He made his first literary attempts here, in the "Dundee Magazine," and after two years' residence returned to London and engaged himself to an uncle, to learn the art of engraving. He continued his attempts at versification, which attracted some attention, and in 1821 was made sub-editor of the "London Magazine," which had passed into the hands of some of his friends. Through this connection he became acquainted with Charles Lamb, Hartley Coleridge, De Quincey, Hazlitt, Bowring, Talfourd, Cary, Procter, and other literary men who were among the contributors. With Lamb he contracted an intimacy which was uninterrupted until the latter's death. Hood's first book, "Odes and

Addresses to Great People," was published anonymously, being in part the work of his brother-in-law J. H. Reynolds. In 1826 he published a collection of miscellaneous papers under the title of "Whims and Oddities." His "National Tales" appeared in 1827, and in the same year he published a volume of poems, including "The Plea of the Midsummer Fairies," "Hero and Leander," and "Lycus the Centaur," which were received with little interest by the public. Returning to his lighter and more popular style, he brought out a second series of "Whims and Oddities," which was followed in 1829 by a humorous poem called "The Epping Hunt." Hood edited the "Gem" for this year, and wrote for it his "Dream of Eugene Aram." In 1830 he began the publication of the "Comic Annual," which was continued through 10 volumes; and after an interruption of two years an 11th was issued in 1842. A selection of pieces from this work, with some additions, appeared in 12 monthly numbers in 1838-'9, under the title of "Hood's Own." In 1831 he removed to a residence in Essex, called the Lake house, where he wrote his novel of "Tynley Hall," but pecuniary troubles compelled him to leave it in 1835. In 1837 he went to the continent for the benefit of his health, and remained abroad several years, publishing while in Belgium his "Up the Rhine," which was constructed on the groundwork of Smollett's "Humphrey Clinker." Returning to England, he became editor of the "New Monthly Magazine," from which he retired in 1843, collecting some of his contributions to its pages in a volume called "Whimsicalities." In 1844 he started "Hood's Magazine," which he continued to the time of his death; and in the same year appeared in "Punch" his "Song of the Shirt," composed, like the "Bridge of Sighs" and the "Lay of the Laborer," on a sick bed from which he never rose. About this time he received through the favor of Sir Robert Peel a pension of £100, which was continued after his death to his widow. The fullest collections of Hood's poems have been made in Boston, one edited by Epes Sargent (4 vols., 1856), and another in Prof. Child's edition of the British poets (4 vols., 1857). "Memorials of Thomas Hood, collected, arranged, and edited by his Daughter," appeared in 1860 (2 vols.), and "A Collection of the favorite Old Tales, told in Verse by Tom Hood," illustrated by Doré, in 1865 (4to).

**HOOF, Pieter Corneliszoon**, a Dutch historian and poet, born in Amsterdam, March 16, 1581, died at the Hague, May 21, 1647. After finishing his education at Leyden, he spent three years in foreign travel, principally in France, Germany, and Italy, and returned to Amsterdam in 1601. In 1609 the stadtholder Maurice appointed him bailiff of Muiden and judge of Gooland, offices which he retained through life. He wrote, in the style of Tacitus, *Nederlandsche Historien* (2 vols., Amsterdam, 1642-'54). To acquire his style, Hooft is said to have read

Tacitus through 52 times. He also wrote a life of Henry IV. (1626), and a history of the house of Medici (1649). Among his poetical compositions are the tragedies *Gerard van Velsen*, *Baete*, and several minor pieces.

**HOOGLY**, a river of Bengal, British India, one of the deltoid mouths of the Ganges, formed by the junction, in lat.  $23^{\circ} 25' N.$ , lon.  $88^{\circ} 22' E.$ , of three branches of the Ganges. Its course is nearly S. with many windings, and it discharges its waters into the bay of Bengal by a broad estuary about 35 m. long and 15 m. wide at its mouth. The length of the Hoogly from the junction of its parent streams to the head of the estuary is 125 m. At Calcutta it is nearly a mile wide, and there is little increase in its size until it receives the Dummodah and Rupnarain, a short distance above its estuary. It is navigable by vessels of 1,400 tons as high as Calcutta, 100 m. from the bay, and ships of the line could formerly ascend to Chandernagore, 17 m. further. It is feared that the bed of the stream is being gradually filled up with mud and sand, and it has been proposed to construct a ship canal from Calcutta to the Mutwal, another mouth of the Ganges some distance E. The Hoogly is the only channel of the delta now frequented by large ships, though its mouth is obstructed by shoals. The Hindoos regard it as the true course of the sacred Ganges. The tidal phenomenon called the bore is often witnessed in it.

**HOOGLY. I.** A district of British India, in the province of Bengal, bounded N. by Burdwan, E. by the Hoogly, S. by the Rupnarain, and W. by Midnapore and Burdwan; area, 1,470 sq. m.; pop. in 1871, 1,491,621. The surface is low and flat in the east and hilly in the west and northwest. The principal streams are the Hoogly and its tributaries, the Dummodah, Rupnarain, and Dalkissore. The soil of the low lands is fertile, and in some places is impregnated with salt. The most important productions are rice, sugar cane, indigo, cotton, tobacco, mustard, oil seeds, ginger, potatoes, garden vegetables, and hemp. Silkworms are reared, and silk is one of the principal articles of export. **II.** The principal town of the district, situated on the right bank of the river of the same name, 22 m. above Calcutta, with which it has communication by the Calcutta and Burdwan railway; pop. about 12,000. It contains a fine church built by the Jesuits in 1599, and a college erected in 1836, in which both English and oriental branches are taught. This institution is supported by endowment from the estate of a wealthy Mohammedan. Hoogly, once an important city, is now of little note, having declined with the rise of Calcutta. The town was probably founded by the Portuguese in 1537. It was taken by Shah Jehan in 1632, when 1,000 Europeans were slaughtered and 4,400 made prisoners. The British established here in 1676 a factory, which, being fortified five years later, and furnished with a guard of 20 men,

became the first military establishment of the East India company in Bengal. The first action fought by the English in Bengal took place here in 1686, when the nawab's troops were defeated and 500 houses burned. In 1756 the town was captured by Surajah Dowlah, but was retaken in 1757 by Clive.

**HOOK, James Clark.** See supplement.

**HOOK, Theodore Edward**, an English author and journalist, born in London, Sept. 22, 1788, died in Fulham, Aug. 24, 1841. After a very inadequate education, terminating prematurely at Harrow, he rejoined his father, then musical director of Vauxhall gardens, and soon gave evidence of his talents by the production of several songs, for which he also composed the music; and when scarcely 16 he wrote a drama entitled "The Soldier's Return," which was well received. Elated by the extravagant praises of friends, he produced in rapid succession a number of farces and vaudevilles, and at an age when most boys are at school was a successful dramatist, the wit of the greenroom, and the companion of actors and playwrights. Yielding to the fascinations of such a life, he gradually enlarged the circle of his admirers by his facile humor, his astonishing faculty of punning, the audacity of his practical jokes, and his brilliant powers of improvisation, until he was welcomed to the most aristocratic society of London, and even attracted the notice of the prince regent, who sent him in 1812 to Mauritius as accountant general and treasurer, with a salary of £2,000. In 1818 he was brought back to England as a prisoner under a charge of embezzling a sum of the public money estimated at £20,000, but which was subsequently reduced to £12,000. The law officer of the crown decided that there was no ground for a criminal prosecution, although his carelessness and incapacity were displayed to an extent almost incredible; and he was set at liberty and once more commenced the career of an author. In 1820 the "John Bull" newspaper was established in the interest of the king, for the purpose of crushing the supporters of Queen Caroline, and Hook's powers of satire and ridicule suggested him as a fit person to conduct it. He performed the task with great adroitness, and the circulation of the paper gave him a handsome income. In 1823 the government reasserted its claim against him, but after two years' confinement he procured a stay of proceedings, although he never made any attempt to discharge the debt. He was again welcomed to society, and to the close of his life remained a professed diner-out and wit. He employed his literary powers to some purpose, in the production of "Sayings and Doings," in three series, "Gilbert Gurney," "Maxwell," "Jack Brag," and a number of other novels. Fashionable dissipation, high living, hard drinking, the excitement of the gaming table, and the constant mental strain to which he was subjected, gradually undermined his constitution, and he ended his

career, to adopt his own words, "done up in purse, in mind, and in body." In 1849 appeared the "Life and Remains of Theodore Hook," by the Rev. Mr. Barham (2 vols. 8vo).

**HOOK, Walter Farquhar**, an English clergyman, nephew of Theodore Hook, born in London in 1798. He graduated at Christchurch, Oxford, in 1821, and was successively curate at Whippingham, Isle of Wight, and in Birmingham, and vicar of Trinity church, Coventry, till 1837, when he was made vicar of Leeds. Here, during his incumbency of 22 years, 21 new churches, 32 parsonages, and more than 60 schools were erected in his parish, chiefly through his instrumentality. He was especially popular among the working classes. In 1859 he became dean of Chichester, and in 1862 a fellow of the royal society. He was appointed chaplain in ordinary to George IV. in 1827, and retained the office under William IV. and Victoria, preaching on the accession of the latter, from the text "Hear the church," a sermon of which more than 100,000 copies were sold in a month. He has published "An Ecclesiastical Biography" (8 vols., London, 1845-'52); "A Church Dictionary" (8th ed., 1859); "Sermons Suggested by the Miracles of our Lord" (2 vols., 1847); "Lives of the Archbishops of Canterbury" (9 vols. published, 1860 *et seq.*); and numerous pamphlets.

**HOOKE, Nathaniel**, a British historian, born in Ireland about 1690, died July 19, 1763. He lost his fortune in the South sea speculation, and was then engaged by the duchess of Marlborough to assist in writing her memoirs (1742), for £5,000. Being a zealous Catholic, he attempted her conversion, and a quarrel was the consequence. He was a friend of Pope, and brought a priest to hear the confession of the poet in his last hours. He wrote "The Roman History, from the Building of Rome to the Ruin of the Commonwealth" (4 vols. 4to, 1757-'71).

**HOOKE, Robert**, an English mathematician, born at Freshwater, Isle of Wight, July 18, 1635, died at Gresham college, London, March 3, 1703. His father, a clergyman, destined him for the church; but his health being too feeble for study, he devoted his leisure to invention. In 1655 he was appointed assistant in chemistry to Dr. Thomas Willis at Oxford, and in 1664 he became professor of geometry in Gresham college, and first Cutlerian professor of mechanics in the royal society. In 1666, having produced a model for the rebuilding of London after the great fire, he was appointed city surveyor; but his plan was not carried into execution. In 1677 he succeeded Oldenburg as secretary of the royal society. In 1691 he was made a doctor of physic by a warrant from Archbishop Tillotson. He made a practical improvement in the pendulum attached to clocks, causing it to swing in small arcs by the application of the recoil escapement. (See CLOCKS AND WATCHES, vol. iv., p. 698.) He also applied himself to devise means to regulate

watches, and when Huygens had some watches constructed, the balances of which were regulated by a spiral spring, Hooke accused Oldenburg, secretary to the royal society, of having communicated to strangers discoveries deposited in the society registers. But that the application is due to Huygens, is not only apparent from a perusal of the latter's description in his *Machinæ quædam et Mechanicæ* published in 1675, but is proved by other evidence. On the publication of Newton's *Principia*, he also claimed the previous discovery of the principle of gravitation. He was jealous of all other inventors, and was involved in continual disputes concerning different inventions, generally pretending that they were all taken from ideas of his own. He left numerous works, among which is his "Micrographia, or Physiological Descriptions of Minute Bodies made by Magnifying Glasses" (London, 1665). His "Posthumous Works, containing his Cutlerian Lectures and other Philosophical Discourses," was published in London in 1705.

**HOOKER, Joseph**, an American soldier, born at Hadley, Mass., in 1815. He graduated at West Point in 1837, served in the Florida war and in the war with Mexico, and was successively brevetted as captain, major, and lieutenant colonel for gallant and meritorious conduct in the battles of Monterey, the National Bridge, and Chapultepec. He was on leave of absence from 1851 to 1853, when he resigned his commission and became a farmer in California, serving also in 1858-'9 as superintendent of military roads in Oregon. He reentered the service at the beginning of the civil war, was appointed brigadier general of volunteers March 17, 1861, and was employed in the neighborhood of Washington till March, 1862, when he was placed in command of a division of the army of the Potomac. He was made major general of volunteers May 5, and took an active part in McClellan's peninsular campaign, especially at the battles of Williamsburg, Fair Oaks, Frazier's Farm, and Malvern Hill, and in the subsequent campaign at Bristoe Station, the second battle of Bull Run, Chantilly, South Mountain, and Antietam, where he was wounded. He was made brigadier general of the United States army Sept. 20, and at the battle of Fredericksburg commanded a grand division under Burnside. He succeeded Burnside in command of the army of the Potomac Jan. 26, 1863, and fought the battle of Chancellorsville in the beginning of May. On June 27 he resigned his command because Gen. Halleck would not consent to the evacuation of Harper's Ferry and the placing of the 10,000 men there under Hooker's orders, for a demonstration on Lee's rear, who was then invading Pennsylvania. He was succeeded by Gen. Meade. In September he was placed in command of the 12th and 13th army corps, which were concentrated about Chattanooga, and took a leading part in the series of battles fought there in November, commanding

in the action on Lookout mountain, for which he was made brevet major general. Subsequently, in command of the 20th army corps, styled the army of the Cumberland, he was prominent in the operations about Atlanta. He resigned the command of this corps in August, 1864, in consequence of a question of rank. In September he was placed in command of the Northern department, in 1865 of the department of the East, and in 1866 of that of the Lakes. He was mustered out of the volunteer service Sept. 1, 1866, and on Oct. 15, 1868, was made brevet major general of the United States army and retired from the service.

**HOOKER, Joseph Dalton**, an English botanist, son of Sir William Jackson Hooker, born in Glasgow in 1817. Having taken his degree in medicine, he devoted himself especially to botany. In 1839 he went as assistant surgeon on Sir James C. Ross's antarctic expedition, and in 1847 set out on a botanical exploration to the regions of the Himalaya mountains. In 1855, having previously served as botanist in the geological survey, he became assistant to his father, whom he succeeded in 1865 as director of the Kew gardens. In 1868 he presided over the meeting of the British association for the advancement of science. In 1867 he visited Morocco, and in company with Mr. Ball ascended several of the peaks of the Atlas chain; and in 1871, also in company with Mr. Ball, ascended the Jebel Tezah, one of the summits, more than 11,000 ft. high, which no European had before ascended. In 1873 he was elected president of the royal society. His principal works are: "*Flora Antarctica*" (2 vols., London, 1845-'8); "*Rhododendrons of the Sikkim Himalaya*" (1849-'51); "*Himalayan Journals*" (2 vols., 1854); "*Flora of New Zealand*" (2 vols., 1853-'55); "*Flora Tasmaniae*" (1855 *et seq.*); and "*The Student's Flora of the British Islands*" (1870). He has also published, with the cooperation of George Bentham, "*Genera Plantarum*" (vol. i., 1867; vol. ii., part i., 1873).

**HOOKER, Richard**, an English divine, born at Heavytree, near Exeter, in 1553 or 1554, died at Bishopsbourne, near Canterbury, Nov. 2, 1600. He became a scholar of Corpus Christi college, Oxford, in 1573, and a fellow and master of arts in 1577, was made deputy professor of Hebrew in 1579, was expelled from this office after three months with four other fellows of his college, but was immediately restored, and received holy orders in 1581. Being appointed to preach a sermon at St. Paul's cross, London, he lodged at the Shunamite's house, a dwelling appropriated to preachers, and was skilfully persuaded by the landlady "that it was best for him to have a wife that might prove a nurse to him, such an one as might prolong his life, and make it more comfortable, and such an one as she could and would provide for him if he thought fit to marry." The unsuspecting young divine agreed to abide by her choice, which fell upon her own daughter,

who proved to be, as Anthony Wood says, a "silly, clownish woman, and withal a mere Xantippe." Resigning his fellowship by his marriage, he was presented in 1584 to the living of Drayton-Beauchamp, Buckinghamshire. There he was visited by two of his former pupils, Edwin Sandys and George Crammer, who found him reading Horace while tending the sheep in the field, his servant having gone to aid Mrs. Hooker in the household labors. On going with them to the house, he was called to rock the cradle, and the lady gave such other samples of hospitality as made them glad to depart on the following morning. To their expressions of commiseration Hooker replied: "If saints have usually a double share of the miseries of this life, I, that am none, ought not to repine at what my wise Creator hath appointed for me; but labor, as indeed I do daily, to submit to his will and possess my soul in patience and peace." Sandys made an appeal to his father, the archbishop of York, in behalf of his former tutor, who was promoted to the mastership of the Temple in London in 1585. The morning and afternoon lectureship belonged respectively to him and to Walter Travers, the one inclining to the Arminian view and maintaining the Anglican form of government, the other maintaining Calvinistic opinions and inclining to the Presbyterian form; and it was soon observed that "the forenoon sermons spoke Canterbury, and the afternoon Geneva." A controversy arose which was the occasion of Hooker's great work on "*Ecclesiastical Polity*." Archbishop Whitgift prohibited the preaching of Travers, who appealed unsuccessfully to the privy council, and published his memorial, which, though answered by his opponent, gained for him many powerful adherents. "To unbeguile and win over those of Mr. Travers's judgment, Hooker designed to write a sober deliberate treatise of the church's power to make canons for the use of ceremonies, and by law to impose an obedience to them as upon her children." To secure the requisite quiet, he requested to be translated to some country parsonage, and received in 1591 the rectory of Boscombe, Wiltshire, where he completed the first four books of the "*Ecclesiastical Polity*" (London, 1594). In the following year he was presented to the rectory of Bishopsbourne, Kent, where he passed the remainder of his life. The last four books were published at intervals, three of them posthumously, and the eight books were probably first collected in 1662, although some contend that all were published together as early as 1617. The sixth book is lost, that which passes for it having been proved to be a totally different production, and the eighth book seems to have been left incomplete. His life was written by Izaak Walton. The latest edition of his works was arranged by the Rev. John Keble (3d ed., 3 vols., Oxford, 1845).

**HOOKER, Thomas**, one of the founders of the colony of Connecticut, born in Markfield, Lei-

cestershire, England, in 1586, died in Hartford, Conn., July 7, 1647. He is supposed to have been a cousin of the preceding. After graduating at Emmanuel college, Cambridge, he took orders, preached in London, and was chosen lecturer at Chelmsford in 1626. Having been silenced by Laud for nonconformity, he established a grammar school at Little Baddow, near Chelmsford, in which John Eliot, "the apostle of the Indians," was an usher. In 1630, being still persecuted by the spiritual court, he went to Holland, where he preached at Delft and Rotterdam, being an assistant to Dr. Ames, who said of him that "he never met with his equal, either in preaching or disputation." In 1633 he came to New England with Cotton and Stone, and was settled with the latter at Newtown (now Cambridge), being ordained by the brethren of the church. In 1636 he removed with about 100 others to what is now Hartford, Conn., where he and Stone were the first ministers of the church. He was a remarkably animated and able preacher, commonly using no notes. Some 200 of his sermons were transcribed by John Higginson and sent to England, where about half of them were published. His most celebrated work, "A Survey of the Summe of Church Discipline," written in conjunction with John Cotton, was published in England under the supervision of Dr. Thomas Goodwin (4to, 1648). A memoir of his life, with a selection from his writings, has been published by the Rev. E. W. Hooker, D. D. (18mo, Boston, 1849).

**HOOKER, Sir William Jackson**, an English botanist, born in Norwich in 1785, died Aug. 12, 1865. He manifested a taste for botany at an unusually early age, and in 1809 he visited Iceland for the purpose of studying its natural history. The collection made with great pains during this visit was subsequently lost, but his copious notes and excellent memory enabled him to give an account of the botany of that region in his "Tour in Iceland in 1809" (Yarmouth, 1811; 2d ed., 2 vols. 8vo, London, 1813). He was subsequently engaged at different times in editing a continuation of Curtis's "Botanical Magazine," from 1830 to 1833 the "Botanical Miscellany," and from 1834 to 1851 the "London Journal of Botany." He was for a long time professor of botany in the university of Glasgow, and afterward became director of the royal gardens at Kew, in which post he was succeeded at his death by his son Joseph Dalton Hooker. He was knighted in 1836. Among his numerous works are: "British Jungermanniæ" (4to, London, 1816; 2d ed., 1846); "Muscologia Britannica" (1818; enlarged, 1855); "Flora Scotica" (1821); "The Exotic Flora" (3 vols., 1823-'7); "Icones Plantarum" (10 vols., 1836-'54); "Flora Boreali-Americana" (2 vols. 4to, 1829-'40); "British Flora" (1830; 7th ed., 1855); "Companion to the Botanical Magazine" (2 vols., 1835-'6); "Icones Filicum" (with the assistance of Greville, 1829-'31); "Botany of Capt.

Beechey's Voyage" (1831-'41); "Genera of Ferns" (1838-'42); "Notes on the Botany of the Antarctic Voyage of Sir James C. Ross" (1843); "Species Filicum" (3 vols., 1846-'53); "Guide to Kew Gardens" (1847); "Century of Orchidaceous Plants" (1846); "Victoria Regia" (1851); "Century of Ferns" (1854); "Filices Exoticae" (1859); "British Ferns," and "Second Century of Ferns" (1861); and "Garden Ferns" (1862).

**HOOPER, Worthington**, an American physician, born in Springfield, Mass., March 2, 1806, died in New Haven, Conn., Nov. 6, 1867. He received his academic education at Yale college, and graduated in medicine at Harvard university in 1829. He then settled in Norwich, Conn., where he practised his profession till 1852, when he was appointed professor of the theory and practice of medicine in the medical institution of Yale college, which post he held till his death. In 1864 he was chosen vice president of the American medical association. In 1849 he published a work entitled "Physician and Patient," which gained him a high reputation as a literary and medical scholar. In 1850 appeared his "Lessons from the History of Medical Delusions," the Rhode Island prize fund dissertation for that year. He made several important committee reports to the American medical association, and was the author of a valuable series of books on physiology, natural history, chemistry, &c., for the use of the young.

**HOOLE, John**, an English translator, born in London in 1727, died near Dorking, Aug. 2, 1803. At the age of 17 he was placed as a clerk in the East India house, where he remained nearly 40 years. He published translations of the "Jerusalem Delivered" (2 vols. 8vo, 1763) and "Rinaldo" (1792) of Tasso, the dramas of Metastasio (2 vols. 12mo, 1767), and the "Orlando Furioso" of Ariosto (5 vols. 8vo, 1773-'83). Sir Walter Scott speaks of Hoole as "a noble transmuted of gold into lead," and Southey alludes to the translation of the Orlando as "that vile version of Hoole's." His dramatic works were three tragedies, "Cyrus," "Timanthes," and "Cleoneice, Princess of Babylon," all of which failed.

**HOOPER, John**, an English prelate, born in Somersetshire about 1495, executed in Gloucester, Feb. 9, 1555. He was educated at Oxford, and became a Cistercian monk. Returning to Oxford, he embraced the doctrines of the reformation, but in 1539 accepted the appointment of chaplain to Sir John Arundel, which he was obliged to relinquish when his Protestant views were discovered. He then went to France, and afterward returned secretly to England; but being recognized he escaped to Ireland, and thence passed over to the continent, remaining in Switzerland until the accession of Edward VI., when he went back to England and preached the reformation in London. In 1550 he was nominated to the see of Gloucester, but refusing to wear the episcopal robes or

to swear obedience to the metropolitan, and declaiming violently from the pulpit against the habits, the ordinal, and the council, he was imprisoned in the Fleet, Jan. 27, 1551. After two months' confinement his objections were overcome. Fourteen months later he received the bishopric of Worcester *in commendam*, in addition to that of Gloucester. On the accession of Queen Mary he was one of the first to suffer. He was deprived of his see, and in July, 1553, was cast into the Fleet prison. On Jan. 28, 1555, he was summoned with five other reformed clergymen before a spiritual court over which Gardiner presided. One of the prisoners recanted; one begged for time; Hooper, Rogers, Saunders, and Taylor replied that their consciences forbade them to subscribe to the doctrines established by law, and they were consequently excommunicated and condemned to the stake. Hooper met his fate with firmness. A collection of his works in 2 vols. 8vo was issued by the Parker society in 1843 and 1852.

**HOOPER, William**, one of the signers of the American Declaration of Independence, born in Boston, June 17, 1742, died in Hillsborough, N. C., in October, 1790. He graduated at Harvard college in 1760, studied law with James Otis in Boston, and removed to Wilmington, N. C., in 1767, where he soon rose to eminence. He was delegated to the continental congress in 1775, and was till his death a leader in the councils of North Carolina.

**HOOPING COUGH.** See WHOOPING COUGH.

**HOPOE**, a tenuirostral bird of the order *passeres* and family *upupidae*. The family includes the subfamilies *upupinae* or hoopoes, and *epimachinae* or plumed birds of New Zealand and Australia; the former comprise the genera *upupa* (Linn.), *irrisor* (Less.) of Africa, and *falculia* (Geoffr.) of Madagascar. The genus *upupa* is characterized by a long, slender, slightly curved bill, with acute tip; wings long and rounded, the fourth and fifth quills equal and longest; tail long, broad, and even; tarsi shorter than middle toe and strong, and toes moderate. About half a dozen species are described in Europe, Asia, and Africa; they are migratory, preferring moist places on the border of woods; their food consists of insects, worms, and caterpillars, which they seek on the ground and among the foliage; their flight is very undulating, and on this their principal safety from birds of prey depends; the nest is made in the holes of trees and crevices of rocks, and is composed of dried grasses lined with softer materials; the eggs are four or five in number. These birds sometimes congregate in small flocks. The tenuirostral tribe, which includes the humming and sun birds, the birds of paradise, the honey suckers, and other brilliant species, belongs almost entirely to tropical climates. The hoopoe, however (*U. epops*, Linn.), is found even in northern Europe, whither it comes in summer from Asia and northern Africa. The bird is about the size of

a thrush; the head, neck, back, and breast are reddish gray, with tints of vinous purple, shading into pure white on the belly and vent, where the centre of the feathers is dashed with dark brown; the rump is white; the wings black, when closed exhibiting five white bands;

Hoopoe (*Upupa epops*).

tail black, with an angular white band across the centre, and the outer feather narrowly edged with the same; there is an ample crest of erectile feathers, of an orange brown color of varying intensity, nearly white at the end, with a terminal oval black spot. The female is less bright, and her crest is smaller. It is a handsome and sprightly bird, and useful in destroying larvae and insects.

**HOORN**, a town of the Netherlands, in the province of North Holland, on a bay of the Zuyder Zee, 21 m. N. N. E. of Amsterdam; pop. in 1868, 9,503. It has 10 churches, a Latin school, a school of design, a house of correction, considerable navigation, and manufactories of gold and silver ware. A brisk trade is carried on in corn, cattle, cheese, and butter. The former fortifications have been converted into promenades.

**HOORNE.** See HORN, PHILIP.

**HOOSAC TUNNEL.** See TUNNEL.

**HOP** (Ger. *Hopfen*), *humulus lupulus*, a plant which with *cannabis*, the hemp, composes the order *cannabinæ*; this is by some botanists regarded as a suborder of the nettle family, the *urticaceæ*. The plant is dioecious; the flowers are apetalous; the staminate ones have five sepals and as many stamens; they are in loose axillary panicles; the fertile flowers are in short catkins of leafy scales, each of which has two flowers; calyx of a single sepal embracing the ovary, which has a style with two stigmas, and in ripening becomes a one-seeded fruit or achene. In maturing, the scales of the catkin increase much in size and form a membranaceous cone or strobile; they

are covered at their base with an aromatic resinous substance of yellowish color, known as lupuline. This constitutes about one sixth of the weight of the dried catkins, and contains the greater portion of their valuable qualities. The hop is a vine, with a perennial root from

Hop (*Humulus lupulus*).

which spring up numerous annual shoots, forming slender flexible stems, angular and rough to the touch. These climb spirally upon trees or around poles to the height of 20 or 30 ft. The leaves are opposite on long petioles, heart-shaped, and three- or five-lobed. The hop is found wild in America, Europe, and Asia. It has long been cultivated in Germany, where its use is traced back as far as the 9th century. In other countries it has become an important agricultural product, and in the United States is now largely cultivated; portions of New York and Wisconsin are the largest hop-growing sections, but considerable quantities are produced in other states; hops are an article of both export and import. The English, who have carried its culture to great perfection, first engaged in it in the reign of Henry VIII., about the year 1524, having learned from people of Artois its qualities of preserving beer from fermentation and imparting an agreeable bitter flavor to the liquor. Previous to the introduction of hops, various bitter herbs were used in beer, especially the alehoof or ground ivy, *glechoma hederacea*, and the use of hops was strongly protested against. The S. E. part of England is particularly favorable for the crop; and in the county of Kent alone from 25,000 to 30,000 acres have long been appropriated to it. Hop plantations are also found in other counties; but the production of Kent probably represents one half of the whole amount raised in England. In ordinary seasons this county supplies nearly enough hops for all the malt liquors brewed in England; but the crop is very fluctuating, and in seasons of scarcity hops are imported from Belgium and the United States. The Belgian hops have a good reputation; but

those of Bavaria are the best of all, the aroma being more perfectly preserved by the method of preparation in practice there. The American hops are not so highly esteemed in England as those raised there, and bring a lower price. Several varieties are known to cultivators, such as the English cluster, grape, Pompey, and others, the first named being considered the best. The situations selected for hop yards are the sunny slopes of hills, or wherever there is a free circulation of air. Such soil as will produce a good crop of Indian corn is suited to hops, but it is essential that it be naturally or artificially drained, as success is impossible on a wet soil. The planting is done with "sets," which are the underground stems of old vines cut into pieces of two or three joints. The plant being dioecious, 8 or 12 male hills are equally distributed in each acre. The hills are marked out from 7 to 10 ft. apart, and from three to five sets are planted in a hill. The plants are well cultivated the first year, the vines being allowed to spread upon the ground. The second spring, two poles 16 to 20 ft. long are set to each hill, and the vines as they grow are assisted, if need be, to twine upon the poles, the crop being kept clear of weeds. Hops are subject to blight of various kinds from mould or rust, and the devastation of an aphid or louse. This insect probably destroys more than half the crops, and much of the remainder is lost by unfavorable seasons and other causes. When the hops are mature, the poles are pulled up with the vines hanging to them, and women and children gather the strobiles, which are immediately carried to the kilns, called hop oasts, in which they are dried upon a floor of wire or hair cloth at a heat not exceeding 180° F. Fumes of burning sulphur are admitted to the hops while drying, by which they are partially bleached. They are then packed tightly in bags or pockets with the aid of a press, and the parcels are made so compact that they may be cut into blocks with a knife. The bales may be kept for years in a dry airy situation. The Belgians follow the same practice; but the Bavarians, when the hops are ripe, cut off the plants close to the ground, and leave them upon the poles to dry in the sun. This is thought to preserve better the aroma, and the hops, though packed loosely in bags, have more strength and flavor than the English or Belgian. Several years ago a plan for training hops on strings or wires was patented under the name of the horizontal hop yard. One pole about 7 ft. high is placed at each hill, and the tops of the poles are connected by twine stretched across the yard in two directions; it is made fast to the end poles in each row and wound once around the tops of the others. When the hops are ripe for picking, the strings are loosened, and as many removed as may be convenient for the pickers. The quality of hops is judged of by the weight of the bags, the heavier samples having more of the lupuline or hop dust, 1 lb. of

which is considered equal to 4 lbs. of the strobiles deprived of it. They should be of a clear bright color, free from greenish particles, but full of hard seeds and lupuline, and become sticky with the heat of the hand. Being greatly injured by dampness, the presence of a crust thereby produced should be particularly looked for. The essential properties of the hop, its bitterness and fragrance, appear to reside in the lupuline; this was for a long time supposed to be the pollen of the hop, but it is found only on the pistillate catkins, and consists of peculiar glands attached to the base of the scales; their appearance when magnified is shown in the engraving. This substance was noticed by Sir J. E. Smith of England and M. Planché of France, and its properties were investigated by Dr. A. W. Ives of New York. When hops are shaken in a coarse bag a fine yellow powder passes through, which is shown to be of a resinous character by its agglutinating under a moderate heat, and burning with a white flame. Dr. Ives called this substance lupuline, but this name is more properly applicable to the bitter principle it contains. In 120 grains he found 5

Lupuline Grains, highly magnified.

of tannin, 10 of extractive, 11 of bitter principle, 12 of wax, 36 of resin, and 46 of lignine. A volatile oil also has been separated by Payen and Chevallier, by distillation of the lupuline. This oil is yellowish, and has an acrid taste with the odor of hops. The oil and the bitter principle impart the virtues of the hops to water and alcohol. The separation of the resinous powder and its use in commerce instead of the hops was strongly recommended by Dr. Ives, on the score of economy in saving transportation, handling of bulky materials, and absorption of wort.—Besides their use for preserving and flavoring malt liquors, hops have a reputation in medical practice as a tonic. Their efficacy depends both upon the bitter principle and, to a less degree, the volatile oil. The effect of the former is chiefly obtained from malt liquors, where it is of course much modified by the alcohol and other constituents. The tincture of hops and tincture of lupuline are preparations in which the alcohol they contain is more active than the hops. The narcotic and sedative effects of hops and lupuline are very slight, and to be obtained

chiefly from large doses of the latter preparation. A hop pillow is however sometimes used to promote sleep, and hop poultices and fomentations are occasionally employed. It is very probable, however, that any supposed specific effect from the hops is largely due to the imagination. Pills of lupuline may be prepared by rubbing the powder in a warm mortar until it becomes plastic, and then working it into pills; these may be given in doses of .6 to 12 grains. In hop-growing countries the young shoots are often blanched by covering with earth, and are highly esteemed as a table delicacy, being prepared like asparagus. The fibres of the vine are strong and flexible, and have been woven into coarse cloth, which served for the sacks in which the hops are carried to market. Hop vines are one of the many substances that have recently been proposed as a stock for paper makers.—The production of hops in the United States has increased from 3,497,029 lbs. in 1850 to 10,991,996 lbs. in 1860, and 25,456,669 in 1870. Of the last amount, New York produced 17,558,681 lbs., Wisconsin 4,630,155, Michigan 828,269, California 625,064, and Vermont 527,927. In 1872 there were under cultivation in Great Britain and Ireland 61,927 acres of hops. The imports for that year amounted to 135,965 cwts., valued at £679,276, of which 66,930 cwts., worth £297,034, were from Belgium, and 36,612 cwts., valued at £221,617, from Germany.

**HOPE. I. Thomas**, an English author, born about 1770, died Feb. 3, 1831. He inherited a large fortune, and at the age of 18, started on a tour in Europe and the East. After an absence of eight years he returned to London, and purchased a house which he remodelled and furnished according to ideas formed on his travels. A distinguishing feature was the long galleries and the series of cabinets stored with pictures, statuary, and objects of art and *virtù*. In 1807 he published "Household Furniture and External Decorations," with 60 plates, in which a full description of his own establishment is given, with hints for the decoration of houses. In 1809 appeared his "Costume of the Ancients" (2 vols. 8vo; 3d ed. with additions, 1841), a magnificent work, containing 321 plates, followed in 1812 by "Designs of Modern Costume." In 1819 he published a novel, "Anastasius, or Memoirs of a Modern Greek, written at the close of the 18th Century." This was at the time attributed to Byron, and created a great sensation, but is now seldom read. Shortly after his death two posthumous works were published: "Essay on the Origin and Prospects of Man" (3 vols., 1831), and a "Historical Essay on Architecture" (2 vols., 1837), which has passed through several editions. He was a liberal patron of art, being the first to discover and appreciate the genius of Thorwaldsen, who executed for him his "Jason;" and he collected one of the finest private galleries of pictures in Europe.

His wife, who was the daughter of Lord Decies, archbishop of Tuam, was of remarkable beauty, and was remarried after his death to Viscount Beresford. She died in 1851.—His eldest son, HENRY THOMAS HOPE of Deepdene (died 1862), was a well known conservative politician, and was M. P. for Gloucester. **II. Alexander James Beresford Beresford-Hope**, son of the preceding, born in 1820. He assumed his mother's name Beresford by royal license in 1854. He was a member of parliament for Maidstone from 1841 to 1852, and was reelected in 1857. In 1865 he was elected for Stoke-upon Trent, and in 1868 for the university of Cambridge, for which he was reelected in 1874. In 1865-7 he was president of the royal institute of British architects. He is the author of "Essays" (London, 1844), "Letters on Church Matters, by D. C. L.," "The English Cathedral of the Nineteenth Century," and numerous pamphlets and articles; and is celebrated for his munificent restoration and endowment of St. Augustine's abbey, Canterbury, as a church of England missionary college.

**HOPE, Thomas Charles**, a Scottish chemist, born in Edinburgh, July 21, 1766, died there, June 13, 1844. His father, Dr. John Hope, was professor of botany in the university of Edinburgh. In 1787 the son was appointed to the chemical chair in the university of Glasgow. About the same time he became a convert to Lavoisier's theory of combustion and oxygenation, and was the first British chemist who publicly taught it. In 1795 he became assistant to Dr. Black, professor of chemistry at Edinburgh, upon whose death in 1799 he succeeded to the chair, which he filled until the end of the session of 1843. As a teacher and lecturer he had few equals. His principal discovery was the presence of a new earth, named by him strontites, in a mineral found in the Strontian lead mines in Argyllshire.

**HOPE AND COMPANY**, a firm of Amsterdam bankers, established in the 17th century by Henry Hope, a Scottish gentleman. One of the leading members of the house in the early part of this century, when it was in the zenith of its prosperity, was Henry Hope, who was born in the United States, the son of a Scottish loyalist who had settled in Boston. This Henry Hope lived some time in Quincy, Mass., and was a poor youth when he emigrated from that place to England in the latter part of the 18th century. Mr. John Williams, an Englishman, who married his niece, and who assumed the name of John Williams Hope, and afterward that of John Hope, was the manager of the establishment. Among the silent partners were Adrian Hope, Henry Philip Hope, and Thomas Hope, the author of "Anastasius." The ablest active partner was Peter Cæsar Labouchere, who entered the house in the capacity of a clerk, and who married in 1796 a daughter of Sir Francis Baring. The relationship with the Baring family was continued by his son, the late Lord Taunton, whose first wife was

a daughter of Sir Thomas Baring. In concert with the house of Baring, the Hopes negotiated the great loan with France after the withdrawal of the allied armies, and several other loans. The governments with which the house of Hope entertain the most intimate financial relations are those of Holland and Russia. The Hope certificates, as the stocks are called, which the Russian government gave to the Dutch bankers in acknowledgment of its debt, amount to about \$25,000,000. A splendid villa built in 1782 for one of the Hopes near Haarlem, at a cost of \$200,000, was purchased by Louis Bonaparte, and now belongs to the Orange dynasty. The present representative of the family is Adrian Elias Hope, born April 8, 1845, the son of Adrian John Hope.

**HOPKINS. I.** A N. E. county of Texas, bounded N. by the S. fork of Sulphur river, and drained by White Oak bayou and Lake fork of the Sabine; area, about 800 sq. m.; pop. in 1870, 12,651, of whom 1,620 were colored. About half of it is timbered and half prairie land. The chief productions in 1870 were 340,676 bushels of Indian corn, 44,872 of sweet potatoes, 22,549 lbs. of wool, 108,884 of butter, and 5,417 bales of cotton. There were 6,210 horses, 6,381 milch cows, 1,571 working oxen, 14,916 other cattle, 10,675 sheep, and 23,747 swine. Capital, Sulphur Springs. **II.** A W. county of Kentucky, bounded N. E. by Green river, E. by Pond river, and S. W. by Trade-water creek; area, 474 sq. m.; pop. in 1870, 13,827, of whom 1,869 were colored. It has a fertile soil and an uneven surface, diversified by hills which contain iron ore. Anthracite coal is also found. The St. Louis and South-eastern and the Elizabethtown and Paducah railroads pass through it. The chief productions in 1870 were 25,506 bushels of wheat, 464,879 of Indian corn, 48,240 of oats, 3,012,053 lbs. of tobacco, 24,849 of wool, and 114,798 of butter. There were 3,511 horses, 1,428 mules and asses, 6,554 cattle, 14,619 sheep, and 22,892 swine. Capital, Madisonville.

**HOPKINS, Edward**, governor of the colony of Connecticut, born in Shrewsbury, England, in 1600, died in London in March, 1657. He was a prominent merchant of London, and came to Boston in 1637, but soon after removed to Hartford, where he was chosen a magistrate in 1639, and governor of the colony every other year from 1640 to 1654, alternating with Haynes. He aided in forming the union of the New England colonies in 1643. On the death of his elder brother he went back to England, and became warden of the English fleet, commissioner of the admiralty and navy, and member of parliament. But he never lost his interest in the colonies, and at his death bequeathed much of his estate to New England, giving £1,000 for the support of grammar schools in Hartford and New Haven, which are still kept up, and £500 which was assigned to Harvard college and the grammar school at Cambridge.

**HOPKINS, Esek**, an American naval officer, born in Scituate, R. I., in 1718, died in North Providence, Feb. 26, 1802. On the breaking out of the revolutionary war he was commissioned by Gov. Cooke as brigadier general. On Dec. 22, 1775, he received a commission from the continental congress as commodore and "commander-in-chief" of the navy. He was officially addressed by Washington as Admiral Hopkins. In February, 1776, he put to sea with the first squadron sent out by the colonies, consisting of four ships and three sloops. The fleet sailed for the Bahama islands, and captured the forts at New Providence, with 80 cannon, and a large quantity of ordnance stores and ammunition. On his return, when off Block island, Hopkins took the British schooner Hawke and the bomb brig Bolton. For this act the president of congress complimented him officially. Two days afterward, with three vessels, he attacked the Glasgow, of 29 guns; but she escaped, and for this he was censured. In June, 1776, he was ordered by congress to appear before the naval committee to reply to charges which had been preferred against him for not annoying the enemy's ships on the southern coast. He was defended by John Adams, and was acquitted. The unavoidable delays at a later period in getting his ships ready for sea gave another chance for his enemies to complain; and neglecting a citation to appear at Philadelphia, he was dismissed the service, Jan. 2, 1777. He resided near Providence, and exerted during a long life a great political influence in Rhode Island, being often elected to the general assembly of that state.

**HOPKINS, John Henry**, an American bishop, born in Dublin, Jan. 30, 1792, died at Rock Point, Vt., Jan. 9, 1868. He came to America with his parents in 1800, and was intended for the law; but after receiving a classical education he passed a year in a counting room in Philadelphia, assisted Wilson the ornithologist in the preparation of the plates to the first four volumes of his work, and about 1810 embarked in the manufacture of iron in the western part of Pennsylvania. The iron business was prostrated by the peace of 1815, and in October, 1817, he quitted it bankrupt in property, and after six months' study was admitted to the bar in Pittsburgh; but in 1823 he left the bar for the ministry, and in 1824 became rector of Trinity church, Pittsburgh. A new building being needed, he became its architect, studying Gothic architecture for the purpose. In 1826 he was sent as clerical deputy to the general convention, and again in 1829, taking in both a prominent part in the debates. In 1831 he accepted a call to Trinity church, Boston, as assistant minister. A theological seminary was at the same time established in the diocese of Massachusetts, in which he became professor of systematic divinity. In 1832 he was elected the first bishop of Vermont, and was consecrated in New York, Oct. 31. He

immediately proceeded to his diocese, accepting at the same time the rectorship of St. Paul's church, Burlington. He soon began a boys' school, and in erecting the needed buildings became involved to a degree which resulted in the sacrifice of his property. He resigned his rectorship in 1856, in order to devote himself to the work of the diocese, and the building up at Burlington of the "Vermont Episcopal Institute." Besides pamphlets, sermons, and addresses, he published "Christianity Vindicated, in a Series of Seven Discourses on the External Evidences of the New Testament" (Burlington, 1833); "The Primitive Creed Examined and Explained" (1834); "The Primitive Church compared with the Protestant Episcopal Church of the Present Day" (1835); "Essay on Gothic Architecture" (1836); "The Church of Rome in her Primitive Purity, compared with the Church of Rome at the Present Day" (1837); "Twelve Canzonets," words and music (New York, 1839); "The Novelties which Disturb our Peace" (Philadelphia, 1844); "Causes, Principles, and Results of the British Reformation" (Philadelphia, 1844); "History of the Confessional" (New York, 1850); "A Refutation of Milner's 'End of Controversy,' in a Series of Letters" (2 vols., 1854); "The American Citizen, his Rights and Duties" (1857); "A Scriptural, Ecclesiastical, and Historical View of Slavery," sustaining that institution (1864); "History of the Church in Verse" (1866); "Law of Ritualism Examined" (1867); and "Candid Examination whether the Pope is the Great Antichrist of Scripture" (1869). He was a strong champion of the high-church party. He took a prominent part in the Pan-Anglican synod at Lambeth (1867), and received from Oxford the degree of D. C. L.

**HOPKINS, Lemuel**, an American poet, born in Waterbury, Conn., June 19, 1750, died in Hartford, April 14, 1801. He practised medicine at Litchfield from 1776 to 1784, when he removed to Hartford. He was singular in his appearance, manners, and opinions; in his early days an admirer of the French philosophers, but in his later years a diligent student of the Bible. He is said to have written for Barlow the version of the 137th psalm beginning, "Along the banks where Babel's current flows." Among his poems, the best known are "The Hypocrite's Hope" and an elegy on "The Victim of a Cancer Quack."

**HOPKINS, Mark**, an American scholar, born in Stockbridge, Mass., Feb. 4, 1802. He graduated at Williams college in 1824, and having filled a tutorship in the college for two years, he received in 1828 the degree of M. D., and began the practice of medicine in New York. In 1830 he was recalled to Williams college as professor of moral philosophy and rhetoric, and in 1836 he succeeded Dr. Griffin as president of the college, which post he held till 1872, when he resigned, and is now (1874) professor of mental and moral philosophy. He

received the degree of D. D. from Dartmouth college in 1837, and of LL. D. from the university of New York in 1857. In the latter year he became president of the American board of commissioners for foreign missions. He has published "Lectures on the Evidences of Christianity" (8vo, Boston, 1846; new ed., 1864); "Miscellaneous Essays and Discourses" (1847); "Lectures on Moral Science" (1862); "Baccalaureate Sermons and Occasional Discourses" (1863); "Law of Love, Love as a Law" (1869); "An Outline Study of Man" (New York, 1873); and a number of occasional sermons and addresses.

**HOPKINS, Samuel**, an American clergyman, born in Waterbury, Conn., Sept. 17, 1721, died in Newport, R. I., Dec. 20, 1803. Till about his 15th year he was occupied chiefly in agricultural labor, when he entered Yale college, where he graduated in 1741, after which he studied divinity with Jonathan Edwards. In 1743 he was ordained pastor of the church in Housatonnuc (now Great Barrington), Mass., where he remained till January, 1769, when he was dismissed, and began preaching in Newport, R. I. In April, 1770, it was voted not to invite him to settle there, as many were dissatisfied with his theological sentiments. He preached a farewell discourse, which was so touching and impressive that the vote was immediately and almost unanimously reversed, and he was settled as pastor. When the British took possession of Newport in 1776, he was obliged to leave the town, and preached in various places till 1780, when, Newport being evacuated, he returned to his parish, which was so much reduced and impoverished that for the remainder of his life he was dependent for his maintenance upon weekly contributions and the voluntary aid of a few friends. In 1799 he was attacked with paralysis, from which he never entirely recovered, though his mental powers were uninjured, and he was afterward able to preach occasionally. By sermons and his famous "dialogues," by letters to public men, and newspaper essays, he stirred up an organized and political action against slavery, so that in 1774 a law was passed forbidding the importation of negroes into the colony, and in 1784 it was declared by the legislature that all children of slaves born after the following March should be free. He also formed a plan for evangelizing Africa, and colonizing it with free negroes from America, as early as 1773. Besides his numerous sermons, addresses, and pamphlets, he published a life of President Edwards, and lives of Susannah Anthony and Mrs. Osborn, and left behind him sketches of his own life. His "System of Theology," however, is his great work, which, in connection with his other theological writings, must be fully understood by every one who would rightly appreciate New England either in its progress or its present condition. Of its author Dr. Channing writes that "he must always fill an important place in our ecclesiastical history."

The entire works of Dr. Hopkins were published by Dr. West in 1805, and again, with a memoir of his life and character by E. A. Park, D. D., by the doctrinal tract and book society (3 vols., Boston, 1852).

**HOPKINS, Stephen**, one of the signers of the American Declaration of Independence, born in Scituate, R. I., March 7, 1707, died in Providence, July 13, 1785. In early life he took up his residence in Providence, and in 1733 was elected a member of the general assembly, and in 1739 chief justice of the court of common pleas. In 1755 he was elected governor of the colony, and held the office, with the exception of four years, till 1768. In 1754 he was appointed a member of the board of commissioners which assembled at Albany, N. Y., to concert and digest a plan of union for the colonies. In 1765 he was elected chairman of a committee appointed at a special town meeting held in Providence to draft instructions to the general assembly on the stamp act. The resolutions reported were the same that Patrick Henry introduced into the house of burgesses of Virginia, with an additional one stating that "we are not bound to yield obedience to any law or ordinance designed to impose any internal taxation whatever upon us, other than the laws and ordinances of Rhode Island." These resolves passed in the assembly, including the above, which had been rejected in Virginia. In August, 1774, he was, with Samuel Ward, elected to represent the state in the general congress held at Philadelphia, and was also chosen in 1775 and 1776. His signature to the Declaration of Independence trembles owing to a nervous affection. He was one of the committee that drafted the articles of confederation for the government of the states. John Adams says: "The pleasantest part of my labors for the four years I spent in congress, from 1774 to 1778, was in this naval committee. Mr. Lee and Mr. Gadsden were sensible men and very cheerful, but Gov. Hopkins of Rhode Island, above 70 years of age, kept us all alive. Upon business his experience and judgment were very useful. But when the business of the evening was over, he kept us in conversation till 11, and sometimes till 12 o'clock. His custom was to drink nothing all day, until 8 in the evening, and then his beverage was Jamaica spirits and water. It gave him wit, humor, anecdotes, science, and learning. He had read Greek, Roman, and British history, and was familiar with English poetry, particularly Pope, Thomson, and Milton; and the flow of his soul made all his reading our own, and seemed to bring in recollection in all of us all we had ever read. I could neither eat nor drink in those days; the other gentlemen were very temperate. Hopkins never drank to excess, but all he drank was immediately not only converted into wit, sense, knowledge, and good humor, but inspired us with similar qualities." In 1765 he commenced a "History of the Planting and Growth of

Providence," published in the "Providence Gazette." He also published "The Rights of the Colonies Examined," reprinted in London.

**HOPKINSON. I. Francis**, one of the signers of the American Declaration of Independence, born in Philadelphia in 1737, died May 9, 1791. He graduated at the college of Philadelphia, having been the first student who entered that institution, and afterward studied law. In 1766 he went to England, where he remained two years, and then settled at Bordentown, N. J. In 1776 he was sent from New Jersey as one of her representatives in congress. During the revolution he distinguished himself by satirical and political writings, which attained great popularity. In 1779 he was made judge of the admiralty of Pennsylvania, which office he held for ten years, until the organization of the federal government, when it expired. As soon as Washington entered upon his duties as president of the United States, he appointed Hopkinson United States district judge for Pennsylvania. He was not only familiar with science as it then existed, but skilled in painting and music, composing popular airs for his own songs. His political writings include "The Pretty Story" (Philadelphia, 1774), "The Prophecy" (1776), and "The Political Catechism" (1777). The best known of his poems are "The Battle of the Kegs," a humorous ballad (new ed., Philadelphia, 1866), and "The New Roof, a Song for Federal Mechanics." The "Miscellaneous Essays and Occasional Writings of Francis Hopkinson" were published by Dobson (Philadelphia, 1792).

**II. Joseph**, an American jurist, son of the preceding, born in Philadelphia, Nov. 12, 1770, died there, Jan. 15, 1842. He graduated at the university of Pennsylvania, studied law, and began to practise at Easton, Pa., in 1791, whence he returned to Philadelphia. In the celebrated case of Dr. Rush against William Cobbett in 1799, he was leading counsel for the plaintiff, and for the defendants in the insurgent trials before Judge Chase in 1800. Subsequently, when Judge Chase was impeached before the United States senate, he chose Mr. Hopkinson to defend him. From 1815 to 1819 he was a member of the house of representatives from Philadelphia, where he opposed the recharter of the United States bank. In 1823 he resumed the practice of his profession, and in 1828 was appointed judge of the United States court for the eastern district of Pennsylvania. He is best known as the author of the national song "Hail Columbia," written in 1798 for the benefit of an actor named Fox, after an air entitled "The President's March," composed in 1789 by a German named Feyles. He was for many years a confidential friend of Joseph Bonaparte, then residing at Bordentown, and during his absence always managed his affairs.

**HOPKINSVILLE**, a city and the county seat of Christian co., Kentucky, on Little river, and on the St. Louis and Southeastern railroad,

71 m. N. W. of Nashville, and 170 m. S. W. of Frankfort; pop. in 1870, 3,136, of whom 1,460 were colored. It is well built and regularly laid out, many of the streets being paved and bordered with shade trees. It contains a botanic garden, manufactories of tobacco, ploughs, carriages, &c., two banks, a handsome court house, two weekly newspapers, a monthly periodical, and eight churches, and has an extensive trade in tobacco. It is the seat of one of the state lunatic asylums, a handsome building 368 ft. long, with rooms for 300 patients. Hopkinsville was laid out in 1799, and incorporated in 1806. It was partly burned by the confederates during the civil war.

**HOPPIN. L. Augustus**, an American artist, born in Providence, R. I., July 13, 1828. He graduated at Brown university in 1848, and was subsequently admitted to the bar of Rhode Island; but his love of art proved too strong to admit of a legal career, and he went to Europe to study the works of the great masters. Of late years he has devoted himself exclusively to drawing upon wood. He has illustrated Butler's poem of "Nothing to Wear," "The Autocrat of the Breakfast Table," "The Potiphar Papers," "The Arabian Days' Entertainments," "Mrs. Partington," and a variety of other publications. Some of his elaborate pen and ink drawings are full of character and noted for graceful execution. **II. Thomas F.**, brother of the preceding, born in Providence in August, 1816. He studied painting with Paul Delaroche in 1837-8, and subsequently designed the figures on the great window of Trinity church in New York. He has produced a spirited model of a dog, which has been cast in bronze, and numerous etchings in outline and designs on wood.

**HOP TREE** (*ptelea trifoliata*), an American shrub of the rue family (*rutaceae*), also called shrubby trefoil. It is a tall shrub, forming if kept trimmed to a single stem a tree 30 or 40 ft. high, and is found from Pennsylvania southward and westward. The leaves are trifoliate with ovate, pointed leaflets, which are downy when young; the flowers, borne in cymes at the ends of the new shoots, are small, greenish, and inconspicuous; they are polygamous—staminate, pistillate, and perfect ones occurring on the same plant; each has three to five sepals and petals, and in the staminate and perfect ones as many stamens; ovary one with a short style; the fruit is two-celled and two-seeded, being surrounded by a broad wing and resembling very much the fruit of the elm; the name *ptelea* is the Greek for elm, applied to this plant on account of the similarity of the two in their fruit. The flowers have an unpleasant odor, as do the leaves when bruised. As an ornamental shrub the hop tree has the merit of being exceedingly neat in appearance, is not subject to the attacks of insects, and from the peculiar character of its compound leaves makes a marked contrast with other shrubs and trees; it has

the demerit of tardiness in the spring, its branches remaining bare long after all other shrubs are clothed with foliage; the large clusters of winged fruit give it an attractive appearance late in the season. The fruit is intensely and even nauseously bitter, and, though

Hop Tree (*Ptelea trifoliata*).

often used as a substitute for hops, is entirely without the aromatic principle which qualifies the bitterness of the true hop. As many vegetable bitters have the property of preventing alcoholic fermentation from passing into the acetous, no doubt the fruit of this will answer the same purpose as hops in making yeast. An infusion of the leaves and young shoots is said to possess anthelmintic properties.

**HOR**, in Biblical geography, a mountain near the southern boundary of eastern Palestine, upon which Aaron, the brother of Moses, died. It is now generally identified with the Jebel Nebi Harun (mountain of the Prophet Aaron), the highest and most conspicuous of the range of the sandstone mountains of Edom, on the E. side of the great valley of the Arabah. Its height is 4,800 ft. above the Mediterranean.

**HORACE** (QUINTUS HORATIUS FLACCUS), a Roman poet, born in Venusia, Apulia, Dec. 8, 65 B. C., died Nov. 27, 8 B. C. His father was a freedman, collector, and proprietor of a farm, and though of servile origin determined to devote his time and fortune to the education of his son. He took him to Rome, where he was educated as the son of a knight or senator. One of his teachers, the flogging Orbilius (*plagosum Orbilius*), the poet has immortalized. He studied the Greek and Latin poets, especially Homer and Livius Andronicus, and went through the usual course of rhetorical instructions. From Rome he was sent in his 18th year to Athens to continue his studies, and, though he chiefly attached himself to the philosophical tenets of the Academy, he heard also Cratippus the Peripatetic and Philodemus

the Epicurean. There, too, he read Homer again, the masterpieces of Grecian tragedy and comedy, and especially the Greek lyric poets. When Brutus arrived in Athens on his way to Macedonia after the death of Cæsar, Horace enthusiastically joined him with other Roman students, and notwithstanding his youth and inexperience was advanced to the rank of a military tribune and the command of a legion in the republican army. To his share in the battle of Philippi, the loss of his shield, and his hasty flight, he playfully alludes (*Carm.* ii. 7), intimating that he knew when he was beaten, and ascribing his escape to Mercury, the god of poets. He returned to Rome with no prospects, his paternal estate having been confiscated, but was enabled to buy a clerkship in the quæstor's office, which furnished scanty emolument. Poverty, he says, impelled him to write verses. His efforts soon won the attention of Virgil and Varius, who introduced him to Mæcenas. The latter dismissed him with few words and no promises, and took no further notice of him for nine months, after which their friendship rapidly ripened into intimacy. In the following year (37) he accompanied his patron on the journey to Brundisium which is the subject of Satire i. 5. He soon after received from Mæcenas the gift of his Sabine farm, which he has often described, and which secured him the means of support and enjoyment for the rest of his life. His constant intercourse with Mæcenas introduced him to the society of other distinguished men, and won the notice of Augustus himself, who was ambitious of being celebrated by the poet, but whose offers of advancement the latter seems to have declined, though he expresses in his odes the prevailing admiration for "the tutelary guardian of peace, civilization, and progress." His friendship with Mæcenas was unbroken till the death of the latter, who in his last words commended him to the emperor: *Horatii Flacci, ut mei, este memor*. Horace died a few weeks later, so suddenly that he had no time to make his will, and appointed Augustus his executor and heir. He was buried on the slope of the Esquiline hill. His poems contain many particulars as to his person, habits, tastes, and temperament. He was of short stature, with dark hair which early turned gray, and dark eyes, and in advanced life was very corpulent. He was never married. He appears to have been of a singularly contented and happy nature, adopting a practical, if not speculative, Epicureanism, a lover of choice wines and good society, but generally simple and frugal in his habits. His odes are exquisitely finished, and are marked by a faultless taste and a mastery of metre and of language, by keen observation and a joyous amenity. His satires are sketches of the life and manners of the Romans in the reign of Augustus, and present a striking contrast to the more grave and severe productions of Juvenal. His epistles, including *De Arte*

*Poetica*, are the most perfect of his poems, fully exhibiting his terseness and elegance of style, and abounding in wise thoughts and just sentiments on manners and society, which have made Horace the favorite companion not only of scholars but of men of the world, the most read, best remembered, and most frequently quoted of all the writers of antiquity. Among the editions of Horace are those of Lambinus (1561), Torrentius (1608), Heinsius (1612), Bentley (1711), Burmann (1713), Sanadon (1728), Döring (1803), Anthon, with English notes (New York, 1830), Orelli (Zürich, 1837), Lincoln (Boston, 1851), Ritter (Leipsic, 1855), Didot (Paris, 1855), and Wickham (London, 1873). Translations of his works have been made into nearly all European languages, but there is no good English version of his complete writings. The free metrical translations of several of the odes and satires by Dryden, Pope, Swift, and others, are excellent. A collection of translations by Ben Jonson, Cowley, Milton, Dryden, Addison, Pope, Chatterton, Byron, &c., was published by Valpy as an appendix to the translation of the works of Horace by the Rev. Philip Francis (2 vols. London, 1831). The odes have also been rendered into English lyric verse by Newman (1853), Robinson (1844-'59), Lord Ravensworth (1858), Theodore Martin (1860), Conington (1863), and Lord Lytton (1869); and into French by Count Siméon (1874). Conington published a translation of the satires and epistles in 1869. Among prose versions is one by J. Lonsdale and S. Lee (London, 1873).

**HORÆ** (Gr. ὥραι, Lat. *Horæ*, hours), in classical mythology, the goddesses of the order of nature. In Homer they are the ministers of Zeus, guardians of the gates of Olympus, and rulers of the clouds and weather. In Hesiod they are the daughters of Zeus and Themis (Justice), who provide not only the fruits in their season, but give to a state good laws, justice, and peace. They are usually mentioned in connection with the graces and the nymphs as attendants on the Olympian divinities, adorned with wreaths of flowers, and bringing blessings to men. Their number was indefinite; in Athens two only were worshipped, Thallo and Carpo, the Horæ of spring and of the harvest season. On works of art they appear as blooming maidens, carrying the products of the seasons. The Hora of spring, the Chloris of the Greeks and Flora of the Romans, is especially celebrated in sculptures as the attendant of Venus rising from the sea, and of Proserpine on her ascent from the lower world.

**HOREB.** See SINAI.

**HOREHOUND** (Ang. Sax. *hora*, hoary, and *hune*, honey, a name originally applied to some related honey-bearing plant), the *marrubium vulgare* (Linn.), a plant of the natural order *labiatae*. It is a native of Europe, now common in the older portions of this country in waste places and by roadsides. It is a herbaceous perennial, with four-angled stems 12 or 18 in.

high, which, as well as the roughish opposite leaves, are whitish downy; it bears in July and August white flowers in crowded axillary whorls. The herb, like many others of the same order, is remarkable for its aromatic odor and tonic properties, so that it is a favorite domestic medicine, being used in the form of a decoction, in a sirup, and in candy, and especially for colds and affections of the lungs. Its bitter taste is imparted to water and to alcohol. Its prolonged use is apt to derange the stomach.

Horehound (*Marrubium vulgare*).

**HORGEN**, or **Horchien**, a town of Switzerland, in the canton and 7 m. S. of

the city of Zürich, on the W. bank of the lake of Zürich; pop. in 1870, 5,199. It is a common starting point for those wishing to ascend the Rigi; has a beautiful church, and manufactories of silk and cotton goods and of chemicals.

**HORITES**, the aboriginal inhabitants of Mount Seir. It is thought that they formed part of the race to which the Zuzims, the Rephaim, and Emim belonged, and inhabited Mount Seir before the Canaanites took possession of Palestine. Their name, which is derived from Hori, the grandson of Seir (Gen. xxxvi. 22), was descriptive of their habits as cave-dwellers. Their excavated dwellings are still found in hundreds in the sandstone cliffs and mountains of Edom, and especially in Petra. They are cut in the natural rock, some of them having rude arches carved over the doorways; and some are inhabited now, as they have been apparently by generation after generation. The genealogy of the Horites is twice given in the Scriptures, which say that they were divided into seven tribes. They were among the nations smitten by the kings of the east in the time of Abraham, and were superseded, or perhaps supplanted and absorbed, by the Edomites, who adopted their habits.

**HORIZON** (Gr. ὁρίζων, from ὁρίεν, to bound or define), the line that apparently separates earth and sky. In astronomy, the apparent horizon is a plane tangent to the earth at the observer, and the real horizon is a plane through the centre of the earth parallel to the apparent horizon. The artificial horizon is a horizontal mirror, usually the surface of a basin of mercury. Half the angular distance between a star and its image seen in the artificial horizon is equal to the altitude of the star above the real horizon.

**HORMAYR, Joseph**, baron, a Tyrolese patriot and historian, born in Innsbruck, Jan. 20, 1781, died in Munich, Nov. 5, 1848. He entered the Austrian military service in 1797, served in the Tyrolese militia, and afterward became director of the archives at Vienna. One of the most strenuous opponents of Napoleon, he became the chief promoter of the insurrection in Tyrol under Hofer against the French and Bavarians. After the armistice of Znaim, July, 1809, he returned to Vienna, where he was made an imperial councillor. In 1813 he interrupted the literary labors in which he was engaged to make a new attempt to revolutionize Tyrol; but he was imprisoned by the Austrian government, which was impelled to this measure by fear of giving umbrage to Bavaria, then on the point of joining the alliance against Napoleon. He was released in 1815, and appointed imperial historiographer. He lived in retirement in Brunn from 1820 to 1828, after which he held various important offices in the Bavarian service. He published *Lebensbilder aus dem Befreiungskriege* (3 parts, 1841-'4); *Geschichte der gefürsteten Grafschaft Tirol* (2 vols., 1806-'8); *Allgemeine Geschichte der neuesten Zeit* (3 vols., 1817-'19); and *Das Land Tirol und der Tirolerkrieg von 1809* (2 vols., 1845).

**HORN**, a modification of the epidermis, presenting the same structure, whether in the nails of man, the claws of the carnivora and birds, the hoofs and horns of ruminants, the spines of the porcupine and hedgehog, the plates of the armadillo, the whalebone of cetaceans, the quills of birds, or the shell of tortoises. The horns of the stag and other deciduous antlers, strictly speaking, are not horn, but true bone, belonging to the dermal or exo-skeleton, and shed by a process of absorption at the root analogous to that by which dead bone is cast off in necrosis. Horn is composed of hardened albumen, gelatine, and a small portion of phosphate of lime. Its structure is a modification of epidermic cells, harder dried, more firmly adherent, and in which the nucleus is generally invisible; the cells are arranged in regular layers, each indicating a period of growth, and are marked by perceptible striæ. The above named horny tissues are generally attached at the base to the dermis, and are removed with the skin; they are constantly growing and wearing away, and are liable to various deformities from accidental circumstances; and the younger cells may contain pigment matter. Sections of horn under the microscope are very beautiful when seen by polarized light. The horn of the rhinoceros, as already stated in the article **HAIR**, in its essential character is a mere bundle of hairs; the substance erroneously called whalebone, formed by the lining membrane of the whale's mouth, has no connection with the bony skeleton, but is a horny tissue, composed of fibres whose central portion, like the medullary substance of hair, contains easily recognizable cells. In the ox,

sheep, and the hollow-horned ruminants, there is a central core of bone upon which the horns are moulded.—Horn in its many varieties is adapted to numerous useful purposes; and it is an article of trade, horns and hoofs of cattle being largely exported from South America, southern Africa, and Russia. The horns of the buffalo are brought from the East Indies. From the most remote periods horns have been applied to various uses. The Egyptians and Hebrews made of them musical instruments. The Latin name *cornu* was also the name for trumpet, and the English name retains the same application, even if the instrument be made of brass or silver. The form of the horn adapted it for a drinking utensil, and the word is still sometimes employed in a manner to suggest this application. Horn was anciently employed for bows, and sometimes for scale armor. It also served instead of glass for windows. The methods now in use for working horn are described in Holtzapfel's "Mechanical Manipulations." The bony horns of the deer, being cellular within, are used only in their natural forms, so as not to expose their internal structure. They are sawn and filed into the shapes required for handles of knives and other implements. The horns particularly adapted for being converted into useful shapes are those of the ox, antelope, goat, and sheep kinds, which by reason of their laminated structure are readily separated into layers. They contain just enough gelatine to admit of their being softened by the application of less heat than is required for melting lead. The material may then be cut open with knives or shears, flattened into plates, divided into leaves, and finally struck between dies like metal. The first step in the treatment of horn is to separate the bony core. For this purpose it is macerated several weeks in water, which causes the lining membrane to putrefy, so that the core will fall out. This is burned, to make the bone earth used for cupels in assaying. The solid tip of the horn is sawn off, and is reserved for handles for knives, umbrellas, &c., and for buttons. The remainder, either cut into short lengths or entire, is softened by immersion in boiling water, and then by heating in the flame of a fire nearly to the temperature of melted lead. The pieces, unless intended for horn cups or similar objects, are then split open with a sharp-pointed knife, and spread out flat. A solid block of iron with a conical hole, and an iron plug to fit it, are also used to open horns without endangering the scorching of them. Both being heated to the right temperature, the horn slit with a knife is inserted in the hole, and the plug driven into the horn with a mallet. In a minute it is sufficiently softened to be easily opened. The pieces, now called flats, are laid between boards, or between heated iron plates, and subjected to pressure. The amount of this for general purposes, as for combs, is moderate, for much pressure tends to make the horn split into thin laminae. But if thin plates

are to be made, such as are used for lanterns, a heavy pressure is required, and if the horn is light-colored this increases its transparency. Such plates, when separated, are scraped with a wiry-edged knife till sufficiently thin, and are then rubbed with a woollen cloth dipped in charcoal dust and water, then with rotten stone, and lastly polished with horn shavings. The horn may be dyed by boiling it in infusions of various colored ingredients. A rich red brown color is given to it by a mixture of quicklime, pearlash, and litharge which has been boiled half an hour in water with the addition of a little pulverized dragon's blood. The compound is applied hot wherever the color is wanted, and a deeper tinge is given by renewing the application.

**HORN**, a musical wind instrument, originally formed, as its name denotes, from the horn of an animal. The name includes a large family of instruments, many of which have fallen into disuse. The hunting horn, a brass or copper tube gradually expanding into a bell-shaped mouth, and bent into a semicircle, was long the chief form. The instrument has been so greatly improved as to rank among the first in the orchestra. The French horn consists of a metallic tube, about ten feet in length, bent into several circular folds, and gradually widening toward the end whence the sound issues, called by the French the *pavillon*. It is blown through a cup-shaped mouthpiece, and the sounds are regulated by the motion of the player's lips, the pressure of his breath, and by inserting a hand or a pasteboard cone in the pavillon. Horns are generally used in pairs, and are blown in different manners, the first horn in the orchestra generally making use of two octaves, and the second of three. For the purpose of adapting them to different keys, shifting pieces, called crooks or shanks, are added to the lower part of the tube. Music for the horn is always written in the key of C, an octave higher than it is played. In order to procure clear and distinct sounds of all the notes, the piston was added to the horn by Stöelzel. (See CORNET-À-PISTONS.) Great improvements have been made in the instrument by Sax of Paris, whose horn, modelled after the antique, affords a far greater volume of sound than the old instrument. The basset horn and the English horn are not properly horns, the former belonging to the clarinets and the latter to the hautboys. The Russian horn is a straight brass tube of various size, expanding toward the lower end.

**HORN, Cape.** See CAPE HORN.

**HORN, Gustaf**, count, a Swedish general, born in Uppland, Oct. 23, 1592, died at Skara, May 16, 1657. He studied in Rostock, Jena, and Tübingen, served for a time in Holland under Prince Maurice, was afterward employed in the Swedish diplomatic service, and became senator in 1624. Receiving a command in the army of Gustavus Adolphus, he conquered Dorpat in 1625 and Kolberg in 1630, and commanded

the left wing at the battle of Leipsic in 1631. He subsequently fought in the battles on the Lech and at Lützen (1632). After the death of Gustavus Adolphus, who called him his right arm, he joined the duke of Weimar. He was made a prisoner in the battle of Nördlingen (1634), which was fought against his advice, and remained in captivity seven years. Obtaining his freedom by exchange for three other generals, in 1642, he fought against the Danes in Scania, was made minister of war in 1652, and died as field marshal and governor of Livonia and Scania.

**HORN, or Hoorne, Philip II. de Montmorency-Nivelle**, count of, a Flemish statesman, born in 1522, executed at Brussels, June 5, 1568. His father was descended from the noble French family of Montmorency, and on his mother's side he was related to Lamoral Egmont, with whose fate his own was destined to be unhappily linked. His mother, becoming a widow when he was about eight years of age, was married again to John, count of Horn, one of the wealthiest nobles of the Netherlands, who, having no children of his own, left his estates to his wife's children, on the condition that they should assume his name. Philip count of Horn thus at the outset of his career became one of the most powerful of his order, and subsequently received from the emperor Charles V. and from Philip II. the appointments of governor of Geldern and Zutphen, admiral of the Flemish fleet, and councillor of state. He fought with reputation in the battles of St. Quentin and Gravelines, and in 1559 accompanied Philip II. to Spain, where during a residence of two years he is supposed to have received information of the designs of the Spanish court against the Netherlands, and to have communicated them to the prince of Orange. Returning to the Netherlands, he joined Orange and Egmont in resisting the aggressive policy of Philip, and in urging him to recall Cardinal Granvelle; and with them he retired from the state councils until the departure of the obnoxious minister. Like Egmont and William of Orange, he also declined to sign the compromise of Breda against the introduction of the Spanish inquisition into the Netherlands, in which the greater part of the lesser Flemish nobility were interested; but his accidental presence with his friends at a banquet at which the signers of the compromise first took the name of *gueux* or "beggars" (April, 1566), proved afterward a serious charge against him. After the excesses committed by the iconoclasts in the same year, he was instrumental in preventing a general massacre of Catholics at Tournay; but his permission to Protestants to worship in the clothiers' hall, within the city, subjected him to a severe reprimand from the regent Margaret, in consequence of which he offered to resign all his offices, and wrote a letter to the king complaining of the policy pursued by the regent, and protesting that he would no longer treat of affairs of business with wo-

men. His possessions had meanwhile been very considerably reduced by disbursements made in the king's service, for which he had received no recompense; and he retired to his estates, discontented and smarting under many injuries real or fancied, but still loyal to the crown and indisposed to accept the doctrine of resistance already broached by the prince of Orange. He refused at first to take the new test oath exacted by Margaret; but after the retirement of the prince to Germany he made her an offer of his services, and agreed to take the oath. This new proof of loyalty was of no avail with Philip, who had long decided upon the death of Horn; and upon the arrival of Alva in Brussels, both Egmont and Horn were enticed to that city and there arrested, Sept. 9, 1567, on a charge of treason and other high offences. (See EGDMONT.) His wife and mother made ceaseless efforts to obtain for him a fair trial, and, as in Egmont's case, appeals for royal clemency in his behalf were made to Philip by potentates in all parts of Europe. He was executed after Egmont, and met his fate with composure, although, when his sentence was first made known to him, he protested against its injustice, exclaiming that it was a poor requital for 28 years of faithful services.

**HORNBEAM.** I. The common name of a genus of trees (*carpinus*) having wood of a horny texture, and the general appearance of the beech, the leaves resembling those of the beech or birch. The hornbeams are included with the oaks in the order *cupulifera*. In the United States the genus is represented by *C. Americana* (Mx.), the American hornbeam, a small tree from 10 to 20 ft. high, growing along streams. Its leaves are ovate-oblong, doubly serrate, nearly smooth; the barren flowers are borne in catkins on the sides of the branches, and appear before the leaves expand; the fertile flowers come out of the same bud with the leaves. The mature catkins consists of a series of unequally three-lobed bracts, each subtending a small ovate, several-nerved nut. The American hornbeam, where it has had ample space in which to grow, is a low tree with a broad, round, crowded, leafy head, the lower branches bending nearly to the ground on every side. It is readily distinguished from other trees by its ridged trunk, which is clothed with smooth bark of a slaty or bluish color, on which account it is often called, especially in western localities, the blue beech; the ridges, which run down from the under sides of the branches, are often so strong as to give the trunk the appearance of a fluted column. It is thus a tree of some claim to beauty, and it forms an interesting object in the forest, especially in autumn, at which season there are few trees which present a greater variety of brilliant tints. Easily cultivated, it is worthy of regard in arboriculture. The close-grained, white wood is used for levers, beetles, and other purposes where great strength is required, and is frequently called

ironwood. Its geographical range is from Canada to the gulf of Mexico. The common hornbeam of Europe (*C. betulus*, Linn.) is a small rigid tree, which under favorable circumstances will reach to the height of 60 or 70 ft.; but it is very seldom allowed to become a timber tree; as it grows freely after being cut down,

European Hornbeam (*Carpinus betulus*).

it is generally grown in copses to furnish small wood; this was formerly used as a hedge plant and in forming bosquets. The tree seems to have been well known to the ancients, and was called by the Greeks *ζυγία* or yoke tree from the use made of its wood. The oriental hornbeam (*C. orientalis*, Lamarck) is only a dwarf

Hop Hornbeam (*Ostrya Virginica*).

tree or shrub, rising to the height of 12 ft., and found wild in Asia Minor and the Levant. Its leaves are much smaller, and the branches grow closer together, than those of the English hornbeam. There are a few other little known and unimportant species. **II. Hop Hornbeam,**

a tree of the genus *ostrea* (the ancient classical name), closely related to *carpinus* in botanical characters; in this the bracts of the fertile aments are tubular, and at maturity each becomes a closed, bladdery, oblong bag, enclosing a smooth nut; these bag-like involucre together form a sort of strobile, in size and appearance so like that of the hop as to justify the common name. The tree, which has the same geographical range as the American hornbeam, never attains a large size, and bears a strong general resemblance to the black birch in manner of growth and the shape of its leaves; it is a handsome tree when in fruit, and is worthy of the attention of those planting for ornament. The wood has the same general character as that of the hornbeam, is used for the same purposes, and like that is called ironwood. The European hop hornbeam (*O. vulgaris*), a native of southern Europe, so closely resembles our native tree that some have supposed that they may be forms of the same species.

**HORNBILL** (*buceros*, Linn.), a genus of conirostral birds of Africa and the East Indies, of the family *bucerotidae*. The principal genus *buceros* is characterized by an enormous bill, long, broad, curved, surmounted by helmet-like prominences of various sizes and shapes, with compressed sides and acute tip; the lateral margins are more or less jagged and serrated in the adult; the nostrils are basal, lateral, and small; the wings are rather short, with the third quills nearly as long as the fourth and fifth, which are equal and longest; tail long and broad, more or less graduated; tarsi short, robust, covered in front by large transverse scales; toes broad and long, and united at the base so as to form a kind of sole; the hind toe large and flat, giving a firm support in their leaping mode of progression; claws long, curved, and sharp. The face and throat are more or less naked, sometimes with a gular pouch; above the eyes are a few bristly hairs, like lashes; the tongue is small and cartilaginous. Nearly 40 species are described, in which the bill, always large, has a great diversity of form, varying in its protuberances according to age; bulky though it be, it is of a light and cellular structure, and by no means the formidable weapon its size would indicate; its awkward shape and slight mechanical support render it difficult for the bird to manage except for seizing objects requiring slight force; its thin edges, broken by use, undergo a constant process of repair. Most of the species are of large size; they are observed singly or in parties, in the dense jungles and woods, perched on the highest branches, especially on decayed limbs near rivers; they feed upon pulpy fruits, small quadrupeds, birds, reptiles, and insects, which they crush with the bill, and, after tossing them into the air, swallow whole; when hard pressed they will not refuse carrion. The flight is heavy and straight, generally at a considerable height, and accompanied

by a remarkable noise; the cries are hoarse croaks or harsh screams; the nest is hollowed in a decayed tree, and the eggs are about four. The largest species is the rhinoceros hornbill (*B. rhinoceros*, Linn.), nearly 4 ft. long, with an expanse of wings of about 3 ft.; the bill is

Rhinoceros Hornbill (*Buceros rhinoceros*).

nearly a foot long, the upper mandible having a recurved prominence like a rhinoceros horn, giving the head the appearance of being top-heavy; the general color is black, the tail being tipped with dirty white; the bill is black at the base, reddish in the middle, and light yellow at the point. It is a stupid and cowardly bird, seldom showing any vivacity except when in search of food; it is found in

Red-billed Hornbill (*Buceros erythrorhynchus*).

India and its archipelago, and is common in collections of natural history; it is voracious, and in captivity is decidedly omnivorous. The red-billed hornbill (*B. erythrorhynchus*, Temm.), a native of Africa, like the rest of the genus, breeds in hollow trees; it occupies

holes, according to Livingstone, in the mopane tree (*Bauhinia*), a very hard wood; the female makes her nest in February, lining it with her own feathers, and lays four or five eggs, of the size of a pigeon's, and of a white color; she remains a close prisoner in the hole until the young are fully fledged, a period of eight or ten weeks; during this time the opening is plastered up with clay by the male, with the exception of a slit three or four inches long and about half an inch wide, exactly fitting the shape of his beak, and through this he feeds the female and the young. While thus imprisoned she gets very fat, and is esteemed by the natives a dainty morsel; they often dig her out, letting alone the lean and overworked male. The female sometimes hatches out two young, and by the time these are fully fledged two others are just out of the egg; she then leaves the nest with the two oldest, and the hole is again plastered up, both parents attending to the wants of the remaining young until they too are able to come forth.

**HORNBLLENDE** (*amphibole* of Haüy), a mineral species placed by Dana in the augite section of the anhydrous silicates. The chemical composition of hornblende was formerly represented by the general formula  $4RO \cdot 3SiO_2$ , in which RO may be either calcium, magnesium, iron and sodium, or sometimes manganese and potassium; but Rammelsberg by comparing his analyses with those of others, concludes that all hornblendes are metasilicates of the general formula  $M_2OSiO_2$ , or  $M_2SiO_3$ . In some varieties the silica is replaced by alumina. The application of the law of isomorphism brings together under the same species many minerals that were formerly regarded as distinct; and thus actinolite, tremolite, asbestos, and others, are now properly included in this species. In common use the name is limited, as it was formerly applied, only to the dark crystalline minerals which are met with in long slender prisms, either scattered in quartz, granite, and other igneous and metamorphic rocks, or generally disseminated throughout their mass; constituting with feldspar alone greenstone and varieties of the trappean rocks, and also hornblende slate; with feldspar and quartz, the rock syenite, or if mica too be present, syenitic granite. The crystals are also aggregated together to form rocks called hornblende or amphibole rocks, the texture of which is sometimes granular. The color of the mineral is usually black or dark green, owing to the presence of much iron; its hardness is 5-6; specific gravity, 3.1-3.4. It has close affinities with augite, and on cooling after fusion it has been found to assume the form and cleavage of this mineral. It appears to have been produced under conditions of fusion and cooling which cannot be imitated in the laboratory, the crystals obtained artificially being of the augite type.

**HORNE, George**, an English bishop, born at Otham, Kent, Nov. 1, 1730, died in Bath, Jan.

17, 1792. He took orders in 1753, and soon became distinguished as a preacher. He became president of Magdalen college, Oxford, in 1768; chaplain to the king in 1771; vice chancellor of the university of Oxford in 1776; dean of Canterbury in 1781; and bishop of Norwich in 1790. Sympathizing with the views of John Hutchinson, his first publication was an ironical attack on the philosophy of Newton in 1751, in which he draws a parallel between the heathen notions of Cicero's *Somnium Scipionis* and the Newtonian doctrines. This was followed by other similar works attacking such men as Kennicott and Shuckford. He published several volumes of sermons; "Letters to Dr. Priestley;" "Letters on Infidelity;" and a letter to Adam Smith on the life, death, and philosophy of David Hume. His chief work is his "Commentary on the Psalms" (2 vols. 4to, Oxford, 1776), on which he labored 20 years. His writings were published in 1795, in 6 vols., with a memoir of his life, &c., by his chaplain, the Rev. William Jones; and his "Aphorisms," with a biography, in 1857.

**HORNE, Richard Hengist**, an English author, born in London about 1803. Educated at the royal military college, Sandhurst, he entered the Mexican navy as a midshipman, and served until the conclusion of the war of independence. Returning to England, he devoted himself to literature, and wrote "Cosmo de Medicis," "The Death of Marlowe," and "The Death Fetch," tragedies founded on Elizabethan models; followed by "The Adventures of a London Doll," "The Good-Natured Bear," and "An Exposition of the False Medium, and Barriers excluding Men of Genius from the Public" (1838). Subsequently he produced a tragedy, "Gregory the Seventh" (1840), preceded by an essay on tragic influence; a "Life of Napoleon" (2 vols. 8vo, 1841); and "Orion, an Epic Poem" (1843), the price of which was announced upon the title page to be one farthing. This sarcasm upon the public appreciation of modern epic poetry attracted attention, and three large editions were sold at a farthing a copy. In the fourth edition the price was raised to a shilling, and in the fifth to a crown. This poem was followed by "A New Spirit of the Age," being criticisms upon living British authors (1844); "Spirit of Peers and People" (1846); "Ballads and Romances" (1846); "Judas Iscariot, a Miracle Play" (1848); "The Poor Artist, or Seven Eyesights and One Object" (1850); and "The Dreamer and the Worker" (1851). He also contributed largely to periodical literature. In 1852 Horne went to Australia, where, after digging in the gold mines, he became successively chief of police, gold commissioner, and territorial magistrate, and in 1859 published "Australian Facts and Principles." He returned to England in 1870.

**HORNE, Thomas Hartwell**, an English author, born Oct. 20, 1780, died Jan. 27, 1862. He

was educated at Christ's hospital, became a clerk in a barrister's office, and in his 19th year published his "Brief View of the Necessity and Truth of the Christian Revelation." He produced in 1818 his "Introduction to the Critical Study and Knowledge of the Holy Scriptures," and was admitted to holy orders. He also published "Introduction to the Study of Bibliography" (2 vols., 1814); an edition of the works of Hogarth (2 vols., 1821); "Manual for the Afflicted" (1832); "Protestant Memorial" (1835); "Manual of Biblical Bibliography" (1839); "Mariolatry, or Facts and Evidences demonstrating the Worship of the Virgin Mary by the Church of Rome" (1840); and "Popery the Enemy and Falsifier of Scripture" (1844). But his principal work is the "Introduction" to the Scriptures, which has been often republished.

**HORNED FROG**, or **Horned Toad**, an iguanian lizard of the genus *phrynosoma* (Wiegmann). In its general aspect it somewhat resembles a frog, and in its sluggishness a toad, hence the common names; but it is a true lizard, and in no respect a batrachian. The genus, which comprises about half a dozen species, all North American, is characterized by a more or less circular or oval body, flattened and covered with tuberculated scales; head short, triangular, with prominent vertex, and sharp spines or rough knobs; the temporal region much developed; neck very short and with transverse folds underneath; nostrils lateral, near the snout; tympanum visible but depressed; dentated margin on the flanks; no spinal or caudal crest; tail short and conical, with similar spiny scales; legs of nearly equal length and size, with five toes on each, moderate, the second the longest, and with sharp and curved nails; femoral pores, but no anal present. The species are found in California, Oregon, Mexico, and the S. W. states. For full descriptions

*Phrynosoma cornutum*.

of the species by Messrs. Baird and Girard, see Capt. Stansbury's "Expedition to Great Salt Lake," and vol. ii. of the "Mexican Boundary Survey." The best known species is the *P. cornutum*, about  $4\frac{1}{2}$  inches long; the general color above is a dusky gray, with black bars

and markings; below, silvery white. This species is not unfrequently carried to the north from Texas; in confinement it is sluggish and will rarely take food, but it is said to be active in pursuit of its insect prey in the wild state; it is very gentle in its disposition. It passes

*Ceratophrys cornuta*.

the winter in a state of lethargy in holes dug by various rodents, appearing about April and disappearing about October, at which seasons travellers are frequently annoyed by their seeking shelter from the cold night air in the folds of their blankets; their spiny covering makes them not very comfortable bedfellows.—This name has also been given to a true batrachian, a frog of the genus *ceratophrys*, in which the head is more or less roughened and spiny; it is three times as large as the common frog, with an enormous mouth. All the species live in tropical South America, and feed upon small rodents, birds, other frogs, toads, and mollusks.

**HORNED POUT.** See CATFISH.

**HORNELLVILLE**, a town and village of Steuben co., New York, at the junction of Canacadea creek with the Canisteo river, and at the intersection of the Buffalo division with the main line of the Erie railway, 200 m. W. by S. of Albany, and 90 m. by rail S. E. of Buffalo; pop. of the town in 1870, 5,837; of the village, 4,552. The village contains a sash and blind factory, several car factories, a boot and shoe and a moving machine factory, tanneries, two banks, six hotels, and one tri-weekly and three weekly newspapers.

**HORNEMANN, Friedrich Konrad**, a German traveller, born in Hildesheim in October, 1772, and last heard from April 7, 1800. He studied theology at Göttingen, and became a teacher in Hanover. Under the auspices of the African society of London he went to Egypt in 1797, and after various vicissitudes reached Moorzook, when he and his companion Freudenburg were taken ill, and the latter died. Immediately after his recovery he proceeded to Tripoli, whence he forwarded the itinerary

of his journey to his friends in Europe. Returning to Moorzook, he joined a caravan for the interior, after which all traces of him were lost. König published at Weimar in 1802 Hornemann's *Tagebuch einer Reise von Cairo nach Murzuck*, an English translation appearing at the same time in London. It was translated into French by Griffet de la Baume, with additions on the geography and the oases of Africa (2 vols., Paris, 1803).

**HORNER. I. Francis**, a British statesman, born in Edinburgh, Aug. 12, 1778, died in Pisa, Feb. 8, 1817. He was educated at the high school and university of Edinburgh, studied for the bar, and was one of the originators of the "Edinburgh Review." In 1803 he removed to London, entered at Lincoln's Inn, was called to the bar in 1804, was one of the commissioners appointed by the East India company for settling the nabob of Arcot's debts, and in 1806 entered parliament. After the general election of 1812 he became a leader of the whig party in the house; but he disagreed with Lord Grenville on the question of war after Napoleon's return from Elba, and consequently tendered the resignation of his seat, which was not accepted. His last speech was on June 25, 1816, in favor of the Catholic claims and deprecating the harsh treatment of Ireland; soon after which he made a visit to Italy for the benefit of his health, and died abroad. A monument to him by Chantrey has been erected in Westminster abbey, and his "Memoirs and Correspondence," edited by his brother, was published at London in 1843 (2 vols. 8vo). **II. Leonard**, brother of the preceding, born in Edinburgh about 1785, died in London, March 5, 1864. In 1827 he became warden of the university of London, and in 1833 an inspector of factories. In 1848 he was elected president of the geological society. Besides many pamphlets on social questions, he published "Memoirs and Correspondence of Francis Horner" (1843), and a translation of Villari's "Life of Savonarola" (1862).

**HORNET**, a stinging hymenopterous insect, of the family *Diploptera* and tribe of *Vespiaria* or wasps, under which title their family and generic characters will be given. The European hornet (*Vespa crabro*, Linn.) is about an inch long, larger than the common wasp; the thorax is black in the middle, and brown elsewhere; the abdomen is black with yellow borders, and below yellow with black spots; the upper lip yellow, and the eyes blackish; the body smooth; the wings are longitudinally folded, and the mandibles strong and dentated. The hornets, like the wasps, live in society, in nests containing males, females, and neuters, the last two of which do all the work and are armed with a venomous sting; their societies are republican, several females and their broods living and working harmoniously together. The nest is built on decayed trees, old posts, and in almost any sheltered place in barns and porticoes; it is of a rounded form, made

of coarse materials, and of the color of faded leaves; the materials of which it is composed are prepared from particles of old wood or bark by their mandibles, reduced to a kind of *papier maché* or soft pasteboard; with this, after the inside of the nest has been thickly plas-

Hornet and Nest.

tered, they make horizontal combs suspended from above by strong columns, the central being the largest; the cells are hexagonal, with the opening downward. A few females, or perhaps a single one, having escaped the rigors of winter, begin to construct a few cells and lay their eggs in the spring, the first broods being neuters, which when perfect help their mothers in the domestic economy of the nest; the larvæ are footless, each enclosed in a separate cell, where it is fed on insects and honey stolen from bees; when the larvæ have acquired their full growth, they line the cell with silk, covering the opening, and in this undergo their metamorphosis. The neuters aid in building the other nests, and in feeding the successive broods of larvæ; as the family increases, new cells and additional platforms are constructed. The young females and young males come forth about the beginning of autumn, and all larvæ which cannot become perfect before cold weather are destroyed by the neuters; the males perform no labor; both sexes meet on the trees in autumn, feeding on saccharine juices, and soon perish from the cold. There are about 150 individuals in a nest. Hornets prey upon other insects, especially flies, upon flesh, and ripe and sweet fruits; they also rob bees of their honey; a hornet's nest suspended in a place infested by flies will soon perceptibly diminish their numbers. If their nest be disturbed, they fiercely attack and sting the intruder, causing a painful and frequently dangerous wound. The wasp called hornet or "yellow jacket" in New England is the *V. maculata* (Linn.); it is too common to need any description, and its habits are those of the

family; it is often seen on trees infested with aphides or plant lice, for the sake of devouring and of carrying to its young the honey dew or sugary excretion of these insects. This species is very fierce if attacked. The nests of some of the South American species, cleared of the platforms of cells, are used as baskets, being light, strong, and very tight. Hornets, like the other wasps, make no honey. Many large wasps, varied with black and yellow, are called hornets in different parts of the country.

**HORNPIPE**, a wind instrument, once a favorite with the Welsh peasantry, and probably still in use among them, consisting of a wooden pipe with holes at stated distances, and a horn at each end. The tone is pleasing, and somewhat resembles that of the hautboy. For this instrument was composed the lively dance tune known as the hornpipe, a name applied also to the dance which accompanies it. Both the tune and the dance are supposed to be of English invention, and the former is generally in triple time, six crotchets in a bar.

**HORROX**, or **Horrocks**, **Jeremiah**, an English astronomer, born at Toxteth, near Liverpool, about 1616, died there, Jan. 3, 1641. He was matriculated as a sizar at Emmanuel college, Cambridge, July 5, 1632, but left without a degree. Devoting himself to astronomy, he found difficulty in procuring the books and instruments he desired. He was for a time misled and induced to distrust the accuracy of his own observations by their incompatibility with those of Lansberg, but was set right by the study of Tycho Brahe and of Kepler. His telescope, which he did not obtain until May, 1638, cost him only 2s. 6d., but it enabled him to make the first observation ever made of the transit of Venus over the sun's disk, Nov. 24, 1639. The transit in 1631 had been predicted by Kepler, but he had failed to point out that of 1639. The tables of Lansberg indicated the latter, but did not give the time. Horrox supplied the omission by his own calculations, and prepared to watch the phenomenon. At this time he was curate of Hoole, a small village near Preston. The transit, according to his calculation, would take place about 3 o'clock of a Sunday afternoon, but to avoid mistake he began his observations at noon the preceding day. After careful watching for more than 24 hours, except during the time of divine service, which he would not neglect even in the interest of science, he was rewarded for all his toil and anxiety. This transit was observed only by himself and his friend Crabtree, whom he apprised of the coming event the preceding month. Horrox's account of it, entitled *Venus in Sole visa*, was printed by Hevelius at the end of his *Mercurius in Sole visus* (Dantzic, 1662). He remained at Hoole only about six months after this great achievement. The last three months of his life were devoted to a study of the irregularities of the tides, from which he hoped to obtain a demonstration of the rotation of the earth. He was also the author of the theory

that the lunar motions might be represented by supposing an elliptic orbit, if the eccentricity of the ellipse were made to vary, and an oscillatory motion given to the line of apsides. Newton afterward verified his suppositions, and showed that they were consequences of the law of gravitation, but he attributed to Halley what properly belonged to Horrox. The remaining works of Horrox were published by Wallis in 1672, with an exposition of his lunar theory by Flamsteed. A translation of the *Venus in Sole visa* is appended to the "Memoirs of the Life and Labors of the Rev. Jeremiah Horrox," by Whatton (London, 1859; 2d ed., 1869).

**HORRY**, an E. county of South Carolina, bordering on the Atlantic and North Carolina, bounded W. by the Little Pedee, which flows into the Great Pedee on the S. W. border of the county, and drained by the Waccamaw river; area, 1,200 sq. m.; pop. in 1870, 10,721, of whom 3,235 were colored. It has a low marshy surface, and is partly covered with large forests of pine. The soil is generally poor. The Wilmington, Columbia, and Augusta railroad touches the N. corner. The chief productions in 1870 were 62,039 bushels of Indian corn, 72,232 of sweet potatoes, 74 bales of cotton, and 417,507 lbs of rice. There were 451 horses, 3,347 milch cows, 6,431 other cattle, 7,592 sheep, and 17,399 swine; 3 saw mills, and 8 manufactories of tar and turpentine. Capital, Conwayborough.

**HORSA**. See HENGIST.

**HORSCHOLT**, **Theodor**, a German painter, born in Munich, March 16, 1829, died there, April 3, 1871. He travelled in 1853 in Spain and Algeria, and was from 1858 to 1863 in the Caucasus with the Russian army. He was especially distinguished for his pictures of battles and of life in the Caucasus.

**HORSE**, a simple-hoofed, non-ruminating quadruped, constituting the soliped family of Cuvier's order of *pachydermata*, and, in Prof. Owen's system, the family *solidungula*, of the order *perissodactyla* (odd-toed), of the group *ungulata* (hoofed), and of the mammalian subclass *gyrencephala* (wave-brained). Zoologically considered, the family consists of the single genus *equus* (Linn.), distinguished from all other quadrupeds by having only one apparent toe and a single solid hoof on each foot, although under the skin, on the sides of the metacarpal and metatarsal bones, are the rudiments of two others on each limb. The dentition is: six sharp and cutting incisors in each jaw; six molars on each side of each jaw, with crowns of a quadrangular form, and having the surface intersected by deep plates of enamel arranged in four crescentic masses, and with a small additional disk of enamel on the inner border of the upper teeth; there are also, in the males, two small upper canines, and sometimes lower ones, usually absent in the females; there is a considerable space between the canines and the molars, opposite the commissure

of the lips, which man has availed himself of to introduce the bit, by which this animal is subjugated to his uses; in the young animal there are also deciduous molars. The different species of *equus*, as the zebras and the asses, so resemble each other in outward form and internal economy that the description of the typical species, the horse, will answer for all, with the exception of a few structural peculiarities; they are so nearly related to each other that they will breed together, producing more or less fertile hybrids, as in the cases of the horse and ass, and both with the zebra, &c. The skull of the horse is remarkable for the great width between the orbits, its flatness, the length of the face compared with the cranium, and the vertical depth of the lower jaw; the intermaxillaries project considerably beyond the nasal bones, the latter overhanging the cavity of the nostrils; the temporal arch is short, straight, and situated in the posterior third of the skull. The cervical vertebræ are of large size, and the posterior are oblong with short processes, so as to secure great freedom of motion in the neck; the dorsals are 18, with short transverse processes, and very long spinous anteriorly to afford origins for the ligament which supports the head; the lumbar are six (but five in the ass), broad and firmly joined together, with remarkably well developed processes, especially the transverse; the sacrum is a single bone, made up of five consolidated vertebræ, in a continuous line with the rest of the spine, and united to the last lumbar by the very large articulating oblique processes of the latter, securing a springiness in this region in leaping and galloping; the caudals vary from 17 to 21, having the form of vertebræ only in the upper ones. The chest is capacious, compressed laterally in front, and prolonged in advance of the first rib so as somewhat to resemble the thorax of a bird; in the middle and posterior portions it is rounded, and extends far back toward the pelvis; the ribs are 18 pairs, the anterior broad and massive (8 being true), and the posterior more slender. The clavicles are absent, and the coracoid process very rudimentary; the shoulder blades are triangular, with a prominent spine, closely approximated to the chest, transmitting the weight of this half of the body perpendicularly to the ground; the arm bone is short and strong; the forearm consists almost entirely of the greatly developed radius, the ulna being a mere appendage consolidated in the adult animal to its posterior surface, though its olecranon process is of large size, affording a powerful purchase to the extensor muscles; there are no movements of pronation and supination, but only of hinge-like flexion and extension. The carpus or wrist has seven bones in two rows, four in the upper and three in the lower; the metacarpus consists of a single long bone, the shank or cannon bone, and of two smaller supplementary pieces; this long bone represents the middle-finger metacarpal of the

human hand, and the others the ring and fore-finger metacarpals, those of the thumb and little finger being absent. The fore foot is made up of three bones representing the three phalanges of a middle finger, called respectively the great and little pastern and coffin bones, the latter large and crescentic, supporting the hoof; there are also three sesamoid bones implanted in the flexor tendon of the foot. The pelvis is remarkable for the elongation of the ilium and the outward extension of the crest and spine; the thigh bone is massive, and so short that it is entirely concealed under the integuments of the trunk, what is commonly called the thigh being in reality the leg; the leg is formed almost entirely by the tibia, which is very strong at its upper portion, the fibula being a long slender bone among the muscles lost about the lower third of the tibia; the tarsus consists of six bones, the astragalus or cockal bone, the os calcis or heel bone, the cuboid, the navicular, and the middle and lesser cuneiform bones, the internal or great cuneiform being absent with the great toe which it supports; the metatarsus and the hind foot are constituted as in the anterior limb, and the bones have received the same names. The muscular system of the horse is very different from that of man, and has been described minutely in treatises on veterinary medicine. The *panniculus carnosus*, of which the *platysma myoides* of man is a rudiment, is greatly developed and very movable, affording support and protection to various organs. The spinal muscles are of great extent and strength, especially in the neck and tail, which admit of much precision and grace of motion; the extensors of the forearm, the *gluteus medius* (the kicking muscle), and the muscles of the loins, extremities, and neck are generally very powerful; the muscles of the face, particularly those of the lips and nostrils, are largely developed, giving the well known variety of facial expression in this animal. The molar teeth of the horse may be known from those of other herbivora by the arrangement of the patches of enamel above referred to, and by their great length before they divide into fangs. The incisors are close together in a circle at the end of the jaws, slightly curved, with long simple fangs; the crowns are broad, thick, and short, of an elliptical form before they are much worn; a fold of enamel penetrates the crown like the inverted finger of a glove, which presents an island of enamel enclosing a cavity partly filled with cement and partly by the food; this is called the "mark," and is useful in determining the age of the animal, disappearing in very old horses, whose teeth get worn below the penetrating fold; according to Owen, it is usually obliterated in the middle incisors of the second set at the sixth year, and in the next and outer pairs in the seventh and eighth years respectively in the lower jaw, remaining longer in the upper, and in both its place is indicated for years by the darker color of the cement, even to the age of

16, after which the summits begin to assume a triangular form; the milk incisors are all shed before the age of five years. The salivary glands, especially the parotid, are remarkably developed; the stomach is simple and capacious; the intestinal canal is long, but short in comparison with that of the ruminants; but the colon is of enormous capacity, as also is the cæcum, apparently occupying the greater portion of the abdominal cavity; the small intestine is about 56 ft. long, with a circumference of from  $2\frac{1}{2}$  to 6 in.; the cæcum is  $2\frac{1}{2}$  ft. long, and 2 ft. in circumference at the widest part; the colon and rectum are 21 ft. long, the former averaging 2 ft. in circumference; the whole canal, therefore, is about 80 ft. long. The liver weighs between 4 and 5 lbs., having no gall bladder, and the spleen 12 oz.; the urinary bladder is small in comparison with the size of the animal, its circumference when moderately distended being about  $1\frac{1}{2}$  ft.; the mammary nipples are two, inguinal, and have at the base a hollow cavity which permits the accumulation of a considerable quantity of milk, which is often used by man as an article of diet, especially for invalids. The hoof of the horse presents an admirable adaptation to secure solidity and elasticity in an instrument of progression; the whole exterior horny covering, to which the shoe is attached, composed of modified epidermic structure, is a hollow cone truncated above, into which the coffin bone is received; highest in front, it gradually diminishes backward, where it is suddenly turned inward, becoming mixed with the sole, supporting the under parts of the foot, and protecting the sole and the frog from too rough pressure against the ground; this internal wall, called the "bars of the foot," by its sloping direction, distributes the weight of the body toward the sides of the hoof, with whose numerous perpendicular horny laminae interdigitate similar processes from the vascular surface of the coffin bone. In the triangular space in the centre of the foot is an elastic horny mass called the frog, its base connecting the posterior curves of the hoof, the sides united with the bar, and the point extending about to the centre of the sole; on the sides are deep channels, to allow of its expansion and render the foot elastic; its actual thickness in horn is not so great as farriers seem to think, from the freedom with which they use the paring knife; in a well formed foot, the base of the frog ought to occupy one sixth of the circumference of the circle of the hoof; in the centre of the frog is a horny conical cavity of considerable depth, which protects the partially cleft foot from further rupture, adds to the elasticity, secures a firmer hold on loose soils, and passing above into the substance of the sensitive frog serves to unite firmly the two halves of the foot, which are completely divided in ruminants; this horny cone has been called the frogstay or bolt. The sensitive frog falls into the inverted arch of the horny frog,

which are thus held mutually in place and preserved from external shock. The sole is an irregular plate of horn, closing up the lower opening of the foot, of an arched form, abutting everywhere against the sides of the wall, another contrivance for securing elasticity. The foot of the horse, therefore, though solid in front, is partially cleft behind, so that the terms *solidungula* and *solipeda* cannot strictly be applied to it; indeed a solid, continuous, unyielding circle of horn would be very painful if not entirely useless as an instrument of active progression; this beautiful structure, however, is sadly interfered with in almost all methods of shoeing. Immediately under the hoof are extensive cartilages, attached to the last two bones, protecting the upper part of the structure and adding greatly to the elasticity of the foot, and permitting the movements of the coffin bone with the hoof; in old horses these cartilages may become partially ossified, and are then called ring-bones. Under the hoof is also a very sensitive and vascular layer, from which the hoof originates, analogous to the soft core of hollow horns and the matrix of nails. The eyes of the horse are large, and the sight is excellent, and capable of distinguishing objects by night; the ears are large and very movable, and the sense of hearing is very acute, as in other timid and comparatively defenceless animals; the sense of smell is also acute, as is seen in their selection of food and in the recognition of their masters; the cutaneous sense is very fine, and the tactile powers of the movable lips exquisite. The food in a state of nature is exclusively vegetable. The time of gestation is about eleven months, and the foal in the domesticated state sucks six or seven months; the sexes are separated at two years; at three they may be broken, and at four be ridden. The disposition of the horse is naturally gentle and confident, which qualities have made it the most useful of animals in all the arts of peace and war; it is bold in the defence of its young, and occasionally an animal is vicious, either naturally or from bad treatment in youth. As we have horses varying in size from the Shetland pony to the Flanders dray horse, and in proportions from the thorough-bred racer to the Canadian cob, with every variety of color, so we find great diversity in their moral qualities; some are bold, intelligent, or good-natured, and others timid, stupid, or cross, and by care or from neglect each of these qualities becomes the characteristic of a race. Their movements are many; besides the walk, trot, gallop, and amble, pace, or rack, some horses gallop with the fore legs and trot with the hind, others move each leg separately in succession, and others execute many artificial movements, the result of education. The horse is quick to perceive and has an excellent memory, two qualities which render his education easy; he is capable also of deep and lasting attachment. The neigh or voice of the horse is well known,

the females exercising it less frequently than the males. The horse rarely lives to a greater age than 30 years, and is not serviceable for speed or very hard work for more than half this period. In compact form, elegance of proportions, and grace of movement, combining speed and strength, it is surpassed by no animal. Almost every part of the horse after death is useful to man; his skin is valuable for gloves, his hair for making cloth, his bones for buttons and for grinding into fertilizers, his flesh as food for hounds if not for man, his hoofs for making glue, and his intestines for the manufacture of delicate membranous tissues. The experience of continental Europe has amply proved that horse flesh is a savory, nutritious, and wholesome article of food.—The original native country of the horse (*equus caballus*, Linn.) is not certainly known; but he was most probably first brought under the subjection of man in central Asia or in the part of northern Africa adjacent to Nubia

Shetland Pony.

and Abyssinia. Useful as is the horse to man, the ass was preferred by nations of antiquity, from its easier management, hardier nature, and the cheaper food required to keep it in good condition; when greater wealth became common, the horse was more highly prized. Horses exist in the wild state in northern Asia and in America, the descendants of individuals formerly domesticated; in such cases they live in large troops, conducted in their wanderings and battles by an old male who has conquered the position of chief by superior strength and courage, and who, when his powers fail, is peacefully superseded by another. When danger threatens, they close their ranks, and present an unbroken circle of heels to the enemy, which is generally some of the larger carnivora. The horse, whether originating in northern Africa or in northern Asia, probably exists nowhere at the present time in its original character; but wild horses, which have lived independently for many generations, entirely exempt from the influence of

man, afford a tolerable idea of what the primeval animal was. Wild horses, as now met with, are generally smaller but more muscular than the domesticated ones, with less variety of color, stronger limbs, larger head, longer and less erect ears, more bushy mane, less sleek coats,

Mustang.

and smaller and more pointed hoofs. When these troops fall in with domesticated horses, the latter almost always rush with them in a wild stampede and are irrecoverably lost. The wild horse, or mustang, even when adult, is readily brought to the domesticated state; the American Indians are very dexterous in taking them on the prairies and the pampas by means of lassos, and much of the wealth of many tribes consists in their herds of these animals roaming without any apparent control. The wild troops have no fixed place of abode or of repose, frequenting the richest pasturages, and resting at night in dry and sheltered situations; they have great dread of storms and high winds, and a loud thunder clap will put them to flight in the utmost confusion and alarm.—Most countries have peculiar breeds of horses, adapt-

Arabian Horse.

ed to the climate and wants of the region. In Arabia we find a horse remarkable for fleetness, endurance, and docility; its blood by intermixture has been made to improve other races of all sizes and constitutions, producing the breeds most highly valued both in Europe

and America. The Tartar horses are small, but hardy, accustomed to inclemencies of weather and scarcity of food, performing long journeys with great speed. The Persian horse is descended from the Arab, but is inferior in speed and less enduring; it was brought to

English Race Horse.

England in the reign of Elizabeth, and by its cross produced an excellent breed. The Spanish breed, derived from the horse of Barbary, long enjoyed the highest reputation in Europe both for civil and military purposes; but they have now much degenerated from want of care. The Turkish horses have many characteristics of the Arab, from which they are descended. The horses of Germany and France have been modified by all the above breeds, and are very hardy; the Dutch breed are very large, and excellent for draught. The English have paid the most attention to the breeding of horses, and have surpassed all other nations in the quality of speed; the English racer is unequalled for quickness and endurance, in which respects he exceeds the best horses of the original oriental stock. America has taken advantage of the best breeds of the old world, and can compare favorably with any country; her trotting horses have no superiors in their peculiar gait. The race horse is the product of the Arabian with the native English breed, commenced by James I., improved by Charles II., who imported barbs and Turkish stallions, and crossed by the Darley and Godolphin Arabian. Crossing the thoroughbred with cold-blooded mares produces the more strong-limbed varieties used as carriage horses, roadsters, chargers, and cavalry horses. Another race is seen in the different kinds of dray horses, remarkable for strength, intelligence, and docility.—There is no doubt that the horse was unknown to the natives of America at the time of its discovery by Europeans, and it is certain also that the animal inhabited this country during the postpliocene period, contemporaneously with the mastodon and megalonyx; its fossil remains, chiefly molar teeth, have been so frequently found, especially in the southern and western states and in South America, and have been so carefully examined by competent palæontologists, that no doubt can remain of the former exist-

ence of the horse in the western world. The *E. neogæus* (Lund) and *E. major* (De Kay), two species of the closely allied genus *hipparion*, and one of *hippotherium*, indicate that the equine family were well represented in America in former geological periods; whether this ancient horse, of about the same size as the recent one, and distinguished by the usually more complex folds of the enamel of the molars, became entirely extinct before the appearance of man, may admit of question. Prof. Leidy says there is no room to doubt the former existence of the horse on the American continent, at the same time with the mastodon, and that "man probably was his companion." The fossil horse has also been found in the old world, in the pliocene of Europe with the mastodon and tapir and through all the diluvial period, and in the upper tertiary of Asia; there are two or three species described in Europe, and as many in Asia. From this it appears that the horse inhabited the old world as well as the new before the advent of man; and some of these antediluvian species may have become extinct, while others persisted in a declining condition during the early part of the human epoch. (See HIPPARION.)

**HORSE CHESTNUT** (*æsculus*, Linn.), a tree of the natural order *sapindaceæ*, comprising about a dozen species, of which the most common and best known is *Æ. hippocastanum* (Linn.), a handsome tree, with broad, digitate leaves,

Common Horse Chestnut (*Æsculus hippocastanum*).

and large and showy spikes of white flowers, spotted with crimson and yellow, solely cultivated for ornamenting parks and streets, its wood being soft and of little value. The buds are remarkably large, and covered with a gummy varnish; the shoots push from them

with great rapidity in spring, and the whole growth of the tree for the year is made in very short time. This species has long been in cultivation, but its native habitat has never been ascertained. The tree has been sometimes known to grow to the height of 80 ft., though ordinarily it does not attain to more than 40.

Fruit of Common Horse Chestnut.

Its bark is astringent, and abounds in tannin; its fruit contains much starch, and has been used in fattening cattle, and given to horses afflicted with colds and coughs; from this circumstance it is said to have received its common name. It is unfit for the food of man. The nuts if not allowed to dry germinate freely, and penetrate the soil at once, by means of a strong tap root; the extremity of the root is sometimes broken off before they are set out, or sown after germination, thereby insuring the growth of more lateral roots. The fruit of the horse chestnut consists of its polished seed covered with a thick prickly husk that divides into three segments before it falls. There is a very handsome variety with deep rose-colored flowers, by some considered a species, one with double flowers, besides a form with variegated flowers, one with the leaflets deeply cut, &c.—The Ohio buckeye (*Æ. glabra*,

Red Buckeye (*Æsculus Pavia*).

Willd.) is a smaller tree than the preceding, but sometimes reaching the height of 50 ft., with pale yellow inelegant flowers; it grows on river banks in western Pennsylvania, Kentucky, Ohio, and Michigan; its bark exhales an unpleasant odor, and its fruit is not half the

size of the common horse chestnut; the timber is worthless. A number of the species have the husk of the fruit without prickles; these smooth-fruited ones were formerly placed in a separate genus, *pavia*, but botanists now include them under *æsculus*. The red buckeye

Dwarf Buckeye (*Æsculus parviflora*).

(*Æ. Pavia*, Linn.) is an ornamental species, cultivated for the beauty of its flowers, which both in calyx and corolla are of a bright red; it is a small tree or large shrub, growing spontaneously from Virginia to Arkansas. The sweet buckeye (*Æ. flava*, Aiton), a large tree 60 or 70 ft. high, with pale yellow blossoms, occurs in rich woods from Virginia to Indiana and southward, where it is only a shrub 4 to 6 ft. in height. Its timber is sometimes used in building log cabins, and bowls are sometimes turned from the wood. The variety *purpurescens* (*Æ. discolor*, Pursh) is a southern form, with the leaves downy beneath and the flowers tinged with flesh color or dull purple. The dwarf horse chestnut or dwarf buckeye (*Æ. parviflora*; *Pavia macrostachya* of the catalogues) is always a shrub, and one of the finest ornaments for the lawn; it forms a dense mass much broader than high, and in July bears numerous long slender spikes of white flowers, to which the long stamens give a fine feathery appearance; it multiplies abundantly by suckers. The California buckeye or horse chestnut (*Æ. Californica*) is a low spreading tree, found along streams; the rose-tinted flowers are smaller than in the next preceding, and in a long more compact raceme; it is very ornamental.—The Spanish buckeye is a name given in Texas to *Ungnadia speciosa*, a shrub 5 to 10 ft. high, found in western Texas. The genus differs from *æsculus* in having alternate leaves and in the structure of the flower; the nut, the size of a boy's marble, is nearly black and shining; the kernel sweet and pleasant to the taste, but with decided emetic properties. It is a pleasing ornamental shrub, hardy in Georgia, but not tested much further north.

The genus was named in honor of Baron Ungnad, who as Austrian ambassador to Constantinople first sent the seeds of the common horse chestnut to Vienna in 1815, and thus introduced that tree into western Europe.

**HORSE FLY.** See DIPTERA, vol. vi., p. 129.

**HORSE MACKEREL.** See TUNNY (American).

**HORSENS,** a seaport town of Denmark, in Jutland, at the head of the Horsensfiord on the Baltic sea, and the mouth of the Bygholms-Aa, 45 m. S. E. of Viborg; pop. in 1869, 10,501. It has a Latin school, manufactories of tobacco, soap, and woollen goods, and a brisk trade in corn and fish.

**HORSE POWER,** in machinery, a measure by which the capacity of engines is rated, established by Boulton and Watt at 33,000 lbs. raised one foot high per minute. On this basis Watt reckoned the force of his steam engines, and the term has continued in use for want of a better. It is unsatisfactory when applied to a steam engine, as it is apparent that the power of the machine varies with the pressure of steam employed. A small steam cylinder of great strength furnished with abundant boiler room may be made to do the work of a much larger engine with little boiler capacity; and it may also be objected to the use of the word, that it has no reference to the quantity of fuel the engine may consume in working up to the power named. The expression is moreover defective, inasmuch as the work of a horse does not continue in action, as may that of the engine, but is interrupted at intervals of a few hours, the length of which varies with the force exerted. Boulton and Watt allowed in their estimate eight hours as the period of work for the horse. If the measure then is regarded as anything more than a mere conventional unit and as suggesting an actual comparative estimate, the power of the engine, continuing throughout the 24 hours, should be called three times as great as the number commonly assigned to it. Computations that have been made by different engineers of the average power of horses differ greatly in their results. This is to be expected in consequence of the various modes in which their strength is applied, of the various rates of speed (the effective force rapidly decreasing with the increase of speed), and also of the different qualities of the horses. Watt based his calculations upon the work of the powerful draught horses employed at the London breweries. D'Aubuisson estimated the work done by average-sized horses in whips or hoisting machines at the mines of Freiberg, working 8 hours out of 24 in two relays of 4 hours each, amounting to 16,440 lbs. raised one foot high per minute, less than half the result of Watt's calculations; while Desaguliers made an estimate of 44,000 lbs., under similar circumstances as to the duration of work. Smeaton's estimate was 22,000 lbs., and Tredgold's 27,500. Different formulas are given for computing the horse power of engines, but they may be reduced to

the simple rule of multiplying the effective pressure upon the piston in pounds per square inch by the velocity of the piston in feet per minute, and dividing by 33,000. (See STEAM ENGINE.)—Horse power is also a name given to various machines contrived to be worked by horses. The common horse whim in use at mines is one of these. It consists of a large drum upon a vertical shaft, which is turned round by horses attached to its horizontal arms. The drum is elevated sufficiently for the horses to pass under the rope, which is wound and unwound by its revolutions. Similar machines are made of cast iron in portable forms, by which toothed wheels or belts are made to drive other machinery. Upon ferry boats the horse power has usually consisted of a revolving circular platform, upon which the horse, generally a blind one, travels, pushing this round under his feet as he draws upon the traces, which are fastened to a fixed object. For threshing machines, circular saws, &c., machines are used in which the horse works upon a narrow platform supported by endless chains, and carried round two drums; the chains are also supported upon friction rollers.

**HORSE RADISH** (*Cochlearia Armoracia*, but by some botanists placed in *nasturtium*), a cruciferous plant having a root from an inch to 2½ in. in diameter, and a stem 2 to 3 ft. high rising from the midst of numerous large radical leaves. The stem supports smaller leaves and clusters of white flowers, which bloom in June. The pod is small, of elliptical form, but is very rarely formed in this country or in England. The plant is probably a native of southern Europe, and is cultivated in gardens for the sake of its root, which is used as a condiment, and also to some extent as a medicine. It has when freshly scraped a hot, biting taste, and a pungent odor, due to a volatile oil which is dissipated by drying. This oil is similar to, if not identical with, that of mustard. It is highly stimulating in its action, promoting digestion in the same way and under the same limitations as the other aromatics. It has besides a marked effect in increasing the secretion of the kidneys, and has been used in dropsy and in chronic rheumatism, in the latter disease both externally and internally. It is an antiscorbutic. Horse radish bears a slight resemblance to aconite, and the root of the latter has sometimes been mistakenly substituted for the former with fatal results. Horse radish is a minor crop of some importance, the root sometimes selling as high as \$200 per ton, but its price fluctuates greatly, and the average is not more than half that. It is usually grown as a second crop; the sets, which are pieces of the lateral roots, 4 to 6 in. long, are dibbled in between the rows of early cabbages, about 18 in. apart. In cultivating the cabbages no regard is had to the horse radish, but if any growth pushes from the sets it is hoed off as if it were a weed. The cabbages are taken off in June, and the ground

is left to the horse radish. An acre produces about five tons of roots, which are taken up before the ground freezes and stored in pits. The root is grated and put up in bottles with

Horse Radish (*Cochlearia* or *Nasturtium Armoracia*).

vinegar, but soon loses strength. In old gardens the horse radish often becomes a persistent weed.

**HORSE SHOE**, a strip of iron bent around in the form of the hoof of the horse, and fastened upon the bottom of the same by nails driven through the outer corneous layer, and clinched upon the outside. An additional security is sometimes given to it by turning up a piece of iron welded to the front part of the shoe and fitting this closely into the toe of the hoof; this serves also still more to protect the hoof from wear. For use upon icy roads, and also upon stone or wooden pavements, the shoes are provided with steel points called corks, one at each heel of the shoe and one at the toe. In the country the heel corks are usually made by turning down the iron shoe, and are not of steel, like the toe cork. Oxen also are furnished with iron shoes, each of which is made, on account of the cleft in the foot, in two parts, shaped to fit the bottom of the hoof. The need of such a protection to the feet of the horses and mules employed in war was greatly felt by the ancients, and the value of sound and strong hoofs was no less appreciated by them than by the moderns. Xenophon, Vegetius, and other authors gave certain methods of rendering the hoofs harder; but no clear intimation is anywhere to be found that either the Greeks or Romans made a practice of shoeing horses to protect their hoofs from wear. In several campaigns the cavalry were rendered useless, and the horses were sent away till their hoofs could be restored. Camels were sometimes provided with leather coverings for the feet, and the feet of oxen were protected by a bandage woven or plaited

with the fibres of plants. Beckmann is of opinion that modern horse shoes when first introduced were known by the Greek name *σεληναία*, from their moon shape; and the earliest use of this that he could discover was in the works of the emperor Leo the Philosopher of the 9th century. It is expressly stated that these are made of iron, and that nails belong to them. Horse shoeing is supposed to have been introduced into England by William the Conqueror. In the graves of some old Germans and Vandals of unknown antiquity in the northern countries, Beckmann states that horse shoes have been found with other horse furniture.—Horse shoes were always made by hand until the introduction of the machines invented by Henry Burden of Troy, N. Y. These are among the most efficient and perfect of the labor-saving machines of the day. A shoe, turned to the proper shape and grooved to receive the heads of the nails, is formed in passing through one machine. A full description would require several pages and many drawings; its general action is as follows. A bar of well worked iron is passed through rollers until it is made of the proper size. This while red hot is introduced into one side of the machine between two rollers. After it has entered a certain distance it is cut off by shears worked automatically. The piece cut off is of exactly the length required for the shoe, and it is bent in the middle over a form by the action of a tongue moved by a cam wheel. This form is placed upon a heavy revolving cylinder about 20 inches in diameter, and in its revolution carries the shoe beneath a die placed upon another cylinder, by which the shape is given to it. It is then transferred to another die formed in two other cylinders, by which the groove is cut, and places indicated by indentations for afterward punching the holes, which operation is performed by hand with a power machine. After passing through the second die the shoe is dropped upon an endless chain, which passes under the machine and also under a number of other machines placed in a row. By this means they are conveyed to an adjoining room and dumped upon a car, which carries them to different parts of a vast semicircle where the machines for punching the holes and finishing are placed. Each machine occupies a space of about 8 ft. in length by 6 in width and 7 in height, weighing several tons, and is capable of making from 50 to 60 shoes per minute.—Horse shoes have long been the subject of a singular superstition. They were thought to be a protection against evil spirits and witches, preventing these from passing the threshold at which one was nailed. Aubrey in his "Miscellanies" says that in his time (the latter half of the 17th century) most of the houses of the west end of London were thus protected.

**HORSETAIL**, the name of plants of the genus *equisetum* (Lat. *equus*, a horse, and *seta*, a bristle), which belongs to the great series of

cryptogamous or flowerless plants. They have rush-like, hollow, jointed stems, with toothed sheaths at the joints, and terminated by a sort of cone of shield-shaped scales; the spore cases or parts concerned in reproduction are

Common Horsetail (*Equisetum arvense*)—Scales and Spores, and Barren and Fertile Stems.

attached to the under side of these scales; each spore has attached to it four long elastic filaments, which coil closely around it when moist, and uncoil when dry; these motions, which may be induced at will by breathing upon the spores, render them interesting objects for the microscope. The cuticle of these plants abounds so largely in silica that some are used in polishing; hence scouring rush is the common name for some species. The most common or field horsetail, *E. arvense*, is a plant of wide distribution, it being found in every continent and from the Arctic zone to Africa; this species is of interest chiefly as it is alleged to be poisonous to cattle. Like some others, it produces two sorts of stems; the fertile ones, which appear in very early spring, especially in moist places, are 4 to 10 in. high, simple, succulent, of a light brown color with black sheaths, and wither soon after the spores are discharged. The barren stems appear later, and are green and ribbed, appearing quite unlike the others; they bear numerous generally simple branches at each node, and have so much the appearance of a young seedling pine-tree that in some localities the plant is called low pine and ground pine. The plant is very generally regarded by farmers as poisonous to animals, but in this, as in other cases of plants reputed to be injurious, it is very difficult to procure positive evidence. It would seem to be quite certain that the dried plant is not poisonous, as it is often cut with the grass

when mown for hay, and we have known hay largely mixed with horsetail to be fed without injury. The sterile stem of this is also annual. There are several perennial-stemmed species, the largest of which, *E. robustum*, 8 to 6 ft. high, grows along the western rivers.

**HORSFIELD, Thomas**, an English traveller and naturalist, born about 1773, died in 1859. He went to Java in 1802 under the auspices of the Dutch colonial government, and remained there during its temporary occupation by the East India company. After having thoroughly studied the natural history of the island, he returned to England in 1817 with a large collection of animals and plants. The former are described in his "Zoological Researches in Java and the Neighboring Islands" (4to, 1821-'4); the latter in a work entitled *Plantæ Javanicæ rariores* (1838-'52).

**HORSLEY, John Calcott**, an English painter, born in London, Jan. 29, 1817. His father was the musician William Horsley. He became known for his genre pictures, gained in 1843 a prize of £200 for his cartoon representing "St. Augustine Preaching," and subsequently executed many frescoes for the houses of parliament. Among his best known works are "L'Allegro and Il Penseroso," painted for Prince Albert, "A Scene from Don Quixote," "Under the Mistletoes," and "Caught Napping."

**HORSLEY, Samuel**, an English prelate and scholar, born in St. Martin's-in-the-fields, London, in 1733, died in Brighton, Oct. 4, 1806. He was educated at Cambridge, took orders in 1759, and held successively several important livings. In 1788 he was made bishop of St. Davids, in 1793 of Rochester, and in 1802 of St. Asaph. For this rapid and unusual preferment he was in part indebted to his controversy with Dr. Priestley on the divinity of Christ. He published an edition of Apollonius Pergæus (1770), and of the works of Newton (1779-'85). From 1773 he was for several years secretary of the royal society. Among his works are: "Critical Disquisitions on the 18th Chapter of Isaiah;" "Hosea, a New Translation, with Notes;" a translation of the Psalms; "Biblical Criticism;" elementary treatises on mathematics; essays on the prosodies of the Greek and Latin languages; and numerous papers in the "Philosophical Transactions." His theological works have been published in 6 vols. 8vo (London, 1845).

**HORTA**, a town, capital of the island of Fayal, one of the Azores, situated on the S. E. coast of the island, on a wide bay between two rocky headlands; pop. in 1864, 8,549. Its port is defended by several forts. It carries on a considerable trade in wine.

**HORTENSE, Queen.** See BEAUHARNAIS, HORTENSE EUGÉNIE.

## SUPPLEMENT TO VOLUME VIII.

### GLEYRE

**G**LEYRE, Charles Gabriel, a French painter, born at Chevilly, in the Swiss canton of Vaud, in 1806, died in Paris, May 5, 1874. He studied in Paris, and afterward in Italy, where he copied works of the masters. He exhibited "St. John inspired by the Apocalyptic Vision" in 1840, but first came into special notice when in 1843 he exhibited "Evening," which is now in the Luxembourg. His other works include "The Departure of the Apostles to preach the Gospel," "Dance of the Bacchantes," "Death of Major Duval," "Pentecost" (in the church of Ste. Marguerite, Paris), "The Battle of Leman," "Hercules at the Feet of Omphale," "The Charmer," "Joan of Arc in the Forest," "Ruth and Boaz," "The Deluge," "Minerva and the Graces," "Pentheus pursued by the Mainades," and "The Bath of a Young Roman." The last named was in the Johnston collection in New York. Gleyre died suddenly, from the rupture of a blood vessel, while visiting an exhibition of pictures.

**GLUCOSE.** Chemists distinguish between two kinds of glucose: dextroglucose, which turns the plane of polarization to the right; and lævoglucose, which turns it to the left. Dextroglucose, with which commercial glucose is identified, has received various names, such as granular sugar (*Krümelsucker*), grape-sugar, fruit-sugar, honey-sugar, starch-sugar, diabetic sugar, sugar of urine, chestnut-sugar, rag-sugar, &c. It occurs abundantly in sweet fruits, frequently together with cane-sugar and lævoglucose, but is only rarely isolated in nature; in honey, with cane-sugar and inverted sugar; and in many animal liquids and tissues. Commercial glucose is a thick, tenacious sirup of a yellowish tint, or almost colorless, with an average specific gravity at 20° C. or 68° F. of 1.412. That which is made for summer consumption is a little more dense than that manufactured for winter use. The sweetness of glucose varies greatly with different specimens, and depends inversely on the extent to which chemical changes are allowed to proceed in the manufacture, that resulting from processes in which the conversion is stopped as soon as the starch has all disap-

### GLUCOSE

peared having the maximum of sweetness. If the manufacture has been well conducted, the grape-sugar made from corn-starch is at first pure white, but has a tendency to assume a yellowish tint when old. It is hard and brittle, does not usually take on a visible crystalline structure, and dissolves more slowly in water than cane-sugar. Its specific gravity has been found to be as high as 1.6. It is much less sweet than cane-sugar, and leaves a faint but perceptible bitter taste when dissolved in the mouth. The manufacture of glucose has attained a great magnitude. Nineteen factories were in operation or ready to go into operation during 1881, in New York, Ohio, Illinois, Michigan, Iowa, and Missouri, which together had a capacity for consuming more than 35,000 bush. of corn daily, and 11,000,000 bush. during the year. The works are estimated to represent more than \$2,000,000 of capital, and to give employment to 2,100 men. Glucose is made at the factories from Indian corn by the conversion of the starch in the grain through the action of sulphuric acid, between 26 and 32 lbs. being obtained from a bushel of corn. The corn is first soaked for two or three days in warm water, and is then ground on specially prepared stones with a stream of water. The meal is next passed into a trough, the bottom of which is made of fine bolting-cloth, where the starch is washed through, after which it is led to large tanks and allowed to settle. After being beaten up with caustic soda to effect a separation of the gluten, the starch is again allowed to settle in long, shallow troughs. Having been washed free from all adhering alkali, it is next beaten up with water into a cream and conducted into the converting-tubs, which are made of wood, and are supplied with coils of copper steam-piping. In these the starch-cream is treated with dilute sulphuric acid, and steam is allowed to bubble up through the mixture from small holes in the copper pipes. This is the "open-conversion" process, and is completed in about two hours. In the "close-conversion" process, which occupies about fifteen minutes, the substances are enclosed in stout copper cylinders, and sub-

jected to the action of superheated steam. The conversion is sometimes accomplished by fermentation, but this process requires a much longer time. The "open-conversion" method is the more usual. After conversion the acid that has been used is neutralized by marble-dust, or by the carbonate of baryta and animal charcoal. The liquid is then filtered through cloth and animal charcoal, and is conveyed to the vacuum-pan, where it is evaporated at as low a temperature as possible, till the required degree of concentration is reached. If grape-sugar is to be made, the process of conversion, instead of being stopped as soon as the starch has disappeared, is carried on still further to a point which can be determined only by trial. After concentration, the liquid is conveyed into tanks, where the process of solidification is accomplished after several days. The sirup-glucose will not harden, except partially, and after many months, whatever the degree of concentration may be short of that necessary for the formation of sugar. Glucose and grape-sugar are sometimes bleached with sulphurous acid, but the practice is objectionable on account of the liability of that acid to form by oxidation free sulphuric acid, and leave it in the product as a dangerous impurity. Glucose, as formed in the earlier stages of the process, may be considered as a mixture of several chemical substances, among which are dextrine, genuine glucose, and a substance isomeric with cane-sugar; and it is on account of the presence of the last substance that the poorly converted glucoses are sweeter than the well converted. Glucose is used chiefly for the manufacture of table-sirups and candies, for brewing, as food for bees, and for artificial honey. It is used extensively and in an increasing degree in brewing, where the artificial product may be made to take the place of the glucose which is naturally developed in malting. All soft candies, wax, and taffies, and a large portion of stick-candies and caramels, are made of glucose. The glucose which is made for this purpose is much thicker and denser than the ordinary glucose, it having a specific gravity that may reach 1.440, with a percentage of water as low as 6.37. A large percentage of all the glucose made is used in the manufacture of cane-sirups. In this manufacture, the glucose is mixed with some kind of cane-sugar sirups until the tint reaches a certain standard, the amount of the latter substance varying from 3 to 10 per cent., according to circumstances. These sirups are graded according to the depth of the tint, as "A," "B," "C," &c., and are sold in the shops under various fanciful names. It is said that by reason of their cheapness, and their acceptable qualities, they have driven all the other sirups out of the market. Glucose is very extensively fed to bees, which eat it with great avidity, and store it away unchanged as honey. It is also put up directly in trade as honey—with which bees have had nothing to do—being

put by means of appropriate machinery into artificial combs made of paraffine. Glucose is also employed in the preparation of condensed milk, and small quantities of it are used by vinegar-makers, tobacco-nists, wine-makers, distillers, mucilage-makers, and for some other purposes. The question whether glucose is deleterious as an article of food, is answered, by those who have given the subject a scientific examination, in the negative. In chemical composition, glucose is identical with the natural sugars of fruits and honey which are universally accepted as wholesome foods. According to Prof. W. S. Haines, of Rush medical college, it differs from cane-sugar, so far as its physiological action is concerned, in that cane-sugar, when eaten, has to be converted into glucose before it can be assimilated, while the glucose itself is already in a condition to be assimilated directly. Prof. Harvey W. Wiley, who has given special attention to the subject, and has read a paper upon it before the American association for the advancement of science, does not hesitate to say that a glucose which is properly made is a salutary article of food.

**GOA POWDER**, the product of a tree the botanical name of which is not positively known, but supposed to be a species of *Cesalpinia*, a genus of the order *leguminosæ*. It grows in Brazil, and contains the powder in chinks or fissures in the ligneous portions of the trunk, running generally nearly through its whole length. To collect it, the trees are cut down, sawed into sections, and split through the fissures. The powder is then scraped from the wood. The substance (*araroba*, *arariba*, or as it is sometimes called *po' de Bahia*) occurs as a rough powder, or in small irregular pieces. Originally light yellow, it becomes darker by exposure to light and moisture, acquiring finally a pale or dark brown shade. Attention was called to its medicinal properties in British India in 1874, where it was found very efficacious in certain chronic diseases of the skin. Chemical examination proved it to be composed largely of chrysophanic acid, as much as 84 per cent. being found in some specimens. It is hence one of the most productive sources of this acid. Hot benzole dissolves the acid from the powder, and deposits it upon evaporation. Numerous experiments have proved the value of Goa powder in certain skin diseases, especially those of a parasitic nature. Ringworm of the scalp yields very readily to its influence. It has also been used with success in mentagra, chronic lichen, psoriasis, &c. The original mode of application was to moisten some of the powder with vinegar or lemon juice, and smear this over the affected part once a day for several days. It is now preferred to make an ointment with from 10 to 40 grains of the powder, 10 drops of acetic acid, and an ounce of lard. The drug possesses emetic and cathartic properties.

**GOODALE**, Elaine and Dora Read, American

poets, born in Mount Washington, Berkshire Co., Mass.—Elaine, Oct. 9, 1863; Dora Read, Oct. 29, 1866. Their father is a farmer. Elaine learned to read very early, and began to make verses almost as soon as she began to write. Her sister also composed verses at the age of six, and in a short time both were enthusiastic students. Their education was conducted by their mother, who took care neither to force nor to repress their intellectual gifts, but to allow them their natural development. The children established a monthly paper for the entertainment of the family, Elaine being editor and copying into it their various compositions. A group of poems selected from this paper appeared in "St. Nicholas" for December, 1877. In 1878 they published in New York a volume of poetry selected from the work of the preceding six years, with the title "Apple Blossoms: Verses of Two Children." This rapidly passed through several editions, and in 1879 they published another volume of poems, entitled "In Berkshire with the Wild Flowers" (enlarged ed., entitled "Verses from Sky Farm," 1880). Elaine has published "The Journal of a Farmer's Daughter" (1881).

**GOODWIN, Harvey**, an English prelate, born in King's Lynn, Norfolk, in 1818. He was educated by private tutors and at Caius college, Cambridge, graduating in 1840 as second wrangler in the mathematical tripos, and second Smith's prizeman. He was made fellow and mathematical lecturer of his college, and was incumbent of St. Edward's church, Cambridge, from 1848 to 1858, during part of which time he held the Hulsean lectureship (theological) in the university. He was dean of Ely from 1858 to 1869, when he was consecrated bishop of Carlisle. He has been select preacher to the university of Oxford, and select, Lady Margaret, and Ramsden preacher to the university of Cambridge. His works include "Memoirs of Bishop Mackenzie;" "Essays on the Pentateuch;" "A Commentary on St. Matthew, St. Mark, and St. Luke;" "Hulsean Lectures before the University of Cambridge;" "Lectures on the Church Catechism;" "On the Imitation of Christ," a new translation; "A Guide to the Parish Church;" "Sermons preached at Cambridge, Oxford, and Elsewhere;" and a large number of mathematical works.

**GOSSE, Edmund William**, an English author, son of Philip Henry Gosse, born in London, Sept. 21, 1849. He was educated in Devonshire, became an assistant librarian at the British museum in 1867, and in 1875 was appointed translator to the board of trade. In 1872, and again in 1874, he visited Norway, Denmark, and Sweden, to study their literature, and in 1877 went to Holland for the same purpose. He has contributed to periodicals critical papers on old English poetry and Dutch and Scandinavian literature, and has published in book form "Madrigals, Songs, and Sonnets," a volume written conjointly with a friend

(1870); "On Viol and Flute," lyric poems (1873); "King Eric," a tragedy (1876); and "The Unknown Lover," a drama (1878).

**GRANGERS, or Patrons of Husbandry**, a coöperative society of American farmers. It was founded in 1867 by William Saunders, then superintendent of the gardens of the agricultural department at Washington. To secure permanence of organization, and to spread among agriculturists a knowledge of their class interests, social and educational exercises were adopted, as well as a secret ritual, resembling that of Masonry. Mr. Saunders interested in the scheme O. H. Kelley, J. R. Thompson, William M. Ireland, Rev. A. B. Grosh, and Rev. John Trimble, other employes of the government. A. S. Moss, F. M. McDowell, George D. Hinckley, Anson Bartlett, William Muir, and Edward P. Faris, farmers of the middle and western states, entered with enthusiasm into the plan. These men established the parent body, called the national grange, at Washington, Dec. 4, 1867. A circular was issued inviting farmers to form granges. The response was slow for the first few years; but between 1873 and 1876 many thousands of granges were established all over the Union, especially in the west and southwest, besides a considerable number in the Canadian Dominion. In the beginning of 1876 the association had about 30,000 branches and counted a membership of nearly 2,500,000.—Every patron of husbandry must be interested in agriculture, and not connected with any conflicting interest, as a condition of membership. The society admits women as well as men. The local granges, which are the unit of the organization, became associations of families and a medium of social intercourse and mutual improvement. Each grange has 13 officers, and must number at least 15 members. The officers are the master, overseer, lecturer, steward, assistant steward, chaplain, secretary, gatekeeper, Ceres, Pomona, Flora, and lady assistant steward. The last four are women. The grange meets weekly or fortnightly in a hall, usually furnished with musical instruments and a library. The exercises, aside from the secret rites, are literary and intellectual. The discussion of the best methods of rural economy and of the commercial interests of the farming class was made the main practical feature. Periodicals were published, and an anthology of songs and poems was developed, which appealed to the farmers to defend their rights and interests. The national grange is composed of the masters and past-masters of the state granges, with their wives, and these of the masters and past-masters of the local granges, with their wives, if members of the order, and the organizing officers, or deputies appointed to initiate new branches.—At the time when the granger movement was started, and owing to the same cause from which it sprang, an agitation was begun in favor of regulating rates on the railroads by law.

Agriculture was depressed after the war, and a large proportion of the farmers were deeply in debt. They considered themselves unjustly treated by the grain-dealers in the grading of grain, and by the railroad companies in the charges for transportation. The granges were precluded from taking part in politics as an organization, and their constitution prohibited the discussion of political subjects at their meetings; but the society nevertheless exerted a powerful indirect influence upon legislation during the contest over the right to regulate railroad transportation. Several states passed laws fixing maximum freight rates. In 1874 a bill passed the house of representatives instituting a board of commissioners for regulating commerce between the states. These laws came to be popularly known as the "granger laws," and the law cases in which the constitutionality of the principle was affirmed as the "granger cases." A system of coöperative buying and selling was instituted by the grangers, which, though not universally adopted, had a marked effect in improving the condition of the farmers. By coöperative action they secured more favorable terms in the grain market, maintaining for a time their own elevators, inspectors, agents, &c., till it was no longer thought necessary to keep up their separate machinery for selling. By purchasing their implements, household goods, &c., at first hand, they obtained for themselves more than the usual benefits of coöperative distribution, as the farming class was subjected to arbitrary prices to a greater extent than other consumers. Owing to the teachings of the order, better business habits prevailed among the farmers. Lifted out of their immediate distress by favorable seasons and an extended market, they adopted largely the business policy of cash payments, and ceased paying excessive profits to the vendors of agricultural machinery, and risking their farms by contracting loans at 12 and 15 per cent. interest.

**GRAY, Elisha**, an American inventor, born at Barnesville, O., Aug. 2, 1835. At an early age he was apprenticed to a blacksmith, and afterward to a carpenter and boat builder, with whom he served the full time. He then entered upon a course of study at Oberlin, giving special attention to physical science, and working at his trade at spare times for his support. During this time he made a practice of constructing the pieces of apparatus called for by the experiments, and carrying them to the class room. Even when a boy he had shown such interest in the subject of electricity that he made a Morse register, which was all of wood except the magnet, armature, and embossing point, and used a candy jar for his battery. His first patent for telegraphic apparatus was granted Oct. 1, 1867, and since that date he has taken out about 40 patents, 30 of them relating to the telephone (see TELEPHONE). The others relate to the telegraphic repeater, telegraphic switch, annunciator, and type-printing

telegraph. His invention of the speaking telephone was the result of a long series of experiments and observations which began in the winter of 1866-'7. One of these is thus narrated by himself: "One day I found my nephew in the bath room, playing with a small induction coil. He was 'taking shocks' for the amusement of the smaller children. He had connected one end of the secondary coil to the zinc lining of the bath tub, which was dry at that time. Holding the other end of the coil in his left hand, he touched the lining of the tub with the right. In making contact, his hand would glide along the side for a short distance. At these times I noticed a sound proceeding from under his hand at the point of contact, which seemed to have the same pitch and quality as that of the vibrating electrotome, which was within hearing. I immediately took the electrode in my hand, and, repeating the operation, to my astonishment found that by rubbing hard and rapidly I could make a much louder sound than the electrotome was making. I then changed the pitch of the vibration, increasing its rapidity, and found that the pitch of the sound under my hand was also changed, it still agreeing with that of the vibration. I then moistened my hand and continued the rubbing, but no sound was produced so long as my hand remained wet; but as soon as the parts in contact became dry, the sound reappeared. So striking was the effect, that by hard rubbing with the dry hand the noise could be distinctly heard throughout the house." His specifications for the speaking telephone were filed in the patent office, Feb. 14, 1876. The peculiarity of his invention is, that it reproduces articulate speech by varying the resistance of a battery current. In November, 1874, he filed a caveat, and in January, 1877, received a patent, for multiplex telegraphy—the simultaneous transmission of more than one message on one wire. His system is "based upon the ability to transmit a number of tones simultaneously over the same wire and analyze them at the receiving end, so that each tone will be audible on a particular instrument which is tuned to it, but on no other." In August, 1875, he transmitted four messages at the same time on one wire between New York and Boston, and the next year he succeeded in sending eight messages in the same way between New York and Philadelphia. He visited Europe in 1874 to perfect himself in the study of acoustics, and exhibited some of his experiments to Prof. Tyndall and others. In 1869-'72 Mr. Gray was a member of a firm engaged in manufacturing telegraphic apparatus, in Cleveland and Chicago, and since that date he has been electrician of the Western electric manufacturing company. He has published "Experimental Researches in Electro-Harmonic Telegraphy and Telephony" (New York, 1878).

**GREEN, John Richard**, an English historian, born in Oxford in 1837, died in Mentone,

France, March 9, 1883. He was educated at Magdalen college school, Oxford, till his fourteenth year, was then under private tuition, and at the age of sixteen obtained by competition an open scholarship at Jesus college, Oxford. But he took a violent dislike to college professors, lectures, and undergraduates, and instead of reading his classics betook himself to the large folios of Matthew of Paris and William of Malmesbury, making no attempt to take honors. While an undergraduate, he wrote a remarkable series of papers on "Oxford in the Eighteenth Century." Dean Stanley singled out Mr. Green as a man of genius, and on his leaving Oxford gave him letters to Dr. Tait, then bishop of London. In 1860 Green was ordained, and given the curacy of St. Barnabas', King square. From there he was promoted to the sole charge of Hoxton in 1862, and shortly afterward was made vicar of St. Philip's, Stepney, one of the poorest and most neglected parishes in the diocese of London. He was an excellent parish priest, and a good organizer. In 1868, owing to ill health, he resigned his living, to give himself up to the life of an invalid. During his incumbency of Stepney he had been preparing materials for a history, and shortly after his resignation Archbishop Tait appointed him librarian at Lambeth palace. Here he found pleasant quarters, and in 1874 brought out his "Short History of the English People," one of the greatest literary successes ever known. It created a furor in England, and elicited many bitter criticisms. Shortly afterward Mr. Green set to work upon his enlarged edition of his history, in four volumes. In 1877 he married a lady of literary ability, to whose assistance he was largely indebted for much of his later work. In 1881 he contracted a serious illness in Egypt, from which he never recovered. His last work, "The Making of England," was produced in two months. At the time of his death he was engaged on a work upon the Danish inroads and colonization, to be called the "Conquest of England." Mr. Green was an authority on architecture and certain branches of natural science, and an able theologian. It is said that he was the most brilliant conversationalist in England. The swiftness of his mind, and its power in perceiving new points, was hardly more remarkable than the wealth of anecdotes and illustrations which rose at his touch. He was a liberal in politics, very broad as to the English policy in Ireland, and had a warm interest in America, believing that even after 1776 American history was still a part of English history.

**GRÉVILLE, Henry.** See DURAND, ALICE, in supplement.

**GRINDELIA**, a genus of herbaceous or suffrutescent perennials of the order *compositæ*, indigenous to the western part of North America. Several species have been proved to possess valuable medicinal virtues. The most important are *G. robusta* and *G. squarrosa*. Both these species are viscidly resinous, and on this

account are commonly called gum plant. *Grindelia* has a balsamic odor, and a pungent, bitter, aromatic taste. It has been proved valuable as a remedy for spasmodic asthma, whooping cough, &c. The best preparation, in the absence of the fresh plant, is the fluid extract, which may be administered in doses of from 10 to 60 drops every two hours. No unpleasant effects have been observed to follow very large doses. The fluid extract has also been recommended as a local application in cases of poisoning by *rhus toxicodendron* (poison ivy). Its effect in these cases is probably due to its forming a coating which excludes the air from the inflamed skin, rather than to any specific curative property.

**GROVE, Sir George**, an English writer, born at Clapham, Surrey, in 1820. He was educated as a civil engineer, and erected the first cast-iron lighthouse in Jamaica in 1841, and another in Bermuda in 1844. Afterward he was engaged with Robert Stephenson on the Chester and Holyhead railway and the Britannia tubular bridge. He was secretary of the Crystal Palace company from 1852 to 1873, and has since been a member of the board of direction. He was active in the formation of the Palestine exploration fund, and contributed largely to Dr. William Smith's "Dictionary of the Bible." For several years, till 1883, he edited "Macmillan's Magazine." He is the author of a "Dictionary of Music and Musicians," which is now (1883) in course of publication in parts. He was knighted in 1883.

**GUEST, Edwin**, an English philologist, born in Row Heath, Worcestershire, in 1800, died in Heyford, Oxfordshire, Nov. 23, 1880. He was descended from an illustrious family, Edmund Geste, bishop of Salisbury in the 16th century, being one of his ancestors. He was educated at the grammar school of Birmingham and at Gonville and Caius college, Cambridge, where he graduated in 1822, and was made a fellow in 1824. In early life he formed a friendship at Weimar, where he was a guest of the grand duke, with Goethe and Schlegel. He read for the bar with Lord Campbell. In 1852 he became master of Caius college, Cambridge, a post which he held till his death. He was recognized as the highest authority on early English, and published "History of English Rhythms" (2 vols., 1838). He also published "Early English Settlements in South Britain" (new ed., 1850), and "University Tests," a pamphlet (1871). He was a frequent contributor to the "Archæological Journal" and the "Philological Transactions," and a collection of his posthumous writings, edited by Profs. Stubbs and Deedes, was published under the title "Origines Celticæ" in 1882. He was eminent as a university reformer.

**GURJUN BALSAM** (*balsamum dipterocarpi*, wood oil), a balsam furnished by several species of *dipterocarpus* (natural order *dipterocarpaceæ*), large trees growing in India and the eastern islands of the Indian archipelago. It

is obtained by excavating a cavity in the trunk of the living tree and keeping up a fire in it until the wood is somewhat charred, when the balsam begins to exude, and is led away into vessels of bamboo. A single tree sometimes yields 30 or 40 gallons during the season, and the process is repeated year after year. Gurgun balsam, being produced by several different species of trees, naturally shows great differences in quality and appearance. It is a thick and viscid fluid, appearing opaque and dingy gray when seen by reflected light; but when placed between the observer and a strong light, it is seen to be transparent and reddish brown. It has a bitter, aromatic, and somewhat acrid taste, resembling copaiba, but less disagreeable. It is used as a substitute for copaiba in specific catarrhal inflammation of the urinary tract, in doses of from two to five grains, three times a day, given in emulsion with gum acaciæ and some aromatic water. In the regions where it is produced it is used to a great extent as a varnish, as a substitute for tar in the seams of boats, and for preserving timber from the attacks of white ants.

**GUY, Seymour Joseph**, an American painter, born in England in 1824. After studying art in his native country, he emigrated to New York in 1854, and for a time devoted himself to portrait painting. His greatest success has been in the production of genre pictures, especially where he deals with incidents of child life. His best works include "Baby's Bed-time," "The Little Stranger," "Fixing for School," "The Good Sister," "The Little Orange Girl," "After the Shower," "Solitaire," "More Free than Welcome," and "Trying on Borrowed Robes."

**HABBERTON, John**, an American author, born in Brooklyn, N. Y., Feb. 24, 1842. He lived in Illinois from his 8th to his 17th year, and was educated in the common school. He then went to New York, learned to set type in the establishment of Harper and Brothers, and subsequently entered their counting room. He enlisted in the army as a private in 1862, rose to the rank of first lieutenant, and served through the war. He reentered the employ of the Messrs. Harper in 1865, and remained there till 1872, when he went into business for himself, and in six months was bankrupt. He now became a contributor to periodicals, and was literary editor of the "Christian Union" from 1874 to 1877, since which time he has been an editorial writer on the "Herald." His "Helen's Babies" (which one publishing house rejected because it was too small for a book, another because it was too childish for adults to read, and a third on the ground that its moral tendency would be bad) was published in Boston in 1876, and has sold to the extent of more than 150,000 copies in the United States. Eleven different English editions of

it have appeared, besides several in the British colonies, and it has been translated into French, German, and Italian. "This book," says the author, "grew out of an attempt to keep for a single day a record of the doings of a brace of boys of whom the author is half owner." Mr. Habberton's other publications are: "The Barton Experiment" (New York, 1877); "The Jericho Road" (Chicago, 1877); "The Scripture Club of Valley Rest" (New York, 1877); "Other People's Children" (1877); "Some Folks," a collection of short stories (1877); "The Crew of the Sam Weller" (1878); "Canoeing in Kanuckia" (in connection with C. L. Norton, 1878); "The Worst Boy in Town" (1880); "Just One Day" (1880); "Who was Paul Grayson?" (1881); "The Bowsham Puzzle" (Leipsic, 1883); and a humorous "Life of Washington" (1883). He has edited selected essays from the "Spectator," "Tatler," "Guardian," and "Freeholder" (3 vols., 1876-'8). His first drama, "Deacon Crankett," was successfully produced in 1880.

**HALL, George Henry**, an American painter, born in Boston in 1825. He began to paint without instruction in 1842, but afterward studied in Düsseldorf and Paris, and travelled in Italy and Egypt. His pictures include "The Precious Lading," "A Group of Spanish Children," "The Thursday Fair of Seville," "The Seasons," "The Roman Fountain," "In the Rug Bazaar, Cairo," "An Oven at Pompeii," "April Showers," and "The Duenna."

**HAMILTON, Gail**. See **DODGE, MARY ABIGAIL**, in supplement.

**HAMILTON, James**, an American painter, born in Ireland in 1819, died in 1878. While he was a boy his parents emigrated to Philadelphia. There he displayed a talent for drawing, and became a teacher of the art, at the same time studying painting. He went to London in 1854, and after his return to Philadelphia, two years later, was employed in the illustration of books. His best pictures are "Capture of the Serapis," "Old Ironsides," "Wrecked Hopes," "Egyptian Sunset," and "Morning off Atlantic City."

**HANLAN, Edward**, a Canadian oarsman, born in Toronto, of Irish parents, July 12, 1855. Being brought up on the island opposite the city, he took to the water almost in his infancy, and when 16 years old, as one of a crew of fishermen, took part in a race. He came out as a single sculler in 1873, when he won the amateur championship of Lake Ontario. He afterward defeated with great ease several local oarsmen, but his powers only began to be known in 1876, when at the centennial regatta in Philadelphia he won the championship by beating Coulter and Thomas in the first heat, Luther and Plaisted in the second, and Brayley in the third, the final heat being taken in 21m. 9½s.—then, and until Courtney cut the time down to 20m. 47½s. in 1877 at Saratoga, the best record for three miles. The next year he was beaten at Silver Lake, Plym-

ton, Mass., by Plaisted and others, through a broken outrigger, and was ruled out of the Boston 4th of July regatta for fouling the same person, but the decision was subsequently revoked. Beyond these reverses and a refusal to row over what had been decided a dead heat with Riley at Barrie, Ont., in August, 1879, Hanlan's course was one of uninterrupted success up to June, 1880. In October, 1877, he defeated Wallace Ross in a five-mile race on Toronto bay. In 1878 he won victories over Plaisted at Toronto; Morris at Pittsburgh; Plaisted, Riley, Luther, and others at Brockville and Cape St. Vincent; Ross at St. John, and again at Barrie with Hosmer; and finally Courtney at Lachine near Montreal, over a five-mile course, by a length and a quarter. Then he went to England, and easily rowed away from Hawdon on May 5, 1879, and without much difficulty on June 16 defeated William Elliott, the champion of England. Both of these matches were rowed on the Tyne course. Hanlan then returned to America, and Courtney was matched against him on Chautauqua lake; but on the evening before the race was to come off, Courtney's boat was mysteriously sawed in two. Hanlan rowed over the course in 33m. 56½s., the fastest five-mile record. But the donors of the purse declared a genuine contest necessary, which, after a great deal of negotiation, finally came off at Washington on May 19, 1880, and proved a hollow victory for Hanlan. A week later, on the same course, he easily defeated Riley; but while rowing against a large field of oarsmen at Providence on June 17, the champion broke down, and Ross came in first, with Riley second. He gained a victory over Kennedy, at Point of Pines, Mass., on May 31, 1883, when he went over a three-mile course in 19m. 4s., winning by twenty lengths. Hanlan is 5 ft. 8 in. in height, and when in rowing condition weighs about 152 lbs.

**HARDY, Thomas**, an English novelist, born in Dorsetshire in June, 1840. He was educated at a small school near his home, and in his 17th year was articled to an architect, during which time a classical scholar took charge of his higher education. He went to London after serving his time, and studied with the modern school of Gothic artists, acquiring some experience in design under Arthur Bloomfield. In 1863 he won the medal and prize of the Institute of British Architects for an essay on colored brick and terra cotta architecture, and also won Sir W. Tite's prize for architectural design. He studied hard at this period, with the view of becoming an art critic, and after hesitating for a few years between architecture and literature, chose the latter in 1871. He has published "Under the Greenwood Tree" (1872); "A Pair of Blue Eyes" (1873); "Far from the Madding Crowd" (1874); "The Hand of Ethelberta" (1876); "Desperate Remedies" (1877); "The Return of the Native" (1878); "The Trumpet Major" (1879); "Two on a Tower" (1881).

**HARRISON, Frederick**, an English author, born in London in 1831. He was educated at King's college, London, and was elected scholar of Wadham college, Oxford, where he graduated in 1853. He studied under Sir Henry Maine in Lincoln's Inn, and has spent his energies on questions relating to working men and their industries, especially in Lancashire and Yorkshire. He has been connected with the Working Men's college and the Working Women's college, and finally with the Positivist school, of which he was one of the founders. He is the author of numerous articles on his favorite topics in English reviews, and has also published "Order and Progress" (1875); and "Social Statics, or the Abstract Theory of Human Order," being vol. ii. of Comte's "Positive Polity," translated (1872). Mr. Harrison represents a new school that has come up in England within the past few years, which devotes its time to promulgating the philosophical, social, and religious doctrines of Auguste Comte.

**HAYES, Rutherford Birchard**, 19th president of the United States, born Oct. 4, 1822, at Delaware, O., whither his parents had removed from Vermont in 1817. His father, a country merchant, died four months before the son's birth. The latter graduated valedictorian at Kenyon college in 1842, studied law at Harvard, and was admitted to the bar at Marietta, O., in 1845. He began to practise at Lower Sandusky, but in 1850 removed to Cincinnati, where two years later he married Lucy W., daughter of Dr. James Webb. In 1856 he was an unsuccessful candidate for judge of the common pleas court. He was appointed city solicitor to fill a vacancy in 1859, and subsequently was elected to the office, but in 1861 was defeated for reelection. In June of that year he was appointed major of the 23d Ohio infantry, which was assigned to duty in West Virginia. In September Major Hayes was appointed judge advocate of the department of the Ohio, and he filled this office for about two months, being made a lieutenant colonel in October. In command of his regiment, he distinguished himself at the battle of South Mountain, Sept. 14, 1862, where he was severely wounded in the arm by a musket ball. The next month he was appointed colonel of his regiment. In 1864 he commanded a brigade in Gen. Crook's expedition to cut the communications between Richmond and the southwest, and led the force that successfully stormed the works at Cloyd mountain. In the first battle of Winchester, July 24, 1864, he displayed great personal bravery while leading off on foot his brigade, which was overpowered by numbers. At the battle of Berryville he led his brigade into action; and at the battle of Opequan, Sept. 19, he was the first man of his command to pass over the slough. He succeeded to the command of a division, and led it in a charge at Fisher's Hill. In the battle of Cedar Creek, Oct. 19, he played a prominent

part, and his horse was shot under him. Ten days afterward he was commissioned brigadier general, and in March, 1865, he was made a major general by brevet "for gallant services during the campaign of 1864 in West Virginia, and particularly at the battles of Fisher's Hill and Cedar Creek, Va." During the war he was wounded four times. In the autumn of 1864 he had been elected to represent one of the Cincinnati districts in congress. He took his seat in December, 1865, and was made chairman of the library committee. He was reelected in 1866. While in congress he took little part in debate, but accomplished a large amount of work. In 1867 he was elected governor of Ohio over Judge Thurman by a majority of 2,983, and, resigning his seat in congress, was inaugurated on Jan. 13, 1868. In 1869 he was reelected governor by 7,506 majority over George H. Pendleton. Declining another election as governor, he became in 1872 a candidate for congress, but was defeated by Gen. H. B. Banning. In January, 1874, a wealthy uncle, Sardis Birchard, who had educated him and been an intimate friend all his life, died, leaving him a considerable estate. The campaign of 1875 in Ohio was looked upon as of national importance, chiefly because it turned on the financial issue. The republicans again nominated Gen. Hayes, and he was elected over Gov. William Allen by a majority of 5,544. In March, 1876, the Ohio republican convention recommended his nomination for the presidency. At the national convention in Cincinnati, June 15, 1876, he received on the first ballot 61 votes, 44 of which were those of his own state. His vote steadily increased, until on the seventh ballot, all the opponents of Mr. Blaine having united in favor of Gov. Hayes, he was nominated by 384 votes, to 351 for the former and 21 for Benjamin H. Bristow. (For the result of the election, see ELECTORAL COMMISSION.) Gov. Hayes was declared elected by a majority of one electoral vote, and was duly inaugurated. His chief acts as president were the withdrawal of troops from the southern states and the recognition of the democratic state officials; the issue of several orders aiming at the reform of the civil service; and the veto of appropriation bills containing clauses in relation to the army and the election laws. In the summer and autumn of 1880 he made a tour through the United States, visiting the Pacific coast.

**HEATH, Francis George**, an English philanthropist, born in Totnes, Devonshire, Jan. 15, 1843. He was educated at Taunton school, and when a child wrote a book called "Autobiographies of Animals." In 1862 he entered the civil service, after a most brilliant examination. For many years he took an active part in supporting movements for the preservation of open spaces in large cities. It was owing to his efforts that the Victoria park was enlarged in 1872. He has labored for the preservation of Epping forest, and it was through his efforts

that the act of 1878 was passed. He has contributed numerous articles to the magazines and reviews on social questions. In 1872, during the great strike among the agricultural laborers in Warwickshire, Mr. Heath made a tour of inquiry among them, and published his experiences. His works include "Romance of Peasant Life" (1872); "English Peasantry" (1874); "The Fern Paradise; a Plea for the Culture of Ferns" (1875); "The Fern World" (1877); and "Our Woodland Trees" (1878).

**HELIOTYPE**, one of a variety of improvements in pictorial reproduction in which photography is combined with some printing process. The plate from which heliotype prints are taken consists of a mixture of gelatine, bichromate of potash, and chrome alum. The process depends on the power possessed by the actinic rays of the sun to render gelatine insoluble when combined with a bichromate. This action of light upon bichromated gelatine was discovered by Poitevin in 1855. By exposing a plate covered with the gelatine mixture under a photographic negative to the light, he found that the gelatine was altered by the actinic action of the solar rays in proportion to the directness of the exposure, in such manner that those parts of the gelatine which received the full force of the light were incapable of absorbing water, those which were partially shaded could take up less quantities, while the absorbent power of the parts which were shut off entirely from the light remained undiminished. With a fatty ink, like lithographic ink, applied to such a plate after immersion in water, it was possible to reproduce the lights and shades of the photographic picture. The practical value of the heliotype process was greatly increased by the improvement, by which the gelatine is rendered durable, firm, and tough, like parchment. This effect is produced by the addition of alum or chrome alum, which does not modify the action of the sun's rays, while it affords a hard and durable plate of excellent qualities for printing. The improved heliotype process was the invention of Ernest Edwards, who developed it in London in 1870, and in 1872 removed to the United States, to take charge of the heliotype works established by Osgood and co., the Boston publishers, for the utilization of his invention.—The heliotype plates are prepared by mixing the composition in hot water and pouring it out on a smooth surface of glass or metal, where it is dried in the dark by the aid of heat. It forms a tough membrane, no thicker than parchment. This sheet is placed in contact with the negative, and both are exposed to sunlight. The parts on which the lines of the photographic image fall acquire the property of shedding water, while the remainder of the surface is capable of absorbing moisture as before. The plate is given a solid back of metal, to which it is made to adhere by atmospheric pressure. It is wetted before the application of the ink, which from its oily nature adheres only to the dry

portions of the surface. The printed impressions taken from it are therefore exact copies of the photograph. From a heliotype plate, used with care, several thousand impressions can be printed. The heliotype process is especially adapted for copying engravings, but is capable of several other uses. It has been employed to a large extent in the illustration of some of the United States government publications, such as the "Medical and Surgical History of the War" and the reports of Hayden's and Wheeler's surveys. Copper-plate engravings and etchings have been reproduced by it on a large scale, the copies possessing all the artistic value of the original prints. By the multiplication and dissemination of heliotype copies of the compositions of the great masters of painting, exactly reproduced from costly prints which are only accessible to the travelled and the wealthy, a valuable service has been done for the popularization of art in the United States.

**HENNESSY, William J.**, an American painter, born in Thomastown, Ireland, in 1839. When he was 10 years old his parents emigrated to New York, where he received his education. Since 1870 he has resided in London. He has been very successful in the illustration of fine books, and has produced numerous works in oil and in water colors, among which are "In Memoriam," "The Wanderers," "On the Sands," "A By-path in Normandy," "Autumn—the New England Hills," "A Summer Sea," "An Evening on the Thames," "In the Twilight," "The Gleaner's Return," "New England Blackberry Pickers," "An Artist's Holiday," "Drifting," and "A Street Ballad."

**HERKIMER, Nicholas**, an American soldier, born about 1725, died at Danube, N. Y., Aug. 16, 1777. His father was one of the original patentees of Burnet's field, in what is now Herkimer county, N. Y. Nicholas became at the age of 30 a lieutenant of militia, and was in command at Fort Herkimer when the French and Indians attacked German Flats in 1758. In 1775 he was commissioned colonel, and became chairman of the committee of safety of Tryon county, and a year later he was made a brigadier general. When Burgoyne set out on his expedition from Canada, expecting to march to the Hudson and sever all communication between the New England states and New York, he sent a cooperating force of regulars, Tories, and Indians, under Lieut. Col. St. Leger, to ascend the St. Lawrence, land at Oswego, and march through the Mohawk valley to a junction with the main force when it should arrive at Albany. St. Leger, with about 1,800 men, reached Fort Schuyler, near the present site of Rome, and invested it. The garrison consisted of 750 men, under Col. Gansevoort, who refused to surrender. Eight hundred militia, under Herkimer, went forward to its relief. They crossed the Mohawk at the present site of Utica, and Herkimer sent word to Gansevoort to make a sortie as he should approach. But this plan

failed, and St. Leger detached a force to intercept the militia. Herkimer, experienced in Indian warfare, was moving cautiously, when the reproaches of his subordinate officers so wrought upon him that he ordered a more hasty march. The consequence was that, as his troops wound through a ravine near Oriskany, they suddenly found the British were posted across the further end of it, and the Indians concealed on both sides. A destructive fire was opened, and in a few minutes the rear guard had been cut off, the supply train captured, and Herkimer wounded. He seated himself on his saddle at the foot of a tree, and continued to give orders through the entire conflict, which lasted five hours, and furnished many examples of desperate valor in hand-to-hand conflicts. Nearly 200 men fell on each side. A strong force made a sortie from Fort Schuyler, captured the enemy's camp, and came to the relief of Herkimer's men; whereupon the Indians retreated, soon followed by the British. Ten days later Herkimer died of his wound. Congress ordered a monument for him, but for a century no steps were taken to carry out the plan. On the occasion of celebrating the centennial anniversary of the battle of Oriskany, a movement was begun for the erection of a statue of Gen. Herkimer on the battle field.

**HERKOMER, Hubert**, an English painter, born in Waal, Bavaria, in 1849. His father, a wood carver of high reputation, emigrated to the United States in 1851, and in 1857 settled in Southampton, England. Hubert at the age of 13 entered the art school of Southampton, and won a medal in his first year. Three years later he accompanied his father to Munich, where he was assisted in his art studies by Prof. Echter. In 1866 he studied in the schools of South Kensington, and in 1868 settled in Hythe. Here he painted two pictures which were exhibited in the Dudley gallery in 1869. Up to this time his life had been a constant struggle with ill health and poverty. But he went to London, where his pictures had begun to attract attention, and became connected with the "Graphic," for which he has furnished numerous designs. During the Franco-German war he painted his "Reading War News" in Normandy, which greatly increased his reputation; and in 1873 the first sketch of his "Chelsea Pensioners" appeared in the "Graphic." The finished picture, considered his masterpiece, was exhibited in 1875. His other pictures in oil include "After the Toil of the Day," "Im Walde," "At Death's Door," "Der Bittgang," "Who Comes Here?" "A Souvenir of Rembrandt," "The Last Muster," "Hoing," a half-length portrait of Richard Wagner, and "Eventide." The last named, a group of aged pauper women taking tea in the workhouse, is one of his most successful pictures. In water-color, he has exhibited "At the Well," "Rest," "Abendbrod," "An Alpine Cheesemonger," "Woodcutters," and "The Poacher's Fate." He has also exhibited

etchings, and is a skilful musician and composer. He has been instrumental in establishing a life school for drawing at Southampton. He came to the United States in 1882.

**HESPERORNIS** (Gr., "western bird"), an extinct genus of birds, of the sub-class *odontithornes*. It was discovered in the cretaceous deposits in Kansas, by Prof. O. C. Marsh, in 1869. It was a swimmer, its legs resembling those of the modern divers, but the sternum had no keel. The wings were very small and feeble. It had well developed teeth set in a groove, and other reptilian characteristics, but the vertebrae are those of the true bird. The species *regalis* was nearly 6 ft. high.

**HICKS, George E.**, an English painter, born in 1814. He studied medicine, but afterward determined to become an artist, and was a student at the royal academy. His works include "Dividend Day at the Bank" (which, exhibited in 1859, first gave him celebrity), "The Post Office," "Before the Magistrates," "Billingsgate Market," "The First Dip," "Black Monday," "The Return from Gleaning," "The Fisherman's Wife," "Faith, Hope, and Charity," and "The Lark at Heaven's Gate."

**HIDDENITE**, a new mineral found in a single narrow vein in Alexander co., N. C., which possesses the essential qualities of a fine gem, and has been marked among the precious stones. Its discovery was first announced by Prof. Hidden, for whom it is named, in 1879, although it was first observed by I. A. D. Chamberlain in 1876. It has a vivid emerald-green color, and extraordinary brilliance, hardness, and transparency. It was at first classed as a diopside, on account of the nearly identical form of its crystals with those of that mineral and of its similarity in color, transparency, and other properties. On analysis it was identified as a variety of spodumene. The crystals are prismatic, with a considerable variety of habit, and twin crystals are common. Hiddenite differs only slightly from diopside in its prismatic angle, and resembles that mineral also in possessing an easy cleavage in two directions. The planes of the fundamental prism in the crystals are pitted with remarkable little rhomboidal depressions, the outlines of which are parallel to the prismatic angles; the same wedge-shaped hollows occur with less frequency in the other planes, and appear also in the cleavage. The crystals vary in length from half an inch to 2 or 3 inches, and are usually very slender, though they sometimes have a thickness in the direction of the clino-diagonal axis of from one third to one half an inch, while in the other transverse direction they are much thinner. Hiddenite possesses all the qualities most valued in precious stones, of rarity, brilliance, and evenness of color, transparency, and excessive hardness, and is highly prized by jewelers. Specimens have been sold at as high a price per carat as diamonds. It is called by the lapidaries *lithia-emerald*, on account of the presence in the stone of more

than 7 per cent. of lithia, a substance which is not found in the beryl-emerald. It is difficult to cut, on account of its perfect cleavage in two directions. Owing to their dichroism, however, the gems cut from the finer crystals possess a peculiar fire which is wanting to the true emerald.

**HILL, Thomas**, an American painter, born in Birmingham, England, in 1829. His family emigrated to Taunton, Mass., when he was 12 years old. He went to Boston three years later, and worked as a decorator there, and afterward in Philadelphia. He has received little instruction in art, except that he studied for a short time with Meyerheim in Paris. He has resided mainly in San Francisco since 1861. His best pictures are "The Yosemite Valley," "The Great Cañon of the Sierras," "The Home of the Eagle," "Donner Lake," and "The White Mountain Notch."

**HOANG-NAN**, a drug which was introduced into France in 1874. It was sent by a missionary in Tong-King, as a remedy for hydrophobia. Examination by M. Pierre, a botanist, proved that the plant which yielded it belonged to the order *Loganiaceæ*, and it was named *strychnos Gauthieriana*, in honor of the missionary who had brought it into notice. Subsequently M. Monrouzier, also a missionary of Tong-King, described the plant as it appears in its native habitat. It is a woody climber, found growing on calcareous mountains, and ascends lofty trees by means of its tendrils. The bark, which is the part used, is grayish or reddish externally, depending somewhat upon the age of the plant. It occurs in market generally in the form of powder, which is yellowish, and has a very persistent bitter taste. Chemical analysis has shown that it possesses the two important alkaloids of nux vomica, viz., strychnia and brucia. Its physiological effects seem to differ little, if any, from those of nux vomica. It was introduced as a remedy for hydrophobia, but has also been lauded as a cure for leprosy, snake bites, scrofula, &c. As yet it is undergoing trial, and cannot be said to have established its reputation, for most of its recommendations come from non-professional sources. It has usually been administered in pill, in doses of from 20 to 30 centigrammes.

**HOBART PASHA**, a Turkish naval officer, born in England, April 1, 1822. He is the third son of the earl of Buckinghamshire, his full name being AUGUSTUS CHARLES HOBART. He entered the British navy in 1836, and distinguished himself while a midshipman in the suppression of the slave trade in Brazilian waters. In 1845 he was appointed to the queen's yacht, on board which he served for two years. During the Crimean war he was in command of the *Driver* in the Baltic, and his conduct during the capture of Bomarsund and the attack on Abo received honorable mention. He then retired on half pay, and during the civil war in the United States commanded a blockade runner, called the *Don*, which cruised along

the coast of North Carolina. Under the name of Capt. Roberts he afterward published an account of this experience. He had been made a post captain in 1862, and in 1867 the Turkish government, to which he had offered his services, employed him in the suppression of the Cretan insurrection, with unlimited powers. For his services he received high-class decorations, and was promoted to the rank of pasha and created a full admiral. Hobart Pasha afterward served as inspector general of the Turkish navy. In consequence of the remonstrances of the Greek government, the British admiralty, at the instance of the foreign office, struck his name from the navy list, on the ground that he had failed to obtain permission to enter the Turkish service; but in 1874, in consequence of a letter in which he acknowledged his fault, but set forth his services in organizing a navy and establishing training schools for an ally, he was reinstated in his former rank, "as a matter of imperial policy," with the opportunity of rising by seniority to the rank of a retired admiral. At the outbreak of the Russo-Turkish war in 1877, he was appointed to the command of the Black sea fleet of Turkey, whereupon his name was again removed from the British navy list, England having issued a proclamation of neutrality. With the exception of running down the Danube under a heavy fire from the enemy, he accomplished nothing during the war, and the fine navy of which he had general command lay idly at anchor during most of the struggle. Russian torpedoes paralyzed action on the Danube, and protected the Black sea ports.

**HOLL, Frank**, an English painter, born in London, July 4, 1845. He is the son of an eminent engraver, and was educated at University college, London. In June, 1861, he entered the schools of the Royal academy, and in 1862 he gained the medal for drawing from the antique. In 1863 he won the gold medal for historical painting, and also the medal for life drawing. He exhibited at the academy in 1864, and in 1866 his picture called "The Ordeal" made him a great reputation. In 1868 he gained the travelling studentship by his "The Lord gave, and the Lord hath taken away," which was exhibited in 1869. Among his celebrated pictures are "The Village Funeral" (1872); "A Seat in a Railway Station" (1873); "Deserted" (1874); "Her First-born" (1876); "Going Home" (1877); "Newgate: Committed for Trial" (1878); "Want—her Poverty but not her Will consents;" "Doubtful Hope;" "Gone," and "The Emigrant's Departure."

**HOLUB, Emil**, a Bohemian naturalist, born about 1845. He departed for the south of Africa immediately after the completion of his studies, and spent seven years in exploring the country north and south of the Zambesi, living alone among the savage tribes, of whose numerous dialects he acquired a thorough knowledge. Possessing no private means, he was

obliged to alternate his scientific researches with the periodical practice of his profession as a physician at the diamond fields. He lived among the tribes of southern Africa, and became more familiar with their habits and languages than any previous traveller. In his third journey he made an accurate survey of the country between the diamond fields and the Zambesi, and of the Zambesi from its junction with the Tchobe to the Barotse country. His map of the river embraces every island, creek, and rapid. This last and most extended of his expeditions into the centre of the continent from the southwest lasted from March, 1875, to November, 1876. He found seven varieties of rhinoceros in Africa, four varieties of the lion, and three of the elephant. In 1879 he returned to Europe with his collections, of which that of beetles alone contained 13,000 specimens; and to arrange for an international expedition to explore central Africa from the south. He has published "Seven Years in South Africa" (2 vols., 1882).

**HOMER, Winslow**, an American artist, born in Boston, Feb. 24, 1836. From early boyhood he showed a talent for drawing, and at the age of 18 entered the service of a lithographer, with whom he remained two years, producing, among other works, a design embracing the portraits of the entire senate of Massachusetts. He then engaged successfully in drawing on the block for wood engravers. In 1859 he took a studio in New York, and in the winter of 1860-'61 studied under Prof. Cummings in the night school at the academy of design. In the summer of 1861 he was appointed artist correspondent for Harper and Brothers at the seat of war. In 1863 he contributed two pictures to the exhibition of the national academy of design: "Home, Sweet Home," a soldier listening to the band playing the familiar air, and "The Last Goose," two soldiers on a foraging expedition, creeping up to a sleeping goose. In 1865 he painted "Prisoners at the Front," which he exhibited at the Paris exposition in 1867, and which was one of the few American pictures there that attracted attention and praise. He remained in Paris nine months, studying without a master from life models. His negro studies rank with the best of the kind. Among them are "Eating Watermelons" and "Cotton Pickers." "In the Fields" represents a muscular, well built young farmer, listening to the "Song of the Lark," by which title the picture was first exhibited in 1877 at the gallery of the Century club.

**HOOK, James Clark**, an English painter, born in London, Nov. 21, 1819. He has painted many historical pictures, but more recently his works consist chiefly of scenes of coast life in Cornwall, and other marine subjects. Among his best pictures are: "Luff, Boy!" (1859), which created a great sensation, "Jolly as a Sand Boy," "The Finding of the Body of Harold," and "Between Tides." He was elected an academician in 1859.
